Association of Radio Industries and Businesses

General Notes to the English translation of ARIB Standards and Technical Reports

1. The copyright of this document is ascribed to the Association of Radio Industries and Businesses (ARIB).
2. All rights reserved. No part of this document may be reproduced, stored in a retrieval system, or transmitted, in any form or by any means, without the prior written permission of ARIB.
3. The ARIB Standards and ARIB Technical Reports are usually written in Japanese and approved by the ARIB Standard Assembly. This document is a translation into English of the approved document for the purpose of convenience of users. If there are any discrepancies in the content, expressions, etc., between the Japanese original and this translated document, the Japanese original shall prevail.
4. The establishment, revision and abolishment of ARIB Standards and Technical Reports are approved at the ARIB Standard Assembly, which meets several times a year. Approved ARIB Standards and Technical Reports, in their original language, are made publicly available in hard copy, CDs or through web posting, generally in about one month after the date of approval. The original document of this translation may have been further revised and therefore users are encouraged to check the latest version at an appropriate page under the following URL:

service information..... 55

Part 3

Data structure and definition of extension information of
service information.....219

Appendix

Guideline for the operational method of service information.....259

Foreword

The ARIB (Association of Radio Industries and Businesses) has established the "ARIB standard" for the basic technical condition of standard specifications related to each radio communication equipment using radio wave and broadcasting transmission and reception equipment, with the participation of radio communication equipment manufacturers, broadcasting equipment manufacturers, electric communication companies, broadcasting companies and other users.

"ARIB standard" is a nonofficial standard established by combining governmental technical standards established for the more effective use of frequencies and to avoid interference among users, and nonofficial optional standards established for the convenience of radio communication equipment manufacturers, broadcasting equipment manufacturers, electric communication companies, broadcasting companies and users, in order to secure appropriate quality and compatibility of radio communication equipment and broadcast equipment, etc.

In order to secure fairness and transparency in drafting steps, this standard is drafted in response to a consensus of the standardization committee, with the participation of interested parties such as radio communication equipment manufacturers, broadcasting equipment manufacturers, electric communication companies, broadcasting companies, and interested users.

At this standardization committee, "Operational standard of basic construction and identifier of service information for digital broadcasting" (ARIB STD-B2), which was the standard specification related to basic construction of service information necessary to enable users to select programs, for the implementation of digital broadcasting, was established as the standard method in Japan, in May 29, 1996. As for the practical use of this standard, a data construction detail standard of service information and guideline for actual operation is necessary in addition to basic construction, so this standard, "Service information for digital broadcasting system", is established as a new nonofficial standard combining the standards mentioned above.

This standard consists of three parts. The first part includes references to other standards related to digital broadcasting and lists of tables and descriptors used in digital broadcasting, in addition to the former standard (ARIB STD-B2). The second part specifies the basic information of service information. The third part specifies the detail data construction of extension of the service information. Guidelines of operational method of service information are attached to this standard as technical documents.

ARIB STD - B10
Version 4.4-E1

Please note that in accordance with the establishment of the new standard, the former "Operational standard of basic construction and identifier of service information for digital broadcasting" (ARIB STD-B2) (May 29, 1996) is abolished.

Service information established herein considers wide application to total broadcasting media such as CS broadcasting, BS broadcasting and digital broadcasting on the ground, preconditioning international coordination of signal structure, flexibility of program organization in each broadcasting company, and the possibility of expansion for future broadcasting service development. From now on, addition or revision of characteristic information and signals may become necessary, depending upon future developments in these broadcasting media.

We hope that this standard will be used actively among radio communication equipment manufacturers, broadcast equipment manufacturers, electric communication companies, broadcasting companies and other users.

Notice:

This standard does not describe industrial proprietary rights mandatory to this standard. However, the owner of industrial proprietary rights is expressed as "Industrial proprietary rights related to this standard, listed in the Annex below, are possessed by the applicant shown in the list. However, execution of the rights listed in the Annex below is permitted indiscriminately, without exclusion, under appropriate conditions, to the user of this standard. If the user of this standard possesses the mandatory industrial proprietary rights for all or part of the contents specified in this standard, and when he asserts those rights, it is not applicable."

7.	Operation of identifier.....	43

1. Purpose

This standard is established for the structure of Service Information (SI) and operational standard of identifier specified in "Standard transmission system for digital broadcasting among standard television broadcasting and the like" in the Ministerial Ordinance No. 26 issued by the Ministry of Public Management, Home Affairs, Posts and Telecommunications in 2003 (hereinafter refer to as "Ordinance").

2. Scope

This standard is applied to the structure of, types of signal, and the data structure of the Service Information and the operational standard of the identifiers used in digital broadcasting.

3. Structure of Service Information

Service Information includes both "ARIB signals" specified in this standard and "company signals" which companies specify individually under certain conditions. Service information is transmitted by section format data structure specified in MPEG-2 Systems (ITU-T H.222.0, ISO/IEC 13818-1).

As service information is closely related to other transmission control signals specified in the Ministerial Ordinance, it is also denoted herein.

Two types of signals for service information are specified. One is a "mandatory" signal, which shall be transmitted as minimum information. And the other type is an "optional" signal, which optionally supplies information on the program. The "company signals" are "optional" signals.

4. Types of Service Information

4.1 Types of table

Types of table used for Service Information are shown in table 4-1. Tables used for digital broadcasting other than Service Information are shown in table 4-2.

Tables established by the companies should be registered and released as company signals.

Table 4-1 Names and functions of Service Information tables

Table name	Functions
PAT* (Program Association Table)	Designates packet identifier of TS packet carrying PMT related to broadcasting program.
CAT* (Conditional Access Table)	Designates packet identifier of the TS packet conveying individual information among related information of charged broadcasting.
PMT* (Program Map Table)	Designates packet identifier of TS packets conveying each coded signal comparing a broadcasting program and packet identifier of TS packets conveying common information among related information of charged broadcasting. .
NIT* (Network Information Table)	Conveys information about the transmitting path such as modulation frequency and its relation to broadcasting programs.
SDT (Service Description Table)	Conveys information related to programmed channel such as channel name and broadcaster's name.
BAT (Bouquet Association Table)	Conveys information related to bouquet (set of programmed channels) such as names of bouquet and programmed channels in it.
EIT (Event Information Table)	Conveys information related to program such as program name, broadcasting date and time, and explanation of contents.
RST (Running Status Table)	Indicates program running status.
TDT (Time Date Table)	Indicates present date and time.
TOT (Time Offset Table)	Indicates present date and time, and designates time difference between present time and indication time for humans.
LIT (Local Event Information Table)	Conveys information related to local event such as discrimination (time), name and explanation of local event (scene etc.) in the program.
ERT (Event Relation Table)	Indicates relationship between programs or local events, such as groups and attributes of programs or local events.
ITT (Index Transmission Table)	Describes information related to program index when sending the program.
PCAT (Partial Content Announcement Table)	Indicates transmission schedule of partial content in data broadcasting.
ST (Stuffing Table)	Makes table invalid.
BIT (Broadcaster Information Table)	Designates unit of broadcaster and SI transmission parameter of each broadcaster unit.
NBIT	Conveys network board information and reference information

(Network Board Information Table)	to gain the network board information.
LDT (Linked Description Table)	Conveys information by which reference information from other tables is collected.
Table set by the companies	To be registered and released

*: Table specified in Ministerial Ordinance

Table 4-2 Names and functions of tables used in digital broadcasting (excluding SI.)

Table name	Function
ECM (Entitlement Control Message) ^{*1}	Conveys common information consisting of program information (information related to programs and descramble key, etc.) and control information (instruction of compulsory on/off of decoder's descramble function).
EMM (Entitlement Management Message) ^{*1}	Conveys individual information including contract information of each subscriber and work key to decrypt common information.
ECM-S (Entitlement Control Message for S-band) ^{*1}	Conveys information related to programs and key information to decrypt, and/or individual contract information of domestic audiences.
EMM-S (Entitlement Management Message for S-band) ^{*1}	Conveys key information to decrypt ECM-S.
DCT (Download Control Table) ^{*3}	Conveys various information to separate and extract DLT.
DLT (DownLoad Table) ^{*3}	Conveys software to be downloaded.
DIT (Discontinuity Information Table) ^{*2}	Indicates changing point where possible discontinuity of service information exists in a program transmitted by partial Transport Stream.
SIT (Selection Information Table) ^{*2}	Conveys information related to programs transmitted by partial Transport Stream.
SDTT ^{*2} (Software Download Trigger Table)	Conveys notification information for download such as service ID, schedule and receiver types for revision.
CDT (Common Data Table) ^{*2}	Conveys data commonly required for receivers and stored in non-volatile memory such as company's logo marks.
DSM-CC section ^{*4}	Conveys various data in data broadcasting.
AIT (Application Information Table)	Conveys dynamic control information concerning ARIB-J Application and additional information for the execution.

*1: Table specified in the Notification No. 37 of the Ministry of Public Management, Home Affairs, Posts and Telecommunications in 2003 (hereinafter referred to as "Notification")

*2: Table specified in ARIB STD-B1 and B21

*3: Table specified in ARIB STD-B16

*4: Table specified in ARIB STD-B24

*5: Table specified in ARIB STD-B23

4.2 Types of descriptor

Types of descriptor used in Service Information are shown in table 4-3, and descriptors used in digital broadcasting other than Service Information are shown in table 4-4.

Descriptors set by the companies should be registered and released as "Company signal".

Table 4-3 Names and function of descriptors in Service Information

Descriptor name	Function
Conditional Access Descriptor* ¹	Describes PID conveying conditional access method and ECM & EMM.
Copyright Descriptor* ¹	Identifies copyright.
Network Name Descriptor	Describes network name.
Service List Descriptor* ¹	Describes programmed channels and their list of type.
Stuffing Descriptor	Secures descriptor space or invalidates descriptor.
Satellite Delivery System Descriptor* ¹	Describe physical characteristics of satellite transmission path
Terrestrial Delivery System Descriptor* ¹	Describes physical characteristics of terrestrial transmission path
Bouquet Name Descriptor	Describes name of bouquet
Service Descriptor	Describes names of programmed channel and company
Country Availability Descriptor	Describes countries intended to be available with the service
Linkage Descriptor	Describes relation to other programmed channels
NVOD Reference Descriptor	Describes a list of time-shifted programmed channels for a reference Near VOD programmed channel.
Time Shifted Service Descriptor	Describes a reference programmed channel for a Near VOD time-shifted programmed channels.
Short Event Descriptor	Describes name and brief explanation of the program.
Extended Event Descriptor	Describes detailed information about the program
Time Shifted Event Descriptor	Describes the reference program for Near VOD time-shifted programs.
Component Descriptor	Describes types and explanation related to program element signal.
Mosaic Descriptor	Describes unit of division related to mosaic (picture division) service and relation with other programmed channels and programs, etc.
Stream Identifier Descriptor	Identifies individual program element signal.
CA Identifier Descriptor	Describes available conditional access method.
Content Descriptor	Describes program genre.
Parental Rating Descriptor	Describes permitted minimum audience age.
Hierarchical Transmission Descriptor	Describes relation between hierarchical streams in hierarchical transmission.
Digital Copy Control Descriptor	Describes information controlling copy generation in digital recording equipment and maximum transmission rate.
Emergency Information Descriptor* ¹	Describes information and function necessary for emergency alarm signal.
Data Component Descriptor* ¹	Identifies data signal format.
System Management Descriptor* ¹	Identifies broadcasting/non-broadcasting.

Local Time Offset Descriptor	Describes time difference between the present time (UTC + 9 hours) and indication time to human when summer time (day-light saving time) system is introduced.
Audio Component Descriptor	Describes parameters related to audio signal among program elements.
Target Region Descriptor* ¹	Describes target region.
Hyperlink Descriptor	Describes links to other programs, program contents and program related information.
Data Content Descriptor	Describes detailed information related to contents of each data program.
Video Decode Control Descriptor	Controls video decoding at event change.
Basic Local Event Descriptor	Describes information for local event identification.
Reference Descriptor	Describes node reference from programs and local events.
Node Relation Descriptor	Describes relation between nodes.
Short Node Information Descriptor	Describes node name and brief explanation.
STC Reference Descriptor	Describes relation between identification time of local event and STC.
Partial Reception Descriptor* ¹	Describes service identifier transmitted by partial reception hierarchy on terrestrial transmission path.
Series Descriptor	Describes series information among multiple events.
Event Group Descriptor	Describes grouping information of multiple events.
SI Parameter Descriptor	Describes SI transmission parameter (periodic group and re-sending period, etc.).
Broadcaster Name Descriptor	Describes broadcaster name.
Component Group Descriptor	Describes grouping information of plural components.
SI Prime TS Descriptor	Describes identifier information of SI prime TS and transmission parameter.
Board Information Descriptor	Describes title and text of board information.
LDT linkage Descriptor	Collects and conveys descriptions referred from other tables.
Connected Transmission Descriptor	Describes physical characteristics of connected transmission in terrestrial audio transmission path
TS Information Descriptor	Describes information related to TS such as allocation of the remote control key number to the TS and the transmission layer of service in the TS.
Extended Broadcaster Descriptor	Describes broadcaster information of other networks.
Logo Transmission Descriptor	Describes character string for simple logo or pointing to CDT-format logo data.
Content Availability Descriptor	Describes information to control record and output of programs.
Carousel Compatible Composite Descriptor	Applies the descriptive functions of the descriptors defined in the Data Carousel scheme.
Conditional Playback Descriptor* ^{1,*2}	Describes PID conveying conditional playback method and its ECM and EMM.
AVC Video Descriptor	Describes profile and level for ITU-T Rec. H.264 ISO/IEC 14496-10 Video.

ARIB STD - B10 Part1
Version 4.4-E1

AVC timing and HRD descriptor	Describes timing information for decoding ITU-T Rec. H.264 ISO/IEC 14496-10 Video.
Service Group Descriptor	Describes grouping information of multiple services.
Descriptor set by the companies	To be registered and released

*1: Descriptor specified in the Notification

*2: Descriptor defined in ARIB STD-B25

Table 4-4 Names and functions of descriptors used in digital broadcasting
(excluding Service Information)

Descriptor	Function
Partial Transport Stream Descriptor ^{*1}	Describes partial Transport Stream.
Network Identification Descriptor ^{*1}	Describes network identifier.
Partial Transport Stream Time Descriptor ^{*1}	Describes partial Transport Stream time
Download Content Descriptor ^{*1}	Describe attribute information such as size and types of downloaded contents and downloaded ID.
CA EMM TS Descriptor ^{*2}	Indicates the specific channel when the EMM transmission is made by the specific channel method
CA Contract Information Descriptor ^{*2}	Describes conditional access service type (tear/flat/PPV) of scheduled program and permission of reception and recording.
CA Service Descriptor ^{*2}	Describes charged broadcast service provider for presenting automatic indication message.
Carousel Identifier Descriptor ^{*3}	Describes Carousel Identifier specified in ISO/IEC 13818-6.
Association Tag Descriptor ^{*3}	Describes ssoication Tag information specified in ISO/IEC 13818-6.
Deferred Association tags Descriptor ^{*3}	Describes Association Tags information of other broadcasting programs specified in ISO/IEC 13818-6.

*1: Descriptor specified in ARIB STD-B1, B21

*2: Descriptor specified in ARIB STD-B25

*3: Descriptor used in ARIB STD-B23

5. Transmission of service information

5.1 PID fortibles

PID values of the Transport Stream packets carrying tables as specified in table 4-1 and table 4-2 shall be as shown in table 5-1.

PID values of Transport Stream packets carrying tables set by companies can be set to any value as long as they do not prevent transmission of the signal specified by the Ministerial Ordinance and Notification or ARIB signal. The PID values shall be registered and released as the company signals.

Table 5-1 Allocation of PID

Table	PID
PAT ^{*1}	0x0000
PMT ^{*1}	Indirect designation by PAT
CAT ^{*1}	0x0001
ECM ^{*1} 、ECM-S ^{*1}	Indirect designation by PMT
EMM ^{*1} 、EMM-S ^{*1}	Indirect designation by CAT
NIT ^{*1}	0x0010
SDT	0x0011

ST	Exclude 0x0000, 0x0001, 0x0014

Null packet ^{*1}	0x1FFF
---------------------------	--------

- *1: According to the Notification
- *2: Specified in ARIB STD-B1, B21
- *3: Specified in ARIB STD-B16
- *4: Specified in ARIB STD- B24
- *5: When used as program group index
- *6: When used as index within program
- *7: In accordance with the Notification No. 522 of Ministry of Posts and Telecommunications in 2000 and JCTEA STD-002
- *8: In accordance with the operational guidelines for the assignment of PID values to each hierarchy
- *9: Specified in ARIB STD- B23

5.2 Table identifier and transmission standard

Allocation of table ID specified in table 4-1 and table 4-2 is shown in table 5-2. Among them, the transmission level of the Service Information tables is shown in table 5-2 in Part 2.

Table ID value of tables set by the companies can be set in the range of 0x90 to 0xBF. The table ID value shall be registered and released as the company signal.

Table 5-2 Allocation of table_ID values

table_id	Table
0x00	PAT ^{*1}

*3: Specified in ARIB STD-B16

*4: Specified in ARIB STD-B24

*5: Specified in ARIB STD-B23

5.3 Identifier of descriptors

Tag values of descriptors specified in tables 4-3 and 4-4 are shown in table 5-3. Transmission standard of descriptors for the Service Information is shown in table 6-1 in Part 2.

When the number of usable descriptors needs to be increased, the method of using composite descriptors shown in Part 2 Annex L shall be used with a tag value of 0xDF. The tag value of sub-descriptor shall be determined for each composite descriptor.

The tag value of descriptors set by the companies can be set in the range of 0x80 to 0xBF. The tag value shall be registered and released as the company signal.

Table 5-3 Allocation of descriptors-tag values

Tag value	Descriptor
0x09	Conditional access descriptor ^{*1}
0x0D	Copyright descriptor ^{*1}
0x13	Carousel identifier descriptor ^{*7}
0x14	Association tag descriptor ^{*7}

*1: In accordance with the Notification

*2: Can be alternated to descriptor implying this function, set by the company

*3: Descriptor specified in ARIB STD-B1 and B21

*4: In accordance with the Notification No. 419 of the Ministry of Public Management, Home Affairs, Posts and Telecommunications in 2002

*5: Descriptor specified in ARIB STD-B25

*6: In accordance with the Notification No. 419 of the Ministry of Public Management, Home Affairs, Posts and Telecommunications in 2002 and JCTEA STD-003

*7: Descriptor used in ARIB STD-B23

*8: In accordance with ITU-T Rec. H.222.0 | ISO/IEC 13818-1

6. Data structure of Service Information

6.1 Data structure of tables

Tables specified in table 4-1 shall be in accordance with the section format specified in MPEG-2 Systems (ITU-T H.222.0, ISO/IEC 13818-1), and its data structure shall be in accordance with figures 6-1 to 6-18.

Data structure of tables specified by companies shall be registered and released as the company signal.

Semantics and usage of each segment of the data structure are specified in part 2 of this standard.

6.2 Data construction of descriptor

Descriptor specified in table 4-3 shall be in accordance with the format specified in MPEG-2 Systems (ITU-T H.222.0, ISO/IEC 13818-1) and its data construction shall be in accordance with figures 6-19 to 6-75.

Data structure of descriptors set by the companies shall be registered and released as the company signal.

Semantics and usage of each segment of data structure are specified in part 2 of this standard..

7. Operation of identifiers

Allocation of each identifier used in service information shall be as shown in table 7-1. Range of value in the table includes reserved value, which will be specified in the future.

Therefore, company specification may contain reserved values; however, it shall be registered and released as the company signal including the reserved values.

Company signal is valid only within the network identifier in the company. However, it is possible to use the same company signal among plural companies.

Table 7-1 Operational standard of identifiers

Identifier	Corresponding portions of STD-B10				Bit	Range of value	Type of definition	Remarks	
	Part	Table	Section	Descriptor name etc.					
Packet identifier (PID)	1	5-1	5.1		13	0x0000 – 0x0010, 0x1FFF	Specified by the Ministry of Public Management, Home Affairs, Posts and Telecommunications	Specified by the Notification	
	2	5-1	5.1.3			0x0011 – 0x002F	Specified by standardization organization (0x0015 and 0x0016 have been specified and operated by the company since before this standard was developed.)	Registered and released after deliberation	
	3	6-1	6.1				Range which does not interfere with the above values	Specified and operated by the company	
		6-2	6.2						
Reference PID (reference_PID)	2		6.2.22	Hierarchical transmission descriptor					
Table identifier (table_id)	1	5-2	5.2		8	0x00 – 0x41, 0x82 – 0x85, 0xFF	Specified by the Ministry of Public Management, Home Affairs, Posts and Telecommunications	Specified by the Notification	
	2	5-2	5.1			0x42 – 0x81, 0x86 – 0x8F, 0xC0 – 0xFE	Specified by standardization organization	Registered and released after deliberation	
	3	6-1	6.1			0x90 – 0xBF	Specified and operated by the company		
		6-2	6.2						

ARIB STD - B10 Part1
Version 4.4-E1

Descriptor tag (descriptor_tag)	1	5-3	5.3			0x00 – 0x3F, 0x41, 0x43, 0x44, 0xF7 – 0xFE	Specified by the Ministry of Public Management, Home Affairs, Posts and Telecommunications	Specified by the Notification		
						0x40, 0x42, 0x45 – 0x7F, 0xC0 – 0xF6, 0xFF			Specified by standardization organization	Registered and released after deliberation
						0x80 – 0xBF				
Transport Stream identifier (transport_stream_id)	2		5.2.4 etc.	Network Information Table (NIT) etc.	16		Specified and operated by the company	Unique within original network identifier		
	3		5.1.1						Local Event Information Table (LIT)	
SI prime Transport Stream identifier (SI_prime_transport_stream_id)	2		6.2.38						SI prime TS descriptor	
Network identifier (network_id)	2	N-1	5.2.4	Network Information Table (NIT)	16		Specified by standardization organization	Registered and released on application		
Original network identifier (original_network_id)	2	5.2.4 etc.	Network Information Table (NIT) etc.							
	3	5.1.1	Local Event Information Table (LIT)							
SI prime TS network identifier (SI_prime_ts_network_id)	2	6.2.38	SI prime TS descriptor							
External network identifier (external_network_id)	3	5.2.5	STC reference descriptor							
Bouquet identifier (bouquet_id)	2		5.2.5 etc.	Bouquet Association Table (BAT) etc.	16		Specified by standardization organization	Registered and released after deliberation. Unique within Japan.		
Service identifier (service_id)	2		5.2.6 etc.	Service Description Table (SDT) etc.	16		Specified and operated by the company	Unique within Japan for the same broadcasting medium		
	3		5.1.1	Local Event Information Table (LIT)						
Original service identifier (original_service_id)	2		5.2.15 etc.	Link Description Table etc.						
Reference service identifier (reference_service_id)	2	6.2.18 etc.	Time shift event descriptor etc.							
Primary service identifier (primary_service_id)	2	6.2.49	Service group descriptor							
Secondary service identifier (secondary_service_id)	2									
External service identifier (external_service_id)	3	5.2.5	STC reference descriptor							
Broadcast event number identifier (program_number)	2	Annex E	PAT, PMT

1. Purpose

Part 2 of this standard is established to specify detail data structure of basic information related to the Service Information as specified in "Standard transmission system for digital broadcasting among standard television broadcasting and the like" in Ministerial Ordinance No. 26 of the Ministry of Public Management, Home Affairs, Posts and Telecommunications in 2003.

2. Scope

Part 2 of this standard is applied to basic structure of the Service Information specified in part 1.

3. Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the following terms and definitions apply:

bouquet: collection of services marketed as a single entity

broadcaster: organization which assemble a sequence of events or programs to be delivered to the viewer based upon a schedule

component: one or more entities which together make up an event

Conditional Access (CA) system: system to control subscriber access to services, programs and events

delivery system: physical medium by which one or more multiplexes are transmitted

Entitlement Management Message (EMM): private Conditional Access information which specify the authorization levels or the services of specific decoders. They may be addressed to individual decoder or groups of decoders.

event: grouping of elementary broadcast data streams with a with a defined start and end time belonging to a common service

forbidden: when used in the clause defining the coded bit stream, indicates that the value shall never be used.

MPEG-2: See ISO/IEC 13818

multiplex: stream of all the digital data carrying one or more services within a single physical channel

network: collection of MPEG-2 Transport Stream (TS) multiplexes transmitted on a single delivery system

original_network_id: unique identifier of a network.

reserved: when used in the clause defining the coded bit stream, indicates that the value may be used in the future for ISO defined extensions. Unless otherwise specified within the present document, all "reserved" bits shall be set to "1".

reserved_future_use: when used in the clause defining the coded bit stream, indicates that the value may be used in the future for ARIB defined extensions. Unless otherwise specified within the present document all "reserved_future_use" bits shall be set to "1".

section: syntactic structure used for mapping all service information defined in ARIB STD-B10 into ISO/IEC 13818-1 TS packets

service: sequence of programs under the control of a broadcaster which can be broadcast as part of a schedule

service_id: unique identifier of a service within a TS

Service Information (SI): digital data describing the delivery system, content and scheduling/timing of broadcast data streams, etc.

sub_table: collection of sections with the same value of table_id and:

for a NIT: the same table_id extension (network_id) and version_number;

for a BAT: the same table_id extension (bouquet_id) and version_number;

for a SDT: the same table_id extension (transport_stream_id), the same original_network_id and version_number;

for a EIT: the same table_id extension (service_id), the same transport_stream_id, the same original_network_id and version_number;

The table_id_extension field is equivalent to the fourth and fifth byte of a section when the section_syntax_indicator is set to a value of "1".

table: comprised of a number of sub_tables with the same value of table_id

Transport Stream (TS): data structure defined in ISO/IEC 13818-1

transport_stream_id: unique identifier of a TS within an original network.

JST (Japanese Standard Time): "UTC +9" hour, irrespective of summer time, etc.

MJD (Modified Julian Date) (Japan Time): date indication denoted in accordance with Annex C. Time shall refer to "UTC + 9" hour.

The relationships of some of these definitions are illustrated in the service delivery model in figure 3-1.

Figure 3-1 Digital broadcasting, service delivery model

3.2 Abbreviations

For the purposes of this standard, the following abbreviations apply:

BAT	Bouquet Association Table
BCD	Binary Coded Decimal
BIT	Broadcaster Information Table
CA	Conditional Access
CAT	Conditional Access Table
CRC	Cyclic Redundancy Check
EIT	Event Information Table
EMM	Entitlement Management Message
EPG	Electronic Program Guide
FEC	Forward Error Correction
IEC	International Electrotechnical Commission
IRD	Integrated Receiver Decoder
ISO	International Organization for Standardization
JTC	Joint Technical Committee
LDT	Linked Description Table
LSB	Least Significant Bit
MJD	Modified Julian Date
MPEG	Moving Pictures Expert Group
NBIT	Network Board Information Table
NIT	Network Information Table
NVOD	Near Video On Demand
PAT	Program Association Table
PCAT	Partial Content Announcement Table
PID	Packet Identifier
PMT	Program Map Table
PSI	Program Specific Information
QPSK	Quadrature Phase Shift Keying
RS	Reed Solomon
RST	Running Status Table
SDT	Service Description Table
SI	Service Information
ST	Stuffing Table
TDT	Time and Date Table
TOT	Time Offset Table
bslbf	bit string, left bit first
rpchof	remainder polynomial coefficients, highest order first
uimbsf	unsigned integer most significant bit first

3.3 Terminology used in Ministerial Ordinances and Notifications

Terminology used in the present document and in Ministerial Ordinances and Notifications is listed in table 3-1.

Table 3-1 Terminology comparison table

Where the terminology is used	Terminology used in the present document	Terminology used in Ministerial Ordinances and Notifications
Everywhere	Identification	Identifier
Everywhere	Descriptor area length	Descriptor length
Everywhere	Stream type	Stream type identifier
Service list descriptor	Service type	Service type identifier

4. SI description

ISO/IEC 13818-1 specifies SI which is referred to as PSI. The PSI data provides information to enable automatic configuration of the receiver to demultiplex and decode the various streams programs within the multiplex.

The PSI data is structured as four types of table. The tables are transmitted in sections.

1) Program Association Table (PAT):

- for each service in the multiplex, the PAT indicates the location (the PID values of the Transport Stream packets) of the corresponding Program Map Table (PMT). It also gives the location of the Network Information Table (NIT).the ST is used to invalidate existing sections, for example at delivery system boundaries.

2) Conditional Access Table (CAT):

- the CAT provides information on the Conditional Access (CA) systems used in the multiplex; the information is private (not defined with this standard) and dependent on the CA system, but includes the location of the EMM stream, when applicable.

3) Program Map Table (PMT):

- the PMT identifies and indicates the locations of the streams that make up each service, and the location of the Program Clock Reference fields for a service.

4) Network Information Table (NIT):

- the location of the NIT is defined in this standard in compliance with ISO/IEC 13818-1[21] specification, but the data format is outside the scope of ISO/IEC 13818-1[21]. It is identified to provide information about the physical network. The syntax and semantics of the NIT are defined in this standard.

In addition to the PSI, data are needed to provide identification of services and events for the user. The coding of this data is defined in this standard. In contrast with the PAT, CAT, and PMT of the PSI, which give information only for the multiplex in which they are contained (the actual multiplex), the additional information defined within this standard can also provide information on services and events carried by different multiplexes, and even on other networks. This data is structured as eleven tables:

- 1) Bouquet Association Table (BAT):
 - the BAT provides information regarding bouquets. As well as giving the name of the bouquet, it provides a list of services for each bouquet.
- 2) Service Description Table (SDT):
 - the SDT contains data describing the services in the system e.g. names of services, the service provider, etc.
- 3) Event Information Table (EIT):
 - the EIT contains data concerning events or programs such as event name, start time, duration, etc.
 - the use of different descriptors allows the transmission of different kinds of event information e.g. for different service types.
- 4) Running Status Table (RST):
 - the RST gives the status of an event (running/not running). The RST updates this information and allows timely automatic switching to events.
- 5) Time and Date Table (TDT):
 - the TDT gives information relating to the present time and date. This information is given in a separate table due to the frequent updating of this information.
- 6) Time Offset Table (TOT):
 - the TOT gives information relating to the present time and date and local time offset. This information is given in a separate table due to the frequent updating of the time information.
- 7) Partial Content Announcement Table (PCAT):
 - the PCAT includes starting time and continuing time of partial content in accumulated data broadcasting.
- 8) Stuffing Table (ST):
 - the ST is used to invalidate existing sections, for example at delivery system boundaries.
- 9) Broadcaster Information Table (BIT):
 - the BIT includes broadcaster unit comprising network or SI transmitting parameter information for each broadcaster.
- 10) Network Board Information Table (NBIT):

ARIB STD - B10 Part2
Version 4.4-E1

- the NBIT includes board information in network and reference information for acquiring the board information.

11) Link Description Table (LDT):

- the LDT includes various collected data for reference from other tables.

Applicable use of descriptors allows a flexible approach to the structure of the tables and allows for future compatible extensions.

*1: Using the PID value 0x0012,0x0026,0x0027 in digital terrestrial television broadcasting

Figure 4-1 Structure of transmission control signal

5. SI tables

5.1 SI table mechanism

The SI specified in this standard and MPEG-2 PSI tables shall be segmented into one or more sections before being inserted into Transport Stream packets. The tables listed in clause 4 are conceptual in that they need never be regenerated in a specified form within an IRD. The tables, when transmitted shall not be scrambled, with the exception of the EIT, which maybe scrambled if required (see subclause 5.1.5). A section is a syntactic structure that shall be used for mapping all MPEG-2 tables and SI tables specified in this standard, into Transport Stream packets. These SI syntactic structures conform to the private section syntax defined in ISO/IEC 13818-1[21].

5.1.1 Explanation

Sections may be variable in length. The sections within each table are limited to 1024 bytes in length, except for sections within the EIT, which are limited to 4096 bytes. Each section is uniquely identified by combinations of the following elements:

- a) `table_id`:
 - the `table_id` identifies to which table the section belongs.
 - some `table_ids` have been defined by ISO and others by the present document. Other values of the `table_id` can be allocated by the user for private purposes. The list of values of `table_id` is contained in table 5-2.
- b) `table_id_extension`:
 - the `table_id_extension` is used for identification of a `sub_table`.
 - the interpretation of each `sub_table` is given in subclause 5.2.
- c) `section_number`:
 - the `section_number` field allows the sections of a particular `sub_table` to be reassembled in their original order by the decoder. It is recommended that sections be transmitted in numerical order, unless it is desired to transmit some sections of the `sub_table` more frequently than others, e.g. due to random access considerations.
 - for the SI tables as specified in the present document, section numbering applies to `sub_tables`.

- d) `version_number`:
- when the characteristics of the TS described in the SI given in the present document change (e.g. new events start, different composition of elementary streams for a given service), then new SI data shall be sent containing the updated information. A new version of the SI data is signaled by sending a `sub_table` with the same identifiers as the previous `sub_table` containing the relevant data, but with the next value of `version_number`.
 - for the SI tables specified in the present document, the `version_number` applies to all sections of a `sub_table`.
- e) `Current_next_indicator`:
- each section shall be numbered as valid "now" (current), or as valid in the immediate future (next). This allows the transmission of a future version of the SI in advance of the change, giving the decoder the opportunity to prepare for the change. There is however, no requirement to transmit the next version of a section in advance, but if it is transmitted, then it shall be the next correct version of that section.

5.1.2 Mapping of sections into Transport Stream (TS) packets

Sections shall be mapped directly into Transport Stream packets. Sections may start at the beginning of the payload of a Transport Stream packet, but this is not a requirement, because the start of the first section in the payload of a Transport Stream packet is pointed to by the `pointer_field`. There is never more than one `pointer_field` in a Transport Stream packet, as the start of any other section can be identified by counting the length of the first and any subsequent sections, since no gaps between sections within a Transport Stream packet are allowed by the syntax.

Within Transport Stream packets of any single PID value, one section is finished before the next one is allowed to be started, or else it is not possible to identify to which section header the data belongs. If a section finishes before the end of a Transport Stream packet, but it is not convenient to open another section, a stuffing mechanism may be used to fill up the space.

Stuffing may be performed by filling each remaining byte of the Transport Stream packet with the value "0xFF". Consequently the value "0xFF" shall not be used for the `table_id`. If the byte immediately following the last byte of a section takes the value of "0xFF", then the rest of the Transport Stream packet shall be stuffed with "0xFF" bytes. These bytes may be discarded by a decoder. Stuffing may also be performed using the `adaptation_field` mechanism.

For more detailed description of the mechanism and functionality, specifically refer to section 2.4.4 and Annex C of ISO/IEC 13818-1[21].

5.1.3 Coding of PID and table_id fields

Table 5-1 lists the PID values which shall be used for the TS packets which carry SI sections.

Table 5-1 PID allocation for SI

Table	PID
PAT ^{*1}	0x0000
PMT ^{*1}	Indirect designation by PAT
CAT ^{*1}	0x0001
NIT ^{*1}	0x0010
SDT	0x0011
BAT	0x0011
EIT	0x0012
EIT(digital terrestrial TV broadcasting) ^{*2}	0x0012, 0x0026, 0x0027
RST	0x0013
TDT	0x0014
TOT	0x0014
PCAT	0x0022
BIT	0x0024
NBIT	0x0025
LDT	0x0025
ST	Exclude 0x0000, 0x0001, 0x0014
Null packet ^{*1}	0x1FFF

^{*1}: In accordance with the Notification

^{*2}: In accordance with the operating guidelines for the PID allocation to each hierarchy

Table 5-2 lists the values, which shall be used for table_id and transmission level for the SI, defined in the present document.

The value specified as sending frequency in table 5-2 is only a criterion of operation and is not the standard value.

Table 5-2 Allocation of table_id values and transmission level

table_id	Table	Transmission level	Transmission frequency
0x00	PAT ^{*1}	Mandatory	Once or more/100m sec.
0x01	CAT ^{*1}	Mandatory	Once or more/1 sec.
0x02	PMT ^{*1}	Mandatory	Once or more/100m sec.
0x40	NIT (Actual network) ^{*1}	Mandatory	Once or more/10 sec.
0x41	NIT (Other network) ^{*1}	Optional	Once or more/10 sec.
0x42	SDT (Actual stream)	Mandatory	Once or more/2 sec.
0x46	SDT (Other stream)	Optional	Once or more/10 sec.
0x4A	BAT	Optional	Once or more/10 sec.
0x4E	EIT (Present and following program of the actual stream)	Mandatory	Once or more/2 sec.
0x4F	EIT (Present and following program of the other stream)	Optional	Once or more/10 sec.
0x50 – 0x5F	EIT (Program within 8 days of the actual stream)	Optional	Once or more/10 sec.
	EIT (Program after 8 days of the actual stream)	Optional	Once or more/30 sec.
0x60 – 0x6F	EIT (Program within 8 days of the other stream)	Optional	Once or more/10 sec.
	EIT (Program after 8 days of the other stream)	Optional	Once or more/30 sec.
0x70	TDT	Mandatory ^{*2}	Once or more/30 sec.
0x71	RST	Optional	Optional
0x72	ST	Optional	Optional
0x73	TOT	Mandatory ^{*2}	Once or more/30 sec.
0xC2	PCAT	Optional	Optional
0xC4	BIT	Optional	Once or more/20 sec.
0xC5	NBIT (Board information body)	Optional	Once or more/20 sec.
0xC6	NBIT (Reference information to gain board information)	Optional	1 sec. or more 10 sec.
0xC7	LDT	Optional	1 sec. or more 20 sec.
0x90 – 0xBF	Selectable range as table_id value set by companies		

*1: In accordance with the Notification

*2: Transmitting either TDT or TOT is mandatory.

5.1.4 Repetition rates and random access

In systems where random access is a consideration, it is recommended to re-transmit SI sections specified within the present document several times, even when changes do not occur in the configuration. For SI specified within the present document, multi-sectional availability in the same sub_table section shall be 4KB at maximum. (Multi-sectional availability herein means continuous allocation to TS packets.)

Moreover, TS packets of the same PID is transmitted within the range of $4\text{KB} \pm 100\%$ in 32msec each. The rule of "4KB in 32msec" is a detailed specification of 1Mbit per 1 sec. for every PID.

This Limit applies for TSs with a total data rate of up to 100Mbit/s.

5.1.5 Scrambling

With the exception of the EIT carrying schedule information, no tables specified in the present document shall be scrambled. One method for scrambling the EIT schedule table is given in the appendix of the present document. If a scrambling method operating over TS packets is used, it may be necessary to use a stuffing mechanism to fill from the end of a section to the end of a packet so that any transitions between scrambled and unscrambled data occur at packet boundaries.

In order to identify the CA streams which control the descrambling of the EIT data, a scrambled EIT schedule table shall be identified in the PSI. Service_id value 0xFFFF is allocated to identifying a scrambled EIT, and the program map section for this service shall describe the EIT as a private stream and shall include one or more CA_descriptors (defined in ISO/IEC 13818-1[21]) which give the PID values and optionally, other private data to identify the associated CA streams. Service_id value 0xFFFF shall not be used for any other service.

5.2 Table definitions

The following subclauses describe the syntax and semantics of the different types of table.

[Note] The symbols and abbreviations, and the method of describing syntax used in this standard are the same as those defined in sections 2.2 and 2.3 of ISO/IEC 13818-1[21].

5.2.1 Program Association Table (PAT)

PAT designates packet identifier of TS packet that transmits PMT related to broadcasting program.

For details, refer to sub-clause 2.4.4 of ISO/IEC 13818-1 [21]

5.2.2 Conditional Access Table (CAT)

CAT designates packet identifier of TS packet that transmits related information of charged broadcasting.

For details, refer to clause 2.4.4 of ISO/IEC 13818-1 [21]

5.2.3 Program Map Table (PMT)

PMT designates packet identifier of TS packet that transmits each coded signal constructing broadcasting program.

For details, refer to clause 2.4.4 of ISO/IEC 13818-1 [21]

5.2.4 Network Information Table (NIT)

[Note] This item is also explained in Notification No. 37 of the Ministry of Public Management, Home Affairs, Posts and Telecommunications in 2003.

The NIT (see table 5-3) conveys information relating to the physical organization of the multiplexes/TSs carried via a given network, and the characteristics of the network itself. The combination of `original_network_id` and `transport_stream_id` allow each TS to be uniquely identified throughout the present document application area. Networks are assigned individual `network_id` values, which serve as unique identification codes for networks. The standardization organization shall specify the allocation of these codes. In the event that the NIT is transmitted on the network on which the TS was originated, the `network_id` and the `original_network_id` shall take the same value.

Guidelines for the processing of SI at transitions between delivery media boundaries, e.g. from satellite to cable, shall be specified otherwise.

IRDs may be able to store the NIT information in non-volatile memory in order to minimize the access time when switching between channels ("channel hopping"). It is also possible to transmit an NIT for other networks in addition to the actual network. Differentiation between the NIT for the actual network and the NIT for other networks is achieved using different `table_id` values (see table 5-2).

The NIT shall be segmented into `network_information_sections` using the syntax of table 5-3. Any sections forming part of NIT shall be transmitted in TS packets with a PID value of 0x0010. Any

sections of the NIT which describe the actual network (that is, the network of which the TS containing NIT is a part) shall have the table_id 0x40 with the same table_id_extension (network_id). The network_id field takes the value assigned to the actual network specified by the standardization organization. Any sections of NIT which refer to a network other than the actual network shall take table_id value of 0x41 and the network_id shall take the value allocated to the other network specified by the standardization organization.

Table 5-3 Network information section

Syntax	No. of bits	Identifier
network_information_section(){		
table_id	8	uimsbf
section_syntax_indicator	1	bslbf
reserved_future_use	1	bslbf

}		
}		
CRC_32	32	rpchof
}		

Semantics for the network information section:

table_id: See table 5-2.

section_syntax_indicator: The section_syntax_indicator is a 1-bit field which shall be set to "1".

section_length: This is a 12-bit field, the first two bits of which shall be "00". It specifies the number of bytes of the section, starting immediately following the section_length field and including the CRC. The section_length shall not exceed 1021 so that the entire section has a maximum length of 1024 bytes.

network_id: This is a 16-bit field which serves as a label to identify the delivery system, about which the NIT informs, from any other delivery system. The standardization organization shall specify allocation of the value of this field. (See Annex N)

version_number: This 5-bit field is the version number of the sub_table. The version_number shall be incremented by 1 when a change in the information carried within the sub_table occurs. When it reaches value 31, it wraps around to 0. When the current_next_indicator is set to "1", then the version_number shall be that of the currently applicable sub_table defined by the table_id and network_id. When the current_next_indicator is set to "0", then the version_number shall be that of the next applicable sub_table defined by the table_id and network_id.

current_next_indicator: This 1-bit indicator, when set to "1" indicates that the sub_table is the currently applicable sub_table. When the bit is set to "0", it indicates that the sub_table sent is not yet applicable and shall be the next sub_table to be valid.

section_number: This 8-bit field gives the number of the section. The section_number of the first section in the sub_table shall be "0x00". The section_number shall be incremented by 1 with each additional section with the same table_id and network_id.

last_section_number: This 8-bit field specifies the number of the last section (that is, the section with the highest section_number) of the sub_table of which this section is part.

network_descriptors_length: This 12-bit field gives the total length in bytes of the following network descriptors.

transport_stream_loop_length: This is a 12-bit field specifying the total length in bytes of the Transport Stream loops that follows, ending immediately before the first CRC-32 byte.

transport_stream_id: This is a 16-bit field which serves as a label for identification of this Transport Stream from any other multiplex within the delivery system.

original_network_id: This 16-bit field gives the label identifying the network_id of the originating delivery system.

transport_descriptors_length: This is a 12-bit field specifying the total length in bytes of Transport Stream descriptors that follow.

CRC_32: This is a 32-bit field that contains the CRC value that gives a zero output of the registers in the decoder defined in Annex B after processing the entire section.

5.2.5 Bouquet Association Table (BAT)

The BAT (see table 5-4) provides information regarding bouquets. A bouquet is a collection of services, which may traverse the boundary of a network.

The BAT shall be segmented into bouquet_association_sections using the syntax of table 5-4. Any sections forming part of a BAT shall be transmitted in TS packets with a PID value of 0x0011. The sections of a BAT sub_table describing a particular bouquet shall have a bouquet_id field taking the value assigned to the bouquet described otherwise.

All BAT sections shall take a table_id value of 0x4A.

Table 5-4 Bouquet association selection

Syntax	No. of bits	Identifier
bouquet_association_section(){		
table_id	8	uimsbf
section_syntax_indicator	1	bslbf
reserved_future_use	1	bslbf
reserved	2	bslbf
section_length	12	uimsbf
bouquet_id	16	uimsbf
reserved	2	bslbf
version_number	5	uimsbf
current_next_indicator	1	bslbf
section_number	8	uimsbf
last_section_number	8	uimsbf
reserved_future_use	4	bslbf
bouquet_descriptors_length	12	uimsbf
for(i=0;i<N;i++){		
descriptor()		
}		
reserved_future_use	4	bslbf
transport_stream_loop_length	12	uimsbf
for(i=0;i<N;i++){		
transport_stream_id	16	uimsbf
original_network_id	16	uimsbf
reserved_future_use	4	bslbf
transport_descriptors_length	12	uimsbf
for(j=0;j<N;j++){		

Semantics for the bouquet association section:

table_id: See table 5-2.

section_syntax_indicator: The section_syntax_indicator is a 1-bit field which shall be set to "1".

section_length: This is a 12-bit field, the first two bits of which shall be "00". It specifies the number of bytes of the section, starting immediately following the section_length field and including the CRC. The section_length shall not exceed 1021 so that the entire section has a maximum length of 1024 bytes.

bouquet_id: This is a 16-bit field which serves as a label to identify the bouquet. Allocations of the value of this field are specified otherwise.

version_number: This 5-bit field is the version number of the sub_table. The version_number shall be incremented by 1 when a change in the information carried within the sub_table occurs. When it reaches value 31, it wraps around to 0. When the current_next_indicator is set to "1", then the version_number shall be that of the currently applicable sub_table defined by the table_id and network_id. When the current_next_indicator is set to "0", then the version_number shall be that of the next applicable sub_table defined by the table_id and bouquet_id.

current_next_indicator: This 1-bit indicator, when set to "1" indicates that the sub_table is the currently applicable sub_table. When the bit is set to "0", it indicates that the sub_table sent is not yet applicable and shall be the next sub_table to be valid.

section_number: This 8-bit field gives the number of the section. The section_number of the first section in the sub_table shall be "0x00". The section_number shall be incremented by 1 with each additional section with the same table_id and bouquet_id.

last_section_number: This 8-bit field specifies the number of the last section (that is, the section with the highest section_number) of the sub_table of which this section is part.

bouquet_descriptors_length: This 12-bit field gives the total length in bytes of the following descriptors.

`transport_stream_loop_length`: This is a 12-bit field specifying the total length in bytes of the Transport Stream loops that follows.

`transport_stream_id`: This is a 16-bit field which serves as a label for identification of this Transport Stream from any other multiplex within the delivery system.

`original_network_id`: This 16-bit field gives the label identifying the `network_id` of the originating delivery system.

`transport_descriptors_length`: This is a 12-bit field specifying the total length in bytes of Transport Stream descriptors that follow.

`CRC_32`: This is a 32-bit field that contains the CRC value that gives a zero output of the registers in the decoder defined in Annex B after processing the entire private section.

5.2.6 Service Description Table (SDT)

Each `sub_table` of the SDT (see table 5-5) shall describe services that are contained within a particular TS. The services may be part of the actual TS or part of other TSs, these being identified by means of the `table_id` (see table 5-2).

The SDT shall be segmented into `service_description_sections` using the syntax of table 5-5. Any sections forming part of an SDT shall be transmitted in TS packets with a PID value of 0x0011. Any sections of the SDT which describe the actual TS (that is, the TS containing the SDT) shall have the `table_id` value 0x42 with the same `table_id_extension` (`transport_stream_id`) and with the same `original_network_id`. Any sections of an SDT which refer to a TS other than the actual TS shall take a `table_id` value of 0x46.

Table 5-5 Service description section

Syntax	No. of bits	Identifier
service_description_section(){		
table_id	8	uimsbf
section_syntax_indicator	1	bslbf
reserved_future_use	1	bslbf
reserved	2	bslbf
section_length	12	uimsbf
transport_stream_id	16	uimsbf
reserved	2	bslbf
version_number	5	uimsbf
current_next_indicator	1	bslbf
section_number	8	uimsbf

free_CA_mode	1	bslbf
descriptors_loop_length	12	uimsbf
for(j=0;j<N;j++){		
descriptor()		
}		
}		
CRC_32	32	rpchof
}		

Semantics for the service description section:

table_id: See table 5-2.

section_syntax_indicator: The section_syntax_indicator is a 1-bit field which shall be set to "1".

section_length: This is a 12-bit field, the first two bits of which shall be "00". It specifies the number of bytes of the section, starting immediately following the section_length field and including the CRC. The section_length shall not exceed 1021 so that the entire section has a maximum length of 1024 bytes.

transport_stream_id: This is a 16-bit field which serves as a label for identification of the Transport Stream, about which the SDT informs, from any other multiplex within the delivery system.

version_number: This 5-bit field is the version number of the sub_table. The version_number shall

be incremented by 1 when a change in the information carried within the sub_table occurs. When it reaches value 31, it wraps around to 0. When the current_next_indicator is set to "1", then the version_number shall be that of the currently applicable sub_table defined by the table_id and network_id. When the current_next_indicator is set to "0", then the version_number shall be that of the next applicable sub_table.

current_next_indicator: This 1-bit indicator, when set to "1" indicates that the sub_table is the currently applicable sub_table. When the bit is set to "0", it indicates that the sub_table sent is not yet applicable and shall be the next sub_table to be valid.

section_number: This 8-bit field gives the number of the section. The section_number of the first section in the sub_table shall be "0x00". The section_number shall be incremented by 1 with each additional section with the same table_id, transport_stream_id, and original_network_id.

last_section_number: This 8-bit field specifies the number of the last section (that is, the section with the highest section_number) of the sub_table of which this section is part.

original_network_id: This 16-bit field gives the label identifying the network_id of the originating delivery system.

service_id: This is a 16-bit field which serves as a label to identify this service from any other service within the Transport Stream. The service_id is the same as the program_number in the corresponding program_map_section.

EIT_user_defined_flags: Each broadcaster can define this 3 bits field individually as the extension to indicate whether it transmits EIT or not. If it is set to "111", it means no use.

EIT_schedule_flag: This is a 1-bit field which, when set to "1", indicates that EIT schedule information for the service is present in the current Transport Stream (see the guideline for information on maximum time interval between occurrences of an EIT schedule sub_table). If the flag is set to 0 then the EIT schedule information for the service should not be present in the Transport Stream.

EIT_present_following_flag: This is a 1-bit field which, when set to "1", indicates that EIT_present_following information for the service is present in the current Transport Stream (see the guideline for information on maximum time interval between occurrences of an EIT present/following sub_table). If the flag is set to 0 then the EIT present/following information for the service should not be present in the Transport Stream.

running_status: This is a 3-bit field indicating the status of the service as defined in table 5-6.

Table 5-6 SDT running_status

Value	Meaning
0	undefined
1	not running
2	starts in a few seconds (e.g. for video recording)
3	pausing
4	running
5 – 7	reserved for future use

free CA mode: This 1-bit field, when set to "0" indicates that all the component streams of the service are not scrambled. When set to "1" it indicates that access to one or more streams may be controlled by a CA system.

descriptors loop length: This 12-bit field gives the total length in bytes of the following descriptors.

CRC 32: This is a 32-bit field that contains the CRC value that gives a zero output of the registers in the decoder defined in Annex B after processing the entire private section.

5.2.7 Event Information Table (EIT)

The EIT (see table 5-7) provides information in chronological order regarding the events contained within each service. Four classifications of EIT have been identified, distinguishable by the use of different table_ids (see table 5-2):

- 1) actual Transport Stream, present/following event information = table_id = "0x4E";
- 2) other Transport Stream, present/following event information = table_id = "0x4F";
- 3) actual Transport Stream, event schedule information = table_id = "0x50" to "0x5F";
- 4) other Transport Stream, event schedule information = table_id = "0x60" to "0x6F".

The present/following table shall contain only information pertaining to the present event and the chronologically following event carried by a given service on either the actual Transport Stream or another Transport Stream, except in the case of a Near Video On Demand (NVOD) reference service, where it may have more than two event descriptions. The event schedule tables for either the actual Transport Stream or other Transport Streams contain a list of events, in the form of a schedule, including events taking place at some time beyond the next event. The EIT schedule tables are optional. The event information shall be chronologically ordered.

The EIT shall be segmented into event_information_sections using the syntax of table 5-7. Any

sections forming part of an EIT shall be transmitted in Transport Stream packets with a PID value of 0x0012.

Table 5-7 Event information section

Syntax	No. of bits	Identifier
event_information_section(){		
table_id	8	uimsbf
section_syntax_indicator	1	bslbf
reserved_future_use	1	bslbf
reserved	2	bslbf
section_length	12	uimsbf
service_id	16	uimsbf
reserved	2	bslbf
version_number	5	uimsbf
current_next_indicator	1	bslbf
section_number	8	uimsbf
last_section_number	8	uimsbf
transport_stream_id	16	uimsbf
original_network_id	16	uimsbf
segment_last_section_number	8	uimsbf
last_table_id	8	uimsbf
for(i=0;i<N;i++){		
event_id	16	uimsbf
start_time	40	bslbf
duration	24	uimsbf
running_status	3	uimsbf
free_CA_mode	1	bslbf
descriptors_loop_length	12	uimsbf
for(j=0;j<N;j++){		
descriptor()		
}		
}		
CRC_32	32	rpchof
}		

Semantics for the event information section:

table_id: See table 5-2.

section_syntax_indicator: The section_syntax_indicator is a 1-bit field which shall be set to "1".

section_length: This is a 12-bit field. It specifies the number of bytes of the section, starting immediately following the section_length field and including the CRC. The section_length shall not exceed 4093 so that the entire section has a maximum length of 4096 bytes.

service_id: This is a 16-bit field which serves as a label to identify this service from any other service within a Transport Stream. The service_id is the same as the program_number in the corre-

sponding program_map_section.

version_number: This 5-bit field is the version number of the sub_table. The version_number shall be incremented by 1 when a change in the information carried within the sub_table occurs. When it reaches value 31, it wraps around to 0. When the current_next_indicator is set to "1", then the version_number shall be that of the currently applicable sub_table defined by the table_id and service_id. When the current_next_indicator is set to "0", then the version_number shall be that of the next applicable sub_table.

current_next_indicator: This 1-bit indicator, when set to "1" indicates that the sub_table is the currently applicable sub_table. When the bit is set to "0", it indicates that the sub_table sent is not yet applicable and shall be the next sub_table to be valid.

section_number: This 8-bit field gives the number of the section. The section_number of the first section in the sub_table shall be "0x00". The section_number shall be incremented by 1 with each additional section with the same table_id, transport_stream_id, and original_network_id. In this case, the sub_table may be structured as a number of segments. Within each segment the section_number shall increment by 1 with each additional section, but a gap in numbering is permitted between the last_section of a segment and the first section of the adjacent segment.

last_section_number: This 8-bit field specifies the number of the last section (that is, the section with the highest section_number) of the sub_table of which this section is part.

transport_stream_id: This is a 16-bit field which serves as a label for identification of the Transport Stream, about which the EIT informs, from any other multiplex within the delivery system.

original_network_id: This 16-bit field gives the label identifying the network_id of the originating delivery system.

segment_last_section_number: This 8-bit field specifies the number of the last section of this segment of the sub_table. For sub_tables which are not segmented, this field shall set to the same value as the last_section_number field.

last_table_id: This 8-bit field identifies the last table_id used. If only one table is used this is set to the table_id of this table. The chronological order of information is maintained across successive table_id values.

event_id: This 16-bit field contains the identification number of the described event (uniquely allo-

cated within a service definition).

start_time: This 40-bit field contains the start time of the event in Japan Standard Time (JST) and Modified Julian Date (MJD) (see Annex C). This field is coded as 16 bits giving the 16 LSBs of MJD followed by 24 bits coded as 6 digits in 4-bit Binary Coded Decimal (BCD). If the start time is undefined (e.g., for an event in a NVOD reference service), all bits of the field are set to "1".

duration: A 24-bit field containing the duration of the event in hours, minutes, seconds. When duration is not defined, (such as emergency news, the end time of which is not known), all bits in this field are set to "1".

format: 6 digits, 4-bit BCD = 24 bit.

Example 2: 01:45:30 is coded as "0x014530".

running_status: This is a 3-bit field indicating the status of the event as defined in table 5-6.

free_CA_mode: This 1-bit field, when set to "0" indicates that all the component streams of the event are not scrambled. When set to "1" it indicates that access to one or more streams is controlled by a CA system.

descriptors_loop_length: This 12-bit field gives the total length in bytes of the following descriptors.

CRC_32: This is a 32-bit field that contains the CRC value that gives a zero output of the registers in the decoder defined in Annex B after processing the entire private section.

5.2.8 Time and Date Table (TDT)

The TDT (see table 5-8) carries only the JST-time and date information.

The TDT shall consist of a single section using the syntax of table 5-8. This TDT section shall be transmitted in TS packets with a PID value of 0x0014, and the table_id shall take the value 0x70.

Table 5-8 Time and date section

Syntax	No. of bits	Identifier
time_date_section(){		
table_id	8	uimsbf
section_syntax_indicator	1	bslbf
reserved_future_use	1	bslbf
reserved	2	bslbf
section_length	12	uimsbf
JST_time	40	bslbf
}		

Semantics for the time and date section:

table_id: See table 5-2.

section_syntax_indicator: This is a 1-bit indicator which shall be set to "0".

section_length: This is a 12-bit field, which shall be "0x005". It specifies the number of bytes of the section, starting immediately following the section_length field and up to the end of the section.

JST_time: (Current time and date): This 40-bit field contains the current time and date in Japan Standard Time (JST) and MJD (see Annex C). This field is coded as 16 bits giving the 16 LSBs of MJD followed by 24 bits coded as 6 digits in 4-bit BCD.

Example: 93/10/13 12:45:00 is coded as 0xC079124500

[Note] As the MJD field is 16-bit, present date can be indicated up to April 22, 2038.

5.2.9 Time Offset Table (TOT)

The TOT (see table 5-9) carries the JST-time and date information and local time offset. The TOT shall consist of a single section using the syntax of table 5-9. This TOT section shall be transmitted in TS packets with a PID value of 0x0014, and the table_id shall take the value 0x73.

Table 5-9 Time offset section

Syntax	No. of bits	Identifier
time_offset_section(){		
table_id	8	uimsbf
section_syntax_indicator	1	bslbf
reserved_future_use	1	bslbf
reserved	2	bslbf
section_length	12	uimsbf
JST_time	40	bslbf
reserved	4	bslbf
descriptors_loop_length	12	uimsbf
for(i=0;i<N;i++){		
descriptor()		
}		
CRC_32	32	rpchof
}		

Semantics for the time offset section:

table_id: See table 5-2.

section_syntax_indicator: This is a 1-bit indicator which shall be set to "0".

section_length: This is a 12-bit field, the first two bits of which shall be set to "00". It specifies the number of bytes of the section, starting immediately following the section_length field and up to the end of the section.

JST_time: (Current time and date): This 40-bit field contains the current time and date in Japan Standard Time (JST) and MJD (see Annex C). This field is coded as 16 bits giving the 16 LSBs of MJD followed by 24 bits coded as 6 digits in 4-bit BCD.

descriptors_loop_length: This 12-bit field gives the total length in bytes of the following descriptors.

CRC_32: This is a 32-bit field that contains the CRC value that gives a zero output of the registers in the decoder defined in Annex B after processing the entire private section.

5.2.10 Running Status Table (RST)

The RST (see table 5-10) allows accurate and rapid updating of the timing status of one or more events. This may be necessary when an event starts early or late due to scheduling changes. The use of a separate table enables a fast updating mechanism to be achieved.

The RST shall be segmented into running_status_sections using the syntax of table 5-10. Any sections forming part of an RST shall be transmitted in TS packets with a PID value of 0x0013, and the table_id shall take the value 0x71.

Table 5-10 Running status section

Syntax	No. of bits	Identifier
running_status_section(){		
table_id	8	uimsbf
section_syntax_indicator	1	bslbf
reserved_future_use	1	bslbf
reserved	2	bslbf
section_length	12	uimsbf
for(i=0;i<N;i++){		
transport_stream_id	16	uimsbf
original_network_id	16	uimsbf
service_id	16	uimsbf
event_id	16	uimsbf
reserved_future_use	5	bslbf
running_status	3	uimsbf
}		
}		

Semantics for the running status section:

table_id: See table 5-2.

section_syntax_indicator: This is a 1-bit indicator which shall be set to "0".

section_length: This is a 12-bit field, the first two bits of which shall be set to "00". It specifies the number of bytes of the section, starting immediately following the section_length field and up to the end of the section. The section_length shall not exceed 1021 so that the entire section has a maximum length of 1024 bytes.

transport_stream_id: This is a 16-bit field which serves as a label for identification of the Transport Stream, about which the RST informs, from any other multiplex within the delivery system.

original_network_id: This 16-bit field gives the label identifying the network_id of the originating

delivery system.

service_id: This is a 16-bit field which serves as a label to identify this service from any other service within a Transport Stream. The service_id is the same as the program_number in the corresponding program_map_section.

event_id: This 16-bit field contains the identification number of the related event.

running_status: This is a 3-bit field indicating the status of the event, as defined in table 5-6.

5.2.11 Stuffing Table (ST)

The purpose of this section (see table 5-11) is to invalidate existing sections at a delivery system boundary, e.g., at a cable head-end. When one section of a sub_table is overwritten, then all the sections of that sub_table shall also be overwritten (stuffed) in order to retain the integrity of the section_number field.

Table 5-11: Stuffing section

Syntax	No. of bits	Identifier
stuffing_section(){		
table_id	8	uimsbf
section_syntax_indicator	1	bslbf
reserved_future_use	1	bslbf
reserved	2	bslbf
section_length	12	uimsbf
for(i=0;i<N;i++){		
data_byte	8	uimsbf
}		
}		

Semantics for the stuffing section:

table_id: This field shall take the value "0x72" according to table 5-2.

section_syntax_indicator: This 1-bit field may take either the value "1" or "0".

section_length: This is a 12-bit field. It specifies the number of bytes of the section, starting immediately following the section_length field and up to the end of the section. The section_length shall not exceed 4093 so that the entire section has a maximum length of 4096 bytes.

data_byte: This 8-bit field may take any value and has no meaning.

5.2.12 Partial Content Announcement Table (PCAT)

Partial content announcement table (see table 5-12) is the information of transmission schedule of partial content data in accumulating type data broadcasting.

Table 5-12 Partial content announcement table

Syntax	No. of bits	Identifier
partial_content_announcement_section(){		
table_id	8	uimsbf
section_syntax_indicator	1	bslbf
reserved_future_use	1	bslbf
reserved	2	bslbf
section_length	12	uimsbf
service_id	16	uimsbf
reserved	2	bslbf
version_number	5	uimsbf
current_next_indicator	1	bslbf
section_number	8	uimsbf
last_section_number	8	uimsbf
transport_stream_id	16	uimsbf
original_network_id	16	uimsbf
content_id	32	uimsbf
num_of_content_version	8	uimsbf
for(i=0;i<num_of_content_version;i++){		
content_version	16	uimsbf
content_minor_version	16	uimsbf
version_indicator	2	bslbf
reserved_future_use	2	bslbf
content_descriptor_length	12	uimsbf
reserved_future_use	4	bslbf
schedule_description_length	12	uimsbf
for(j=0;j<N;j++){		
start_time	40	bslbf
duration	24	uimsbf
}		
for(j=0;j<N2;j++){		
descriptors()		
}		
}		
CRC_32	32	rpchof
}		

Semantics for the partial content announcement section:

table_id: See table 5-2

section_syntax_indicator: The section_syntax_indicator is a 1-bit field which shall be set to "1".

section_length: This is a 12-bit field. It specifies the number of bytes of the section, starting imme-

ARIB STD - B10 Part2
Version 4.4-E1

diately following the section_length field and including the CRC. The section_length shall not exceed 4093 so that the entire section has a maximum length of 4096 bytes.

service_id: This is a 16-bit field which indicates service_id that announces partial original data broadcasting program and partial data. The service_id is the same as the program_number in the corresponding program_map_section.

version_number: This 5-bit field is the version number of the sub_table. The version_number shall be incremented by 1 when a change in the information carried within the sub_table occurs. When it reaches value 31, it wraps around to 0.

current_next_indicator: This 1-bit indicator, when set to "1" indicates that the sub_table is the currently applicable sub_table.

section_number: This 8-bit field gives the number of the section.

last_section_number: This 8-bit field specifies the number of the last section of the sub_table of which this section is part.

transport_stream_id: This is a 16-bit field which serves as a label to identify the TS, from any other multiplex within the delivery system.

original_network_id: This 16-bit field gives the label identifying the network_id of the originating delivery system.

content_id: This is a 32-bit field which serves as a label to identify in which partial contents the partial data belongs. The content_id is given to the original data broadcasting contents of the partial contents so that it serves as a label to identify the contents in the service uniformly.

num_of_content_version: This 8-bit field indicates the number of contents version announced in the table.

content_version: This 16-bit field indicates the total contents version of the partial contents announced in the table.

content_minor_version: This 16-bit field indicates partial contents version announced in the table.

version_indicator: This 2-bit field indicates the meaning related to contents version and contents minor version.

00: Whole version is target (designation of contents version is invalid.)

01: Target is the version after the designated version

02: Target is the version before the designated version

03: Target is only the designated version

content_descriptor_length: This 12-bit field gives the total length in bytes of the following schedule loop and descriptor loop.

schedule_description_length (Schedule description length): This 12-bit field gives the total length in bytes of the following schedule loop.

start_time (Start time): This 40-bit field indicates the start time of partial contents announcement by JST and MJD.

duration: A 24-bit field indicates the duration of the partial contents announcement by hours, minutes, and seconds.

descriptor0: Stores data contents descriptor in case of partial contents.

5.2.13 Broadcaster Information Table (BIT)

The BIT (see table 5-13) is used to submit broadcaster information on network.

Table 5-13 Broadcaster information section

Syntax	No. of bits	Identifier

--	---

Semantics for the broadcaster information section

table_id: See table 5-2.

section_syntax_indicator: The section_syntax_indicator is a 1-bit field which shall be set to "1".

section_length: This is a 12-bit field. It specifies the number of bytes of the section, starting immediately following the section_length field and including the CRC. The section_length shall not exceed 4093 so that the entire section has a maximum length of 4096 bytes.

original_network_id: This 16-bit field gives the label identifying the network_id of the originating delivery system.

version_number: This 5-bit field is the version number of the sub_table. The version_number shall be incremented by 1 when a change in the information carried within the sub_table occurs. When it reaches value 31, it wraps around to 0.

current_next_indicator: This 1-bit indicator, when set to "1" indicates that the sub_table is the currently applicable sub_table.

section_number: This 8-bit field gives the number of the section.

last_section_number: This 8-bit field specifies the number of the last section (that is, the section with the highest section_number) of the sub_table to which this section in part.

This serves as a label to specify the network id of the originating delivery system.

broadcast_view_propriety: This 1-bit indicator, when set to "1" indicates that the user indication with a unit of broadcaster name is appropriate and when set to "0" indicates that the user indication with a unit of broadcaster name is not appropriate. (Each setting according to the broadcaster_id in transmission is valid.)

first_descriptors_length: This 12-bit field gives the total length in bytes of the following descriptor.

broadcaster_id: This 8-bit field identifies the broadcaster denoted with this loop.

broadcaster_descriptors_length: This 12-bit field gives the total length in bytes of the following descriptor.

CRC_32: This is a 32-bit field that contains the CRC value that gives a zero output of the registers in the decoder defined in Annex B after processing the entire private section.

5.2.14 Network Board Information Table (NBIT)

The NBIT (see table 5-14) transmits board information on network, e.g. guide. There are two types of NBIT according to purpose and discriminated in table_id (see table 5-2).

- 1) Table describing the content of board information itself = table_id = "0xC5"
- 2) Table describing necessary information to obtain the content of board information = table_id = "0xC6"

Table 5-14 Network board information section

Syntax	No. of bits	Identifier
network_board_information_section(){		
table_id	8	uimsbf
section_syntax_indicator	1	bslbf
reserved_future_use	1	bslbf
reserved	2	bslbf
section_length	12	uimsbf
original_network_id	16	uimsbf
reserved	2	bslbf
version_number	5	uimsbf
current_next_indicator	1	bslbf
section_number	8	uimsbf
last_section_number	8	uimsbf
for(i=0;i<n;i++){		
information_id	16	uimsbf
information_type	4	uimsbf
description_body_location	2	uimsbf
reserved_future_use	2	bslbf
user_defined	8	bslbf
number_of_keys	8	uimsbf
for(j=0;j<number_of_keys;j++){		
key_id	16	uimsbf
}		
reserved_future_use	4	bslbf

information_type: This 4-bit field indicates the submitted information type according to table 5-15.

Table 5-15 Information type

Value	Semantics	key_id
0x0	Undefined	—
0x1	Information	None
0x2	Information with service_id	service_id
0x3	Information with genre	content_nibble, user_nibble
0x4 – 0xF	Reserved for future use	—

description_body_location: This 2-bit field indicates the location of the table where contents of the information are described according to table 5-16.

Table 5-16 Description body location

Value	Semantics
00	Undefined
01	Detail information is described in the actual TS table
10	Detail information is described in SI prime TS table
11	Reserved for future use

user_defined: Each broadcaster can define this 8-bit field individually.

number_of_keys: This 8-bit field indicates the number of the following key_id.

key_id: This 16-bit field describes key_id according to table 5-15.

descriptors_loop_length: This 12-bit field gives total length in bytes of the following descriptors.

CRC_32: This is a 32-bit field that contains the CRC value that gives a zero output of the registers in the decoder defined in Annex B after processing the entire private section.

5.2.15 Linked Description Table (LDT)

The LDT (see table 5-17) is used to link various descriptions to refer from other tables.

Table 5-17 Link description section

Syntax	No. of bits	Identifier
linked_description_section(){		
table_id	8	uimsbf
section_syntax_indicator	1	bslbf
reserved_future_use	1	bslbf
reserved	2	bslbf
section_length	12	uimsbf
original_service_id	16	uimsbf
reserved	2	bslbf
version_number	5	uimsbf
current_next_indicator	1	bslbf
section_number	8	uimsbf
last_section_number	8	uimsbf
transport_stream_id	16	uimsbf
original_network_id	16	uimsbf
for(i=0;i<n;i++){		
description_id	16	uimsbf
reserved_future_use	12	bslbf
descriptors_loop_length	12	uimsbf
for(j=0;j<m;j++){		
descriptor()		
}		
}		
CRC_32	32	rpchof
}		

Semantics for the link description section:

table_id: See table 5-2.

section_syntax_indicator: The section_syntax_indicator is a 1-bit field which shall be set to "1".

section_length: This is a 12-bit field. It specifies the number of bytes of the section, starting immediately following the section_length field and including the CRC. The section_length shall not exceed 4093 so that the entire section has a maximum length of 4096 bytes.

original_service_id: This 16-bit field indicates group identification which links descriptions in this sub_table using service_id of the representing service. It is allocated uniformly within the network.

version_number: This 5-bit field is the version number of the sub_table. The version_number shall

be incremented by 1 when a change in the information carried within the sub_table occurs. When it reaches value 31, it wraps around to 0. When the current_next_indicator is set to "1", then the version_number shall be that of the currently applicable sub_table defined by table_id and network_id. When the current_next_indicator is set to "0", then the version_number shall be that of the next applicable sub_table defined by table_id and network_id.

current_next_indicator: This 1-bit indicator, when set to "1" indicates that the sub_table is the currently applicable sub_table. When the bit is set to "0", it indicates that the sub_table sent is not yet applicable and shall be the next sub_table to be valid.

section_number: This 8-bit field gives the number of the section. The section_number of the first section in the sub_table shall be "0x00". The section_number shall be incremented by 1 with each additional section with the same table_id and network_id.

last_section_number: This 8-bit field specifies the number of the last section (that is, the section with the highest section_number) of the sub_table of which this section is part.

transport_stream_id: This is a 16-bit field which serves as a label to identify the TS, from any other multiplex within the delivery system.

original_service_id: This 16-bit field gives the label identifying the service_id of the originating delivery system.

description_id: This 16-bit field indicates id_number of collected description (allocated uniformly within the representing service).

descriptors_loop_length: This 12-bit field gives total length in bytes of the following descriptors.

CRC_32: This is a 32-bit field that contains the CRC value that gives a zero output of the registers in the decoder defined in Annex B after processing the entire private section.

6. Descriptors

This clause describes the different descriptors that can be used within the SI.

6.1 Descriptor identification and location

Table 6-1 lists the descriptors defined within the present document, giving the intended placement within the SI tables. This does not imply that their use in other tables is restricted.

Table 6-1 Location and requirements of SI descriptors

Descriptor	Transmission level	CAT	PMT	NIT	BAT	SDT	EIT	TOT	BIT	NBIT	LDT
conditional_access_descriptor ^{*1}	Mandatory for conditional access	O	O								
copyright_descriptor ^{*1}	^{*3}		O								
network_name_descriptor ^{*2}	Mandatory			O							
service_list_descriptor ^{*1}	Mandatory in NIT (actual network) Optional in NIT (other network) Mandatory in BAT, Optional in BIT			O	O				O		
stuffing_descriptor	Optional			O	O	O	O			O	O
satellite_delivery_system_descriptor ^{*1}	Mandatory in digital satellite broadcasting			O							
bouquet_name_descriptor	Mandatory in BAT				O	O					
service_descriptor ^{*2}	Mandatory in SDT (actual stream) Optional in SDT (other stream)					O					
country_availability_descriptor	Optional		O		O	O					
linkage_descriptor	Optional		O	O	O	O	O				
NVOD_reference_service_descriptor	Mandatory for NVOD					O					
time_shifted_service_descriptor ^{*2}	Mandatory for time shift service					O					
short_event_descriptor ^{*2}	Mandatory in EIT						O				O
extended_event_descriptor	Optional						O				O
time_shifted_event_descriptor ^{*2}	Mandatory in time shift event						O				
component_descriptor	Optional		O				O				
mosaic_descriptor	Optional		O			O					
stream_identifier_descriptor	Optional		O								

Descriptor	Transmission level	CAT	PMT	NIT	BAT	SDT	EIT	TOT	BIT	NBIT	LDT
CA_identifier_descriptor	Optional				0	0	0				
content_descriptor	Optional						0				
parental_rating_descriptor	Optional		0				0				
hierarchical_transmission_descriptor	Mandatory for hierarchical transmission		0								
digital_copy_control_descriptor	Optional		0			0	0				
emergency_information_descriptor ^{*1}	Mandatory for emergency alarm broadcasting		0	0							
data_component_descriptor ^{*1}	Mandatory for data broadcasting		0								
system_control_descriptor ^{*1}	Mandatory either in PMT or NIT		0	0							
local_time_offset_descriptor	Mandatory for local time execution							0			
audio_component_descriptor	Optional						0				
hyper_link_descriptor	Optional						0		0		
target_area_descriptor	Optional		0								
data_contents_descriptor	Optional						0				
video_decode_control_descriptor	Optional		0								
terrestrial_delivery_system_descriptor ^{*1}	Mandatory for digital terrestrial broadcasting			0							
partial_reception_descriptor ^{*1}	Mandatory for partial reception service			0							
series_descriptor	Optional						0				
event_group_descriptor	Optional						0				
SI_transmission_parameter_descriptor	Optional								0		
broadcaster_name_descriptor	Optional								0		
component_group_descriptor	Optional						0				
SI_prime_TS_descriptor	Optional								0		
board_information_descriptor	Optional									0	
LDT_link_descriptor	Optional						0				
linkage_descriptor	Mandatory for linkage transmission.			0							
TS information descriptor	Optional			0							
Extension broadcaster descriptor	Optional								0		
Logo transmission descriptor	Optional					0					
Content availability descriptor	Optional		0			0	0				

Descriptor	Transmission level	CAT	PMT	NIT	BAT	SDT	EIT	TOT	BIT	NBIT	LDT
Carousel compatible composite descriptor ^{*1}	Optional		0				0				
Conditional playback descriptor ^{*1,*5}	Mandatory in case of conditional playback ^{*4}	0	0								
AVC video descriptor	Optional		0								
AVC timing HRD descriptor	Optional		0								
Service group descriptor	Optional			0							

^{*1}: In accordance with the Notification

^{*2}: Can be substituted with the descriptor defined by service provider, if it has at least the same function.

^{*3}: Locations and requirements of descriptors shall be obeyed the future international standard.

^{*4}: This is not applicable when using the function with conditional access descriptor.

^{*5}: Specified in ARIB STD-B25

6.2 Descriptor coding

When the construct "descriptor()" appears in the sections of subclause 5.2, this indicates that zero or more of the descriptors defined within this subclause shall occur.

The following semantics apply to all the descriptors defined in this subclause.

descriptor_tag: The descriptor tag is an 8-bit field which identifies each descriptor. Those values with MPEG-2 normative meaning are described in ISO/IEC 13818-1 [21]. The values of descriptor_tag are defined in table 5-3 in Part 1.

descriptor_length: The descriptor length is an 8-bit field specifying the total number of bytes of the data portion of the descriptor following the byte defining the value of this field.

6.2.1 Bouquet name descriptor

The bouquet name descriptor provides the bouquet name in text form, see table 6-2.

Table 6-2 Bouquet name descriptor

Syntax	No. of bits	Identifier
bouquet_name_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
for(i=0;i<N;i++){		
char	8	uimsbf
}		
}		

Semantics for the bouquet name descriptor:

char: This is an 8-bit field, a sequence of which conveys the name of the bouquet about which the BAT sub_table informs. Text information is coded using the character sets and methods described in Annex A. 6.2.2 CA identifier descriptor

The CA identifier descriptor (see table 6-3) indicates whether a particular bouquet, service or event is associated with a conditional access system and identifies the CA system type by means of the CA_system_id.

Table 6-3 CA identifier descriptor

Syntax	No. of bits	Identifier
CA_identifier_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
for(i=0;i<N;i++){		
CA_system_id	16	uimsbf
}		
}		

Semantics for the CA identifier descriptor:

CA_system_id: This 16-bit field identifies the CA system. The standardization organization shall specify allocation of the value of this field (see Annex M).

6.2.3 Component descriptor

The component descriptor identifies the type of component stream and may be used to provide a text description of the elementary stream (see table 6-4).

Table 6-4 Component descriptor

Syntax	No. of bits	Identifier
component_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
reserved_future_use	4	bslbf
stream_content	4	uimsbf
component_type	8	uimsbf
component_tag	8	uimsbf
ISO_639_language_code	24	bslbf
for(i=0;i<N;i++){		
text_char	8	uimsbf
}		

}

Semantics for the component descriptor:

stream_content: This 4-bit field specifies the type (video, audio, or data) of stream. The coding of this field is specified in table 6-5.

component_type: This 8-bit field specifies the type of the video, audio or data component. The coding of this field is specified in table 6-5.

component_tag: This 8-bit field has the same value as the **component_tag** field in the stream identifier descriptor (see sub-clause 6.2.16) (if present in the PSI program map section) for the component stream.

ISO_639_language_code: This 24-bit field identifies the language of the component (in the case of audio or data) and of the text description which may be contained in this descriptor. The ISO 639_language_code contains a 3-character code as specified by ISO 639-2[22]. Each character is coded into 8 bits according to ISO/IEC 8859-1[24] and inserted in order into the 24-bit field.

EXAMPLE: Japan has 3-character code "jpn", which is coded as:

"0110 1010 0111 0000 0110 1110"

text_char: This is an 8-bit field. A string of "text_char" fields specifies a text description of the component stream. Text information is coded using the character sets and methods described in Annex A.

Table 6-5 stream_content and component_type

Stream_content	Component_type	Description
0x00	0x00 – 0xFF	Reserved for future use
0x01	0x00	Reserved for future use
0x01	0x01	Video 480i(525i), 4:3 aspect ratio
0x01	0x02	Video 480i(525i), 16:9 aspect ratio, with pan vectors
0x01	0x03	Video 480i(525i), 16:9 aspect ratio, without pan vectors
0x01	0x04	Video 480i(525i), >16:9 aspect ratio
0x01	0x05 – 0xA0	Reserved for future use
0x01	0xA1	Video 480p(525p), 4:3 aspect ratio
0x01	0xA2	Video 480p(525p), 16:9 aspect ratio, with pan vectors
0x01	0xA3	Video 480p(525p), 16:9 aspect ratio, without pan vectors
0x01	0xA4	Video 480p(525p), >16:9 aspect ratio
0x01	0xA5 – 0xB0	Reserved for future use
0x01	0xB1	Video 1080i(1125i), 4:3 aspect ratio

0x01	0xB2	Video 1080i(1125i), 16:9 aspect ratio, with pan vectors
0x01	0xB3	Video 1080i(1125i), 16:9 aspect ratio, without pan vectors
0x01	0xB4	Video 1080i(1125i), >16:9 aspect ratio
0x01	0xB5 – 0xC0	Reserved for future use
0x01	0xC1	Video 720p(750p), 4:3 aspect ratio
0x01	0xC2	Video 720p(750p), 16:9 aspect ratio, with pan vectors
0x01	0xC3	Video 720p(750p), 16:9 aspect ratio, without pan vectors
0x01	0xC4	Video 720p(750p), >16:9 aspect ratio
0x01	0xC5 – 0xD0	Reserved for future use
0x01	0xD1	Video 240p, 4:3 aspect ratio
0x01	0xD2	Video 240p, 4:3 aspect ratio, with pan vectors
0x01	0xD3	Video 240p, 4:3 aspect ratio, without pan vector
0x01	0xD4	Video 240p, 4:3 aspect ratio > 16:9
0x01	0xD5 – 0xFF	Reserved for future use
0x02	0x00	Reserved for future use
0x02	0x01	Audio, 1/0 mode (single mono)
0x02	0x02	Audio, 1/0+1/0 mode (dual mono)
0x02	0x03	Audio, 2/0 mode (stereo)
0x02	0x04	Audio, 2/1 mode
0x02	0x05	Audio, 3/0 mode
0x02	0x06	Audio, 2/2 mode
0x02	0x07	Audio, 3/1 mode
0x02	0x08	Audio, 3/2 mode
0x02	0x09	Audio, 3/2+LFE mode
0x02	0x0A – 0x3F	Reserved for future use
0x02	0x40	Audio description for the visually impaired
0x02	0x41	Audio for the hard of hearing
0x02	0x42 – 0xAF	Reserved for future use
0x02	0xB0 – 0xFE	User-defined
0x02	0xFF	Reserved for future use
0x03 – 0x0B	0x00 – 0xFF	Reserved for future use
0x0C – 0x0F	0x00 – 0xFF	User-defined

6.2.4 Content descriptor

The intention of the content descriptor (see table 6-6) is to provide classification information for an event.

Table 6-6 Content descriptor

Syntax	No. of bits	Identifier
content_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
for(i=0;i<N;i++){		
content_nibble_level_1	4	uimsbf
content_nibble_level_2	4	uimsbf
user_nibble	4	uimsbf
user_nibble	4	uimsbf
}		
}		

Semantics of the content descriptor:

content_nibble_level_1: This 4-bit field represents the first level of a content identifier. Coding of this field shall be specified otherwise (see Annex H).

content_nibble_level_2: This 4-bit field represents the second level of a content identifier. Coding of this field shall be specified otherwise (see Annex H).

user_nibble: This 4-bit field is defined by the broadcaster.

6.2.5 Country availability descriptor

In order to identify various combinations of countries efficiently, the descriptor may appear twice for each service, once giving a list of countries and/or groups of countries where the service is intended to be available, and the second giving a list of countries and/or groups where it is not. The latter list overrides the former list. If only one descriptor is used, which lists countries where the service is intended to be available, it indicates that the service is not intended to be available in any other country. If only one descriptor is used, which lists countries where the service is not intended to be available, it indicates that the service is intended to be available in every other country. If no descriptor is used, then it is not defined for which countries the service is intended to be available (see table 6-7).

Table 6-7 Country availability descriptor

Syntax	No. of bits	Identifier
country_availability_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
country_availability_flag	1	bslbf
reserved_future_use	7	bslbf
for(i=0;i<N;i++){		
country_code	24	bslbf
}		
}		

Semantics for the country availability descriptor:

country_availability_flag: This 1-bit indicates whether the following country codes represent the countries in which the reception of the service is intended or not. If country_availability_flag is set to "1" the following country codes specify the countries in which the reception of the service is intended. If set to "0", the following country codes specify the countries in which the reception of the service is not intended.

country_code: This 24-bit field identifies a country using the 3-character code as specified in ISO 3166 [23]. Each character is coded into 8-bits according to ISO/IEC 8859-1 [24] and inserted in order into the 24-bit field.

EXAMPLE: Japan has 3-character code "JPN", which is coded as:

"0100 1010 0101 0000 0100 1110"

6.2.6 Satellite delivery system descriptor

The satellite delivery system descriptor indicates the physical conditions of the satellite transmission path. See table 6-8.

Table 6-8 Satellite delivery system descriptor

Syntax	No. of bits	Identifier
Satellite_delivery_system_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
Frequency	32	bslbf
orbital_position	16	bslbf
west_east_flag	1	bslbf
polarization	2	bslbf
modulation	5	bslbf

system_rate	28 bslbf
FEC_inner	4 bslbf
}	

Semantics for satellite delivery system descriptor:

frequency: The frequency is a 32-bit field giving the 4-bit BCD values specifying 8 characters of the frequency value. For the satellite_delivery_system_descriptor, the frequency is coded in GHz, where the decimal point occurs after the third character (e.g. 012.73300GHz)

orbital_position: The orbital_position is a 16-bit field giving the 4-bit BCD values specifying 4 characters of the orbital position in degrees where the decimal point occurs after the third character (e.g. 144.0 degrees).

west_east_flag: The west_east_flag is a 1-bit field indicating if the satellite position is in the western or eastern part of the orbit. A value "0" indicates the western position and a value "1" indicates the eastern position.

polarization: The polarization is a 2-bit field specifying the polarization of the transmitted signal. The first bit defines whether the polarization is linear or circular (see table 6-9).

Table 6-9 Polarization

Polarization	Description
00	linear - horizontal
01	linear - vertical
10	circular - left
11	circular - right

modulation: This is a 5-bit field. It specifies the modulation scheme used on a satellite delivery system according to table 6-10.

Table 6-10 Modulation scheme for satellite

Modulation bit 43210	Description
0 0000	Not defined
0 0001	QPSK
0 1000	ISDB-S system (refer to TMCC signal)
0 1001	2.6GHz band digital satellite sound broadcasting transmission system (refer to pilot channel)
0 1010	Advanced narrow-band CS digital broadcasting system (refer to PLHEADER and BBHEADER)
0 0010 – 0 0111 0 1011 – 1 1111	Reserved for future use

symbol_rate: The symbol_rate is a 28-bit field giving the 4-bit BCD values specifying 7 characters of the symbol_rate in Msymbol/s where the decimal point occurs after the third character (e.g. 027.4500).

FEC_inner: The FEC_inner is a 4-bit field specifying the inner FEC scheme used according to table 6-11.

Table 6-11 Inner FEC scheme

FEC_inner bit 3210	Description
0000	Not defined
0001	1/2 conv. code rate
0010	2/3 conv. code rate
0011	3/4 conv. code rate
0100	5/6 conv. code rate
0101	7/8 conv. code rate
1000	ISDB-S system (refer to TMCC signal)
1001	2.6GHz band digital satellite sound broadcasting transmission system (refer to pilot channel)
1010	Advanced narrow-band CS digital broadcasting system (refer to PLHEADER)
1111	No conv. coding

0110 – 0111 1011 – 1110	Reserved for future use
----------------------------	-------------------------

6.2.7 Extended event descriptor

The extended event descriptor provides a detailed text description of an event, which may be used in addition to the short event descriptor. More than one extended event descriptor can be associated to allow information about one event greater in length than 256 bytes to be conveyed. Text information can be structured into two columns, one giving an item description field and the other the item text. A typical application for this structure is to give a cast list, where for example the item description field might be "Producer" and the item field would give the name of the producer.

Table 6-12 Extended event descriptor

Syntax	No. of bits	Identifier
Extended_event_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
descriptor_number	4	uimsbf
last_descriptor_number	4	uimsbf
ISO_639_language_code	24	bslbf
length_of_items	8	uimsbf
for(i=0;i<N;i++){		
item_description_length	8	uimsbf
for(j=0;j<N;j++){		
item_descriptor_char	8	uimsbf
}		
item_length	8	uimsbf
for(j=0;j<N;j++){		
item_char	8	uimsbf
}		
}		
text_length	8	uimsbf
for(i=0;i<N;i++){		
text_char	8	uimsbf
}		
}		

Semantics for the extended event descriptor:

descriptor_number: This 4-bit field gives the number of the descriptor. It is used to associate information which cannot be fitted into a single descriptor. The descriptor_number of the first ex-

tended_event_descriptor of an associated set of extended_event_descriptors shall be "0x0". The descriptor_number shall be incremented by 1 with each additional extended_event_descriptor in this section.

last_descriptor_number: This 4-bit field specifies the number of the last extended_event_descriptor (that is, the descriptor with the highest value of descriptor_number) of the associated set of descriptors of which this descriptor is part.

ISO_639_language_code: This 24-bit field identifies the language of the following text fields. The ISO_639_language_code contains a 3-character code as specified by ISO 639-2 [22]. Each character is coded into 8 bits according to ISO 8859-1 [24] and inserted in order into the 24-bit field.

EXAMPLE: Japan has 3-character code "jpn", which is coded as:

"0110 1010 0111 0000 0110 1110"

length_of_items: This is an 8-bit field specifying the length in bytes of the following items.

item_description_length: This 8-bit field specifies the length in bytes of the item description.

item_description_char: This is an 8-bit field. A string of "item_description_char" fields specifies the item description. Text information is coded using the character sets and methods described in Annex A.

item_length: This 8-bit field specifies the length in bytes of the item text.

item_char: This is an 8-bit field. A string of "item_char" fields specify the item text. Text information is coded using the character sets and methods described in Annex A.

text_length: This 8-bit field specifies the length in bytes of the non itemized extended text.

text_char: This is an 8-bit field. A string of "text_char" fields specify the non itemized extended text. Text information is coded using the character sets and methods described in Annex A.

6.2.8 Linkage descriptor

The linkage descriptor (see table 6-13) identifies a service that can be presented if the consumer requests additional information related to a specific entity described by the SI system. The location of the linkage descriptor in the syntax indicates the entity for which additional information is available. For example a linkage descriptor located within the NIT shall point to a service providing additional information on the network, a linkage descriptor in the BAT shall provide a link to a ser-

vice informing about the bouquet, etc.

A CA replacement service can be identified using the linkage descriptor. This service may be selected automatically by the IRD if the CA denies access to the specific entity described by the SI system.

Table 6-13 Linkage descriptor

Syntax	No. of bits	Identifier
linkage_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
transport_stream_id	16	uimsbf
original_network_id	16	uimsbf
service_id	16	bslbf
linkage_type	8	uimsbf
for(i=0;i<N;i++){		
private_data_byte	8	bslbf
}		
}		

Semantics for the linkage descriptor:

transport_stream_id: This is a 16-bit field which identifies the Transport Stream containing the information service indicated.

original_network_id: This 16-bit field gives the label identifying the network_id of the originating delivery system of the information service indicated.

service_id: This is a 16-bit field which uniquely identifies an information service within a Transport Stream. The service_id is the same as the program_number in the corresponding program_map_section. If the linkage_type field has the value 0x04, then the service_id field is not relevant, and shall be set to 0x0000.

linkage_type: This is an 8-bit field specifying the type of linkage e.g. to information (see table 6-14).

Table 6-14 Linkage type coding

Linkage_type	Description
0x00	Reserved for future use
0x01	Information service
0x02	EPG service
0x03	CA replacement service
0x04	TS containing complete Network/Bouquet SI
0x05	Service replacement service
0x06	Data broadcast service
0x07 – 0x7F	Reserved for future use
0x80 – 0xBF	User defined
0xC0 – 0xFD	Reserved for future use (Standardization organization defined area)
0xFE	Reserved for re-transmission
0xFF	Reserved for future use

private_data_byte: This is an 8-bit field, the value of which is privately defined.

6.2.9 Mosaic descriptor

A mosaic component is a collection of different video images to form a coded video component. The information is organized so that each specific information, when displayed, appears on a small area of a screen.

The mosaic descriptor gives a partitioning of a digital video component into elementary cells, the allocation of elementary cells to logical cells, and gives a link between the content of the logical cell and the corresponding information (e.g. bouquet, service, event etc.); see table 6-15.

Table 6-15 Mosaic descriptor

Syntax	No. of bits	Identifier
mosaic_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
mosaic_entry_point	1	bslbf
number_of_horizontal_elementary_cells	3	uimsbf
reserved_future_use	1	bslbf
number_of_vertical_elementary_cells	3	uimsbf
for(i=0,i<N; i++){		
logical_cell_id	6	uimsbf
reserved_future_use	7	bslbf
logical_cell_presentation_info	3	uimsbf
elementary_cell_field_length	8	uimsbf
for(j=0,j<elementary_cell_field_length;j++){		
reserved_future_use	2	bslbf
elementary_cell_id	6	uimsbf
}		
cell_linkage_info	8	uimsbf
if(cell_linkage_info ==0x01){		
bouquet_id	16	uimsbf
}		
if(cell_linkage_info ==0x02){		
original_network_id	16	uimsbf
transport_stream_id	16	uimsbf
service_id	16	uimsbf
}		
if(cell_linkage_info ==0x03){		
original_network_id	16	uimsbf
transport_stream_id	16	uimsbf
service_id	16	uimsbf
}		
if(cell_linkage_info ==0x04){		
original_network_id	16	uimsbf
transport_stream_id	16	uimsbf
service_id	16	uimsbf
event_id	16	uimsbf
}		
}		
}		

Semantics for mosaic descriptor:

mosaic_entry_point: This is a 1-bit field which when set to a value of "1" indicates that the mosaic is the highest mosaic in a hierarchy. A complete mosaic system could be organized in a tree structure, the flag being set to identify the entry point in the tree.

number_of_horizontal_elementary_cells: This 3-bit field indicates the number of cells of horizontal

screen display, see table 6-16 for coding.

Table 6-16 Coding of horizontal_elementary_cells

Value	Meaning
0x00	one cell
0x01	two cells
0x02	three cells
0x03	four cells
0x04	five cells
0x05	six cells
0x06	seven cells
0x07	eight cells

number_of_vertical_elementary_cells: This 3-bit field indicates the number of cells of vertical screen display, see table 6-17 for coding.

Table 6-17 Coding of vertical_elementary_cells

Value	Meaning
0x00	one cell
0x01	two cells
0x02	three cells
0x03	four cells
0x04	five cells
0x05	six cells
0x06	seven cells
0x07	eight cells

logical_cell_id: This 6-bit field is coded in binary form.

Different adjacent (see figure 6-1) elementary cells may be grouped together to form a logical cell. A logical_cell_number is associated to such a group of adjacent elementary_cell_ids. The total number of logical cells shall not exceed the number of elementary cells (maximum = 64). Each elementary cell shall be allocated to one logical cell. More than one elementary cell may belong to one logical cell.

A	B	C
D	E	F
G	H	I

Cells B, D, H, F are adjacent to cell E; C is not adjacent to A or D; D is not adjacent to H.

Figure 6-1 Adjacent cells

logical_cell_presentation_info: This 3-bit field identifies the type of presentation for a logical cell.

The logical_cell_presentation information allows an identification of presentation styles, which are defined in table 6-18.

Table 6-18 Coding of logical_cell_presentation_info

Value	Meaning
0x00	undefined
0x01	video
0x02	still picture (Note 1)
0x03	graphics/text
0x04 to 0x07	reserved for future use

[Note 1]: Still picture: A coded still picture consists of a video sequence containing exactly one coded picture which is intra-coded.

elementary_cell_field_length: The elementary_cell_field_length is an 8-bit field specifying the number of bytes following this field up to and including the last elementary_cell_id in this logical_cell_id loop.

elementary_cell_id: This 6-bit field indicates in binary form the number of the cell. The value of this field is in the range 0 to N.

[Note 2]: The elementary cells are implicitly numbered from 0 to N. The value 0 is allocated to the cell of the first row (top left corner). This number is incremented from left to right and from top to bottom in such a way that the number N is allocated to the cell of the last position of the last row (bottom right corner).

cell_linkage_info: This 8-bit field identifies the type of information carried in a logical cell, see table 6-19 for coding.

Table 6-19 Coding of cell_linkage_info

Value	Meaning
0x00	undefined
0x01	bouquet related
0x02	service related
0x03	other mosaic related
0x04	event related
0x05 to 0xFF	reserved for future use

bouquet_id: This is a 16-bit field which serves as a label to identify the bouquet described by the

cell.

original_network_id: This 16-bit field is a label (see subclause 5.2) which in conjunction with the following fields uniquely identifies a service, event or mosaic.

transport_stream_id: This is a 16-bit field which serves as a label identifying the transport stream which contains the service, event or mosaic described by the cell.

service_id: This is a 16-bit field which identifies a service within a transport stream. The **service_id** is the same as the **program_number** in the corresponding **program_map_section**.

The interpretation of this field is context sensitive, dependent on the value of **cell_linkage_info**:

- when **cell_linkage_info** = "0x02", this is the **service_id** of the service described by the cell.
- when **cell_linkage_info** = "0x03", this is the **service_id** of the mosaic service described by the cell.
- when **cell_linkage_info** = "0x04", this is the **service_id** of the service to which the event described by the cell belongs.

event_id: This is a 16-bit field containing the identification number of the described event.

6.2.10 Near Video On Demand (NVOD) reference descriptor

This descriptor, in conjunction with the time shifted service and time shifted event descriptors, provides a mechanism for efficiently describing a number of services which carry the same sequence of events, but with the start times offset from one another. Such a group of time-shifted services is referred to as Near Video On Demand, since a user can at any time access near to the start of an event by selecting the appropriate service of the group.

The NVOD reference descriptor (see table 6-20) gives a list of the services which together form a NVOD service. Each service is also described in the appropriate SDT sub_table by a time shifted service descriptor, see sub-clause 6.2.19.

The time shifted service descriptor associates a time shifted service with a **reference_service_id**. The **reference_service_id** is the label under which a full description of the NVOD service is given, but the **reference_service_id** does not itself correspond to any **program_number** in the **program_map_section**.

The time shifted event descriptor is used in the event information for each time shifted service. Instead of duplicating the full information for each event, the time shifted event descriptor points to a reference_event_id in the reference service. The full event information is provided in the event information for the reference service.

The services which make up an NVOD service need not all be carried in the same TS. However, a reference service shall be described in the SI in each TS which carries any services of the NVOD service.

Table 6-20 NVOD reference descriptor

Syntax	No. of bits	Identifier
NVOD_reference_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
for(i=0;i<N;i++){		
transport_stream_id	16	uimsbf
original_network_id	16	
service_id	16	uimsbf
}		
}		

Semantics for the NVOD reference descriptor:

transport_stream_id: This is a 16-bit field which identifies the Transport Stream.

original_network_id: This 16-bit field gives the label identifying the network_id of the original delivery system.

service_id: This is a 16-bit field which uniquely identifies a service within a Transport Stream. The service_id is the same as the program_number in the corresponding program_map_section.

6.2.11 Network name descriptor

The network name descriptor provides the network name in text form (see table 6-21).

Table 6-21 Network name descriptor

Syntax	No. of bits	Identifier
network_name_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
for(i=0;i<N;i++){		
char	8	uimsbf
}		
}		

Semantics for the network name descriptor

char: This is an 8-bit field. A string of char fields specify the name of the delivery system about which the NIT informs. Text information is coded using the character sets and methods described in Annex A.

6.2.12 Parental rating descriptor

This descriptor (see table 6-22) gives a rating based on age and allows for extensions based on other rating criteria.

Table 6-22 Parental rating descriptor

Syntax	No. of bits	Identifier
parental_rating_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
for(i=0;i<N;i++){		
country_code	24	bslbf
rating	8	uimsbf
}		
}		

Semantics for the parental rating descriptor:

country_code: This 24-bit field identifies a country using the 3-character code as specified in ISO 3166 [23]. Each character is coded into 8-bits according to ISO 8859-1 [24] and inserted in order into the 24-bit field.

EXAMPLE: Japan has 3-character code "JPN" which is coded as:

"0100 1010 0101 0000 0100 1110"

rating: This 8-bit field is coded according to table 6-23, giving the recommended minimum age in years of the end user.

Table 6-23 Parental rating descriptor, rating

Rating	Description
0x00	undefined
0x01 – 0x0F	minimum age = rating + 3 years
0x10 – 0xFF	defined by the broadcaster

EXAMPLE: 0x04 implies that end users should be at least 7 years old.

6.2.13 Service descriptor

The service descriptor (see table 6-24) provides the names of the service provider and the service in text form together with the service_type.

Table 6-24 Service descriptor

Syntax	No. of bits	Identifier
service_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
service_type	8	uimsbf
service_provider_name_length	8	uimsbf
for(i=0;i<N;i++){		
char	8	uimsbf
}		
service_name_length	8	uimsbf
for(i=0;i<N;i++){		
char	8	uimsbf
}		
}		

Semantics for the service descriptor:

service_type: This is an 8-bit field specifying the type of the service. It shall be coded according to table 6-25.

[Note]: This field is expressed as "service_type_id" in the Notification No. 37 of the Ministry of Public Management, Home Affairs, Posts and Telecommunications in 2003.

Table 6-25 Service type coding

Service type	Description
0x00	Not defined
0x01	Digital television service
0x02	Digital audio service
0x03 – 0x7F	Not defined
0x80 – 0xA0	Service provider defined
0xA1	Special video service
0xA2	Special audio service
0xA3	Special data service
0xA4	Engineering service
0xA5	Promotion video service
0xA6	Promotion audio service
0xA7	Promotion data service
0xA8	Data service for accumulation in advance
0xA9	Data service exclusive for accumulation
0xAA	Book mark list service
0xAB	Server-type simultaneous service
0xAC	Independent file service
0xAD – 0xBF	Not defined (to be defined by standardization organization)
0xC0	Data service
0xC1 – 0xFF	Not defined

service_provider_name_length: This 8-bit field specifies the number of bytes that follow the service_provider_name_length field for describing characters of the name of the service provider.

char: This is an 8-bit field. A string of char fields specify the name of the service provider or service. Text information is coded using the character sets and methods described in Annex A.

service_name_length: This 8-bit field specifies the number of bytes that follow the service_name_length field for describing characters of the name of the service.

6.2.14 Service list descriptor

The service list descriptor (see table 6-26) provides a means of listing the services by service_id and service type.

Table 6-26 Service list descriptor

Syntax	No. of bits	Identifier
service_list_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
for(i=0;i<N;i++){		
service_id	16	uimsbf
service_type	8	uimsbf
}		
}		

Semantics for the service list descriptor:

service_id: This is a 16-bit field which uniquely identifies a service within a Transport Stream. The service_id is the same as the program_number in the corresponding program_map_section.

service_type: This is an 8-bit field specifying the type of the service. It shall be coded according to table 6-25.

6.2.15 Short event descriptor

The short event descriptor provides the name of the event and a short description of the event in the text form (table 6-27).

Table 6-27 Short event descriptor

Syntax	No. of bits	Identifier
short_event_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
ISO_639_language_code	24	uimsbf
event_name_length	8	uimsbf
for(i=0;i<event_name_length;i++){		
event_name_char	8	uimsbf
}		
text_length	8	uimsbf
for(i=0;i<text_length;i++){		
text_char	8	uimsbf
}		
}		

Semantics for the short event descriptor:

ISO 639_language_code: This 24-bit field contains the ISO 639-2 [22] three character language code of the language of the following text fields. Each character is coded into 8 bits according to ISO8859-1 [24] and inserted in order into the 24-bit field.

EXAMPLE: Japan has 3-character code "jpn", which is coded as:

"0110 1010 0111 0000 0110 1110"

event_name_length: An 8-bit field specifying the length in bytes of the event name.

event_name_char: This is an 8-bit field. A string of "char" fields specifies the event name. Text information is coded using the character sets and methods described in Annex.

text_length: This 8-bit field specifies the length in bytes of the following text describing the event.

text_char: This is an 8-bit field. A string of "char" fields specify the text description for the event. Text information is coded using the character sets and methods described in Annex A.

6.2.16 Stream identifier descriptor

The stream identifier descriptor (see table 6-28) may be used in the PMT to label component streams of a service (table 6-5) given in component descriptors in the EIT if present so that they can be differentiated (e.g. a component stream of a certain service is "video, 16:9 aspect ratio, with pan vector") . The stream identifier descriptor shall be located following the relevant ES_info_length_field.

Table 6-28 Stream identifier descriptor

Syntax	No. of bits	Identifier
service_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
component_tag	8	uimsbf
}		

Semantics for the stream identifier descriptor:

component_tag: This 8-bit field identifies the component stream for associating it with a description given in a component descriptor. Within a program map section each stream identifier descriptor shall have a different value for this field.

6.2.17 Stuffing descriptor

The stuffing descriptor provides a means of invalidating previously coded descriptors or inserting dummy descriptors for table stuffing (see table 6-29).

Table 6-29 Stuffing descriptor

Syntax	No. of bits	Identifier
stuffing_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
for(i=0;i<N;i++){		
stuffing_byte	8	bslbf
}		
}		

Semantics for the stuffing descriptor:

stuffing_byte: This is an 8-bit field. Each occurrence of the field may be set to any value. The IRDs may discard the stuffing bytes.

6.2.18 Time shifted event descriptor

The time shifted event descriptor (see table 6-30) is used in place of the short_event_descriptor to indicate an event which is a time shifted copy of another event.

Table 6-30 Time shifted event descriptor

Syntax	No. of bits	Identifier
time_shifted_event_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
reference_service_id	16	uimsbf
reference_event_id	16	uimsbf
}		

Semantics for the time shifted event descriptor:

reference_service_id: This 16-bit field identifies the reference service of a NVOD collection of services. The reference service can always be found in this Transport Stream. The service_id here does not have a corresponding program_number in the program_map_section.

reference_event_id: This 16-bit field identifies the reference event of which the event described by

this descriptor is a time shifted-copy.

6.2.19 Time shifted service descriptor

This descriptor is used in place of the service descriptor to indicate services which are time shifted copies of other services (see table 6-31).

Table 6-31 Time shifted service descriptor

Syntax	No. of bits	Identifier
time_shifted_service_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
reference_service_id	16	uimsbf
}		

Semantics for the time shifted service descriptor:

reference_service_id: This 16-bit field identifies the reference service of a NVOD collection of services. The reference service can always be found in this Transport Stream. The service_id here does not have a corresponding program_number in the program_map_section.

6.2.20 Data component descriptor

[Note] This item is specified in Notification No. 37 of the Ministry of Public Management, Home Affairs, Posts and Telecommunications in 2003.

The data component descriptor (see table 6-32) is used to identify data components.

Table 6-32 Data component descriptor

Syntax	No. of bits	Identifier
data_component_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
data_component_id	16	uimsbf
for(i=0;i<N;i++){		
additional_data_component_info	8	uimsbf
}		
}		

Semantics for the data component descriptor:

data_component_id: This 16-bit field is used to identify data coding method. The standardization organization shall allocate this field value.

additional_data_component_info: This is an 8-bit field and used to extend identifier number or storage of supplement information specified in each coding method. Syntax of information described in this area is specified otherwise for each data coding method. (see Annex J)

6.2.21 System management descriptor

[Note] This item is specified in Notation No. 37 of the Ministry of Public Management, Home Affairs, Posts and Telecommunications in 2003.

The system management descriptor (see table 6-33) is used to identify broadcasting and non-broadcasting.

Table 6-33 System management descriptor

Syntax	No. of bits	Identifier
system_management_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
system_management_id	16	uimsbf
for(i=0;i <N;i++){		
additional_identification_info	8	uimsbf
}		
}		

Semantics for the system management descriptor:

system_management_id: This is a 16-bit field and composed as shown in table 6-34.

Table 6-34 Construction of system management identifier

Syntax	No. of bits	Identifier
system_management_id(){		
broadcasting_flag	2	uimsbf
broadcasting_identifier	6	uimsbf
additional_broadcasting_identification	8	uimsbf
}		

broadcasting_flag: This is a 2-bit field and indicates type of broadcasting/non-broadcasting in accordance with table 6-35.

Table 6-35 Broadcasting/non-broadcasting type

Value	Semantics
00	Broadcasting
01,10	Non-broadcasting
11	Undefined

broadcasting_identifier: This is a 6-bit field and indicates standard broadcasting method in accordance with table 6-36.

Table 6-36 Types of standard broadcasting system

Value	Semantics
000000	Undefined
000001	Standard system specified as digital satellite broadcasting using 27 MHz bandwidth in 12.2 to 12.75 GHz frequency band
000010	Standard system specified as digital satellite broadcasting using 34.5 MHz bandwidth in 11.7 to 12.2 GHz frequency band
000011	Standard system specified as digital terrestrial television broadcasting.
000100	Standard system specified as digital satellite broadcasting using 34.5 MHz bandwidth in 12.2 to 12.75 GHz frequency band
000101	Standard system specified as digital terrestrial sound broadcasting.
000110	Standard system specified as broadcasting operated by broadcasting satellites or broadcasting stations in 2630 to 2655 MHz frequency band.
000111	Standard system specified as digital satellite broadcasting based on advanced narrow-band transmission system using 27 MHz bandwidth in 12.2 to 12.75 GHz frequency band
001000 – 111111	Undefined

additional_broadcasting_identification: This is an 8-bit field and is specified by the operation standard of service providers.

additional_identification_info: This is an 8-bit field and used to extend system management indication number.

6.2.22 Hierarchical transmission descriptor

The hierarchical transmission descriptor (see table 6-37) is used to indicate relation between hierarchical streams when transmitting events hierarchically.

Table 6-37 Hierarchical transmission descriptor

Syntax	No. of bits	Identifier
hierarchical_transmission_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
reserved_future_use	7	bslbf
quality_level	1	bslbf

reserved_future_use	3	bslbf
reference_PID	13	uimsbf
}		

Semantics for the hierarchical transmission descriptor:

quality_level: This 1-bit information indicates hierarchy level. Hierarchical construction is in two levels, HQ and LQ, and when the hierarchy level is "1", the stream is in high quality. When the level is "0", the stream is in low quality.

reference_PID: This 3-bit information indicates PID of elementary stream to be referred, for all the stream having hierarchical construction.

6.2.23 Digital copy control descriptor

The digital copy control descriptor (see table 6-38) indicates information to control copied generation in digital recording equipments, and when digital recording is assumed, broadcasting service provider (holder of copyrights) use it to inform about event recording and copyright information for the digital recording equipment. This descriptor is also used to identify maximum transmission rate to each event.

Table 6-38 Digital copy control descriptor

Syntax	No. of bits	Identifier
digital_copy_control_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
digital_recording_control_data	2	bslbf
maximum_bitrate_flag	1	bslbf
component_control_flag	1	bslbf
user_defined	4	bslbf
if(maximum_bitrate_flag == 1){		
maximum_bitrate	8	uimsbf
}		
if(component_control_flag == 1){		
component_control_length	8	uimsbf
for(i=0;i<N;i++){		
component_tag	8	uimsbf
digital_recording_control_data	2	bslbf
maximum_bitrate_flag	1	bslbf
reserved_future_use	1	bslbf
user_defined	4	bslbf
}		
}		
}		

```

        if(maximum_bitrate_flag == 1){
            maximum_bitrate           8 uimsbf
        }
    }
}

```

Semantics for the digital copy control descriptor:

digital_recording_control_data: This 2-bit field indicates information to control copy generation and coded in accordance with table 6-39.

Table 6-39 Digital copy control information

Digital copy control information	Description
00	Copy can be made without control condition
01	Defined by service provider ^{*1}
10	Copy can be made for only one generation ^{*2}
11	Copy is forbidden

^{*1}: Broadcasting service provider can define independently.

^{*2}: Received broadcasting signals can be recorded (first-generation copy) but the recorded signals cannot be reproduced furthermore.

maximum_bit_rate_flag: When this 1-bit flag is "1", it means that following maximum transmitting rate field is effective. When it is "0", following maximum transmitting rate field does not exist.

component_control_flag: This 1-bit flag indicates whether to specify digital copy control information in each component consisting event. When this flag is "1," field after component control length is effective and digital copy control information is specified in each component consisting event. When it is "0", digital copy control information is specified for the whole event and field after component control length does not exist. When this descriptor is transmitted by PMT, component control flag should always be "0".

user_defined: This is a 4-bit field, and broadcasting service provider can define it originally.

maximum_bit_rate: This 8-bit field describes transmission rate of TS packet of each event or elementary stream by rolling up in each 1/4Mbps. In case of variable transmission rate, maximum value is described.

component_control_length: This 8-bit field indicates byte length of the following component con-

trol loop.

component_tag: This is an 8-bit field. Component tag is a label to identify elementary stream of component, which composing events and is the same value as the component tag in the stream identifier descriptor and the component descriptor.

6.2.24 Emergency information descriptor

[Note] This item is specified in Notation No. 37 of the Ministry of Public Management, Home Affairs, Posts and Telecommunications in 2003.

The emergency information descriptor (see table 6-40) is a signal in accordance with emergency alarm signal specified in No.5 of clause 9-3 of Radio Equipment Regulation and used in case of emergency alarm broadcasting.

Table 6-40 Emergency information descriptor

Syntax	No. of bits	Identifier
emergency_information_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
for(i=0;i<N;i++){		
service_id	16	uimsbf
start_end_flag	1	bslbf
signal_level	1	bslbf
reserved_future_use	6	bslbf
area_code_length	8	uimsbf
for(j=0;j<N;j++){		
area_code	12	bslbf
reserved_future_use	4	bslbf
}		
}		
}		

Semantics for the emergency information descriptor:

service_id: This 16-bit field indicates broadcasting event number. This is the same as program_number.

start_end_flag: This 1-bit flag corresponds to start signal and end signal in the emergency alarm signal specified in Notation No. 405 of the Ministry of Posts and Telecommunications in 1985. When this bit is 1, it means that emergency alarm signal has started or is being broadcast. When

this bit is 0, it means that the emergency alarm signal is ended.

signal_level: This 1-bit field corresponds to emergency alarm signal specified in article 138-2 of Radio Station Operation Rule. When this bit is 0, it means that broadcast emergency alarm signal is the 1st type of start signal. When this bit is 1, it means that broadcast emergency alarm signal is the 2nd type of start signal (see Annex D).

area_code_length: This is an 8-bit field, which indicates following area code byte length.

area_code: This is a 12-bit field and corresponds to area code specified in clause 138-3 of Radio Station Operation Rule. For allocation of area code, specification in the Notation No. 405 of the Ministry of Posts and Telecommunications in 1985 is used (see Annex D).

6.2.25 Local time offset descriptor

The local time offset descriptor (see table 6-41) is used to give fixed offset value to present time (UTC + 9 hours) and indicating time for human in local time.

Table 6-41 Local time offset descriptor

Syntax	No. of bits	Identifier
local_time_offset_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
for(i=0;i<N;i++){		
country_code	24	bslbf
country_region_id	6	bslbf
reserved	1	bslbf
local_time_offset_polarity	1	bslbf
local_time_offset	16	bslbf
time_of_change	40	bslbf
next_time_offset	16	bslbf
}		
}		

Semantics for the local time offset descriptor:

country_code: This 24-bit field identifies a country using the 3-character code as specified in ISO 3166. Each character is coded into 8-bits according to ISO 8859-1 and inserted in order into the 24-bit field.

EXAMPLE: Japan has 3-character code "JPN" which is coded as:

"0100 1010 0101 0000 0100 1110"

country_region_id: This 6-bit field identifies a zone in the country. Use "000000" if regions are not distinguished.

local_time_offset_polarity: This 1-bit information indicates the polarity of the value of following local_time_offset and next_time_offset. If this bit is set to "0", the local time is in advance of JST_time. If this bit is set to "1", the local time is behind JST_time.

local_time_offset: This 16-bit field contains the current offset time from JST (UTC+9 hours) in the range between -12 hours and +12 hours at the area which is indicated by the combination of country_code and country_region_id in advance. These 16 bits are coded as 4 digits in 4-bit BCD in the order hour tens, hour, minute tens, and minutes.

time_of_change: This is a 40-bit field which specifies the date and time in MJD and JST (see Annex C), when the time change takes place. This 40-bit field is coded as 16 bits giving the 16 LSBs of MJD followed by 24 bits coded as 6 digits in the 4-bit BCD.

next_time_offset: This 16-bit field contains the next offset time after the change from JST in the range between -12hours and +12hours at the area which is indicated by the combination of country_code and country_region_id in advance. These 16-bits are coded as 4-digits in 4-bit BCD in the order hour tens, hour, minute tens and minutes.

6.2.26 Audio component descriptor

The audio component descriptor is used to indicate each parameter of audio elementary stream and to express the elementary stream in character form. (see table 6-42.)

Table 6-42 Audio component descriptor

Syntax	No. of bits	Identifier
audio_component_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
reserved_future_use	4	bslbf
stream_content	4	uimsbf
component_type	8	uimsbf
component_tag	8	uimsbf
stream_type	8	uimsbf

simulcast_group_tag	8	bslbf
ES_multi_lingual_flag	1	bslbf
main_component_flag	1	bslbf
quality_indicator	2	bslbf
sampling_rate	3	uimsbf
reserved_future_use	1	bslbf
ISO_639_language_code	24	bslbf
if(ES_multi_lingual_flag == 1){		
ISO_639_language_code_2	24	bslbf
}		
for(i=0;i<N;i++){		
text_char	8	uimsbf
}		
}		

Semantics for the audio component descriptor:

stream_content: This 4-bit field indicates a stream type. For audio stream it is set to "0x02". (See table 6-5)

component_type: This 8-bit field specifies audio component type and coded in accordance with table 6-43.

Table 6-43 Audio component descriptor

Component type	Description
0x00	Reserved for future use
0x01	1/0 mode (single monaural channel)
0x02	1/0 + 1/0 mode (dual monaural channel)
0x03	2/0 mode (stereo)
0x04	2/1 mode
0x05	3/0 mode
0x06	2/2 mode
0x07	3/1 mode
0x08	3/2 mode
0x09	3/2 + LFE mode
0x0A – 0x3F	Reserved for future use
0x40	Commentary for visually disabled persons
0x41	Voice for audibly disabled persons
0x42 – 0xAF	Reserved for future use
0xB0 – 0xFE	Defined by the broadcaster
0xFF	Reserved for future use

component_tag: This 8-bit field is a label to identify the component stream and has the same value as the component_tag field in the stream identifier descriptor (see subclause 6.2.16) (if present in the PSI program map section) for the component stream.

stream_type: This 8-bit field indicates audio stream type (MPEG2 BC Audio, AAC Audio) (see Annex E).

simulcast_group_tag: This 8-bit field gives the same number to the component operating simulcast (transmit the same contents by different coding method). For component, which does not operate simulcast, it is set to "0xFF".

ES_multi_lingual_flag: This 1-bit flag is set to "1" when 2-language multilingual (ES multilingual mode) is made in ES at 1/0 + 1/0 mode. In case of other mode, this bit is reserved.

main_component_flag: This 1-bit flag is set to "1" when the audio component is the main audio. In case of 1/0 + 1/0 mode, it is set to "1" when the 1st audio component is the main audio.

quality_indicator: This 2-bit field indicates tone quality mode and coded in accordance with table 6-44.

Table 6-44 Quality indicator

Quality indicator	Description
00	Reserved for future use
01	Mode 1*
10	Mode 2*
11	Mode 3*

*: For detail, refer to ARIB STD-B32 Part 2 Appendix 2.

sampling_rate: This 3-bit field indicates sampling frequency and is coded in accordance with table 6-45.

Table 6-45 Sampling frequency

Linkage type	Description
000	Reserved for future use
001	16kHz
010	22.05kHz
011	24kHz
101	32kHz
110	44.1kHz
111	48kHz

ISO_639_language_code: This 24-bit field identifies the language of the audio component. In the case of ES multilingual mode, it indicates the first audio component language. This field contains a 3-character code as specified by ISO 639-2 (16). Each character is coded into 8 bits according to ISO 8859-1(18) and inserted in order into the 24-bit field.

EXAMPLE: Japan has 3-character code "jpn", which is coded as:

"0100 1010 0101 0000 0100 1110"

ISO_639_language_code_2: This 24-bit field identifies the second audio component language in ES multilingual mode.

text_char: This is an 8-bit field. A string of "text_char" fields specifies a text description of the component stream. Text information is coded using the character sets and methods described in Annex A.

6.2.27 Target region descriptor

Target region descriptor (see table 6-46) is used to describe target region of the program or a part of the stream composing a program.

Table 6-46 Target region descriptor

Syntax	No. of bits	Identifier
target_region_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
region_spec_type	8	uimsbf
target_region_spec()		
}		

Semantics for the target region descriptor:

region_spec_type: This 8-bit field designates region description method in the following target_region_spec() construction and coded in accordance with table 6-47.

Table 6-47 Region description method designation

Value of region_spec_type	Semantics
0x00	Reservation
0x01	Region designation of prefecture for BS digital
0x02 – 0xFF	Reservation

target_region_spec(): This field indicates syntax for the target region specified by each-region_spec_type.

6.2.28 Data content descriptor

The data content descriptor (see table 6-48) is used to describe detail information relating to individual contents of data broadcasting event.

Table 6-48 Data contents descriptor

Syntax	No. of bits	Identifier
data_content_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
data_component_id	16	uimsbf
entry_component	8	uimsbf
selector_length	8	uimsbf
for(i=0;i<N;i++){		
selector_byte	8	uimsbf
}		
num_of_component_ref	8	uimsbf
for(i=0;i<num_of_component_ref;i++){		
component_ref	8	uimsbf
}		
ISO_639_language_code	24	bslbf
text_length	8	uimsbf
for(i=0;i<N;i++){		
text_char	8	uimsbf
}		
}		

Semantics for the data contents descriptor:

data_component_id: This is a 16-bit field and describes the same value as the data component identifier of data component descriptor.

entry_component: This 8-bit field designates the component stream including data to be referred first, among multiple component streams composing data broadcasting contents, using component tag.

selector_length: This 8-bit field specifies byte length of the following selector area.

selector_byte: This is an 8-bit field. Series of selector area describes necessary information to get data. Syntax described in this area is specified otherwise in each data component. (See Annex J)

num_of_component_ref: This 8-bit field indicates number of all component stream in the event it is necessary to playback and record contents indicated by this descriptor (however, component stream designated by entry component is excluded). This number corresponds to byte length of the following component reference loop.

component_ref: This 8-bit field describes component tag of the component stream in the event it is necessary to watch or record the contents (however, component stream designated by the entry component is excluded).

ISO_639_language_code: This 24-bit field identifies the language of the character description used in the following service descriptor containing a 3-character code as specified by ISO 639-2.

text_length: This 8-bit field indicates byte length of following contents descriptor.

text_char: This is an 8-bit field. A string of "text_char" fields describes the explanation related to transmitted contents.

6.2.29 Hyperlink descriptor

The hyperlink descriptor (see table 6-49) is used to describe linkage to other event, event contents, and events relating to information.

Table 6-49 Hyperlink descriptor

Syntax	No. of bits	Identifier
hyperlink_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
hyper_linkage_type	8	uimsbf
link_destination_type	8	uimsbf
selector_length	8	uimsbf
for(i=0; i<selector_length; i++){		
selector_byte	8	uimsbf
}		
for(i=0; i<N; i++){		
private_data	8	uimsbf
}		
}		

Semantics for the hyperlink descriptor:

hyper_linkage_type: This 8-bit field indicates linkage type and coded in accordance with table 6-50.

Table 6-50 Hyperlink descriptor

hyper_linkage_type	Semantics
reserved(0x00)	Reservation
combined_data(0x01)	Used to indicate data broadcast event that transport SI related to TV event, when the SI is transported in other time frame or other event. In order to make reservation or playback of the linkage destination data-broadcast event when reserving or playing back TV event, it is described as detail SI of the TV event.
combined_stream(0x02)	Used to indicate TV event that relates to SI transported in data broadcast event, when the SI is transported in other time frame or other event. In order to make reservation or playback of the linkage destination data broadcast event when reserving or playing back TV event, it is described as detail SI of the data broadcast event.
content_to_index(0x03)	Used to indicate event that transport internal index information related to TV event, when the internal index information is transported in other time frame or other event. In order to accumulate or utilize the related index information when accumulating or playing back TV event, it is described as detail internal index information of the TV event.
index_to_content(0x04)	Used to indicate TV event that relates to internal index information transported in event, when the internal index information is transported in other time frame or other event. In order to accumulate or playback the related TV event when accumulating or utilizing index information, it is described as detail information of the index information event.
guide_data(0x05)	Used to indicate data broadcast event that transport the event guide information related to this event, when the event guide information is transported in other data broadcast event. In order to get detail information on event guide application as requested, it indicates the designated data.
(0x06)	Undefined
content_to_metadata(0x07)	Used to indicate event and service that transport meta data related to TV event or data broadcast event, when meta data is broadcasted in time frame or service different from TV event or data broadcast event. In order to accumulate or utilize the related meta data when accumulating or playing back TV event or data broadcast event, it is described as detail information of TV event or data broadcast event.
metadata_to_content(0x08)	Used to indicate TV event or data broadcast event that relate to metadata transported in event or service, when meta data is broadcasted in time frame or service different from TV event or data broadcast event. In order to accumulate or playback the related TV event or data broadcast event when storing or utilizing meta data, it is described as detail information of meta data event.

portal_URI (0x09)	Used to indicate the URI of the portal link destination in server-type broadcasting. The URI of the portal link destination corresponds to the URI of the BML document provided by the broadcaster for the contract between the broadcaster and the audience.
authority_URI (0x0A)	Used to indicate the URI of the authority in server-type broadcasting. The authority is the character string used as the name space for each broadcaster when accumulating server-type contents in server-type broadcasting receivers.
(0x0B – 0x3F)	Undefined
index_module(0x40)	Used only for LIT used as internal index information in data broadcast event, to indicate correspondence of local event identifier and data broadcasting event module. Operation depends on receiver application using the internal index information.
(0x41 – 0x7F)	Undefined
user_private(0x80 – 0xFF)	Linkage type defined by the users.

link_destination_type: This 8-bit field indicates link designation type and coded in accordance with table 6-51.

Table 6-51 Link destination type

link_destination_type	selector_length	Target of link
reserved(0x00)	-	
link_to_service(0x01)	6	Service
link_to_event(0x02)	8	Event
link_to_module(0x03)	11	Specific module of event
link_to_content(0x04)	10	Content
link_to_content_module(0x05)	13	Specific module of content
link_to_ert_node(0x06)	6	Node of event related table
link_to_stored_content(0x07)	Variable length	Accumulated content
reserved_future_use(0x08 – 0x7F)		Reserved for future use
user_private(0x80 – 0xFE)	-	Link destination type of user definition
reserved(0xFF)	-	

selector_length: This 8-bit field indicates byte length of the following selector area.

selector_byte: This is an 8-bit field. Series of selector area describes link destination by the following type specified in each link destination type.

Table 6-52 Description of selector area (link_destination_type: 0x01)

Syntax (link_destination_type:0x01)	No. of bits	Identifier
link_service_info(){		
original_network_id	16	uimsbf
transport_stream_id	16	uimsbf
service_id	16	uimsbf
}		

original_network_id: This 16-bit field gives the label identifying the network_id of the originating delivery system where the linked service belongs.

transport_stream_id: This 16-bit field gives the label identifying the Transport Stream where the linked service belongs.

service_id: This 16-bit field gives the label identifying the service in the linked Transport Stream and describes the same service_id as the program_number in the corresponding program map section.

Table 6-53 Description of selector area (link_destination_type: 0x02)

Syntax (link_destination_type:0x02)	No. of bits	Identifier
link_event_info(){		
original_network_id	16	uimsbf
transport_stream_id	16	uimsbf
service_id	16	uimsbf
event_id	16	uimsbf
}		

original_network_id: This 16-bit field gives the label identifying the network_id of the originating delivery system where the linked event belongs.

transport_stream_id: This 16-bit field gives the label identifying the Transport Stream where the linked event belongs.

service_id: This 16-bit field gives the label identifying the service in the Transport Stream where the linked event belongs and describes the same service_id as the program_number in the corresponding program map section.

event_id: This 16-bit field describes the identifier number of the linked event.

Table 6-54 Description of selector area (link_destination_type: 0x03)

Syntax (link_destination_type:0x03)	No. of bits	Identifier
link_module_info(){		
original_network_id	16	uimsbf
transport_stream_id	16	uimsbf
service_id	16	uimsbf
event_id	16	uimsbf
component_tag	8	uimsbf
moduleId	16	uimsbf
}		

original_network_id: This 16-bit field describes the label identifying the network_id of the originating delivery system where the linked carousel module belongs.

transport_stream_id: This 16-bit field describes the label identifying the Transport Stream where the linked carousel module belongs.

service_id: This 16-bit field gives the label identifying the service in the Transport Stream where the linked carousel module belongs and describes the same service_id as the program_number in the corresponding program map section.

event_id: This 16-bit field describes the identifier number of the event where the linked carousel module belongs.

component_tag: This 8-bit field describes the label identifying the component stream transmitting the linked carousel module.

moduleId: This 16-bit field describes the identifier number of the linked carousel module.

Table 6-55 Description of selector area (link_destination_type: 0x04)

Syntax (link_destination_type:0x04)	No. of bits	Identifier
link_content_info(){		
original_network_id	16	uimsbf
transport_stream_id	16	uimsbf
service_id	16	uimsbf
content_id	32	uimsbf
}		

original_network_id: This 16-bit field gives the label identifying the network_id of the originating delivery system where the linked content belongs.

transport_stream_id: This 16-bit field gives the label identifying the Transport Stream where the linked contents belong.

service_id: This 16-bit field gives the label identifying the service in the Transport Stream where the linked content belongs and describes the same service_id as the program_number in the corresponding program map section.

content_id: This 32-bit field describes identifier number to identify linked contents in the service uniformly.

Table 6-56 Description of selector area (link_destination_type: 0x05)

Syntax (link_destination_type:0x05)	No. of bits	Identifier
link_content_module_info(){		
original_network_id	16	uimsbf
transport_stream_id	16	uimsbf
service_id	16	uimsbf
content_id	32	uimsbf
component_tag	8	uimsbf
moduleId	16	uimsbf
}		

original_network_id: This 16-bit field describes the label identifying the network_id of the originating delivery system where the linked contents module belongs.

transport_stream_id: This 16-bit field describes the label identifying the Transport Stream where the linked contents module belongs.

service_id: This 16-bit field gives the label identifying the service in the Transport Stream where the linked contents module belongs and describes the same service_id as the program_number in the corresponding program map section.

content_id: This 32-bit field describes identifier number to identify content where the linked module belongs in the service uniformly.

component_tag: This 8-bit field describes the label identifying the component stream transmitting the linked carousel module.

moduleId: This 16-bit field describes the identifier number of the linked module.

Table 6-57 Description of selector area (link_destination_type: 0x06)

Syntax (link_destination_type:0x06)	No. of bits	Identifier
link_ert_node_info(){		
information_provider_id	16	uimsbf
event_relation_id	16	uimsbf
node_id	16	uimsbf
}		

information_provider_id: This 16-bit field designates information provider identifier of event relation sub_table to which the linked node belongs.

event_relation_id: This 16-bit field designates event relation identifier of event relation sub_table to which the linked destination belongs.

node_id: This 16-bit field designates node identifier of linked destination node.

Table 6-58 Selector area description (link_destination_type: 0x07)

Syntax (link_destination_type:0x07)	No. of bits	Identifier
link_stored_content_info(){		
for(i=0; i<N; i++){		
uri_char	8	uimsbf
}		
}		

uri_char: The series of fields describes URI of the contents of the accumulated data service. Describing method of URI is specified in ARIB STD-B24 Part 2 Section 9.

6.2.30 Video decode control descriptor

The video decode control descriptor (see table 6-59) is used to control video decoding to receive still picture composed of MPEG-I pictures transmitted at low transmission speed and to get smooth displaying at video splice point where video coding method is changed.

Table 6-59 Video decode control descriptor

Syntax	No. of bits	Identifier
video_decode_control_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
still_picture_flag	1	bslbf
sequence_end_code_flag	1	bslbf
video_encode_format	4	bslbf
reserved_future_use	2	bslbf
}		

Semantics for the video decode control descriptor:

still_picture_flag: This is a 1-bit field and when it is "1" it means that this component is still picture (MPEG-I picture). When it is "0", it means that this component is moving picture.

sequence_end_code_flag: This is a 1-bit field and it indicates whether or not this video component has a sequence end code at the end of the sequence that is defined by the video coding standards. When it is "1", it means that the video stream has a sequence end code at the end of the sequence and when it is "0", it means that the video stream does not have a sequence end code.

video_encode_format: This is a 4-bit field, and shows the encode format of the component in accordance with table 6-60.

Table 6-60 Video encode format

Video encode format	Description
0000	1080p
0001	1080i
0010	720p
0011	480p
0100	480i
0101	240p
0110	120p
0111	Reserved
1000 – 1111	For extension of video encode format

6.2.31 Terrestrial delivery system descriptor

The terrestrial delivery system descriptor indicates the physical condition of terrestrial transmission path. See table 6-61.

Table 6-61 Terrestrial delivery system descriptor

Syntax	No. of bits	Identifier
terrestrial_delivery_system_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
area_code	12	bslbf
guard_interval	2	bslbf
transmission_mode	2	bslbf
for(i=0; i<N; i++){		
frequency	16	uimsbf
}		
}		

Semantics for the terrestrial delivery system descriptor:

area_code: This 12-bit field indicates the service area code.

guard_interval: This is a 2-bit field and indicates guard interval in accordance with table 6-62.

Table 6-62 Guard interval

Guard interval	Description
00	1/32
01	1/16
10	1/8
11	1/4

transmission_mode: This is a 2-bit field and indicates mode information in accordance with table 6-63.

Table 6-63 Mode information

Mode information	Description
00	Mode 1
01	Mode 2
10	Mode 3
11	Undefined

frequency: This 16-bit field indicates center frequency. Frequency unit shall be 1/7MHz, which is the same as tuning step of digital terrestrial broadcasting system. In case of MFN, list multiple frequencies that are used.

6.2.32 Partial reception descriptor

The partial reception descriptor describes service_id transmitted by the partial reception hierarchy of the terrestrial transmission path. See table 6-64.

Table 6-64 Partial reception descriptor

Syntax	No. of bits	Identifier
partial_reception_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
for(i=0; i<N; i++){		
service_id	16	uimsbf
}		
}		

Semantics for the partial reception descriptor:

service_id: This 16-bit field indicates service_id of the information service transmitted in the partial reception hierarchy. The service_id is the same as the program_number in the corresponding program map section.

6.2.33 Series descriptor

The series descriptor is used to identify series event. See table 6-65.

Table 6-65 Series descriptor

Syntax	No. of bits	Identifier
series_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
series_id	16	uimsbf
repeat_label	4	uimsbf
program_pattern	3	uimsbf
expire_date_valid_flag	1	uimsbf
expire_date	16	uimsbf
episode_number	12	uimsbf
last_episode_number	12	uimsbf
for(i=0; i<N; i++){		
series_name_char	8	uimsbf
}		
}		

Semantics for the series descriptor:

series_id: This is a 16-bit field and identifies series uniquely.

repeat_label: This 4-bit field gives the label identifying program when the broadcasting duration of the series and that of repeating the series of broadcasting. Original series broadcasting is given with "0x0".

program_pattern: This 3-bit field indicates program pattern of the series content according to table 6-66. This may show when the event belonging the series appears next time.

Table 6-66 Program pattern

Program pattern	Description
0x0	Nonscheduled (other than defined as 0x1 to 0x7)
0x1	Regular program (every day, every day except weekend, only weekends, etc.), programmed several days a week
0x2	Programmed about once a week
0x3	Programmed about once a month
0x4	Programmed several events in a day
0x5	Division of long hour program
0x6	Program for regular or irregular accumulation
0x7	Undefined

`expire_date_valid_flag`: This 1-bit flag indicates that the following `expire_date` value is valid. When the value of the scheduled series end date is valid, set this value to "1".

`expire_date`: This 16-bit field indicates the date of the effective limit of the series in lower 16 bits of MJD. Even when the last event could not be recognized for some reason, the IRD recognizes that the series is ended when the date is passed.

`episode_number`: This 12-bit field indicates the episode number in the series in the event which this descriptor indicates. It can be indicated from No. 1 to No. 4095. When the episode number exceeds this value, define the series separately. When the event number cannot be defined due to a series event, set to "0x000".

`last_episode_number`: This 12-bit field indicates the total number of the corresponding series. It can be indicated from No. 1 to No. 4095. When the episode number exceeds this value, define the series separately. When the last time is not yet decided, set to "0x000".

`series_name_char`: In this character code field, series name is transmitted. For coding character information, see Annex A.

6.2.34 Event group descriptor

When there is a relation between multiple events, the event group descriptor is given to indicate that those events are in a group. See table 6-67.

Table 6-67 Event group descriptor

Syntax	No. of bits	Identifier
event_group_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
group_type	4	uimsbf
event_count	4	uimsbf
for(i=0; i< event_count; i++){		
service_id	16	uimsbf
event_id	16	uimsbf
}		
if(group_type == 4 group_type ==5){		
for(i=0 ;i< N ; i++){		
original_network_id	16	uimsbf
transport_stream_id	16	uimsbf
service_id	16	uimsbf
event_id	16	uimsbf
}		
}		
else{		
for(i=0; i< N; i++){		
private_data_byte	8	uimsbf
}		
}		
}		

Semantics for the event group descriptor:

group_type: This is a 4-bit field and indicates group type of the event in accordance with table 6-68.

Table 6-68 Group type

Group type	Description
0x1	Event common
0x2	Event relay
0x3	Event movement
0x4	Event relay to other networks
0x5	Event movement from other networks
0x0, 0x06 – 0xF	Undefined

event_count: This is a 4-bit field and indicates the following event_id loop number.

service_id: This is a 16-bit field and indicates the service_id of the related information service. The service_id is the same as the program_number in the corresponding program map section.

event_id: This is a 16-bit field and indicates the event_id of the related event.

original_network_id: This is a 16-bit field and indicates the original_network_id of the related event transmitted at the time of event relay or event move across networks.

transport_stream_id: This is a 16-bit field and indicates the transport_stream_id of the related event transmitted at the time of event relay or event move across networks.

6.2.35 SI parameter descriptor

The SI parameter descriptor is used to indicate the SI parameter. See table 6-69.

Table 6-69 SI parameter descriptor

Syntax	No. of bits	Identifier
SI_parameter_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
parameter_version	8	uimsbf
update_time	16	uimsbf
for(i=0; i<N; i++){		
table_id	8	uimsbf
table_description_length	8	uimsbf
for(j=0; j<N; j++){		
table_description_byte	8	uimsbf
}		
}		
}		

Semantics for the SI parameter descriptor:

parameter_version: This is an 8-bit field and indicates SI parameter version. It denotes value incremented by 1 when a parameter is updated.

update_time: This is a 16-bit field which is denoted in lower 16 bits of MJD when the denoted parameter becomes valid.

table_id: This 8-bit field indicates the table_id described in the following table_description_byte field.

table_description_length: This 8-bit field indicates the byte length of the following table_description_byte.

table_description_byte: This is an 8-bit field. A series of table description area describes parameter in each table specified in the operational standard of service providers.

6.2.36 Broadcaster name descriptor

The broadcaster name descriptor describes the name of the broadcaster. See table 6-70.

Table 6-70 Broadcaster name descriptor

Syntax	No. of bits	Identifier
broadcaster_name_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
for(i=0; i<N; i++){		
char	8	uimsbf
}		
}		

Semantics for the broadcaster name descriptor:

char: This is an 8-bit field. A string of character information field indicates the broadcaster name.

For character information coding, see Annex A.

6.2.37 Component group descriptor

The component group descriptor defines and identifies component grouping in the event. See table 6-71.

Table 6-71 Component group descriptor

Syntax	No. of bits	Identifier
component_group_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
component_group_type	3	uimsbf
total_bit_rate_flag	1	uimsbf
num_of_group	4	uimsbf
for(i=0; i< num_of_group; i++){		
component_group_id	4	uimsbf
num_of_CA_unit	4	uimsbf
for(i=0; i< num_of_CA_unit; i++){		
CA_unit_id	4	uimsbf
num_of_component	4	uimsbf
for(i=0; i< num_of_component; i++){		
component_tag	8	uimsbf
}		
}		
if(total_bit_rate_flag==1){		
total_bit_rate	8	uimsbf
}		
text_length	8	uimsbf
for(i=0; i< text_length; i++){		
text_char	8	uimsbf
}		
}		
}		

Semantics for the component group descriptor:

component_group_type: This is a 3-bit field and indicates group type of the component in accordance with table 6-72.

Table 6-72 Component group type

Component group type	Description
000	Multi-view TV service
001 – 111	Undefined

total_bit_rate_flag: This is a 1-bit flag and indicates the description status of the total bit rate in the component group in the event. When this bit is "0", the total bit rate field in the component group

does not exist in the corresponding descriptor. When this bit is "1", the total bit rate field in the component group exists in the corresponding descriptor.

num_of_group: This is a 4-bit field indicating number of component groups in the event.

component_group_id: This is a 4-bit field and describes the component group identifier in accordance with table 6-73.

Table 6-73 Component group identifier

Component group identifier	Description
0x0	Main group
0x1 – 0xF	Sub group

num_of_CA_unit: This is a 4-bit field and indicates CA/non-CA unit within the component group.

CA_unit_id: This is a 4-bit field and describes the CA_unit_id, to which the component belongs in accordance with table 6-74.

Table 6-74 CA_unit_id

CA_unit_id	Description
0x0	Non-CA unit group
0x1	CA unit group including default ES group
0x2 – 0xF	CA unit group other than above

num_of_component: This is a 4-bit field indicating number of components which belong to the corresponding component group and the CA CA/non-CA unit indicated in the CA_unit_id immediately before.

component_tag: This is an 8-bit field and indicates the component tag value belonging to the component group.

total_bit_rate: This is an 8-bit field and describes the total bit rate of the component in the component group by rounding up the TS packet transmission rate in each 1/4Mbps.

text_length: This is an 8-bit field and indicates the byte length of the following component group description.

text_char: This is an 8-bit field. A series of character information field describes explanation of component group. For character information coding, see Annex A.

6.2.38 SI prime_ts descriptor

The SI prime_ts descriptor is used to indicate the identifier information of the SI prime_ts (Transport Stream having special transmission format for SI) and its transmission parameter. See table 6-75.

Table 6-75 SI prime_ts descriptor

Syntax	No. of bits	Identifier
SI_prime_ts_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
parameter_version	8	uimsbf
update_time	16	uimsbf
SI_prime_ts_network_id	16	uimsbf
SI_prime_transport_stream_id	16	uimsbf
for(i=0; i<N; i++){		
table_id	8	uimsbf
table_description_length	8	uimsbf
for(j=0; j<N; j++){		
table_description_byte	8	uimsbf
}		
}		
}		

Semantics for the SI prime_ts descriptor

parameter_version: This is an 8-bit field and indicates the version of SI parameter. The version_number shall be incremented by 1 when the parameter is updated.

update_time: This is a 16-bit field which is denoted in the lower 16 bits of MJD when the denoted parameter becomes valid.

SI_prime_ts_network_id: This 16-bit field indicates the SI_prime_ts_network_id.

SI_prime_transport_stream_id: This 16-bit field indicates the SI_prime_transport_stream_id.

table_id: This 8-bit field indicates the table_id described in the following table_description_byte field.

table_description_length: This 8-bit field indicates the byte length of the following table_description_byte.

table_description_byte: This is an 8-bit field. A series of table description area describes parameter in each table specified in the operational standard of service providers.

6.2.39 Board information descriptor

The board information descriptor indicates title and content of the board information in text format. See table 6-76.

Table 6-76 Board information descriptor

Syntax	No. of bits	Identifier
board_information_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
title_length	8	uimsbf
for(i=0;i<title_length;i++){		
title_char	8	uimsbf
}		
text_length	8	uimsbf
for(i=0;i<text_length;i++){		
text_char	8	uimsbf
}		
}		

Semantics for the board information descriptor:

title_length: This 8-bit field indicates the byte length of the following title.

title_char: This is an 8-bit field. A series of character information indicates the board information title. For character information coding see Annex A.

text_length: This 8-bit field indicates the byte length of the following content description.

text_char: This is an 8-bit field. A series of character information field describes the content of board information. For character information coding see Annex A.

6.2.40 LDT linkage descriptor

The LDT linkage descriptor is used to describe linkage of the information collected in LDT. See table 6-77.

Table 6-77 LDT linkage descriptor

Syntax	No. of bits	Identifier
LDT_linkage_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
original_service_id	16	uimsbf
transport_stream_id	16	uimsbf
original_network_id	16	uimsbf
for(i=0;i<N;i++){		
description_id	16	uimsbf
reserved_future_use	4	uimsbf
description_type	4	uimsbf
user_defined	8	bslbf
}		
}		

Semantics for the LDT linkage descriptor:

original_service_id: This 16-bit field indicates the original_service_id of the linked LDT sub_table.

transport_stream_id: This 16-bit field indicates the ts_id of the LDT sub_table which the linked LDT sub_table is included.

original_network_id: This 16-bit field indicates the network_id of the originating delivery system in which the linked LDT sub_table is included.

description_id: This 16-bit field indicates the id_number of the linked descriptor.

description_type: This 8-bit field indicates the linked description type in accordance with table 6-78.

Table 6-78 Description type

Value	Semantics
0x0	Undefined
0x1	Described with short_event_descriptor
0x2	Described with extended_event_descriptor (Independent type without describing item_description is used)
0x3	Described with extended_event_descriptor
0x4 – 0xE	Reserved for future use
0xF	Others (Including not specified descriptor and mixed)

user_defined: The service provider can define this 8-bit field independently.

6.2.41 Connected transmission descriptor

The connected transmission descriptor indicates physical condition in connected transmission in terrestrial audio transmission path. See table 6-79.

Table 6-79 Connected transmission descriptor

Syntax	No. of bits	Identifier
connected_transmission_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
connected_transmission_group_id	16	uimsbf
segment_type	2	bslbf
modulation_type_A	2	bslbf
modulation_type_B	2	bslbf
reserved_future_use	2	bslbf
for(i= 0;i<N;i++){		
additional_connected_transmission_info	8	uimsbf
}		
}		

Semantics for the connected transmission descriptor:

connected_transmission_group_id: This 16-bit field gives the label identifying the connected transmission group.

segment_type: This is a 2-bit field and indicates segment type in accordance with table 6-80.

Table 6-80 Segment type

Segment type	Description
00	1 segment
01	3 segment
10	Reserved for future use
11	Refer to TMCC signal

modulation_type_A: This is a 2-bit field which indicates modulation_type_A in accordance with table 6-81.

modulation_type_B: This is a 2-bit field which indicates modulation_type_B in accordance with table 6-81. If the segment type is 1 segment, it is meaningless.

Table 6-81 Modulation type

Modulation type	Description
00	Differential modulation
01	Synchronous modulation
10	Reserved for future use
11	Refer to TMCC signal

additional_connected_transmission_info: This is an 8-bit field and used to store the additional information specified in the operational standard of service providers.

6.2.42 TS information descriptor

The TS information descriptor specifies the remote control key identifier assigned to the applicable TS and indicates the relationship between the service identifier and the transmission layer during hierarchical transmission (see table 6-82).

Table 6-82 TS information descriptor

Syntax	No. of bits	Identifier
ts_information_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
remote_control_key_id	8	uimsbf
length_of_ts_name	6	uimsbf
transmission_type_count	2	uimsbf
for(i = 0;i < length_of_ts_name;i++){		
ts_name_char	8	uimsbf
}		
for(j = 0;j < transmission_type_count;j++){		
transmission_type_info	8	bslbf
num_of_service	8	uimsbf
for(k = 0;k < num_of_service;k++){		
service_id	16	uimsbf
}		
}		
for(l = 0;l < N;l++){		
reserved_future_use	8	bslbf
}		
}		

Semantics for the TS information descriptor:

remote_control_key_id: This 8-bit field indicates the recommended remote control key number to which the applicable TS shall be assigned.

length_of_ts_name: This 6-bit field indicates the byte length of TS name description.

transmission_type_count: This 2-bit field indicates the number of loops for the subsequent information on the number of transmission types.

ts_name_char: This is a 8-bit field. A series of TS name description fields describes the applicable TS name. See Annex A for character information coding.

transmission_type_info: This 8-bit field, which is used for discriminating hierarchical layers etc., is defined by the operational standards of each service provider.

num_of_service: This 8-bit field indicates the number of loops for the subsequent service identifier.

service_id: This 16-bit field indicates the service identifier transmitted at each hierarchy of transmission type.

6.2.43 Extended broadcaster descriptor

The extended broadcaster descriptor specifies the extended broadcaster identification information such as terrestrial broadcaster identifier and defines the relationships with other extended broadcasters and broadcasters of other networks (see table 6-83).

Table 6-83 Extended broadcaster descriptor

Syntax	No. of bits	Identifier
extended_broadcaster_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
broadcaster_type	4	uimsbf
reserved_future_use	4	bslbf
if(broadcaster_type == 0x1){		
terrestrial_broadcaster_id	16	uimsbf
number_of_affiliation_id_loop	4	uimsbf
number_of_broadcaster_id_loop	4	uimsbf
for(i=0; i<N1; i++){		
affiliation_id	8	uimsbf
}		
for(j=0; j<N2; j++){		
original_network_id	16	uimsbf
broadcaster_id	8	uimsbf
}		
for(k=0; k<N3; k++){		
private_data_byte	8	bslbf
}		
}		
Else if(broadcaster_type == 0x2){		
terrestrial_sound_broadcaster_id	16	uimsbf
number_of_sound_broadcast_affiliation_id_loop	4	uimsbf
number_of_broadcaster_id_loop	4	uimsbf
for(i=0; i<N1; i++){		
sound_broadcast_affiliation_id	8	uimsbf
}		
for(j=0; j<N2; j++){		
original_network_id	16	uimsbf
broadcaster_id	8	uimsbf
}		
for(k=0; k<N3; k++){		
private_data_byte	8	bslbf
}		
}		
else{		
for(i=0; i<N; i++){		
reserved_future_use	8	bslbf
}		
}		
}		

Semantics for the extended broadcaster descriptor:

broadcaster_type(broadcaster type): This is a 4-bit field whose coding is specified in table 6-84.

Table 6-84 broadcaster type

value	type
0x1	Digital terrestrial television broadcast
0x2	Digital terrestrial sound broadcast
Except above	Not defined

terrestrial_broadcaster_id: This 16-bit field identifies the terrestrial broadcaster described in this field.

number_of_affiliation_id_loop: This 4-bit field indicates the number of loops for the subsequent affiliation identifier.

number_of_broadcaster_id_loop: This 4-bit field indicates the number of loops for the subsequent broadcaster identifier.

affiliation_id: This 8-bit field is used for identifying the affiliation of the applicable terrestrial broadcaster identifier.

original_network_id: This 16-bit field works as a label to specify the network identifier of the original distribution system.

broadcaster_id: This 8-bit field identifies the broadcaster in the original network.

terrestrial_sound_broadcaster_id: This 16-bit field identifies the terrestrial sound broadcaster described in this field.

number_of_sound_broadcast_affiliation_id_loop: This 4-bit field indicates the number of loops for the subsequent sound broadcasting affiliation identifier. .

number_of_sound_broadcaster_id_loop: This 4-bit field indicates the number of loops for the subsequent terrestrial sound broadcaster identifier.

sound_broadcast_affiliation_id: This 8-bit field is used for identifying the sound broadcasting affiliation of the applicable terrestrial sound broadcaster identifier.

6.2.44 Logo transmission descriptor

The logo transmission descriptor is used for describing such information as the character string for simple logo and pointing to CDT-format logo data (see table 6-85).

Table 6-85 Logo transmission descriptor

Syntax	No. of bits	Identifier
logo_transmission_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
logo_transmission_type	8	uimsbf
if(logo_transmission_type == 0x01){		
reserved_future_use	7	bslbf
logo_id	9	uimsbf
reserved_future_use	4	bslbf
logo_version	12	uimsbf
download_data_id	16	uimsbf
}		
else if(logo_transmission_type == 0x02){		
reserved_future_use	7	bslbf
logo_id	9	uimsbf
}		
else if(logo_transmission_type == 0x03){		
for(i=0;i<N;i++){		
logo_char	8	uimsbf
}		
}		
else{		
for(j=0;j<M;j++){		
reserved_future_use	8	bslbf
}		
}		
}		

Semantics for the logo transmission descriptor:

logo_transmission_type : This 8-bit field indicates the logo transmission scheme shown in table 6-86 (see ARIB STD-B21).

Table 6-86 Logo transmission scheme

logo_transmission_type value	explanation
0x01	CDT transmission scheme 1 : when referring to CDT directly with download data identification
0x02	CDT transmission scheme 2 : when referring to CDT using logo identification indirectly with download data identification
0x03	Simple logo system
Except above	Reserved for future use

logo_id: This 9-bit data denotes the ID value of the logo data defined in the applicable service (see ARIB STD-B21).

download_data_id : This 16-bit field identifies data to be downloaded. Its value should be the same as the table_id_extension value of the CDT where logo data is located (see ARIB STD-B21).

logo_version: This 12-bit field denotes the version number of the applicable logo_id (see ARIB STD-B21).

logo_char: This 8-bit field describes the 8-unit code character string for simple logo.

6.2.45 Content availability descriptor

The content availability descriptor (see table 6-87), which describes information to control record and output, is used in combination with the digital copy control descriptor by the broadcasting service provider (copyright holder) to control the record and output of programs.

Table 6-87 Content availability descriptor

Syntax	No. of bits	Identifier
content_availability_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
reserved_future_use	2	bslbf
image_constraint_token	1	bslbf
retention_mode	1	bslbf
retention_state	3	bslbf
encryption_mode	1	bslbf
for(i=0;i<N;i++){		
reserved_future_use	8	uimsbf
}		
}		

Semantics for the content availability descriptor:

`image_constraint_token`: This 1-bit field indicates whether the image quality of video signal output is constrained. The resolution of video signal output must be constrained when this field is "0", and does not have to be constrained when the field is "1".

`retention_mode`: When this 1-bit field is "0", temporal accumulation is possible even if copy is prohibited by the `digital_recording_control_data` of the digital copy control descriptor. When this field is "1", temporal accumulation is not possible.

`retention_state`: This 3-bit field, whose coding is shown in table 6-88, indicates the allowable time of temporal accumulation after the reception of contents.

Table 6-88 Allowable time of temporal accumulation

Allowable time of temporal accumulation	description
111	1 hour and half
110	3 hours
101	6 hours
100	12 hours
011	1 day
010	2 days
001	1 week
000	No limit

`encryption_mode` (output protection bit): This 1-bit field indicates whether the output of high-speed digital interface is protected. When this field is "0", the output of high-speed digital interface must be protected. When the field is "1", the protection is not required.

6.2.46 Carousel compatible composite descriptor

The carousel compatible composite descriptor uses descriptors defined in the data carousel transmission scheme (Chapter 6 of ARIB STD-B24 Part 3) as subdescriptors, and describes accumulation control of stream-type contents etc. by applying the descriptive functions of the subdescriptors (see table 6-89).

Table 6-89 Carousel compatible composite descriptor

Syntax	No. of bits	Identifier
carousel_compatible_composite_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
for(i=0;i<N;i++){		
sub_descriptor()		
}		
}		

Semantics for the carousel compatible composite descriptor:

sub_descriptor(): A subdescriptor is placed in this area. The descriptors in the module information area and the private area defined in the data carousel transmission scheme (Chapter 6 of ARIB STD-B24 Part 3) are used as subdescriptors, and the descriptive function of each descriptor is inherited. Refer to Annex K for the functions of the subdescriptors.

6.2.47 AVC video descriptor

The AVC video descriptor (see table 6-90) is used for describing the basic coding parameters of the AVC video stream in ITU-T Recommendation H.264 and ISO/IEC 14496-10. When this descriptor is not described in the PMT, the AVC stream should not contain AVC still images or AVC 24-hour pictures. For more information, see ITU-T Recommendation H.222.0 and ISO/IEC 13818-1.

Table 6-90 AVC video descriptor

Syntax	No. of bits	Representation of bit string
AVC_video_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
profile_idc	8	uimsbf
constraint_set0_flag	1	bslbf
constraint_set1_flag	1	bslbf
constraint_set2_flag	1	bslbf
AVC_compatible_flags	5	bslbf
level_idc	8	uimsbf
AVC_still_present	1	bslbf
AVC_24_hour_picture_flag	1	bslbf
reserved	6	bslbf
}		

Semantics for the AVC video descriptor:

`profile_idc`: Shows the profile of the AVC video stream. See Section 7.4.2.1 of ITU-T Recommendation H.264 and ISO/IEC 14496-10.

`constraint_set0_flag`: See Section 7.4.2.1 of ITU-T Recommendation H.264 and ISO/IEC 14496-10.

`constraint_set1_flag`: See Section 7.4.2.1 of ITU-T Recommendation H.264 and ISO/IEC 14496-10.

`constraint_set2_flag`: See Section 7.4.2.1 of ITU-T Recommendation H.264 and ISO/IEC 14496-10.

`AVC_compatible_flags`: The same value as `reserved_zero_5bits` in the sequence parameter set specified in ITU-T Recommendation H.264 and ISO/IEC 14496-10.

`level_idc`: Shows the level of the AVC video stream. See Section 7.4.2.1 of ITU-T Recommendation H.264 and ISO/IEC 14496-10.

`AVC_still_present`: When this field is "1", the AVC video stream contains AVC still images. When this field is "0", the AVC video stream should not contain AVC still images.

`AVC_24_hour_picture_flag`: When this field is "1", the AVC video stream contains 24-hour pictures, which are AVC access units having presentation times exceeding 24 hours. When this field is "0", the AVC video stream should not contain AVC 24-hour pictures.

6.2.48 AVC timing and HRD descriptor

The AVC timing and HRD descriptor (see table 6-91) is used to describe the video stream time information and the hypothetical reference decoder (HRD) information of ITU-T Recommendation H.264 and ISO/IEC 14496-10. When the AVC video stream does not transmit the video usability information (VUI) parameter, this descriptor must be described in the PMT. For more information, see ITU-T Recommendation H.222.0 and ISO/IEC 13818-1.

Table 6-91 AVC timing and HRD descriptor

Syntax	No. of bits	Representation of bit string
AVC_timing_and_HRD_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
hrd_management_valid_flag	1	bslbf
reserved	6	bslbf
picture_and_timing_info_present	1	bslbf
if(picture_and_timing_info_present == 1){		
90kHz_flag	1	bslbf
reserved	7	bslbf
if(90kHz_flag == 0){		
N	32	uimsbf
K	32	uimsbf
}		
num_units_in_tick	32	uimsbf
}		
fixed_frame_rate_flag	1	bslbf
temporal_poc_flag	1	bslbf
picture_to_display_conversion_flag	1	bslbf
reserved	5	bslbf
}		

Semantics for the AVC timing and HRD descriptor:

hrd_management_valid_flag: When this 1-bit field is "1", the buffering period SEI defined in Annex C of ITU-T Recommendation H.264 and ISO/IEC 14496-10 needs to be contained in the AVC video stream, and bytes shall be transferred from MB_n to EB_n according to the schedule of transfer to the coded picture buffer (CPB) in the network abstraction layer hypothetical reference decoder (NAL HRD). When this field is "0", the leak method defined in Section 2.14.3.1 of ITU-T Recommendation H.222.0 and ISO/IEC 13818-1 is used for transfer from MB_n to EB_n.

picture_and_timing_info_present: When this field is "1", the descriptor contains 90kHz_flag and parameters for precise mapping to the system clock.

90kHz_flag: When this field is "1", the AVC time base is 90 kHz. The AVC time base period is specified by AVC's time_scale defined in Annex E of ITU-T Recommendation H.264 and ISO/IEC 14496-10.

N, K: Parameters to describe the relationship between AVC's time_scale and system_clock_reference with the following equation (K is equal to or greater than N):

$$time_scale = \frac{(N \times system_clock_frequency)}{K}$$

num_units_in_tick: See Annex E of ITU-T Recommendation H.264|ISO/IEC 14496-10.

fixed_frame_rate_flag: See Annex E of ITU-T Recommendation H.264|ISO/IEC 14496-10. When this flag is "1", the coded frame rate is constant within the AVC video elementary stream. When this flag is "0", there is no information on the frame rate of the AVC video stream in the descriptor.

temporal_poc_flag: When this field is "1" and fixed_frame_rate_flag is "1", the AVC video stream must transmit the picture order count (POC) information. See Annex E of ITU-T Recommendation H.264|ISO/IEC 14496-10. When this field is "0", information on the relationship between the POC information of the AVC video stream and time is not transmitted.

picture_to_display_conversion_flag: When this field is "1", the AVC video stream transmits information on displaying coded pictures. When this field is "0", pic_struct_present_flag, which is a VUI parameter of the AVC video stream, must be set to "0".

6.2.49 Service group descriptor

The service group descriptor (see table 6-92) is used to indicate that multiple services are grouped together when they are related to each other.

Table 6-92 Service group descriptor

Syntax	No. of bits	Representation of bit string
service_group_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
service_group_type	4	uimsbf
reserved_future_use	4	uimsbf
if(service_group_type==1){		
for(i=0; i<N; i++){		
primary_service_id	16	uimsbf
secondary_service_id	16	uimsbf
}		
}		
else{		
for(i=0; i<N; i++){		
private_data_byte	8	uimsbf
}		
}		
}		

Semantics for service group descriptor:

service_group_type (service group type): This 4-bit field indicates, according to table 6-93, the type of service that constitute the group.

Table 6-93 Service group type

Service group type	Description
0x1	Server-type simultaneous service
0x0, 0x2 – 0xF	Undefined

primary_service_id (primary service identifier): This 16-bit field indicates the service identifier of the primary service for grouping.

secondary_service_id (secondary service identifier): This 16-bit field indicates the service identifier of the secondary service for grouping.

Annex A (Normative)

Coding of character

Characters and control codes used in SI are in accordance with the following, specified in the ARIB STD-B24 "Data Coding and Transmission Specification for Digital Broadcasting".

- "8-unit character code" specified in sub-clause 7.1, section 7, part 2 of Vol. 1

However, the details of the character set shall be specified in operational standard of the service providers.

Annex B (Normative)

CRC decoder model

32-bit CRC decoder is shown in figure B-1.

Figure B-1 32 bit CRC decoder model

The 32-bit CRC decoder is operated in bit level and is constituted of 14 adders (+) and 32 delay elements $z(i)$. Input of the CRC decoder is added to the output of $z(31)$, and the result is divided into the input of $z(0)$ and input of one side of the rest of each of the adders. Input of the other side of the rest of the adders are output of $z(i)$, and output of the rest of each adders is connected to the input of $z(i+1)$, with $i=0, 1, 3, 4, 6, 7, 9, 10, 11, 15, 21, 22, 25$. Refer to the figure above.

CRC is calculated by the following polynomial:

$$x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

Reception at the input of the CRC decoder is made in byte unit. Each byte is shifted to CRC decoder in 1 bit each, in the order of MSB. For example, where byte 0x01 (last byte of start code prefix), first 7 "0"s are input to the CRC decoder and then 1 "1" is input. Output of each delay element $z(i)$ is set to initial value "1", before data of 1 section is processed by CRC. After initialized, each byte of section including 4 CRC_32 byte is provided to input of the CRC decoder. After the last bit of the last CRC_32 byte is shifted to the decoder, which means that when added to output $z(31)$ and then input to $z(0)$, output of all delay element $z(i)$ is read out. When there is no error, output of each $z(i)$ is zero. In the CRC encoder, CRC_32 field is encoded in such value that it is assured.

Annex C (Informative)

Conversion of hours and dates

Conversion of Modified Julian Date (Japan time) and Japan standard time is as shown in figure C-1.

Figure C-1 Conversion of MJD (Japan time) and Japan standard time (JTC)

Relation of year-month-date and MJD (Japan time) is as shown below.

Used symbol:

MJD: Modified Julian Date (Japan time)

JTC: Japan Time Code

Y: Year from 1900 (For example, 2003 is Y=103)

M: Month (January = 1 to December = 12)

D: Date (1 to 31)

WY: Week number year since 1900

WN: Week number in accordance with ISO 2015

WD: Week day (Monday = 1 to Sunday = 7)

K, L, M', W, Y': Intermediate variables

x: Multiplication symbol

int: Integer part, ignoring remainder

mod 7: Remainder number after dividing integer by 7

ARIB STD - B10 Part2
Version 4.4-E1

- a) Method to find year, month and date (Y, M, D) from MJD

$$Y' = \text{int}[(\text{MJD} - 15078.2) / 365.25]$$

$$M' = \text{int}\{[\text{MJD} - 14956.1 - \text{int}(Y' \times 365.25)] / 30.6001\}$$

$$D = \text{MJD} - 14956 - \text{int}(Y' \times 365.25) - \text{int}(M' \times 30.6001)$$

$$\text{Where } M' = 14 \text{ or } M' = 15: K = 1$$

$$\text{In other cases, } K = 0$$

$$Y = Y' + K$$

$$M = M' - 1 - K \times 12$$

- b) Method to find MJD from year, month and date (Y, M, D)

$$\text{Where in case of } M = 1 \text{ or } M = 2: L = 1$$

$$\text{In other cases: } L = 0$$

$$\text{MJD} = 14956 + D + \text{int}[(Y - L) \times 365.25] + \text{int}[(M + 1 + L \times 12) \times 30.6001]$$

- c) Method to find week day (WD) from MJD

$$\text{WD} = [(\text{MJD} + 2) \bmod 7] + 1$$

- d) Method to find MJD from WY, WN and WD

$$\text{MJD} = 15012 + \text{WD} + 7 \times \{\text{WN} + \text{int}[(\text{WY} \times 1461 / 28) + 0.41]\}$$

- e) Method to find WY and WN from MJD

$$W = \text{int}[(\text{MJD} / 7) - 2144.64]$$

$$\text{WY} = \text{int}[(W \times 28 / 1461) - 0.0079]$$

$$\text{WN} = W - \text{int}[(\text{WY} \times 1461 / 28) + 0.41]$$

Example:	MJD = 45218	W = 4315
	Y = (19)82	WY = (19)82
	M = 9 (Sept.)	WN = 36
	D = 6	WD = 1 (Monday)

[Note]: These formulas are effective from March 1, 1900 to February 28, 2100.

Annex D (Informative)

Specification of emergency alarm signal

Emergency alarm signal is specified in No.5 of clause 9-3 of Radio Equipment Regulation, article 138 of Radio Station Operation Rule, and Notation No. 405 of the Ministry of Posts and Telecommunications, 1985.

Signal type and local code specified in these rules are shown as follows.

Table D-1 Signal type

Signal type	Description	Classification of usage
0	1st type start signal	<ul style="list-style-type: none"> • When broadcasting that alarm declaration is issued by the specification of article 9, clause 1 of "Large scale earthquake countermeasure exceptional action law" (Law No. 73 in 1978). • When broadcasting in accordance with the specification of article 57 of "Disaster countermeasure basic law" (Law No. 223 in 1961) (including when applying article 20 of "Large scale earthquake countermeasure exceptional action law".)
1	2nd type start signal	<ul style="list-style-type: none"> • When broadcasting that tidal wave alarm has been issued by the specification of article 13 clause 1 of "Weather business law" (Law No. 165 in 1952.)

Table D-2 Local code

Local code	Description		Local code	Description	
0011 0100 1101	Local common code		1101 0100 1010	Prefecture code	Yamanashi

Annex F (Informative)

Example of service provider define bit of digital copy control descriptor

Example of service provider define bit of digital copy control descriptor is shown in table F-1.

Table F-1 Digital copy control descriptor

Syntax	No. of bits	Identifier
digital_copy_control_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
digital_recording_control_data	2	bslbf
maximum_bitrate_flag	1	bslbf
component_control_flag	1	bslbf
copy_control_type	2	bslbf
if(copy_control_type == 01){		
APS_control_data	2	bslbf
}		
else{		
reserved_future_use	2	bslbf
}		
if(maximum_bitrate_flag == 1){		
maximum_bitrate	8	uimsbf
}		
if(component_control_flag == 1){		
component_control_length	8	uimsbf
for(j=0;j<N;j++){		
component_tag	8	uimsbf
digital_recording_control_data	2	bslbf
maximum_bitrate_flag	1	bslbf
reserved_future_use	1	bslbf
copy_control_type	2	bslbf
if(copy_control_type == 01){		
APS_control_data	2	bslbf
}		
else{		
reserved_future_use	2	bslbf
}		
if(maximum_bitrate_flag == 1){		
maximum_bitrate	8	uimsbf
}		
}		
}		
}		

Semantics for the digital copy control descriptor:

copy_control_type: This 2-bit field indicates type information to control copy generation and encoded in accordance with table F-2.

Table F-2 Copy control type information

Copy control type information	Description
00	Undefined
01	Output by encoding to serial interface *1
10	Undefined
11	Output by not encoding to serial interface

*1 : Encoding method specified by service provider is used.

digital_recording_control_data: This 2-bit field indicates information to control copy generation and encoded in accordance with table F-3.

Table F-3 Digital recording control data

Digital recording control data	Description	
	When copy_control_type is 11	When copy_control_type is 01
00	Can be copied without control condition	Can be copied without control condition
01	Not used	Copy forbidden
10	Can be copied only once	Can be copied only once
11	Copy forbidden	Copy forbidden

APS_control_data: This 2-bit field indicates data to control analog output copy when the copy_control_type is 01 and encoded in accordance with table F-4.

Table F-4 Analog output copy control data

Analog output copy control data	Description
00	Can be copied without control condition
01	With pseudo-sync pulse
10	Pseudo-sync pulse + 2-line reversed division burst insertion
11	Pseudo-sync pulse + 4-line reversed division burst insertion

Annex G (Normative)

Region designator for prefecture designation for target region descriptor

When the area description method designation (`region_spec_type`) in target region descriptor is 0x01, that is when it is prefecture designation for BS digital, syntax of the `bs_prefecture_spec()`, which is the content of region designator `target_region_spec()`, is as shown below.

Table G-1 Region designator in prefecture designation

Syntax	No. of bits	Identifier
<code>bs_prefecture_spec(){ prefecture_bitmap }</code>	56	bslbf

Semantics for the region designator in prefecture designation:

`prefecture_bitmap`: This 56-bit field is a bit map specified in table G-2. Bit designated with value 1 indicates that the region is the target and bit designated with value 0 indicates that the region is out of the target.

EXAMPLE: When the target area is Tokyo (excluding islands) value 1 is designated in the 14th bit from left.

"0000 0000 0000 0100 0000 0000 0000 0000 0000 0000 0000 0000 0000 0000"

Table G-2 Prefecture designation bit map

Order of bit	Description	Order of bit	Description	Order of bit	Description
1 st	East Hokkaido	20 th	Yamanashi	40 th	Kochi
2 nd	West Hokkaido	21 st	Nagano	41 st	Fukuoka

18 th	Ishikawa	38 th	Kagawa	55 th	Reserved
19 th	Fukui	39 th	Ehime	56 th	Reserved

Annex H (Normative)

Genre designation in content descriptor

The event genre of the content descriptor is designated in the following classification.

For events hard to classify genre should select "others".

For the future genre addition area, content_nibble_level1 = "0xC" to "0xD" is reserved.

"0xE" is an extension area and is defined as designation classification enabling to make reference to user_nibble.

[Large genre classification]

Large genre classification	Described content
0x0	News, report
0x1	Sports
0x2	Information/tabloid show
0x3	Drama
0x4	Music
0x5	Variety show
0x6	Movies
0x7	Animation/special effect movies
0x8	Documentary/culture
0x9	Theatre/public performance
0xA	Hobby/education
0xB	Welfare
0xC – 0xD	Reserved
0xE	For extension
0xF	Others

Large classification and medium classification list are shown as follows.

ARIB STD - B10 Part2
Version 4.4-E1

Content_nibble_level_1 Large genre classification	Content_nibble_level_2 Middle genre classification	Description
0x0	*	News/reports
0x0	0x0	Regular, general
0x0	0x1	Weather report
0x0	0x2	Special program, documentary
0x0	0x3	Politics, national assembly

Annex J (Informative)

Additional specification related to data component

In the data component descriptor and data content descriptor, there are fields to denote necessary information for the extension of id_number, storing supplement information and gaining data. Syntax of these fields is specified in each data component. Denoted places of the data component system and syntax are shown in table J-1.

Table J-1 Denoted places of data component system and syntax

Data component (data_component_id)	Operational guideline	Places of syntax (reference) ^{*1}		
		Standard	additional_data_ component_info of data component descriptor	sector_byte of data content descriptor
ARIB-XML-base multimedia coding (0x0007)	TR-B15	STD-B24 Ver. 4.0	Sub-clause 9.3.2, Vol. 2; Appended specification C.1, Vol. 3	Sub-clause 9.3.3, Vol. 2; Appended specifica- tion C.2, Vol. 3

Accumulation-type data service (Mobile profile) (0x0011)				
Subtitle coding for digital terrestrial broadcasting (C profile) (0x0012)	TR-B14	STD-B24 Ver. 4.0	Sub-clause 9.6.1, Part 3, Vol. 1	Relevant descriptor not used
Multimedia coding for digital terrestrial broadcasting (P2 profile) (0x0013)				
Data carousel scheme for TYPE2 content transmission (0x0014)	TR-B27 (TBD)	STD-B27 Ver. 1.0 (TBD)	Relevant information not used	Sub-clause 11.3.2.4, Vol. 4
DSM-CC section scheme for transmission of program start time information (0x0015)			Relevant information not used	Relevant descriptor not used
ARIB-Program index coding (data_component_id is not defined)		STD-B10 Ver. 3.9	Sub-clause 6.4.1, Part 3	Sub-clause 6.4.2, Part 3
ARIB-Descriptive language type meta data coding (0x0016)	TR-B27 (TBD)	STD-B38 Ver. 1.1	Sub-clause 3.5.1.1, Chapter 3	Sub-clause 3.5.1.1, Chapter 3
ARIB-Application execution engine (data_component_id is not defined)		STD-B23 Ver. 1.1	Sub-section 10.6.(1), Part 2	Sub-section 10.6.(2), Part 2
ARIB-Application information table (data_component_id is not defined)			Sub-section 10.6.(3), Part 2	This descriptor is not used

*1: Denoted places may be subject to change due to revision of the specifications.

Annex K (Normative)

Subdescriptors used in the carousel compatible composite descriptor

The descriptors in the module information area and the private area defined in the data carousel transmission scheme (Chapter 6 of ARIB STD-B24 Part 3) are used in the subdescriptor area of the carousel compatible composite descriptor. The tag values of the subdescriptors are listed in table K-1.

This Annex specifies the functions of those subdescriptors with a circle marked in the "Definition" column of table K-1, regarding their use for service information.

Table K-1 Subdescriptors used in the carousel compatible composite descriptor

Tag value	Subdescriptor	Function	Definition
0x01	Type descriptor	Type of contents (such as MIME)	○
0x02	Name descriptor	File name of accumulated contents	○
0x03	Info descriptor	(Undefined)	
0x04	Module link descriptor	(Undefined)	
0x05	CRC32 descriptor	(Undefined)	
0x06	Reserved for future use		
0x07	Download estimate time descriptor	(Undefined)	
0x08 – 0x70	Reserved for future use		
0x71	Cache priority descriptor	(Undefined)	
0x72 – 0x7F	Reserved for future use		
0x80 – 0xBF	Selectable for provider-defined descriptor		
0xC0	Expire descriptor	Time of expiration of accumulated contents	○
0xC1	Activation Time descriptor	(Undefined)	
0xC2	Compression Type descriptor	(Undefined)	
0xC3	Control descriptor	(Undefined)	
0xC4	Provider Private descriptor	Specific auxiliary information is described by network and broadcasting service providers.	○
0xC5	Store Root descriptor	The directory where contents are accumulated in the accumulation device is specified.	○
0xC6	Sub Directory descriptor	The subdirectory where contents are accumulated within the directory specified by StoreRoot is specified.	○
0xC7	Title descriptor	The name of accumulated contents, with the aim of showing it to viewers, is described.	○

0xC8	Data Encoding descriptor	(Undefined)	
0xC9	TS descriptor with time stamp	(Undefined)	
0xCA	Route certificate descriptor	(Undefined)	
0xCB	Encrypt descriptor	(Undefined)	
0xCC	ACG descriptor	(Undefined)	
0xCD – 0xEE	Reserved for future use		
0xEF	Reserved for Transport Location descriptor		
0xF0 – 0xFE	Reserved for descriptor tags inserted in the private area in each coding scheme		

K.1 Type descriptor

The Type descriptor (see table K-2) indicates the type of object addressed by the carousel compatible composite descriptor containing this descriptor.

Table K-2 Type descriptor

Syntax	Number of bits	Representation of bit string
<pre> type_descriptor(){ descriptor_tag descriptor_length for(i=0; i<N; i++){ text_char } } </pre>	8	uimsbf
	8	uimsbf
	8	uimsbf

Semantics for the Type descriptor:

text_char: This is an 8-bit field. A series of areas indicates the type of media complying with RFC1521 and RFC1590. The the method of specifying media type used in XML-based multimedia coding is defined by Specification C of STD-B24 Part 2. Regardless of the specifications in Annex A, the character coding of this descriptor follows the specifications in Chapter 6 of ARIB STD-B24 Part 3.

K.2 Name descriptor

The Name descriptor (see table K-3) indicates the file name for accumulating the object addressed by the carousel compatible composite descriptor containing this descriptor.

Table K-3 Name descriptor

Syntax	Number of bits	Representation of bit string
name_descriptor(){ descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
for(i=0; i<N; i++){ text_char	8	uimsbf
}		
}		

Semantics for the Name descriptor:

text_char: this is an 8-bit field. A series of areas indicates the file name for accumulating the applicable object. Regardless of the specifications in Annex A, the character coding of this descriptor follows the specifications in Chapter 6 of ARIB STD-B24 Part 3.

K.3 Expire descriptor

The Expire descriptor (see table K-4) indicates the time of expiration of the object addressed by the carousel compatible composite descriptor containing this descriptor. For example, an objected accumulated in a receiver having an accumulation device will be erased at the time of expiration. The time of expiration is not set if this descriptor is not used.

Table K-4 Expire descriptor

Syntax	Number of bits	Representation of bit string
expire_descriptor(){ descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
time_mode	8	uimsbf
If(time_mode == 0x01){ MJD_JST_time	40	bslbf
}		
else if(time_mode == 0x04){ reserved_future_use	8	bslbf
passed_seconds	32	uimsbf
}		
}		

Semantics for the Expire descriptor:

time_mode (time mode): Indicates the method of specifying the time of expiration (see table K-5).

Table K-5 Time mode

time_mode	Time specifying method	meaning
0x00	—	Reserved for future use
0x01	MJD_JST_time	Absolute time based on the Modified Julian Date and Japan Standard Time
0x02	—	Reserved for future use
0x03	—	Reserved for future use
0x04	passed_seconds	Elapsed time after downloading (sec)
0x05 – 0xFF	—	Reserved for future use

MJD_JST_time: This 40-bit field, which is coded when time_mode = "0x01", indicates the time of expiration based on the Modified Julian Date (MJD) and Japan Standard Time (JST) (see Annex C). This field is coded as 16 bits corresponding to the 16 least significant bits of MJD followed by 24 bits coded as 6 digits in 4-bit binary coded decimal (BCD).

passed_seconds: This 32-bit field, which is coded when time_mode = "0x04", indicates the time of expiration based on the elapsed time (in sec) after accumulation.

K.4 ProviderPrivate descriptor

The ProviderPrivate descriptor (see table K-6) describes specific auxiliary information on the object addressed by the carousel compatible composite descriptor containing this descriptor, according to the rules defined by the scope of each network or broadcasting service provider.

Table K-6 ProviderPrivate descriptor

Syntax	Number of bits	Representation of bit string
<pre> provider_private_descriptor(){ descriptor_tag descriptor_length private_scope_type scope_identifier for(i = 0; i < N; i++){ private_byte } } </pre>	<p>8</p> <p>8</p> <p>8</p> <p>32</p> <p>8</p>	<p>uimbsf</p> <p>uimbsf</p> <p>bslbf</p> <p>bslbf</p> <p>bslbf</p>

Semantics for the ProviderPrivate descriptor:

private_scope_type: This 8-bit field indicates the type of identifier that shows the scope of this de-

scriptor.

scope_identifier: This 32-bit field is used to indicate the scope identifier value of each scope type (see table K-7).

Table K-7 Private scope types and scope identifiers

private_scope_type	scope_identifier	Number of bits	Representation of bit string	Description
0x00	-	-	-	Reserved for future use
0x01	network_id	16	uimsbf	Network identifier is used as the scope of this descriptor.
	Padding	16	bslbf	
0x02	network_id	16	uimsbf	Service identifier is used as the scope of this descriptor.
	service_id	16	uimsbf	
0x03	network_id	16	uimsbf	Broadcaster identifier is used as the scope of this descriptor.
	broadcaster_id	8	uimsbf	
	Padding	8	bslbf	
0x04	bouquet_id	16	uimsbf	Bouquet identifier is used as the scope of this descriptor.
	Padding	16	bslbf	
0x05	information_provider_id	16	uimsbf	Information provider identifier is used as the scope of this descriptor.
	Padding	16	bslbf	
0x06	CA_system_id	16	uimsbf	CA system identifier is used as the scope of this descriptor.
	Padding	16	bslbf	
0x07 – 0xFF	-	-	-	Reserved for future use

Note: "1" is set to all bits in "padding".

private_byte: This is an 8-bit field. A series of areas describes auxiliary information based on the rules defined by each scope.

K.5 StoreRoot descriptor

The StoreRoot descriptor (table K-8) indicates the reference directory where the object addressed by the carousel compatible composite descriptor containing this descriptor is accumulated. It also indicates whether to renew or add to the existing object in the same directory when accumulating.

Table K-8 StoreRoot descriptor

Syntax	Number of bits	Representation of bit string
store_root_descriptor(){ descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
update_type	1	bslbf
reserved	7	bslbf
for(i = 0;i< N;i++){ store_root_path	8	uimsbf
}		
}		

Semantics for the StoreRoot descriptor:

update_type: This 1-bit field indicates whether to erase the content of the directory specified by store_root_path before accumulating the applicable object. Accumulation starts after erasing the existing content when update_type is "1", and without erasing when update_type is "0".

store_root_path: This is an 8-bit field. A series of areas indicates the reference directory where the applicable object is accumulated in the accumulation device, using the character coding defined in Chapter 9 of STD-B24 Part 2.

K.6 Subdirectory descriptor

The Subdirectory descriptor (see table K-9) indicates the subdirectory, within the reference directory specified by StoreRoot in the accumulation device, to accumulate the object addressed by the carousel compatible composite descriptor containing this descriptor. When the Subdirectory descriptor is not used, the reference directory specified by the StoreRoot descriptor is effective.

Table K-9 Subdirectory descriptor

Syntax	Number of bits	Representation of bit string
subdirectory_descriptor(){ descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
for(i = 0;i< N;i++){ subdirectory_path	8	uimsbf
}		
}		

Semantics for the Subdirectory descriptor:

subdirectory_path: This is an 8-bit field. A series of areas indicates the subdirectory where the applicable object is accumulated within the directory specified by the StoreRoot descriptor, using the character coding defined in Chapter 9 of ARIB STD-B24 Part 2.

K.7 Title descriptor

The Title descriptor (see table K-10) indicates the name to be recognized by viewers as a character string when the object addressed by the carousel compatible composite descriptor containing this descriptor is accumulated.

Table K-10 Title descriptor

Syntax	Number of bits	Representation of bit string
title_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
ISO_639_language_code	24	bslbf
for(i=0; i<N; i++){		
text_char	8	uimsbf
}		
}		

Semantics for the Title descriptor:

ISO_639_language_code: This 24-bit field denotes the language used in the subsequent text_char area. The language coding follows the alphabetic 3-character coding defined in ISO 639-2. Each character is coded into 8 bits according to ISO 8859-1 and inserted in the order into the 24-bit field.

text_char: This is an 8-bit field. A series of areas indicates the name presented to viewers for the applicable object. Regardless of the specifications in Annex A, the character coding of this descriptor follows the specifications in Chapter 6 of ARIB STD-B24 Part 3.

Annex L (Normative)

Composite descriptor for tag value extension

When the number of usable descriptors needs to be increased, the method of using composite descriptors shown in this Annex shall be used to code the descriptors. A subdescriptor shall be placed in each composite descriptor.

Figure L-1 Data construction of composite descriptor for tag value extension

Table L-1 Composite descriptor for tag value extension

Syntax	Number of bits	Representation of bit string
composite_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
sub_descriptor()		
}		

Table L-2 Subdescriptor

Syntax	Number of bits	Representation of bit string
sub_descriptor(){		
sub_descriptor_tag	8	uimsbf
sub_descriptor_length	8	uimsbf
for(i=0; i<N; i++){		
data_byte;	8	uimsbf
}		
}		

Annex M (:informative)

Allocation of conditional access system identifiers

The conditional access system identifier (CA_system_id) shall be specified, registered, and released by the standardization organization. The allocated conditional access system identifiers are listed in table M-1.

Table M-1 Allocation of conditional access system identifiers

Name of conditional access system	CA_system_id	Operational guideline (reference)
SKY Perfect Communications conditional access system	0x0001	Proprietary specification of SKY Perfect Communications
Hitachi system	0x0003	JCL SPEC-005 ^{*1}
Secure Navi system	0x0004	JCL SPEC-005 ^{*1}
ARIB conditional access system	0x0005	ARIB TR-B14, B15
Matsushita CATV conditional access system	0x0006	JCL SPEC-005 ^{*1}
Cable Labs access control system	0x0007	JCL SPEC-001-01 ^{*1} JCL SPEC-002 ^{*1} JCL SPEC-007 ^{*1}
u-CAS system	0x0008	
PowerKEY system	0x0009	
ARIB conditional access system B	0x000A	ARIB TR-B26

*1 Operational specification of JCTA Japan Cable Laboratories

Annex N (:informative)

Allocation of network identifiers

The network identifier (network_id) shall be specified, registered, and released by the standardization organization. The allocated network identifiers are listed in table N-1.

Table N-1 Allocation of network identifiers

Name of conditional access system	network_id	Operational guideline (reference)
PerfecTV! service	0x0001	Proprietary specification of SKY Perfect Communications
SKY service	0x0003	Proprietary specification of SKY Perfect Communications
BS digital broadcasting	0x0004	ARIB TR-B15 Part 1
e2 CS1	0x0006	ARIB TR-B15 Part 2
e2 CS2	0x0007	ARIB TR-B15 Part 2
Mobile broadcasting	0x0010	ARIB TR-B26
Terrestrial digital television broadcasting	0x7880 – 0x7FE8 ^{*2}	ARIB TR-B14
Tokyo Seg#1 – Seg#8 (Terrestrial digital sound broadcasting)	0x8090 – 0x8097	ARIB TR-B13
Osaka Seg#1 – Seg#8 (Terrestrial digital sound broadcasting)	0x8098 – 0x809F	ARIB TR-B13
Independent broadcasting by cable television operators in the terrestrial digital broadcasting network	0x7C1F – 0x7F5F ^{*3}	JCL SPEC-006 ^{*1} JCL SPEC-007 ^{*1}
Analogue to digital system conversion	0xFFFC	JCL SPEC-008 ^{*1}
JC-HITS Trans-Modulation	0xFFFD	JCL SPEC-005 ^{*1}
Digital broadcasting ReMUX	0xFFFE	JCL SPEC-003 ^{*1} JCL SPEC-004 ^{*1}
Kagoshima Cable Television	0xFFFF	Proprietary specification of Kagoshima Cable Television

Explanation

1. How to standardize SI

In the July 24th, 1995 partial report to the government; the necessity for standardized SI concerning the broadcast service, the multiplexing and arrangement of individual program etc. in order to facilitate program selection by viewers was reported. On the condition that a) the signal transmission format be MPEG section data and format and b) the SI presentation be only in text form; a non-governmental organization was to realize this, ensuring flexible reaction to future innovations, In response to this, the transmission-path-coding committee in the new-broadcast-system special group in the Association of Radio Industries and Businesses has established SI as a non-governmental standard according to the following basic.

(1) Early realization and international compatibility

DVB-SI* is a SI standard which has been presented at various international committees and is being standardized by Europe. The DVB-SI standard was selected as the basic method because a) the DVB* method basically adheres to condition reported above, b) has adequate SI functions although some changes are necessary to adapt to broadcasting conditions in Japan, c) makes early introduction of digital broadcasting possible, 4) makes widespread use of receiving circuits through international compatibility possible.

(2) Media independence

SI should be media independent as far as possible. Target of DVB-SI is independence for total broadcasting media. The ARIB standardization scope includes CS digital broadcasting transmission media but parts of the transmission media such as cable TV, etc. have not been considered. Those will be specified additionally by the related organization when it becomes necessary.

(3) Convenience for users

Digital broadcasting signals were standardized to be capable of providing greatly improved convenience for users, compared to conventional broadcast. In particular, signals providing minimum function necessary for broadcasting were classified as "mandatory" and signals providing functions "as needed" by broadcasting service providers were classified as "optional".

(4) Signal extensibility

Taking into consideration future developments in technology, and also to ensure flexible development of the broadcasting industry, service providers are allowed to independently define original signals in addition to the standardized signals as long as they are within the ISO/IEC13818-1 scope. These independent service provider defined signals should be registered and released to the public in order to ensure transparency of broadcasting signal and make "common" receivers possible.

Also accordingly, part of mandatory signal, can be substituted by service provider defined signals, if these signals contain functions already defined in the mandatory signals.

SI informs the viewer about multiplexed program information; simplifies program selection and complements PSI (Program Specific Information) in MPEG-2 Systems. In order to establish the standard; it was necessary to map descriptors describing information service details to individual tables, including tables defined in PSI, so PSI tables newly defined for SI is also described.

2. Extension of SI and allocation of descriptor

With the development of digital broadcasting and the development and practical use of new services, addition and updating of this standard will be made. Since SI is regarded as independent throughout the broadcasting media and the identifiers of the service are allocated fixedly, there should be careful discussion considering international trends of identifier allocation when revising the standard.

In the case of independent service provider defined signals, it is assumed that tables and descriptors will be added in accordance with service development. In this case also, the signals should be registered and released to the public.

In principle, identifier values for service provider defined signals should be unique throughout a network, and it is the responsibility of the network manager to supervise.

This principle can be implemented by a receiver with a software switching function which switches identifiers for each network. However, unconditional switching may cause problems, making net-

work-to-network common use of service provider signals difficult. Study should be carried out regarding which method to select by viewing further industrial trends.

3. Extension of SI

With the development of digital broadcasting and accumulation of viewing experience with the new service, there might arise some need to update the standard to provide more efficient, user-friendly SI. In this case, extension of the specification should be made such as addition of tables or descriptors, or addition of transmission tables of a descriptor when necessary, after deliberation by the committee. In the case of these extensions, compatibility with former specifications should be considered and the IRD should be designed so that former functions are not obstructed by the extension signal.

4. Publication and registration of service provider defined signal

Broadcast program organization differs from service provider to service provider. In order to secure individual and flexible program organization, basic signals and universal information are standardized in ARIB and transmitted SI which reflect program organization of a particular service provider are approved as extensions of the ARIB standard.

Tables and descriptors defined by service providers are regarded as basic signals for broadcasting and should comply with the publication rules of a public broadcasting system. Identifier values allocated to service provider defined signals are related closely to software design of receivers and as described in the previous clause might possibly be extended beyond the scope of a single network, so they and their data structure should be publicized.

Registration procedures to register broadcasting systems particular to certain service providers will be established elsewhere. Registration and publication of service provider defined SI, data structure, identifier values etc. by this same registration system will be required.

Meaning of "publication" used herein does not include unconditional release/publication of intellectual proprietary rights of the method owned by the registrant.

5. Operational standard of the identifier

Unified management for the allocation of identifier and identifier values is necessary in order to avoid confusion such as overlapping of values, etc., Part 1, table 7-1 are management guidelines.

For allocation of the identifier related to signal specified in non-governmental standard, it is necessary to be in accordance with this table. For the unified management of the identifier, it is recommended to unify also in the non-governmental standardization organization. When multiple organizations are related, overlapping of the value should be avoided by adjusting the range of the used identifier value, etc.

"Standardization organization" denoted in Part 1 table 7-1 is a general expression and does not indicate any specific group.

DVB: Abbreviation of Digital Video Broadcasting. It means a non-governmental group studying digital broadcasting methods in Europe, or its digital broadcasting system. Examination of SI "DVB-SI (DVB-SI)" and broadcasting of satellite, cable, and digital terrestrial broadcasting are made. Examined results are standardized in "ETSI", the standardization organization in Europe.

1. Purpose

Part 3 of this standard is established to specify detail syntax of extension information of SI, basing on the SI defined in Ministerial Ordinance No. 102 of the Ministry of Posts and Telecommunications "Standard transmission system of digital broadcast of standard TV broadcasting, etc." in 1999.

2. Scope

Part 3 of this standard applies to extension information of SI specified in Part 1.

3. Definitions and abbreviations

3.1 Definitions

This standard applies the following definitions in addition to the definitions set forth in Part 2.

Local event (program segment event): Part of the event (program) subdivided by time line or program component, etc.

Node: Node of graph defined to describe relation of the event (program) and/or the local event (program segment event), which is encoded as extension information of SI. Node itself has no meaning, but a meaning is given from the relation with other node or node description.

Information provider: Organization who provides information encoded in extension information of SI to audience.

3.2 Abbreviations

This standard applies the following abbreviations in addition to abbreviations set forth in Part 2.

LIT	Local event Information Table
ERT	Event Relation Table
ITT	Index Transmission information Table
STC	System Time Clock
NPT	Normal Play Time
PTS	Presentation Time Stamp

4. Explanation of extension information of SI

4.1 Organization of extension information of SI

In addition to the basic information of SI defined in Part 2, data for describing the relation among programs, information of contents smaller than program and relation among them are expected.

The EIT in basic information of SI (Part 2) describes information individually in the unit of the event (program). Extension information of SI defined in Part 3 of this standard can describe the relation among events and information of the local event and relation among local events, which are smaller parts of the events.

Information to describe the relation among multiple events and/or local events is called a program group index, and information to describe information of local event in one program or the relation among local events is called a program segment index. The program group index and program segment index are called a program index as a whole.

Extension information of SI consists of the following three tables in addition to the EIT and ST defined in basic information of SI.

Local event Information Table (LIT):

The LIT includes information related to the local event (program segment event) such as name, start time and duration of a local event

Event Relation Table (ERT):

The ERT includes information related to node indicating attribute or group of event (program) and/or the local event (program segment event), and information of relation of those nodes.

It indicates relation of the events by using with the EIT and indicates relation of the local events by using with the LIT. By using with both EIT and LIT, it can indicate relation of both events and local events.

Program Index Transmission information Table (ITT):

The ITT includes auxiliary information related to program transmission, such as the relation between the STC and the time information for identifying local event (program segment event). These information are given an exclusive table dividing with the LIT, because there may be information, that is fixed at the moment of program transmission or values differing in each time

of program transmission.

Flexible table structure and compatible extension for the future are possible by using descriptors.

Figure 4-1 Organization of extension information of SI

4.2 Program group index

Program group index provides grouping information of the program (event) and assists in selecting or searching a program by this grouping information. The program group index enables grouping of

programs in various viewpoints such as series program group like a series TV drama, program group with same contents such as broadcasting and rebroadcasting, and group of recommended programs, etc.

Program group index is provided by the EIT defined in basic information of SI (Part 2) and the ERT defined in extension information of SI (Part 3). The EIT defines events (programs) and describes grouping information of events in character or code of the program group defined in the ERT. The ERT defines the program group and describes its attributes in text. The ERT can also express the relation among program groups.

In the program group index, not only events (programs) but also local events (program segment events) can be objects of the grouping. In this case, the LIT is used to define the local events.

Figure 4-2 Outline of program group index

4.3 Program segment index

Program segment index provides information to assist in selecting or searching local events (program segment events). Furthermore, grouping information of local events is provided and selecting

or searching local events is assisted by this grouping information.

The program segment index is provided by the LIT and the ERT defined in extension information of SI (Part 3). The LIT defines the local event and also describes grouping information defined in the ERT by code. The ERT defines grouping information of local events and describes the grouping information in text. The ERT can also express the relation among groups.

Figure 4-3 Outline of program internal index

5. Program index encoding method

5.1 Table used for program index encoding

The following tables are defined as extension information of SI in Part 3 of this standard for encoding program index.

- (1) Local event information table (LIT)
- (2) Event relation table (ERT)
- (3) Index transmission information table (ITT)

The following tables defined as basic information of SI (Part 2) are also used.

- (4) Event information table (EIT)
- (5) Stuffing table (ST)

Syntax and semantics of each table (1), (2), (3) are described in the following clauses.

[Note]: Symbols, abbreviations and description method of the syntax used in this standard is in accordance with clauses 2.2 and 2.3 in ISO/IEC 13818-1.

5.1.1 Local event Information Table (LIT)

The LIT is information related to the local event (program segment event) included in each event (program). Each sub_table includes all description related to the local event of one program and composed of local event information section, for which the values of table_id, event_id service_id, transport_id, original_network_id, and version_number coincide.

Syntax of the local event information section is shown in table 5-1.

Table 5-1 Local event information sections

Syntax	No. of bits	Identifier
local_event_information_section(){		
table_id	8	uimsbf
section_syntax_indicator	1	bslbf
reserved_future_use	1	bslbf
reserved	2	bslbf
section_length	12	uimsbf
event_id	16	uimsbf
reserved	2	bslbf
version_number	5	uimsbf
current_next_indicator	1	bslbf
section_number	8	uimsbf
last_section_number	8	uimsbf
service_id	16	uimsbf
transport_stream_id	16	uimsbf
original_network_id	16	uimsbf
for(i=0;i<N;i++){		
local_event_id	16	uimsbf
reserved_future_use	4	bslbf
descriptors_loop_length	12	uimsbf
for(j=0;j<M;j++){		
descriptor()		
}		
}		
CRC_32	32	rpchof
}		

Semantics for the local event information section:

table_id: This field indicates the local event information section and shall be set to 0xD0. See tables 6-1 and 6-2.

section_syntax_indicator: Section syntax indicator is a 1-bit field which shall be set to "1".

section_length: This is a 12-bit field. It specifies the number of bytes of the section, starting immediately following the section_length field and including the CRC. The section_length shall not exceed 4093 so that the entire section has a maximum length of 4096 bytes.

event_id: This 16-bit field indicates the event_id (uniquely assigned in a service) of the event, that the local event information section describes.

version_number: This 5-bit field is the version number of the sub_table. The version_number shall be incremented by 1 when a change in the information carried within the sub_table occurs. When it reaches value 31, it wraps around to 0. When the current_next_indicator is set to "1", then the version_number shall be that of the currently applicable sub_table defined by the table_id and event_id. When the current_next_indicator is set to "0", then the version_number shall be that of the next applicable sub_table defined by the table_id and event_id.

current_next_indicator: This 1-bit indicator, when set to "1" indicates that the sub_table is the currently applicable sub_table. When the bit is set to "0", it indicates that the sub_table sent is not yet applicable and shall be the next sub_table to be valid.

section_number: This 8-bit field gives the number of the section. The section_number of the first section in the sub_table shall be "0x00". The section_number shall be incremented by 1 with each additional section with the same table_id, event_id, service_id, transport_stream_id and original_network_id.

last_section_number: This 8-bit field specifies the number of the last section of the sub_table to which this section belongs.

service_id: This 16-bit field indicates the service_id number (uniquely assigned in a network) of the service to which the event described by the local event information section belongs. The service_id is the same as the program_number in the corresponding program map section.

transport_stream_id: This 16-bit field indicates the transport_stream_id (uniquely assigned in a network) of the transport stream where to which the event described by the local event information section belongs.

original_network_id: This 16-bit field indicates the originating_network_id of the original_network to which the event described by the local event information section belongs.

local_event_id: This 16-bit field serves as a label to identify the local_event (program segment event).

descriptors_loop_length: This 12-bit field gives the total length in byte of the following descriptors.

CRC_32: This 32-bit field contains the CRC value for the entire section.

5.1.2 Event Relation Table (ERT)

The ERT describes the relation among the events (programs) and/or local events (program segment events). The event relation table consists of sub_tables. The sub_table specifies the relation among the events and/or local events for a particular use, and it is constructed by the event relation section in which values of table_id, event_relation_id, information_provider_id and version_number coincide.

Event relation section is indicated in table 5-2.

Table 5-2 Event relation section

Syntax	No. of bits	Identifier
event_relation_section(){		
table_id	8	uimsbf
section_syntax_indicator	1	bslbf
reserved_future_use	1	bslbf
reserved	2	bslbf
section_length	12	uimsbf
event_relation_id	16	uimsbf
reserved	2	bslbf
version_number	5	uimsbf
current_next_indicator	1	bslbf
section_number	8	uimsbf
last_section_number	8	uimsbf
information_provider_id	16	uimsbf
relation_type	4	uimsbf
reserved_future_use	4	bslbf
for(i=0;i<N;i++){		
node_id	16	uimsbf
collection_mode	4	uimsbf
reserved_future_use	4	bslbf
parent_node_id	16	uimsbf
reference_number	8	uimsbf
reserved_future_use	4	bslbf
descriptors_loop_length	12	uimsbf
for(j=0;j<M;j++){		
descriptor()		
}		
}		
CRC_32	32	rpchof
}		

Semantics for the event relation section:

table_id: Table field indicates the event relation section and shall be set to 0xD1. See tables 6-1 and 6-2.

section_syntax_indicator: Section syntax indicator is a 1-bit field which shall be set to "1".

section_length: This is a 12-bit field. It specifies the number of bytes of the section, starting immediately following the section_length field and including the CRC. The section_length shall not exceed 4093 so that the entire section has a maximum length of 4096 bytes

event_relation_id: This is a 16-bit field and serves as a label to identify the event relation.

version_number: This 5-bit field is the version number of the sub_table. The version_number shall be incremented by 1 when a change in the information carried within the sub_table occurs. When it reaches value 31, it wraps around to 0. When the current_next_indicator is set to "1", then the version_number shall be that of the currently applicable sub_table defined in table_id and event_relation_id. When the current_next_indicator is set to "0", then the version_number shall be that of the next applicable sub_table defined in table_id and event_relation_id.

current_next_indicator: This 1-bit indicator, when set to "1", indicates that the sub_table is the currently applicable sub_table. When the bit is set to "0", it indicates that the sub_table sent is not yet applicable and shall be the next sub_table to be valid.

section_number: This 8-bit field gives the number of the section. The section_number of the first section in the sub_table shall be "0x00". The section_number shall be incremented by 1 with each additional section with the same table_id, event_relation_id and information_provider_id.

last_section_number: This 8-bit field specifies the number of the last section of the sub_table to which this section belongs.

information_provider_id: This 16-bit field identifies the information provider who specifies the event relation.

relation_type: This 4-bit field indicates the type of the relation described by the event relation section. See table 5-3.

Table 5-3 Relation type

relation_type	Semantics
0x0	Reserved
0x1	Relation for the contents description (Indicates tree structure to describe contents)
0x2	Relation for navigation (Indicates tree structure to assist display and selection)
0x3-0xF	Reserved for future use

node_id: This 16-bit field serves as a label to identify the node used to describe the relation among the event and/or local event. Node identifier "0x0000" is reserved for a special node to describe the event relation sub_table. The node identifier "0xFFFF" is not used.

collection_mode: This 4-bit field indicates the characteristics of the collection of events, local events and nodes which refer to this node by the parental_node_id, node_relation_descriptor or reference_descriptor. See table 5-4.

Table 5-4 Collection mode

collection_mode	Semantics
0x0	Group (bag)
0x1	Concatenation (sequential)
0x2	Selection (alternate)
0x3	Parallel
0x4-0xF	Reserved for future use

parent_node_id: This 16-bit field indicates the node_id of the parent node when the node refers another node in the event relation sub_table as a parent of the tree structure. When the parent node is not specified by this field, "0xFFFF" shall be coded.

reference_number: This 8-bit field specifies the priority of reference in the collection of events, local events and nodes which refers to the same node.

descriptors_loop_length: This 12 bit field gives the total length in byte of the following descriptors.

CRC_32: This 32-bit field contains the CRC value for the entire section.

5.1.3 Index transmission information table (ITT)

The index transmission information table describes information to be used for transmission of program index.

Index transmission information table consists of sub_tables. The sub_table is a table including information for transmission of program index of an event (program), and constructed of program index transmitting information section. See table 5-5.

Table 5-5 Index transmitting section

Syntax	No. of bits	Identifier
index_transmission_section(){		
table_id	8	uimsbf
section_syntax_indicator	1	bslbf
reserved_future_use	1	bslbf
reserved	2	bslbf
section_length	12	uimsbf
event_id	16	uimsbf
reserved	2	bslbf
version_number	5	uimsbf
current_next_indicator	1	bslbf
section_number	8	uimsbf
last_section_number	8	uimsbf
reserved_future_use	4	bslbf
descriptors_loop_length	12	uimsbf
for(i=0;i<N;i++){		
descriptor()		
}		
CRC_32	32	rpchof
}		

Semantics for the program index transmitting information section:

table_id: This field indicates the event relation section and shall be set to 0xD2. See table 6-2.

section_syntax_indicator: Section syntax indicator is a 1-bit field which shall be set to "1".

section_length: This is a 12-bit field. It specifies the number of bytes of the section, starting immediately following the section_length field and including the CRC. The section_length shall not exceed 4093 so that the entire section has a maximum length of 4096 bytes

event_id: This 16-bit field identifies the event (program). It indicates the event identifier of the

event, by which the program index transmission information section is provided.

version_number: This 5-bit field is the version number of the sub_table. The version_number shall be incremented by 1 when a change in the information carried within the sub_table occurs. When it reaches value 31, it wraps around to 0. When the current_next_indicator is set to "1", then the version_number shall be that of the currently applicable sub_table defined in table_id and event_id. When the current_next_indicator is set to "0", then the version_number shall be that of the next applicable sub_table defined in table_id and event_id.

current_next_indicator: This 1-bit indicator, when set to "1" indicates that the sub_table is the currently applicable sub_table. When the bit is set to "0", it indicates that the sub_table sent is not yet applicable and shall be the next sub_table to be valid.

section_number: This 8-bit field gives the number of the section. The section_number of the first section in the sub_table shall be "0x00". The section_number shall be incremented by 1 with each additional section having the same table_id, event_id, service_id, transport_stream_id and original_network_id.

last_section_number: This 8-bit field specifies the number of the last section of the sub_table to which this section belongs.

descriptors_loop_length: This 12-bit field gives the total length in bytes of the following descriptors.

CRC_32: This 32-bit field contains the CRC value for the entire section.

5.2 Descriptor used for program index encoding

The following identifiers are defined as extension information of SI in Part 3 of this standard for encoding program index.

- (1) Basic local event descriptor
- (2) Reference descriptor
- (3) Node relation descriptor
- (4) Short node information descriptor
- (5) STC reference descriptor

The following descriptors defined in basic information of SI (Part 2) are also used as a standard.

- (6) Short event descriptor
- (7) Extended event descriptor
- (8) Hyperlink descriptor
- (9) Stuffing descriptor

Syntax and semantics of each descriptor of (1) to (5) are described in the following clauses.

5.2.1 Basic local event descriptor

The basic local event descriptor used in the LIT indicates segmentation information of the local event (program segment event), such as start time, duration and component identifier, etc. See table 5-6.

Table 5-6 Basic local event descriptor

Syntax	No. of bits	Identifier
<code>basic_local_event_descriptor(){</code>		
<code>descriptor_tag</code>	8	uimsbf
<code>descriptor_length</code>	8	uimsbf
<code>reserved_future_use</code>	4	bslbf
<code>segmentation_mode</code>	4	uimsbf
<code>segmentation_info_length</code>	8	uimsbf
<code>if(segmentation_mode == 0){</code>		
<code> }</code>		
<code>else if(segmentation_mode == 1){</code>		
<code>reserved_future_use</code>	7	bslbf
<code>start_time_NPT</code>	33	uimsbf
<code>reserved_future_use</code>	7	bslbf
<code>end_time_NPT</code>	33	uimsbf
<code> }</code>		
<code>else if(segmentation_mode < 6){</code>		
<code>start_time</code>	24	uimsbf
<code>duration</code>	24	uimsbf
<code>if(segmentation_info_length == 10){</code>		
<code>start_time_extension</code>	12	uimsbf
<code>reserved_future_use</code>	4	bslbf
<code>duration_extension</code>	12	uimsbf
<code>reserved_future_use</code>	4	bslbf
<code> }</code>		
<code> }</code>		
<code>else{</code>		
<code>for(i=0; i< M; i++){</code>		
<code>reserved</code>	8	bslbf
<code> }</code>		
<code> }</code>		
<code>for(i=0; i<N; i++){</code>		
<code>component_tag</code>	8	uimsbf
<code> }</code>		
<code>}</code>		

Semantics for the basic local event descriptor:

segmentation_mode: This 4-bit field specifies the coding type of the segmentation information such as time and hour, etc. in the basic local event descriptor. See table 5-7.

Table 5-7 Segmentation mode

segmentation_mode	Name	Semantics
0x0	Invalid	Segmentation information is not designated in the basic local event descriptor
0x1	NPT	Designated by NPT form
0x2	Relative time	Designate relative time from the start time of program in hour, minute, and second (ms.) form
0x3	Relative time (STC reference descriptor is used together)	Designate relative time from the start time of program in hour, minute, and second (ms.) form
0x4	JST time	Designate JST time of broadcasting in hour, minute, and second (ms.) form
0x5	JST time (STC reference descriptor is used together)	Designate JST time of broadcasting in hour, minute, and second (ms.) form
0x6-0xF	reserved_future_use	Reserved for future use.

segmentation_info_length: This 8-bit field specifies the byte length of the subsequent segmentation information.

start_time_NPT: This 33-bit field specifies the start time of the local event in NPT form.

end_time_NPT: This 33-bit field specifies the end time of the local event in NPT form.

start_time: This 24-bit field expresses the unit of seconds or the greater time unit of the start time of the local event. Using six 4-bit binary-coded decimal numbers (BCD), the time is coded in the order of hours, minutes and seconds. When no start time is defined (for example, the start time remains undetermined, or it is not open yet), all bits in this field must be set to "1".

duration: This 24-bit field expresses the unit of seconds or the greater time unit of duration of the local event. Using six 4-bit binary-coded decimal numbers (BCD), the time duration is coded in the order of hours, minutes and seconds. When no time duration is defined (for example, the time duration remains undetermined, or it is not open yet), all bits in this field must be set to "1". The value for this field must be set to "0" to indicate a point on the time base.

start_time_extension: This 12-bit field expresses units smaller than seconds of the start time of the

local event. Using three 4-bit binary-coded decimal numbers (BCD), the time is coded in milliseconds. When no start time is defined, all bits in this field must be set to "1". This field is omitted when no specification is made down to the millisecond level of accuracy.

duration_extension: This 12-bit field expresses units smaller than seconds of the time duration of the local event. Using three 4-bit binary-coded decimal numbers (BCD), the time is coded in milliseconds. When no time duration is defined, all bits in this field must be set to "1". The value for this field must be set to "0" to indicate a point on the time base. This field is omitted when no specification is made down to the millisecond level of accuracy.

component_tag: This 8-bit field serves as a label to identify the component stream within this local event. The component stream to which the corresponding value of this component tag is assigned in the PMT belongs to this local event. This field could be omitted if all the component streams belong to this local event. This field has the value of "0xFF" if none of the component streams belong to this local event. "0xFF" is used only for this case, and is not used for the stream identifier descriptor.

5.2.2 Reference descriptor

The reference descriptor used in EIT or LIT associates the event or the local event with the event relation sub_table. The reference descriptor refers to the event relation sub_table (omitted in some cases) and indicates that event or local event placed with this descriptor has attribute indicated by reference node. See table 5-8.

Table 5-8 Reference descriptor

Syntax	No. of bits	Identifier
reference_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
information_provider_id	16	uimsbf
event_relation_id	16	uimsbf
for(i=0;i<N;i++){		
reference_node_id	16	uimsbf
reference_number	8	uimsbf
last_reference_number	8	uimsbf
}		
}		

Semantics for the reference descriptor:

information_provider_id: This 16-bit field indicates the information provider id of the event relation sub_table to which the referred node belongs.

event_relation_id: This 16-bit field indicates the event relation id of the event relation sub_table to which the referred node belongs.

reference_node_id: This 16-bit field indicates the node id of the referred node.

reference_number: This 8-bit field specifies the reference priority of the nodes to be referred to. If the referred node is the node that indicates the event or the local event itself, it should be "0x00". If the referred node indicates the parent node of the event or the local event, the reference_number should be specified by the value calculated based on the following equation.

The value should be "0xFF" when the reference priority is not designated.

$$\text{reference_number} = \text{mod}(\text{actual reference priority order} - 1, 254) + 1$$

last_reference_number: This 8-bit field indicates the maximum value of the reference_number of the referred node. The last_reference_number should be specified buy the value calculated based on the following equatation. The value should be "0xFF" when the last reference priority is not designated.

$$\text{last_reference_number} = \text{mod}(\text{actual last reference priority order} - 1, 254) + 1$$

The last_reference_number should not be equal to the reference_number, except when the actual reference order coincides with the last reference priority order. Therefore, when there is a possibility that the encoded value of reference order equals the encoded value of the last reference order, "0xFF" is set to the last_reference_number.

5.2.3 Node relation descriptor

The node relation descriptor is used to describe the referencing relation of nodes in event relation table (ERT). If the referencing is the basic referencing relation that is only made to the parent node and the parent node is located in the same event relation identifier, the parent node identifier field of ERT section is used to express the node relation. See table 5-9.

Table 5-9 Node relation descriptor

Syntax	No. of bits	Identifier
node_relation_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
reference_type	4	uimsbf
external_reference_flag	1	bslbf
reserved_future_use	3	bslbf
if(external_reference_flag == 1){		
information_provider_id	16	uimsbf
event_relation_id	16	uimsbf
}		
reference_node_id	16	uimsbf
reference_number	8	uimsbf
}		

Semantics for the node relation descriptor:

reference_type: This 4-bit field indicates the reference attribute for the node indicated by the reference_node_id. See table 5-10.

Table 5-10 Reference type

reference_type	Semantics
0x0	Reference to parent node
0x1 – 0xF	Reserved for future use

external_reference_flag: The value "0" indicates that the node to be referred to by the reference node id is located in the same event relation table, while the value "1" indicates that the node to be referred to by the reference node id is located in the other event relation table.

information_provider_id: This 16-bit field designates information provider identifier of the sub_table when the referred node belongs to different event relation sub_table.

event_relation_id: This 16-bit field designates event relation identifier of the sub_table when the referred node belongs to different event relation sub_table.

reference_node_id: This 16-bit field identifies the node to be referred to.

reference_number: This 8-bit field specifies the reference priority of the nodes to be referred to by the reference_node_id. The value "0xFF" may be used if there is no need to specify the priority

order. "0x00" is not used.

5.2.4 Short node information descriptor

The short node information descriptor used in the event relation table (ERT) expresses the node name as well as the descriptions on the node definition in the textual format. The short node information descriptor used in the EIT expresses the node name and the description related to the node, of the node to be referred to by the event, in textual format. See table 5-11.

Table 5-11 Short node information descriptor

Syntax	No. of bits	Identifier
short_node_information_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
ISO_639_language_code	24	bslbf
node_name_length	8	uimsbf
for(i=0;i<node_name_length;i++){		
node_name_char	8	uimsbf
}		
text_length	8	uimsbf
for(i=0;i<text_length;i++){		
text_char	8	uimsbf
}		
}		

Semantics for the short node information descriptor:

ISO_639_language_code: This 24-bit field indicates the language of the subsequent character information field in a form of three alphabetical characters specified by ISO639-2[2]. Each character is encoded in eight bits in accordance with ISO8859-1[3] and inserted into the 24-bit field in the same order as that of the character code.

EXAMPLE: Japan has 3-character code "jpn", which is coded as:

"0110 1010 0111 0000 0110 1110"

node_name_length (Node name length): This 8-bit field indicates the byte length of the following node name.

node_name_char: This is an 8-bit field. The series of character information indicates the node name.

text_length: This 8-bit field indicates the byte length of the following node description.

text_char: This is an 8-bit field. The series of character information provide an explanation of the node.

5.2.5 STC reference descriptor

The STC reference descriptor describes the corresponding relation between the time information described in the LIT and the STC to enable precise synchronizing of the event component in program segment index. See table 5-12.

Table 5-12 STC reference descriptor

Syntax	No. of bits	Identifier
STC_reference_descriptor(){		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
reserved_future_use	3	bslbf
external_event_flag	1	bslbf
STC_reference_mode	4	uimsbf
if(external_event_flag == 1){		
external_event_id	16	uimsbf
external_service_id	16	uimsbf
external_network_id	16	uimsbf
}		
if(STC_reference_mode == 0){		
}		
else if(STC_reference_mode == 1){		
reserved_future_use	7	bslbf
NPT_reference	33	uimsbf
reserved_future_use	7	bslbf
STC_reference	33	uimsbf
}		
else if(STC_reference_mode == 3		
STC_reference_mode == 5){		
time_reference	24	uimsbf
time_reference_extention	12	uimsbf
reserved_future_use	11	bslbf
STC_reference	33	uimsbf
}		
else{		
for(i=0; i<N; i++){		
reserved	8	bslbf
}		
}		
}		

Semantics for the STC reference descriptor:

external_event_flag: Set this field to "1" when the information of the STC reference descriptor is the reference information of the stream which is broadcasted as a different program from this program index.

external_event_id: This 16-bit field designates the event_id of the broadcasting program which the STC reference descriptor indicates.

external_service_id: This 16-bit field designates the service_id of the broadcasting program which the STC reference descriptor indicates

external_network_id: This 16-bit field designates the original_network_id of the broadcasting program which the STC reference descriptor indicates.

STC_reference_mode: This 4-bit field designates the reference type of the time in the STC reference descriptor. See table 5-13. Generally, the mode corresponding to the segmentation mode of the basic local event descriptor shall be used.

Table 5-13 STC reference mode

STC_reference_mode	Name	Semantics
0x0	Invalid	No relation is specified
0x1	NPT	Designate relation with NTP and STC
0x2	Undefined	Reserved for future use
0x3	Relative time	Relation between relative time from the start of the program (hour, minute, second, ms) and STC is designated.
0x4	Undefined	Reserved for future use
0x5	JST time	Relation between JST time (hour, minute, second, ms) and STC is designated.
0x6-0xF	Undefined	Reserved for future use

STC_reference: This 33-bit field indicates the STC value corresponding to the time designated with the NPT reference value or time reference value (extension) in 90kHz unit.

NPT_reference: This 33-bit field indicates the NPT expression time referring to the STC.

time_reference: This 24-bit field indicates unit of more than a second either the relative time in the expression of hour, minute, second and millisecond expression referring to the STC or the JST time. Using six 4-bit binary-coded decimal numbers (BCD), the time is coded in the order of hours, minutes and seconds.

time_reference_extension: This 12-bit field indicates units of less than a second, either the relative time in the expression of hour, minute, second and millisecond expression referring to the STC or the JST time. Using three 4-bit binary-coded decimal numbers (BCD), the time is coded in milliseconds. The value "0" is specified when no specification is made down to the millisecond level of accuracy.

5.2.6 Allocation of the tag value and possible locations of the descriptors

Table 5-14 shows allocation of the possible locations of the descriptors.

Table 5-14 Allocation of the tag value and possible locations of the descriptors
in the index encoding system

Descriptor	Tag value	EIT	LIT	ERT	ITT
Stuffing descriptor	0x42	0	0	0	0
Short event descriptor	0x4D	0	0		
Extended event descriptor	0x4E	0	0		
Hyperlink descriptor	0xC5	0	0	0	
Basic local event descriptor	0xD0		0		
Reference descriptor	0xD1	0	0		
Node relation descriptor	0xD2			0	
Short node information descriptor	0xD3	0		0	
STC reference descriptor	0xD4				0

6. Program index transmission system

6.1 Transmission of program group index

Each table of program group index is transmitted by the same method as tables of EIT in basic information of SI (Part 2) and transmitted PID are specified directly.

When grouping the local event (program segment event) as the program group index, LIT is transmitted. The PID transmitting the LIT in this case is also specified directly.

Table 6-1 Table ID and PID used for program and program group index

Table	Table ID	PID used for transmission
EIT	0x4E-0x6F	0x0012
LIT	0xD0	0x0020
ERT	0xD1	0x0021

6.2 Transmission in program segment index

Each table of the program segment index is transmitted as one program component in ISO/IEC 13818-1[2] and transmitted PID is specified indirectly by the PMT. To identify that the program component is each table of the index in the PMT, the data component descriptor specified as basic information of SI (Part 2) is used.

The PID used to transmit each table section is shown in table 6-2.

Table 6-2 Table ID and PID used for index in program

Table	Table ID	PID used for transmission
LIT	0xD0	Indirect designation by PMT
ERT	0xD1	Indirect designation by PMT
ITT	0xD2	Indirect designation by PMT

6.3 Identifier used for transmission of program index

6.3.1 Stream type

The value of stream_type given to section signal transmitting program index "0x05", is used indicating private section in ISO/IEC 13818-1[4] as shown in table 6-3. The stream type is encoded in PMT, etc.

Table 6-3 Stream type

Value	Semantics
0x05	ISO/IEC 13818-1 private sections

6.3.2 Data component identifier

The standardization organization specifies the value of data coding method identifier (data_component_id) given to the transmission of program index. Data component identifier is encoded in data component descriptor, etc.

6.3.3 Service type

The value of service type given to the service added to the program index uses the value indicating main service, and encoded in accordance with table 6-4. For example, when index information is added to the digital TV service, "0x01" is used which indicates digital TV service, the main service.

When providing the program index as an independent service, "0xC0" is used as a value of service type.

Table 6-4 Service type

Value	Semantics
0x01	Digital TV service
0x02	Digital audio service
0xA1	Special video service
0xA2	Special audio service
0xA3	Special data service
0xA4	Engineering download service
0xA5	Promotion video service
0xA6	Promotion audio service
0xA7	Promotion data service
0xA8	Data service for accumulation beforehand
0xA9	Data service exclusive for accumulation
0xAA	Book mark list data service
0xC0	Data service

6.4 Descriptor used for program index transmission

The data component descriptor and data contents descriptor are used for transmission of the program index in accordance with the basic information of SI specified in part 2.

When transmitting the program segment index in other time (other event) or other program channel (other service) than the program body, or when providing the program segment index as an independent service, the hyperlink descriptor is used in accordance with the basic information of SI. Standard placement of these descriptors is shown in table 6-5.

Table 6-5 Placement of descriptor used for index transmission

Descriptor	Tag value	CAT	PMT (1st)	PMT (2nd)	NIT	BAT	SDT	EIT
Data component descriptor	0xFD			0				
Hyperlink descriptor	0xC5							0
Data contents descriptor	0xC7							0

Definitions of additional identification information of the data component descriptor and the program index transmission system for the selector area of the data contents descriptors are made in the following clauses.

6.4.1 Data component descriptor

Additional identification information area of the data component descriptor is used for the program index transmission, and the table identification information is shown in table 6-6.

Table 6-6 Table identifier information

Syntax	No. of bits	Mnemonic
<pre> table_identifier_info(){ for(i=0; i<N; i++){ table_id } } </pre>	8	uimsbf

Semantics definition of fields in the table identifier information:

table_id: This 8-bit field indicates the table_id of the table or sub_table transmitting in that component. When multiple tables are transmitting, multiple table_id can be specified.

6.4.2 Data content descriptor

When transmitting the program index, index transmission information such as table transmission status and size are described using selector area of the data content descriptor. Index transmission information is shown in table 6-7.

Table 6-7 Index transmission information

Syntax	No. of bits	Mnemonic
<pre> index_transmission_info(){ start_time_offset end_time_offset version Updating Indicator interim_version_indicator reserved index_version cycle_time reserved leak_rate table_size } </pre>	<p>24</p> <p>24</p> <p>1</p> <p>1</p> <p>6</p> <p>16</p> <p>32</p> <p>2</p> <p>22</p> <p>32</p>	<p>bslbf</p> <p>bslbf</p> <p>bslbf</p> <p>bslbf</p> <p>bslbf</p> <p>uimsbf</p> <p>uimsbf</p> <p>bslbf</p> <p>uimsbf</p> <p>uimsbf</p>

Semantics definition of fields in index transmission information:

start_time_offset: This 24-bit field specifies the offset time of the index information transmission

when starting index information transmission preceding the event starting time. Using six 4-bit binary coded decimal numbers (BCD), the time is coded in the order of hours, minutes and seconds. When transmission is not made before the event, all bits in this field must be set at "0". When transmission time before the event is not defined, all bits in this field must be set at "1".

`end_time_offset`: This 24-bit field specifies duration of index information transmission when continuing index information transmission after the event end time. Using six 4-bit binary coded decimal numbers (BCD), the time is coded in the order of hours, minutes and seconds. When transmission is not made after the event, all bits in this field must be set at "0". When transmission time after the event is not defined, all bits in this field must be set at "1".

`version_updating_indicator`: This 1-bit flag indicates that the index information is updated within transmission time. When updating of the index information is not made in the event, this field is set to "0" and when updating is made, this field is set to "1".

`interim_version_indicator`: This 1-bit flag indicates that the index information is interim information. When the index of this event is interim information, that is, when broadcasting of updated information is scheduled in other event, this field is set to "1". When updated information other than the index of (final version) of the event is not broadcast, this field is set to "0".

`index_version`: This 16-bit field indicates the index information version (differing with the version number of the section). When the index information is updated in the event, it indicates the final version. When the version is not specified, all bits must be set at "1".

`cycle_time`: This 32-bit field indicates the upper limit (the uppermost value) of the cycle which the `sub_table` is transmitted, in ms unit. When table transmission is made, this `sub_table` is completed when section of hours indicated here is gathered. It can be used as time out hour in the IRD. When cycle time is not specified, all bits must be set at "1".

`leak_rate`: This 22-bit field indicates leak rate (size of data which should be taken out per unit time from transport buffer) of the `sub_table`. Unit shall be 50 byte/sec.

`table_size`: This 32-bit field indicates the upper limit (the uppermost value) of the `sub_table` in byte units. When multiple `sub_tables` are transmitted, it indicates the upper limit of the total. When size is not specified, all bits must be set at "1".

Annex A (Normative)

Program index protection system

Program index protection system is specified herein, to suppress the use of the program segment index, which is against the service provider or program producer's will. This function is optional.

The LIT is protected beforehand and transmitted. The IRD store the LIT, which is protected. The protected program index information cannot be used in this condition, but when the program signal is decoded at the order of the service providers or at the program producers' will, the program index enables the information to work in the correct order and the program index information becomes available.

A.1 Protection of program index information

When transmitting the LIT, start time and continuation time of the local event is protected beforehand and then transmitted using the local event information section. Protection herein is made by the following methods:

- (1) Value not defined is set
- (2) Value with low accuracy including tolerance is set

A.2 Enable program index information

Protected program index information enable by overwriting new information using index enabling information. To enforce the program index protection function, ciphering is used in some cases when encoding index enabling information. When encoding the index enabling information, it should be specified otherwise in the service provider specification, etc. An example of index enabling information is shown in table A-1.

Table A-1 Index enabling information

Syntax	No. of bits	Mnemonic
index_enable_info(){		
local_event_id	16	uimsbf
enable_info_type	4	uimsbf
enable_info_priority	4	uimsbf
if(enable_info_type==1){		
start_time	24	uimsbf
duration	24	uimsbf
}		
if(enable_info_type==2){		
start_time	24	uimsbf
duration	24	uimsbf
start_time_extension	12	uimsbf
reserved_future_use	4	bslbf
duration_extension	12	uimsbf
reserved_future_use	4	bslbf
}		
}		

Semantic definition of fields in index enabling information:

local_event_id: This 16-bit field indicates the local event to operate the enabling information.

enable_info_type: Indicates information to protect and enable the index. This field classifies the syntax on and after the enabling information priority field.

Table A-2 Enabling information type

Value	Semantics
0x0	Reserved for future use
0x1	Time information (sec. unit)
0x2	Time information (ms unit)
0x3 – 0xF	Reserved for future use

enable_info_priority: Indicates priority when setting multiple enabling information to the same local event. On the IRD side, the enabling information is worked to the LIT when the value of the decoded enabling information priority is greater than the previous value of the decoded enabling information priority. (When the value of the decoded enabling information priority is not greater than the previous value of decoded enabling information priority, the decoded enabling information

is cancelled.)

start_time : This 24-bit field specifies the value to overwrite as the local event start time of the LIT. Using six 4-bit binary-coded decimal numbers (BCD), the start time is coded in the order of hours, minutes and seconds.

duration: This 24-bit field specifies the value to overwrite as the local event duration of the LIT. Using six 4-bit binary-coded decimal numbers (BCD), the duration is coded in the order of hours, minutes and seconds.

start_time_extension: This 12-bit field specifies the value to overwrite as the local event start time extension of the LIT. Using three 4-bit binary-coded decimal numbers (BCD), the start time extension is coded in milliseconds.

duration_extension: This 12-bit field specifies the value to overwrite as the local event duration extension of the LIT. Using three 4-bit binary-coded decimal numbers (BCD), the duration extension is coded in milliseconds.

A.3 Transmission of index enabling information

Index enabling information is transmitted by either of the methods as shown below. The IRD is decoded in accordance with the program signal decoding.

The closer the layer to transmit index enabling information approaches the grade of the presentation layer, the stronger the index protection function becomes, generally. However, decoding process of the index enabling information becomes more complex accordingly. Transmission method of the index enabling information should be operated considering the balance of the strength of protection function and complexity of the decoding process.

(1) Transmission by section type

When transmitting the index enabling information using the section type, private descriptor of the service provider standard is placed using the ITT, or the private table of the service provider standard is used.

Though the protection function is not so strong, decoding process is the easiest (decode material for index method is available) and the transmission method does not depend on a service encoding

method.

(2) Transmission by independent PES

When the index enabling information is transmitted using the data transmission method of independent PES, it should be in accordance with the transmission method of ARIB STD-B24 "Data Coding and Transmission Specification for Digital Broadcasting".

As the transmission method does not depend on the service encoding method and the strength of the protection function is almost the same as method (3), independent PES should be set for the index protection method.

(3) Transmission by PES header

When transmitting the index enabling information using the PES private data area of the PES packet header such as video and audio PES, it should be in accordance with ISO/IEC 13818-1[4].

The protection method is the strongest among those transmission methods, which do not depend on the service encoding methods, but index enabling information, which can be transmitted is limited to a maximum of 16 bytes.

(4) Transmission by video or audio PES

When transmitting the index enabling information using the data transmission method of video PES or audio PES, it should be in accordance with the transmission method of ARIB STD-B24 "Data Coding and Transmission Specification for Digital Broadcasting".

Though it offers the strongest protection, the transmission method depends on the service encoding method.

Preface

This appendix is established as a guideline of SI specified in Part 1 and Part 2 for various attentions and conditions of transmission in actual operation, and is not a part of the standard.

1. How to use SI table

This chapter contains some guidelines on the usage of the Service Information (SI) table.

1.1 Network Information Table (NIT) information

The Network Information Table (NIT) provides a grouping of Transport Streams (TSs) and the relevant tuning information. The NIT could be used during set-up procedures of the IRD and the relevant tuning information may be stored in no-volatile memory. The NIT also could be used to signal changes of tuning information. The following rules apply to the NIT:

- a) transmission of the NIT is mandatory for the actual delivery system;
- b) the NIT describing the actual delivery system is valid if and only if it contains applicable delivery system descriptors for the actual delivery system. This rule specifies the conditions under which the NIT contains valid information. At some transitions of broadcast delivery system boundaries, the NIT carried in a TS is allowed to describe an earlier network in the broadcast chain. A different mechanism has to be selected by the IRD to obtain the relevant tuning information for the actual delivery system. If a satellite IRD receives a satellite delivery system descriptor for the actual delivery system, then it is valid. If a cable IRD receives a satellite delivery system descriptor for the actual delivery system, then it is valid. If a cable IRD receives a satellite delivery system descriptor for the actual delivery system, then it is assumed to be invalid for the cable IRD;
- c) if a valid NIT for the actual delivery system is present in the SI bit stream then it shall lost all TSs of the actual delivery system;
- d) the SI stream shall have at least 8 TS packets per 10 seconds carrying NIT data or NULL packets. This rule simplifies the replacement of the NIT at broadcast delivery system boundaries. With the simple replacement mechanism, local frequency control is possible with relatively low cost equipment.

The SI uses two labels related to the concept of a delivery system, namely the `network_id` and the `original_network_id`. The latter is intended to support the unique identification of a service, contained in a TS, even if that TS has been transferred to another delivery system than the delivery system where it originated. A TS can be uniquely referenced through the path `original_network_id/transport_stream_id`. A service can be uniquely referenced through the path origi-

nal_network_id/transport_stream_id/service_id. The network_id, thus, is not part of this path. In addition each service_id shall be unique within each original_network_id. When a service (contained inside a TS) is transferred to another delivery system, only the network_id changes, whereas the original_network_id remains unaffected.

Figure 1-1 shows an example, where two services (A and B), which originate in two different delivery systems and happen to have the same service_ids and transport_stream_ids, are transferred to a new delivery system.

Figure 1-1 Transfer to a new delivery system

1.2 Bouquet Association Table (BAT) information

The BAT provides a grouping of services which serves as one basis on which an IRD presents the available services to a user. Transmission of the BAT is optional. The following rule improves the consistency in the SI bit streams and simplifies the processing in the IRDs.

The SI bit stream shall list in each BAT sub-table all the services belonging to that bouquet.

One service may belong to more than one bouquet. This rule creates consistency across the different TSs which are accessible to the IRD.

If it is intended for the IRD to present service information to the user grouped in bouquets, then it

would be beneficial to ensure that every service is listed in one or more bouquets, or some services will be omitted from this method of presentation. A bouquet may group together services from more than one TS, which could even be carried in different networks. The IRD's access to information on all the services of a bouquet would be facilitated if all the service referred to in the BAT were listed in the Service Description Table (SDT). Similarly, the IRD's access to these services is facilitated if NIT information is given for all TSs in which services of the bouquet occupy capacity.

1.3 Service Description Table (SDT) information

The SDT is used to list the names and other parameters of the services within TSs. For each TS a separate SDT sub-table exists. The following rules apply in order to improve the acquisition of services:

- the transmission of the SDT for the actual TS is mandatory;
- the SI bit stream shall list in the SDT of a particular TS at least all the services of that TS.

In addition:

- any SDT for another TS than the actual one (i.e. with table_id = 0x46) shall list all the services of that TS;
- it is strongly recommended that service_ids, once assigned to a specific service within a network, remain unchanged in order to enable IRDs to implement features like favourite channel lists, etc.

1.4 Event Information Table (EIT) information

The Event Information Table (EIT) is used to transmit information about present, following and further future events. For each service a separate EIT sub-table exists.

1.4.1 EIT Present/Following information

The following rule simplifies the acquisition of the EIT Present/Following information. The SI specification states that an EIT section has a maximum size of 4096 bytes.

The SI bit stream shall have two sections per service for an EIT Present/Following with the section_number 0x00 reserved for the description of the present event and section_number 0x01 for the following event. These constraints do not apply in the case of an NVOD reference service which may have more than one event description of the EIT Present/Following. The event after the following event can be implied optionally, using the section_number 0x02 and after.

The SI bit stream shall have a maximum of 4096 bytes to describe a single event in a section.

The organization of the EIT Present/Following is based on the concept of present and following events. Which event is the present one can be determined using the following scheme:

- a) at each instant in time, there is at most one present event;
- b) when there is a present event, this event shall be described in section 0 of the EIT Present/Following;
- c) when there is no present event (e.g. in the case of a gap in the schedule) an empty section 0 of the EIT Present/Following;
- d) the `running_status` field in the description of the present event shall be given the interpretation in table 1-1.

Table 1-1 `running_status` of the present event

undefined	No information except the nominal status is provided. IRDs and VCRs shall treat the present event as running.
running	IRDs and VCRs shall treat the present event as running.
not running	IRDs and VCRs shall treat the present event as not running. In other words, this event is nominally the present one, but at this time has either not started or has already ended.
pausing	IRDs and VCRs shall treat the present event as pausing. In other words, this event is nominally the present one and has already started, but at this time the material being broadcast is not a part of the event itself.
starts in a few seconds	IRDs and VCRs shall prepare for the change of event status to "running" in a few seconds.

The duration of an event as encoded in the EIT shall also include the duration of all times when the event has the status "not running" or "paused". The start time of an event as encoded in the field `start_time` of the EIT shall be the start time of the entire event, i.e. not the start time after the pause has finished;

- e) at each point in time, there shall be at most one following event:
- f) if a following event exists, it shall be described in section 1 of the EIT Present/Following;
- g) if no following event exists, an empty section 1 of the EIT Present/Following shall be transmitted;
- h) the `running_status` field in the definition of the following event shall be given the following interpretation of table 1-2:

Table 1-2 `running_status` of the following event

undefined	No information except the nominal status is provided.
-----------	---

	IRDs and VCRs shall treat the following event as not running.
running	Not allowed.
not running	IRDs and VCRs shall treat the present event as not running.
pausing	This status is intended to indicate that the "following" event has been running at some time, but is now overlapped by another event. In such a case, during the whole time that the "following" event has status "pausing", one and the same overlapping event shall be encoded in section 0 of the EIT Present/Following. Furthermore, an event which has the status "pausing" shall acquire the status "running" at a later time, then replacing the overlapping event in section 0 of the EIT Present/Following.
starts in a few seconds	IRDs and VCRs shall prepare for the status of the following event to change to running within a few seconds.

The duration of an event as encoded in the EIT shall also include the duration of all times when the event has the status "not running" or "paused". The start time of an event as encoded in the field `start_time` of the EIT shall be the start time of the entire event, i.e. not the start time after the pause has finished.

The start time of one event plus its duration may be smaller than the start time of the following event. In other words, gaps between events are allowed. In such a case, the following event is considered to be the event scheduled to begin after the gap. This event shall be encoded in section 1 of the EIT Present/Following. The start time and duration are scheduled times. Some broadcasts may update this information if the schedule is running late, whereas others may prefer to keep the indicated start time unchanged, e.g. to avoid having an event called "The News at 8" from being indicated as starting at 8:01:23, instead of 8:00:00.

1.4.2 EIT Schedule information

1.4.2.1 EIT Schedule structure

The EIT Schedule information is structured in such a way that it is easy to access the EIT data in a flexible manner. The EIT Schedule Tables shall obey the following rules:

- a) the EIT/Schedule is distributed over 16 `table_ids`, being 0x50 – 0x5F for the actual TS, and 0x60 – 0x6F for other TSs, which are ordered chronologically;
- b) the 256 sections under each sub-table are divided into 32 segments of 8 sections each. Segment #0, thus, comprises sections 0 to 7, segment #1 section 8 to 15 etc.;
- c) each segment contains information about events that start anywhere within a three-hour period;

- d) the information about separate events is ordered chronologically within segments;
- e) if only $n < 8$ sections of a segment are used, the information shall be placed in the first n sections of the segment. To signal that the last sections of the segment are not used, the value $s_0 + n - 1$, where s_0 is the first section number of the segment, shall be encoded in the field `segment_last_section_number` of the EIT header. As an example, if segment 2 contains only 2 sections, the field `segment_last_section_number` shall contain the value $8 + 2 - 1 = 9$ in those two sections;
- f) segments that contain all their sections shall have the value $s_0 + 7$ encoded in the field `segment_last_section_number`;
- g) entirely empty segments shall be represented by an empty section, (i.e. a section which does not contain any loop over events) with the value $s_0 + 0$ encoded in the field `segment_last_section_number`;
- h) the placing of events in segments is done referring to a time t_0 . t_0 is "last midnight" in Japan Standard Time (JTC)
- j) there are the following two methods of placing event information in segments:
 - 1) segment #0 of table_id 0x50 (0x60 for other TSs) shall contain information about events that start between midnight and 02:59:59 of "today". Segment #1 shall contain events that start between 03:00:00 and 05:59:59, and so on. This means that the first sub_table (table_id 0x50, or 0x60 for other TSs) contains information about the first four days of the schedule, starting today at midnight.
 - 2) segment #0 of table_id 0x50 (0x60 for other TSs) shall contain information about events that start between midnight and 02:59:59 of the first day in every month. Segment #1 shall contain events that start between 03:00:00 and 05:59:59, and so on. This means that the first sub_table (table_id 0x50, or 0x60 for other TSs) contains information about the first four days of schedule, starting the first day of every month at midnight.
- k) the field `last_section_number` is used to indicate the end of the sub-table. Empty segments that fall outside the section range indicated by `last_section_number` shall not be represented by empty sections;

- l) the field `last_table_id` is used to indicate the end of the entire EIT/Schedule structure. Empty segments that fall outside the `table_id` range indicated by `last_table_id` shall not be represented by empty sections;
- m) segments that correspond to events in the past may be replaced by empty segments (see rule g));
- n) the `running_status` field of event definitions contained in the EIT/Schedule shall be set to undefined (0x00).

1.4.2.2 EIT scrambling

The EIT Schedule Tables may be scrambled. In order to provide an association with the Conditional Access (CA) streams, it is necessary to allocate a `service_id` (= MPEG-2 `program_number`) which is used in the Program Specific Information (PSI) to describe scrambled EIT Schedule Tables. The EIT is identified in the Program Map Table (PMT) section for this `service_id` as a program consisting of one private stream, and this PMT section includes one or more `CA_descriptors` to identify the associated CA streams. The `service_id` value 0xFFFF is reserved for this purpose.

1.5 Time and Date Table (TDT)

The Time and Date Table (TDT) transmits the actual JTC-time coded as Modified Julian Date (MJD). It may be used to synchronize the internal clock of an IRD. The TDT shall be transmitted at least every 30 seconds. The encoded time is intended to be valid when the section becomes valid according to figure 1-2 of this standard.

Figure 1-2 Timing of table updates and validity

1.6 Time and Data Offset Table (TOT)

The TOT transmits the time and data offset information coded as MJD and JTC (Note 1) in place of TDT. That is, either the TDT or the TOT shall be transmitted. It may be used to synchronize the internal clock of an IRD. By mapping the local time offset descriptor in TOT at local time, partial content time of the actual time (UTC+9) and indicated time to human can be transmitted. The TOT shall be transmitted at least every 30 seconds. Updating of table and timing of validity is operated in accordance with the TDT.

(Note 1) Whether the encoded time should be the transmitted time or the received time shall be specified in the operational guideline.

1.7 Running Status Table (RST)

Running status sections are used to rapidly update the running status of one or more events. Running status sections are sent out only once, at the time the status of an event changes, unlike other SI Tables which are normally repetitively transmitted. Thus there does not exist any update mechanism for RSTs. At the moment an RST is transmitted to update the running status of an event, it invali-

dates the running status of that event, transmitted previously by the EIT Present/Following. The following time the EIT is transmitted, it shall contain the updated running status bits.

The intended use of this optional mechanism is to enable IRDs or VCRs to implement highly accurate switching to the beginning of events by setting up a filter on Running Status Tables and waiting for the occurrence of the RST section containing the event.

1.8 Stuffing Table (ST)

A stuffing section may occur anywhere that a section belonging to an SI Table is allowed. Stuffing Tables may be used to replace or invalidate either sub-tables or complete SI Tables. In order to guarantee consistency, all sections of a sub-table shall be stuffed. It is not allowed to replace some sections of a sub-table by stuffing some sections while keeping others.

1.9 Partial Contents Announcement Table (PCAT)

The partial contents announcement table is used to announce the schedule of partial contents to update a part of information in the specific data broadcasting contents accumulated in the IRD, etc.

Rules to maintain consistency to realize partial contents to accumulated data broadcasting contents are as follows.

- Total contents are broadcast as normal data broadcasting program that is an event. Partial contents are broadcast with the same service as total contents.
- Partial contents should always announce the partial content depending on the total contents and do not depend on the prior partial contents. For example, when it is announced in the order of:
Total content → Partial content (A) → Partial content (B),
the Partial content (B) does not depend on the Partial content (A).
- Version of the contents is controlled by the total announcement version (contents version) and version of the partial announcement (contents minor version) depending on it.
- A field for the content identifier (content_id) and the contents version (content_version) is operated in the selector area of the EIT data contents descriptor at the time of total announcement, for data component expressing contents which can be accumulated.
- When intending to update by overwriting a partial or total contents on an accumulated content, their content identifier should have the same value consistently.

Example: The figure below indicates the relation of version of the total contents announcement and the partial content announcement, and version of the accumulated contents gained by the

result of those receptions.

	Total an- nounce- ment	→	Partial content an- nounce- ment	→	Partial content an- nounce- ment	→	Total an- nounce- ment
content_version	1		(1)		(1)		2
content_minor_version	-		1		2		-
Version of accumulated content	1.0	→	1.1	→	1.2	→	2.0

Total announcement contents version at the first time is 1. In the partial content announcement following it, the partial contents of contents minor version 1 is announced having the content version 1 as a target. Then the partial content of contents minor version 2 is announced having the content version 1 as target. And then, content of the content version 2 is announced in the second total announcement at the last.

1.10 Broadcaster Information Table (BIT)

The broadcaster information table provides combination of the broadcaster existing on the original network and the relating SI transmission parameter information. The BIT can be used to know in what cycle/span the SI table including NIT is transmitted in the IRD. The BIT is applied with the following rules.

- The BIT constructs a sub_table in each original network.
- In the sub_table, a descriptor loop exists in each original network and broadcaster. In the original network descriptor area (the first descriptor area), the SI transmission parameter operated commonly in the original network is denoted. In the broadcaster descriptor area (the second descriptor area), information for each broadcaster is denoted. The information for each broadcaster means the broadcaster name, a service list provided by the broadcaster and the SI transmission parameter operated in each broadcaster.

The broadcaster name is indicated in the broadcaster name descriptor. When the broadcaster view propriety is "1", it can be used to realize functions of the IRD to indicate or select a program list for each broadcaster.

The service list for each broadcaster can be used to know the searching area of the series identification.

1.11 Network Board Information Table (NBIT)

The NBIT is a table to provide board information in the network.

The board information itself and reference information to acquire the board information can be provided by dividing the table id.

The board information is provided as noticing information to viewers. By including service id and genre codes, the IRD can give indication including service id and genre icons at the beginning of the message.

The NBIT is applied under the following rules

- The NBIT constructs a sub_table in each original network.
- Information identifier is given to information, each transmitted as board information. When certain information is transmitted and the content of the information is changed, other information identifier is given.
- The information type with service or genre information to the board information is provided with a key identifier.
- The content body of the actual board information is indicated by placing the board information descriptor in the descriptor area.

1.12 Linkage Description Table (LDT)

The LDT is provided with collecting various descriptions referred from other tables. The LDT linkage descriptor is placed to other table to indicate linkage to the LDT.

The LDT is applied under the following rules.

- The LDT constructs a sub_table in each group to collect descriptions such as service id of the representative service, etc.
- In case of linkage from other tables, the descriptor identifier indicated in the LDT descriptor and descriptor type are given as information when linked. The value of the descriptor identifier and the descriptor indicated in the descriptor type are indicated in the descriptor area in the corresponding table.
- One event may be linked to multiple collecting groups.

1.13 Table Updating Mechanism

The Section syntax used for SI has various mechanisms to indicate the updating of the SI contents.

The updating of the section is indicated by the increase of the version number field. Updating be-

ARIB STD - B10 Appendix
Version 4.4-E1

comes effective immediately after the final byte of the CRC32 of the new version section. Therefore, the value of the current next indication shall always be "1". The section with the current next indication "0" shall not be transmitted.

2. SI descriptor allocation and usage

This chapter specifies the location where descriptors can be expected in a SI bit stream, and identifies which descriptors may occur multiple times. Descriptors which contain fundamental SI data are identified as recommended to be decoded by the IRD. The interpretation of other descriptors by the IRD is optional.

2.1 Descriptors of the Network Information Table (NIT)

The NIT is organized as shown in table 5-3, part 2 of this standard.

2.1.1 First descriptor loop

In the first loop of the NIT, the SI descriptors in this sub-clause are defined in addition to those defined in the Ministerial Ordinances and Notifications.

2.1.1.1 Linkage descriptor

This descriptor is used to give a link to another service or TS. If it appears in this loop it links to a service that is attached to the network operator. This descriptor is allowed more than once in this loop. It could, for example, point to the "123 Info channel" and to "123 Text". Transmission of this descriptor is optional. The meaning of the descriptor when it occurs here depends on the value of the linkage_type. If the linkage_type is:

- a) 0x01, it refers to a service that contains information about the network. An example of the intended use is for the IRD to switch to the information service when the user requests additional information about the network;
- b) 0x02, it refers to an Electronic Program Guide (EPG) for the network. Note that the IRD can only make use of this type of linkage if it can decode the EPG service. This standard does not specify the contents of such a service;
- c) 0x04, it refers to a TS which carries comprehensive SI. The SI carried in the referenced TS includes at least all the SI information available on all other TSs of the network.

The meanings of other values of linkage_type are not defined in this context. Note that the linkage_type does not indicate the service_type of the referenced service. An example of the intended use of the linkage descriptor is that an IRD user interface could include a mechanism like "info about the network" which would make the IRD tune to the linked service after the user initiated the

mechanism.

2.1.1.2 Network name descriptor

This descriptor is used to transmit the name of a physical network, e.g. "JCSAT-3", "SUPERBIRD-C" etc. This descriptor shall be used exactly once in any NIT sub-table.

2.1.2 Second descriptor loop

In the second loop of the NIT, the SI descriptors in this sub-clause are defined in addition to those defined in the Ministerial Ordinances and Notifications.

2.1.2.1 Delivery system descriptor

The delivery system descriptors are used to transmit the physical parameters for each transport multiplex in the network.

One (and only one) delivery system descriptor shall appear in each loop. IRDs shall be able to interpret the delivery system descriptor in order to tune to TSs quickly (see sub-clauses 1.1 and 4.3.1).

2.1.2.2 Service list descriptor

This descriptor is used to list the services and service_types for each TS. The services are listed identified by service_id (= MPEG-2 program_number). The transport_stream_id and original_network_id, which are necessary to identify a service uniquely, are given at the start of the descriptor loop.

The service list descriptor is allowed only once in each loop. Transmission of this descriptor is optional, but if it is present, then the service list shall be complete.

2.1.2.3 Emergency information descriptor

This descriptor is transmitted when the emergency warning broadcasting is made and includes information and function necessary for the emergency warning signal which is transmitted as an audio signal formerly.

2.1.2.4 Partial reception descriptor

This descriptor is used to indicate which service id can receive by the narrow band IRD, which receives only partial reception hierarchy when there is a service which is transmitted only in the partial reception hierarchy in digital terrestrial television broadcasting system. When there is a service transmitted in conditional access hierarchy, this transmission is mandatory.

2.1.2.5 Connected transmission descriptor

This descriptor is used to identify which connected transmission group transmits the TS when the connected transmission is made to transmit multiple segments (1-segment type or 3-segment type) is made without a guard band. By using the segment information (segment form and modulation system type) by which each TS is transmitted and the terrestrial delivery system descriptor in the IRD, quick tuning to TS can be realized. When the TS connected transmission is made, transmission of this descriptor is mandatory.

2.1.2.6 TS information descriptor

This descriptor indicates, for digital terrestrial television broadcasting, the remote control key identifier to which the applicable TS should be allocated during scan operation in the initial setting of the receiver. Such operation includes grasping of receivable network identifiers, transport stream identifiers, and receivable frequency information. This descriptor also indicates the relationship between the service identifier and the transmission layer.

2.1.2.7 Service group descriptor

This descriptor provides a list of service relationships when interrelated services are provided in a Transport Stream. In the case of server-type broadcasting, a list of server-type broadcasting services operated simultaneously with the conventional broadcast is provided.

2.2 Bouquet association table descriptor

Composition of the BAT is indicated in table 5-4 of Part 2 in this standard. The BAT has the same structure as the NIT. The BAT gives a logical grouping of services into bouquets, which may group together services delivered by different networks. A TS may contain services from more than one bouquet within a network. Each BAT collects the services that are allocated to the specified bouquet.

2.2.1 First descriptor loop

The SI descriptors in this sub-clause have a defined meaning in the first loop of the BAT.

2.2.1.1 Bouquet name descriptor

This descriptor is used to transmit the name of the bouquet the following services are allocated to. This descriptor is allowed once in each sub-table of the BAT. It is mandatory to be transmitted in any BAT sub-table in the TS.

2.2.1.2 CA identifier descriptor

Transmission of this descriptor is optional; it is allowed to only once in this loop. It identifies one or more CA system which apply to the services in the BAT.

2.2.1.3 Country availability descriptor

This descriptor is used to indicate whether a bouquet is available in a specific country. It has no meaning in the sense of CA. However, it may be a good feature for IRDs to interpret this descriptor, not to display bouquets that are not available in order to avoid frustration of the user.

This descriptor is allowed a maximum of twice in each BAT sub-table, once to indicate a list of countries in which the bouquet is intended to be available, and once to indicate those countries in which it is not intended to be available. If the descriptor is not present, the availability status of the bouquet is undefined. Transmission of this descriptor is optional.

2.2.1.4 Linkage descriptor

This descriptor is used to give a link to another service or TS. If it appears in this loop it links to a service that is attached to the bouquet provider. The linkage_descriptor is allowed more than once in this loop. It could, for example, point to the "123 Info channel" and to "123 Text". Transmission of this descriptor is optional. The meaning of the descriptor when it occurs here depends on the value of the linkage_type. If the linkage_type is:

- a) 0x01, it refers to a service that contains information about the bouquet. An example of the intended use is for the IRD to switch to the information service when the user requests additional information about the bouquet;
- b) 0x02, it refers to an Electronic Program Guide (EPG) for the bouquet. Note that the IRD can only make use of this type of linkage if it can decode the EPG service. This standard does not specify the contents of such a service:
- c) 0x04, it refers to a TS which carries comprehensive SI. The SI carried in the referenced TS includes at least all the SI information available on all other TSs which carry services of the bouquet.

The meanings of other values of linkage_type are not defined in this context. Note that the linkage_type does not indicate the service_type of the referenced service. An example of the intended use of the linkage descriptor is that an IRD user interface could include a mechanism like "info

about the bouquet" which would make the IRD tune to the linked service after the user initiated the mechanism.

2.2.2 Second descriptor loop

The SI descriptors in this sub-clause have a defined meaning in the second loop of the BAT.

2.2.2.1 Service list descriptor

This descriptor is used to list the services and service types of each TS that belong to the bouquet of this section. This allows to find all services that belong to a specific bouquet.

The `service_list_descriptor` is allowed only once in each loop. It should be transmitted if a BAT exists.

2.3 Service description table descriptor

The construction of the SDT is indicated in the table 5-5, part 2 of this standard. In the SDT, there is one loop for the descriptors for each service described in the SDT. The SI descriptor in this sub-clause has a defined meaning in the loop.

2.3.1 Bouquet name descriptor

This descriptor is used to transmit the name of the bouquet the service is allocated to. This descriptor is allowed more than once in the loop because a service could belong to more than one bouquet. Transmission of this descriptor is optional in the SDT. The use of this descriptor in the SDT is wasteful of bandwidth, since the information can be conveyed more efficiently using the BAT.

2.3.2 CA identifier descriptor

If a service is generally CA protected, this descriptor may be used to transmit data of the CA-system. The `CA_identifier_descriptor` is not involved in any CA control function, it is an indication for the user interface software in the IRD that a service is under conditional access and which CA-system is used. Then the user interface software may decide whether this service is reachable or not. The aim of the transmission of this descriptor is to avoid frustration to users caused by services being displayed for selection that are not reachable. This descriptor is allowed only once in the loop. Transmission of this descriptor is optional.

2.3.3. Country availability descriptor

This descriptor is used to indicate whether a service is available in the specified country. It has no meaning in the sense of CA, however, it may be a good feature for IRDs to interpret this descriptor, not to display services that are not available in order to avoid frustration of the user.

This descriptor is allowed a maximum of twice in each SDT service loop, once to indicate a list of countries in which the service is intended to be available, and once to indicate those countries in which it is not intended to be available. If the descriptor is not present, the availability status of the service is undefined. It is not allowed if there is a `time_shifted_service_descriptor`. Transmission of this descriptor is optional.

2.3.4 Linkage descriptor

This descriptor is used to give a link to another service. If it appears in this loop it links to a service that is attached to this service. This descriptor is allowed more than once in this loop. Transmission of this descriptor is optional. The meaning of the descriptor when it occurs here depends on the value of the `linkage_type`. If the `linkage_type` is:

- a) 0x01, it refers to a service that contains information about this service. An example of the intended use is for the IRD to switch to the information service when the user requests additional information about this service;
- b) 0x02, it refers to an Electronic Program Guide (EPG) for this service. Note that the IRD can only make use of this type of linkage if it can decode the EPG service. This standard does not specify the contents of such a service;
- c) 0x03, it refers to a CA replacement service for this service. An example of the intended use is for the IRD to switch automatically to the replacement service if the CA system denies access to this service.
- d) 0x05, it refers to a replacement service for this service. An example of the intended use is for the IRD to switch automatically to this replacement service when the selected service has a running status of "not running".

The `linkage_type` does not indicate the `service_type` of the reference service. An example of the intended use of the linkage descriptor is that an IRD user interface could include a mechanism like "info about the service" which would make the IRD tune to the linked service after the user initiated

the mechanism.

2.3.5 Mosaic descriptor

This descriptor may be located in the SDT and/or PMT. It is used to describe mosaic services described in sub-clause 4.2.

2.3.6 NVOD reference descriptor

This descriptor lists the services which belong to a Near Video On Demand (NVOD) service. A description of the NVOD-mechanism is given in sub-clause 4.1.

The `NVOD_reference_descriptor` is allowed only once in each loop and if there is no `time_shifted_service_descriptor` in it. It is mandatory to be transmitted if the corresponding services are described using the `time_shifted_service_descriptor`.

IRDs are recommended to make use of the `NVOD_reference_descriptor` in order to allow access to `NVOD_services`.

2.3.7 Service descriptor

This descriptor contains the basic textual identifications of a service such as service name and provider name. The `service_descriptor` is allowed only once in each loop and if there is no `time_shifted_service_descriptor`.

It is mandatory to be transmitted. IRDs are recommended to make use of it in order to display the service names in the user interface.

The service type defined in this standard is the service used for the following:

- Temporary (video, audio, data) service is not a regular service but is a service organizing the program temporarily.
- Engineering download service is a service to download software and data to the IRDs.
- Promotion (video, audio, data) service is to advertise contents of programs and services.
- Data service for accumulation beforehand is a service to be used without depending on the placement on the accumulation media among the service which can be viewed after the data is accumulated in the IRD.
- Data service exclusively for accumulation is an exclusive service used for maintaining the ser-

vice in the designated directory of the accumulating media among the service which can be viewed after the data is accumulated in the IRD.

- Book mark list data service is a service to indicate book mark information recorded in the IRD.

2.3.8 Time shifted service descriptor

This descriptor identifies a service as a time shifted copy of another service (sub-clause 4.1). The `time_shifted_service_descriptor` is allowed only once in each loop, if there is no `service_descriptor`. It is mandatory to be transmitted for services listed in a `NVOD_reference_descriptor`. IRDs are recommended to be able to interpret it in order to access NVOD-events.

2.3.9 Digital copy control descriptor

This descriptor is mapped to the SDT when digital copy control information and maximum transmission rate is the same in most programs of the same service. When a program differing with this information exists, this descriptor is mapped to the PMT and/or EIT for the program differing from the information.

When this descriptor is transmitted in multiple tables, priority of information expressed by this descriptor is PMT>EIT>SDT.

2.3.10 Logo transmission descriptor

This descriptor describes service logo information, such as pointing to PNG logo data transmitted by CDT (see ARIB STD-B21), logo identifier, logo version, and the 8-unit code alphanumeric character string for simple logo. Transmission is essential in a service that refers to simple logo or PNG logo data transmitted by using CDT.

2.3.11 Content availability descriptor

This descriptor is used in combination with the digital copy control descriptor. This descriptor can be put into the SDT when information to control record and output is the same in most programs of the same service. When there is a program with different information or when this descriptor is not put into the SDT, it can be put into the PMT and/or EIT.

When this descriptor is transmitted by multiple tables, the priority of information expressed by this descriptor is in the order of PMT, EIT, and SDT.

2.4 Descriptors of the Event Information Table (EIT)

An EIT-section is organized as shown in table 5-7, part 2 of this standard. The EIT has a loop for

descriptors for each event described in the EIT. The SI descriptors in this sub-clause have a defined meaning in the loop.

2.4.1 Component descriptor

This descriptor is used to specify all streams that are attached to an event. The descriptor may appear more than once in a loop since there may be more than one stream. Even if there is a `time_shifted_event_descriptor`, this descriptor is allowed.

It is useful to indicate which streams will be available for future events.

2.4.2 Content descriptor

This descriptor is used to classify the content of the event. Only one content descriptor may appear in the loop, but there is the possibility to transmit more than one classification term because there is a loop within the descriptor. Even if there is a `time_shifted_event_descriptor`, this descriptor is allowed. The content information can be provided in the EIT `sub_table` for the corresponding NVOD reference service. Transmission of this descriptor is optional.

2.4.3 Extended event descriptor

This descriptor is used to transmit a larger amount of textual information for an event than is possible with the `short_event_descriptor`. The information in extended event descriptors supplements that given in a short event descriptor. A language code is transmitted in order to indicate in which language the text is written. More than one `extended_event_descriptor` is allowed, for transmitting more data than one descriptor may contain (255 bytes excluding header) and for different languages. Descriptors for the same language have to be grouped together, and the `last_descriptor` field specifies the number of the last `extended_event_descriptor` for a specific language.

Even if there is a `time_shifted_event_descriptor`, this descriptor is allowed. Transmission of this descriptor is optional.

2.4.4 Linkage descriptor

This descriptor is used to give a link to another service. If it appears in this loop it links to a service that is attached to this event. This descriptor is allowed more than once in this loop. Transmission of this descriptor is optional. Even if there is a `time_shifted_event_descriptor`, this descriptor is allowed. The meaning of the descriptor when it occurs here depends on the value of the `linkage_type`. If the `linkage_type` is:

- a) 0x01, the descriptor refers to a service that contains information about this event. An example of the intended use is for the IRD to switch to the information service when the user requests additional information about this event;

The meaning of other values of `linkage_type` is not defined in this context. Note that the `linkage_type` does not indicate the `service_type` of the referenced service. An example of the intended use of the linkage descriptor is that an IRD user interface could include a mechanism like "info about the event" which would make the IRD tune to the linked service after the user initiated the mechanism.

2.4.5 Parental rating descriptor

This descriptor is used to give a rating of the program based on age or other criteria that is used to prevent children from viewing unsuitable programs. Even if there is a `time_shifted_event_descriptor`, this descriptor is allowed. The parental rating information can be provided in the EIT sub_table for the corresponding NVOD reference service. Transmission of this descriptor is optional.

2.4.6 Short event descriptor

This descriptor is used to transmit the name and a short text description for an event. A language code is transmitted in order to indicate in which language the title and the text are written. Transmission of this descriptor is mandatory, unless there is a `time_shifted_event_descriptor`, in which case the descriptor is allowed. This descriptor is allowed more than once in the loop for different languages. Thus it is not allowed to have more than one `short_event_descriptor` with the same language code.

2.4.7 Time shifted event descriptor

This descriptor is used to indicate that an event is the `time_shifted` copy of another event. Transmission of this descriptor is mandatory in case of NVOD. IRDs are recommended to decode this descriptor, without which access to the SI of NVOD events is not possible.

2.4.8 Digital copy control descriptor

This descriptor indicates digital copy control information of individual program and the maximum transmission rate.

When this descriptor is transmitted in multiple tables, priority of the information indicated by this descriptor is PMT>EIT>SDT.

2.4.9 Audio component descriptor

This descriptor is used to specify each parameter of audio stream composing an event. As multiple audio streams exist for one event in some cases, this descriptor may occur more than once in one loop. Even if there is a `time_shifted_event_descriptor`, this descriptor is allowed.

2.4.10 Data contents descriptor

This descriptor describes data component of the contents in the event, and component tag of the component stream. `Selector_byte` area in the descriptor is used to describe information of language of multimedia service or picture size, or capacity for storage, according to the form specified in each data component. The component stream composing data broadcasting contents may be transmitted in the event or in other event or service, and this descriptor describes component tag of all component streams related to the corresponding contents in the former event.

Example: The component tag of all streams necessary to indicate video/audio and related data in data contents descriptor is described when program linked data produced at the same time as the video and audio in the same Transport Stream is announced in the same event in the same service. Therefore, all component streams necessary to record data broadcasting are specified only by referring to the data content descriptor.

2.4.11 Hyperlink descriptor

This descriptor is used to describe linkage information when two related programs are made in different events and services, for the following:

- a) Video audio program and related information program
- b) Video audio program and index program in program
- c) Video audio program and its guide information program
- d) Others

When the hyperlink type is `combined_data` (0x01), `combined_stream` (0x02), `index_data` (0x03), or `index_stream` (0x04), it is recommended to link in bi-directional. It means that when the hyperlink made to other event B is made by mapping the hyperlink descriptor in the EIT of event A, it is recommended to make hyperlink to event A by mapping the hyperlink descriptor to the EIT of event B.

2.4.12 Series descriptor

This descriptor is used to identify multiple events, which are made in series. An individual series is identified with the series identifier. The IRD can use it when operating as a whole (such as reservation) for the series event group.

2.4.13 Event group descriptor

This descriptor describes grouping information for the same event of a common event, linkage information for the event relay, information of the original event when moving the event to different service.

- Common event is a broadcasting style, which the same program can be viewed whichever service is selected by describing the same ES_PID in the PMT of multiple services when broadcasting programs.
- Event relay is a broadcasting style, in which a program is broadcast continuously on a different service from midway in the program.
- Event moving is a broadcasting style, by which a program is broadcast on the service differing from the service scheduled before the broadcasting starts.

2.4.14 Component group descriptor

This descriptor is used to indicate that the component group is organized in a group, when there is a relation in multiple components composing one event. Its relation is identified with the component group type. CA setting and total bit rate description for each component group can be made. It is used for the multi-view TV (MVTV), etc.

- Multi-view (MVTV) is an application to broadcast related contents in one service by multiple video, audio and other components, simultaneously.

2.4.15 CA identifier descriptor

If a service is generally CA protected, this descriptor may be used to transmit data of the CA-system. The CA_identifier_descriptor is not involved in any CA control function, it is an indication for the user interface software in the IRD that a service is under conditional access and which CA-system is used. Then the user interface software may decide whether this service is reachable or not. The aim of the transmission of this descriptor is to avoid frustration to users caused by services being displayed for selection that are not reachable. This descriptor is allowed only once in the loop. Trans-

mission of this descriptor is optional.

2.4.16 LDT linkage descriptor

This descriptor provides information of linkage for the descriptor collected in the LDT.

When placed in the EIT, the event information linked from the descriptor is collected to the LDT and transmitted.

2.4.17 Content availability descriptor

This descriptor, which is used in combination with the digital copy control descriptor, describes information to control the record and output of each program.

When this descriptor is transmitted by multiple tables, the priority of information expressed by this descriptor is in the order of PMT, EIT, and SDT.

2.4.18 Carousel compatible composite descriptor

This descriptor shows the accumulation control information of each program by using the descriptors in the module information area and the private area defined in the data carousel transmission scheme (Chapter 6 of ARIB STD-B24 Part 3) as subdescriptors.

More than one subdescriptor can be placed in one carousel compatible composite descriptor.

2.5 Descriptors of the Program Map Table (PMT)

In addition to the descriptors defined in ISO/IEC 13818-1, the Ministerial Ordinances and Notifications, the following SI descriptors may be used in the PMT.

2.5.1 Mosaic descriptor

This descriptor may be located in the PMT and/or SDT. Its use to describe mosaic services is described in sub-clause 4.2.

2.5.2 Stream identifier descriptor

This descriptor enables specific streams to be associated with a description in the EIT, in cases where there are more than one stream of the same type within a service. The descriptor is mandatory only if the service contains more than one stream of the same type and there are component descriptors for that type of stream within the EIT.

2.5.3 Hierarchical transmission descriptor

This descriptor indicates the relation between hierarchical streams when transmitting elementary stream composing program to prevent deterioration of transmission or discriminating information quality. Hierarchical transmission is presupposed to transmit with the same TS and the same service identifier, to improve response characteristics at user selection and for SI transmission efficiency. The hierarchical transmission description is denoted in the second loop of the PMT.

When video stream is transmitted in two-hierarchical transmission, the higher-level and lower-level streams refer to each other.

If hierarchical level has more than two levels, an undefined bit is added before the hierarchical level to use as an hierarchical level to have cyclic linkage construction from the higher level to the lower level.

2.5.4 Digital copy control descriptor

This descriptor is used to indicate a program, digital copy control information of an elementary stream composing program, and maximum transmission rate.

When the descriptor is transmitted in PMT, the component control flag should always be "0". When this descriptor exists in the first descriptor loop, this information is applied to all elementary streams composing the program. When this descriptor is in the second descriptor loop, it is designated in each elementary stream. When designation to whole program and to individual elementary stream differs, designation to individual elementary stream has the priority.

When this descriptor is transmitted in multiple tables, information priority which the descriptor indicates is in the order of PMT>EIT>SDT.

2.5.5 Emergency information descriptor

This descriptor is transmitted when the emergency warning broadcasting is made and includes necessary information and function as emergency warning signal, which is transmitted as the audio signal formerly.

2.5.6 Target region descriptor

The target region descriptor indicates the region that is the target of that service when it is placed in

the first loop and the target of that component when it is placed in the second loop. When the descriptor is not encoded, it means that target of that component is all areas. When the descriptor is encoded, it is recommended that the IRDs in the target area receive this component as default.

2.5.7 Video decode control descriptor

The video decode control descriptor is placed in the second loop and used to receive still picture composed of MPEG-I picture transmitted in small transmission speed and to have smooth indication when switched to video encoding method.

2.5.8 Country availability descriptor

This descriptor is used to indicate if the service is available in a special country.

This descriptor can be used twice at maximum within the program loop of the PMT, once to indicate the country list where the service is available and once to list the countries where the service is not available.

2.5.9 Component descriptor

This descriptor compensates for the use in the EIT to specify all streams, which composes the service and can be used in the PMT. This descriptor can be used only once in the ES loop of the PMT.

2.5.10 Parental rating descriptor

This descriptor is used to rate the program during broadcast based on age or other judgment standard to prevent young people from viewing inappropriate programs.

2.5.11 Linkage descriptor

This descriptor is used to give a link to another service. If it appears in the first loop, it links to other service that is attached to this service. This descriptor is allowed only once in the first loop. Transmission of this descriptor is optional. The meaning of the descriptor depends on the value of the linkage_type.

If the linkage_type is:

- 0x03, it refers to a CA substitution service for this service.

The meanings of other values of linkage_type are not defined in this context. Note that linkage_type does not indicate the service_type of the referenced service. An example of the intended use of the linkage descriptor is that when access to this service is denied by the conditional access system, and

when the CA substitution service exists to the selected service, information necessary to switch to the CA substitution service can be transmitted.

2.5.12 Content availability descriptor

This descriptor, which is used in combination with the digital copy control descriptor, describes information to control the record and output of each program and the elementary streams that constitute the program.

When this descriptor is in the first descriptor loop, the information applies to all the elementary stream that constitutes the program. When this descriptor is in the second descriptor loop, specific information is applied to each elementary stream. When specifications applied are different between the entire program and each elementary stream, priority is given to the specifications for each elementary stream.

When this descriptor is transmitted by multiple tables, the priority of information expressed by this descriptor is in the order of PMT, EIT, and SDT.

2.6 Descriptors of the Time Offset Table

Composition of the TOT is indicated in table 5-9 of Part 2 of this standard. The TOT includes all items defined in the TDT and adds only the descriptor area. This descriptor area can map the descriptor only when the time offset time changing date and the time (set value of time_of_change) of next time are clear, and not mapped in other case.

2.6.1 Local time offset descriptor

This descriptor is mapped to the descriptor area in the TOT to add regular offset to the transmitted hour (UTC + 9 hours) and indication hour to human, when executing local time system.

2.7 Stuffing descriptor

This descriptor can be placed anywhere, by which the descriptor is usable in SI. This descriptor is used to fill up the table or to make enabled descriptor to non-operation status for a certain reason (such as re-multiple, etc.) The IRDs should skip the stuff descriptor.

2.8 ISO 13818-1 descriptors

The following ISO/IEC 13818-1 (MPEG-2) descriptors can be expected in the SI bit streams:

- registration_descriptor;
- private_data_descriptor;

- copyright_descriptor;
- ISO_639_language_descriptor.

This descriptor lists the different languages in which a service/event is broadcast. This descriptor may be present in the SDT (and in the EIT). When present, the descriptor can be used by the IRD to select services or events with a language criterion. When this descriptor is used within the SI bit streams the audio type field should be set to the value 0x00 (undefined).

The meaning of other MPEG-2 descriptors is not defined if included in the SI Tables.

2.9 Unknown descriptors

If an unknown descriptor appears in a context where its meaning is not specified in this standard, or if the IRD encounters a descriptor with an unrecognized tag, the IRD is recommended to skip over that descriptor (using the length field) and proceed with decoding the following SI data.

2.10 Broadcaster information table descriptor

The construction of the BIT is specified in table 5-13, part 2 of this standard.

2.10.1 First descriptor area (Original network group)

In the first descriptor area of the BIT, the SI descriptors in this sub-clause are defined.

2.10.1.1 SI transmission parameter descriptor

When this descriptor is placed in the first descriptor area of the BIT, it is used to indicate the SI transmission parameter information operated commonly in the original network. This descriptor can be placed more than once in the same area. This is because for enabling transmission of the parameter to be used in the near future beforehand, as well as transmission of the actually enabled parameter, when changing the SI transmission parameter from a certain time. The changing time of the parameter, either enabled or disabled, is indicated with the parameter version number and update_time of the descriptor.

2.10.1.2 SI prime TS descriptor

When this descriptor is placed in the first descriptor area of the BIT (original network group), the identification information and transmission parameter of the SI prime TS of the network (TS of the special transmission style regarding the SI) is provided.

In the table description length byte, both NBIT and LDT information are provided. Even when they are the default parameter, description is not omitted, as it is the judgment reference of the table usage for the IRD. That is, when there is no description, it means that the table is not transmitted.

2.10.2 Second descriptor area (broadcaster group)

In the second descriptor area of the BIT, the SI descriptors in this sub-clause are defined.

2.10.2.1 Broadcaster name descriptor

This descriptor is used to transmit the broadcaster name. Only one descriptor can be placed for one broadcaster group.

2.10.2.2 Service list descriptor

This descriptor can provide a list of the service and service type in each broadcaster. One descriptor can be placed for one broadcaster group.

2.10.2.3 SI transmission parameter descriptor

When this descriptor is placed in the second descriptor area of the BIT, it is used to indicate the SI transmission parameter information operated commonly in the broadcaster. When the SI transmission parameter operated in the broadcaster is the same as the SI transmission parameter operated in the original network common placed in the first descriptor area, this descriptor does not have to be placed in the second descriptor area. This descriptor can be placed more than once in the same area. This is because it is for enabling transmission of the parameter to be used in the near future beforehand, as well as transmission of the actually enabled parameter, when changing the SI transmission parameter from a certain time in the broadcaster. The changing time of the parameter, either enabled or disabled, is indicated with the parameter version number and update_time of the descriptor for each broadcaster group.

2.10.2.4 Extended broadcaster descriptor

This descriptor is used for describing the extension information of broadcasters. Terrestrial broadcasters are identified in digital terrestrial television broadcasting, and terrestrial audio broadcasters are identified in digital terrestrial sound broadcasting.

A terrestrial broadcaster may share the same NVRAM in the receiver with terrestrial broadcasters who are out of the service area or broadcasters of other networks. Other than the access right to the NVRAM, this descriptor can also be used, when a mobile receiver moves out of the service area of

a digital terrestrial television broadcaster, for describing information needed to tune in to terrestrial broadcasters of other areas who might be broadcasting the same program. Similar use of information is possible also in the case of a terrestrial sound broadcaster.

For the above purposes, this descriptor is used for grouping the relation of a terrestrial broadcaster with other terrestrial broadcasters and broadcasters of other networks as well as the relation of a terrestrial audio broadcaster with other terrestrial audio broadcasters and broadcasters of other networks.

2.10.2.5 Hyperlink descriptor

This descriptor is used to specify for each broadcaster the URI of the portal link destination and the URI of the authority, which allow the access of receiver units. Multiple hyperlink descriptors can be placed for one broadcaster group. The URI of the portal link destination corresponds to the URI of the BML document provided by the broadcaster for the contract between the broadcaster and the users. The authority is the character string used as the name space for each broadcaster when accumulating server-type contents in server-type broadcasting receivers.

2.11 Network board information table descriptor

The construction of the NBIT is specified in table 5-14, part 2 of this standard.

2.11.1 Board information descriptor

When this descriptor is placed in the NBIT, the title and the content of the board information are provided in text type.

2.12 Linkage description table descriptor

The construction of the LDT is shown in table 5-15, part 2 of this standard.

2.12.1 Short event descriptor

Operation of this descriptor, which is linked with the EIT using the LDT linkage descriptor, shall be in accordance with the operation of the same descriptor in the EIT.

2.12.2 Extended event descriptor

Operation of this descriptor, which is linked with the EIT using the LDT linkage descriptor, shall be in accordance with the operation of the same descriptor in the EIT.

When linking from LDT linkage descriptor to the LDT, the item name is not described in cases where the descriptor identification is in independent style.

3. Program Specific Information (PSI) and SI operational interaction states

For the description of a service state the following four columns of table 3-1 are relevant: Program Association Table (PAT), PMT, SDT and EIT. The possible indications given by these tables for a service are listed in table 3-1. The first three columns and the fifth column give the possible combinations of the existence of the four tables, the fourth column lists the relevant combinations of the running status bits in the SDT.

For information about the states of the running_status field in event information, see sub-clause 1.4.

Table 3-1 Service state

Service present in					State of the service
PAT	PMT	SDT	SDT running status	EIT p/f	
Yes	Yes	Yes	Running or undefined	Yes	Service is running and broadcasting
No	No	Yes	Not running or undefined	No	Service definition still exists but the elementary stream does not exist and the broadcasting is not made (stopped) e.g. before broadcasting start or after broadcasting.
Yes	Yes	Yes	Pausing	Yes	Service definition still exists and the elementary stream exists and the broadcasting is not made (stopped) e.g. Other service guide or test broadcasting during broadcasting stop time.
No	No	Yes	Start within several seconds or undefined	Yes	Service definition still exists and broadcasting will start soon (stopped)
No	No	No	-	No	Under preparation, starting to make the service or corresponding to the end status of the service (service does not exist)

* All statuses other than listed above are in transition status.

4. Application

The syntax of SI is designed so that it operates under a wide range of operation conditions. Usage of SI in some applications is described (or illustrated) herein.

4.1 NVOD service

In MPEG-2, a method to transmit multiple video programs at once on one Transport Stream is provided. This has the possibility to provide the NVOD service by one broadcast service provider. This clause explains how such service can be realized or how to describe such service in SI.

A concept to provide one service as 6 services by shifting time is shown in figure 4-1. This is the simplest form of such service. All programs are the same in all channels. (Other forms, such as inserting different commercial messages between programs, can also be made.)

Figure 4-1 Example of NVOD service

In order to describe such NVOD service by former SI, event information table (EIT) should be transmitted 6 times repeatedly. Instead of this method, a concept of "reference service" is used herein.

"Reference service" is a kind of fictional service, and provides the means to relate the time shift services (service 1 to 6) during transmission with SI. This "reference service" is identified by the reference service identifier linked to the description common to the event in all the services belonging to the NVOD. The event information table (EIT) of the reference service always exists in the Transport Stream, by which the NVOD service is transmitted. Each time, the shift service is completely referred to Transport Stream identifier, original network identifier, and service identifier and these services are listed to the NVOD reference descriptor. Moreover, each time, the shift service is described with time shift service descriptor, which designates the reference description. Those are shown in figure 4-2.

Figure 4-2 Description of SI in NVOD service

By using this method, data quantity can be reduced to 1/5. All the start times of the "reference service event information table" are set to "1" which is an invalid value, and the correct start time of each event is given in the EIT of each time shift service.

4.2 Mosaic services

4.2.1 General consideration

Mosaic services can be spread out over several TSs. A complete mosaic system can be organized in a tree structure.

A mosaic component is a collection of different video images to form a coded MPEG-2 video stream. The merging of the video images is performed at the source level, in such a way that at the display each image will occupy a specific area of the screen.

Each specific area is called a logical cell. Logical cells are composed of elementary cell(s). The mosaic screen is subdivided by a maximum of 8×8 elementary cells. Each elementary cell is numbered. A logical cell is a collection of elementary cells. Each logical cell is identified by a unique `logical_cell_id`.

The mosaic descriptor identifies the elementary cells (see figure 4-3), groups different elementary cells to form logical cells (see figure 4-4), and establishes a link between the content of all or part of the logical cell and the corresponding information carried in the SDT or EIT or BAT. Thus there is a close association between the mosaic descriptor and other SI Tables. The mosaic descriptor may be placed in either or both of the SDT and PMT sections for the mosaic service. Use in the SDT reduces the amount of interaction between the SI and MPEG Tables. However, a single mosaic service containing multiple video components can only be described by having the mosaic descriptor appearing multiple times within the PMT section. Some logical cells may have no link to SI (see figure 4-4).

Figure 4-4 Examples of logical cell organization and content

4.2.2 Relationship between mosaic service and SI/PSI table

Algorithm to look for a mosaic service:

a) check the SDT Tables (actual TS / other TSs);

b) if a mosaic service exists:

- go to the corresponding TS;
- process the PAT and PMT;
- display the mosaic service;
- look after the content of the mosaic service:

- if you are interested by the content of one logical cell and if it is related to:

- a bouquet: display the information of the corresponding BAT, go forward or cancel;
- a service: display the information of the corresponding SDT, process the PAT and the PMT and display the selected service;
- an event: display the information of the corresponding EIT, process the PAT and the PMT and display the selected event;
- a mosaic service: display the information of the corresponding SDT, process the PAT, the PMT, display the selected mosaic service, and go to “-look after the content of the mosaic service”.

4.3 Transitions at broadcast delivery media boundaries

A very common broadcast delivery media infrastructure will be, that signals received from a satellite are converted and rebroadcast on a cable network. Depending on the size of the network, various technical options exist to facilitate these transitions.

4.3.1 Seamless transitions

A simple and low-cost solution is to remove the Quadrature Phase Shift Keying (QPSK) modulation from a satellite signal and replace it with a Quadrature Amplitude Modulation (QAM) suitable for the cable system. This mode is usually called a seamless transition. The major complication in this seamless mode is that the bit stream is left unchanged, which causes the NIT to be invalid for the actual delivery system to which the IRD is connected, for example a cable system.

Seamless transitions are supported by the SI System, with the proviso that it must be readily possible for the IRD to identify whether the NIT information is valid. The rules of operation specified in subclause 1.1 permit invalid NIT data in the case that applicable delivery system descriptors are not given for the actual delivery system.

The NIT is intended to simplify the set-up and installation procedure for the viewers, and to signal changes of tuning information. However, since it is impossible after a seamless transition of a broadcast delivery media boundary always to maintain valid information in the NIT, the IRD may require mechanisms in addition to reception of the NIT to obtain tuning data.

The support of seamless network transitions is based on the definition of a unique identification mechanism for a TS. The `transport_stream_id` field, as specified in the MPEG-2 standard, allows

65,536 TSs to be uniquely identified. If `transport_stream_id` values are uniquely assigned to multiplex originators, this number is considered too small. Thus, the range of unique identifications of TSs has been extended in the SI by a field called `original_network_id` of 16 bits. The concatenation of these 2 fields results in 4,294,967,296 unique identifiers for TSs. This gives sufficient room to allow for a unique identification of TSs without requiring a registration procedure.

Given this unique identification of the TSs, it is then possible to build IRDs that do not require a correct NIT for correct installation purposes. In order to support seamless transitions of TSs for small cable systems it is highly recommended that IRDs are able to initiate a frequency scan and store the unique TS identifiers with the sets of delivery system parameters. Within this procedure the same information as carried in the NIT can be obtained. However, the presence of a NIT does provide certain advantages for installation set-up and network management purposes.

In a seamless mode of operation, an IRD is able to detect the permitted instances of incorrect NIT data, even though no modifications to the bit stream have been made. In general, a network transition will occur between two different types of networks, e.g. from satellite to cable. In this case, the detection of an incorrect NIT is based on the value of the `descriptor_tag` in the NIT's `delivery_system_descriptor`. If the transition is between networks of the same type, the NIT should be replaced (see subclause 4.3.2) by either a valid NIT or a NIT for another type of network. After the detection of an incorrect NIT, the IRD should be able to initialize itself correctly, e.g. by using a frequency scanning procedure.

4.3.2 Non-seamless transitions without re-multiplexing

A slightly more complex option is to restore the TS packet bit stream and to perform some selective TS packet replacements in the TS. Such a packet replacement option does not require a re-timestamp operation and is of relatively low complexity. Some error handling operations need to be implemented in order to deal with the unrecoverable errors in the satellite signal and with lost TS packets. The NIT is carried in TS packets with a unique Packet Identifier (PID) value which allow the replacement function to be based on simple PID filter logic.

If a network transition is based on a TS packet replacement function, it is desirable that the new NIT information is stored and managed at the network boundary. This is the logical location of, as each network operator will demand the control over the frequency allocation in his network. For this local control to be as simple as possible, a fixed PID value is selected for TS packets carrying NIT

data. A certain minimum data rate for the transmission of NIT data is specified to allow the replacement function to meet the minimum repetition time for the replacement NIT.

4.3.3 Transitions with re-multiplexing

The most complicated and expensive solution is to combine two or more TSs into a single one at the broadcast delivery media boundary. This re-multiplexing also involves the re-timing of the TS packets and the generation of a new SI data stream. The SI data in other TSs might in this case also be incorrect, which requires the checking and regeneration of the SI data in all TSs in the network. This option will only be feasible for very large networks.

4.4 Mixed multiple programming (Madara-broadcasting)

This clause explains usage of SI when mixed multiple programming (hereinafter referred to as Madara-broadcasting) broadcast by switching the HDTV or plural SDTVs in time series within the same band area is made.

4.4.1 Service image in Madara-broadcasting

There are three service images in the Madara-broadcasting: when all service_id exists all the time, when a part of SDTV service_id stops during the HDTV service broadcasting, and when the HDTV service_id and SDTV service_id are defined as different services. Usage of the SI in each case image is explained. The number of the service_id and ES_PID herein is one example.

4.4.1.1 When all service_id exists all the time

Madara-broadcasting when all service exists all the time is allocated with elementary PID (ES_PID) as shown in table 4-1 and services are broadcast as shown in table 4-5.

Table 4-1 Entry sample of ES_PID in Madara-broadcasting when all services exist all the time

service_id	ES_PID entered in PMT	
	SDTV	HDTV
0x0001	0x0030	0x0033
0x0002	0x0031	0x0033
0x0003	0x0032	0x0033

service_id	19:00	20:00	21:00
0x0001	SDTV(ES_PID=0x0030)	HDTV(ES_PID=0x0033)	SDTV(ES_PID=0x0030)
0x0002	SDTV(ES_PID=0x0031)		SDTV(ES_PID=0x0031)
0x0003	SDTV(ES_PID=0x0032)		SDTV(ES_PID=0x0032)

Figure 4-5 Service image of the Madara-broadcasting in which all services exists all the time

4.4.1.2 When a part of SDTV services stops

While the HDTV service is broadcast, Madara-broadcasting, which a part of SDTV services pause is allocated with ES_PID as shown in table 4-2 and services are broadcast as shown in figure 4-6.

Table 4-2 Entry sample of ES_PID in Madara-broadcasting which part of service pauses

service_id	ES_PID entered in PMT	
	SDTV	HDTV
0x0001	0x0030	0x0033
0x0002	0x0031	–
0x0003	0x0032	–

service_id	19:00	20:00	21:00
0x0001	SDTV(ES_PID=0x0030)	HDTV(ES_PID=0x0033)	SDTV(ES_PID=0x0030)
0x0002	SDTV(ES_PID=0x0031)	pause	SDTV(ES_PID=0x0031)
0x0003	SDTV(ES_PID=0x0032)	pause	SDTV(ES_PID=0x0032)

Figure 4-6 Service image of the Madara-broadcasting which part of services pause

4.4.1.3 When the HDTV service and SDTV service are defined as different services

The Madara-broadcasting, by which the HDTV service and SDTV services are defined as different services, is allocated with the elementary PID as shown in table 4-3 and the services are broadcast as shown in figure 4-7.

Table 4-3 Entry sample of ES_PID which the HDTV service and SDTV services are defined as different services

service_id	ES_PID entered in PMT	
	SDTV	HDTV
0x0001	0x0030	—
0x0002	0x0031	—
0x0003	0x0032	—
0x0004	—	0x0033

service_id	19:00	20:00	21:00
0x0001	SDTV(ES_PID=0x0030)	pause	SDTV(ES_PID=0x0030)
0x0002	SDTV(ES_PID=0x0031)	pause	SDTV(ES_PID=0x0031)
0x0003	SDTV(ES_PID=0x0032)	pause	SDTV(ES_PID=0x0032)
0x0004	Stop	HDTV(ES_PID=0x0033)	Stop

Figure 4-7 Service image when the HDTV service and SDTV services are defined as different services

4.4.2 Seamless switching of HDTV/SDTV

Usage of SI to switch the HDTV and SDTV seamlessly is explained.

4.4.2.1 Presupposition condition

- a) PTS and DTS are synchronized between video ESs of target HDTV and SDTV.

* STC of both encoding equipment are synchronized

- b) The GOP is synchronized between the video ESs of the target HDTV and SDTV.
- c) The video ES on the ending transmission side should add the sequence end code after the final frame of the GOP transmission is finished, before ending.
- d) The video ES on the starting transmission side should start as the closed GOP having a sequence header.
- e) The video ES on the ending transmission side and the video ES on the starting transmission side should not be overlapped on TS.

There should be no gap which underflows buffer for the video ES of the IRD equipment.

4.4.2.2 PMT procedure

a) Updating of the PMT should be 0.5 to 2.0 sec. prior to switching control time between the HDTV and SDTV.

* Actual switching time of the video ES should be delayed 0.0 to 0.5 sec. to control time as there is a time lag in the cycle of 500.5ms in 1 GOP (in case of 15 frame) though the service control device is controlled in correct seconds generally.

b) At least the PMT before and after the switching control time of the HDTV and SDTV should include the video control descriptor.

* The IRD equipment corresponding to the seamless switching detects updating of the PMT version number, and selection of the video ES and decoding of the video are made according to the change of the video encode format of the video control descriptor.

c) The `sequence_end_code_flag` included in the video decode control descriptor should indicate whether or not the sequence end code exists when the transmission of the video ES indicated by the PMT ends.

4.4.2.3 Timing chart

Switching of the video ESs in a multiplied TS and version upgrade position of the PMT are shown in figure 4-8.

Figure 4-8 Timing chart of the seamless switching

Postscript

In the signal transmission multiplied in MPEG-2 Systems, many control signals are related, and the multiple style has a complex construction, by which they are combined each other. This appendix is attached to the standard because in organization and transmission of SI, which simplifies the users program selection, it is important to grasp and understand fully those characteristics and restricted items of those multiple system. It is recommended to use this appendix fully for smooth actual operation when the broadcast service providers and broadcast equipment production company use this standard.

This appendix is in accordance with ETSI ETR 211 "Digital broadcasting systems for television implementation guidelines for the use of MPEG-2 systems" issued as a technical document as a European area standard by ETSI, which is drafted by EP-DVB and EBU. Refer to the original technical documents when necessary.
