## 9.2.1.3\_C.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.1.3\_C.1.4.2.

## 9.2.1.4

## 9.2.1.4\_C TDD CQI Reporting under AWGN conditions – PUCCH 1-0 for eICIC

## 9.2.1.4\_C.1 TDD CQI Reporting under AWGN conditions – PUCCH 1-0 for eICIC (non-MBSFN ABS)

## 9.2.1.4\_C.1.1 Test purpose

To verify the variance of the wideband CQI reports - in subframes overlapping with aggressor cell ABS and non-ABS subframes - is within the limits defined and a PDSCH BLER of 10% falls between the transport format based median CQI-1 and median CQI or the transport format based median CQI and median CQI +1.

#### 9.2.1.4\_C.1.2 Test applicability

This test applies to E-UTRA TDD UE Category  $\geq 1$  release 10 and forward. Applicability requires support for FGI bit115.

#### 9.2.1.4\_C.1.3 Minimum conformance requirements

For the parameters specified in Table 9.2.1.4\_C.1.3-1, and using the downlink physical channels specified in tables C.3.2-1 for Cell 1, C.3.3-1 for Cell2 and C.3.2-2, the reported CQI value according to RC.2 TDD / RC.6 TDD in Table A.4-1 in subframes overlapping with aggressor cell ABS and non-ABS subframes shall be in the range of  $\pm 1$  of the reported median more than 90% of the time. If the PDSCH BLER in non-ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets  $C_{CSI,1}$  is less than or equal to 0.1, the BLER in non-ABS subframes using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER in non-ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in non-ABS subframes using transport format indicated by (median CQI - 1) shall be less than or equal to 0.1. The value of the median CQI obtained by reports in CSI subframe sets  $C_{CSI,0}$  minus the median CQI obtained by reports in CSI subframe sets  $C_{CSI,1}$  shall be larger than or equal to 2 and less than or equal to 5 in Test 1 and shall be larger than or equal to 0 and less than or equal to 1 in Test 2.

Note 1:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 2:	ABS pattern as defined in [14].
Note 3:	As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in [5].
Note 4:	Time-domain measurement resource restriction pattern for PCell measurements as defined in [5]
Note 5:	Cell 1 is the serving cell. Cell 2 is the aggressor cell. The number of the CRS ports in Cell1 and Cell2 is the same.
Note 6:	This noise is applied in OFDM symbols #1, #2, #3, #5, #6, #8, #9, #10, #12, #13 of a subframe overlapping with the aggressor ABS.
Note 7:	This noise is applied in OFDM symbols #0, #4, #7, #11 of a subframe overlapping with the aggressor ABS
Note 8:	This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS.
Note 9:	Downlink physical channel setup in Cell 2 in accordance with Annex C.3.3 applying OCNG pattern as defined in Annex A.5.2.5.
Note 10:	Reference measurement channel in Cell 1 RC.2 TDD according to Table A.4-1 for UE Category 2-8 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1, and RC.6 TDD according to Table A.4-1 for Category 1 with one/two sided dynamic OCNG Pattern OP.1/2 TDD as described in Annex A.5.2.1 and Annex A.5.2.2.
Note 11:	To avoid collisions between HARQ-ACK and wideband CQI it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#4 and #9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#8 and #3.
Note 12:	<i>cqi-pmi-ConfigurationIndex</i> is applied for $C_{CSI,0}$ .
Note 13:	<i>cqi-pmi-ConfigurationIndex2</i> is applied for $C_{CSI,1}$ .

The normative reference for this requirement is TS 36.101 [2] clause 9.2.1.4.

#### 9.2.1.4\_C.1.4 Test description

##### 9.2.1.4\_C.14.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.40.
2. The parameter settings for the cell are set up according to Table 9.2.1.4\_C.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.1.4\_C.1.4.3.

##### 9.2.1.4\_C.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.1.4\_C.1.3-1 and C.3.3-1 of Annex C.3.3 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{RNTI}$  to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF #8 and #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report for subframe set  $C_{CSI,0}$  using PUCCH and for subframe set  $C_{CSI,1}$  using PUSCH. Continue transmission of the PDSCH until 2000 wideband CQI reports, respectively for

subframe set  $C_{CSI,0}$  and for subframe set  $C_{CSI,1}$ , have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI reports.

3. Set up a relative frequency distribution for the reported wideband CQI-values for subframe set  $C_{CSI,0}$  and for subframe set  $C_{CSI,1}$ . Calculate respectively the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). These CQI-values are declared respectively as wideband Median CQI<sub>0</sub> and Median CQI<sub>1</sub>.
4. If Median CQI<sub>0</sub> is not equal to 1 or 15, and 1800 or more of the wideband CQI values for subframe set  $C_{CSI,0}$  are in the range  $(\text{Median CQI}_0 - 1) \leq \text{Median CQI}_0 \leq (\text{Median CQI}_0 + 1)$  AND Median CQI<sub>1</sub> is not equal to 1 or 15, and 1800 or more of the wideband CQI values for subframe set  $C_{CSI,1}$  are in the range  $(\text{Median CQI}_1 - 1) \leq \text{Median CQI}_1 \leq (\text{Median CQI}_1 + 1)$  AND the difference Median CQI<sub>0</sub> minus Median CQI<sub>1</sub> is  $2 \leq (\text{Median CQI}_0 - \text{Median CQI}_1) \leq 5$  for Test 1 and  $0 \leq (\text{Median CQI}_0 - \text{Median CQI}_1) \leq 1$  for Test 2, then continue with step 5, otherwise go to step 8.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC only in non-ABS subframes according to the wideband Median CQI<sub>1</sub> value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF #8 and #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report for subframe set  $C_{CSI,0}$  using PUCCH and for subframe set  $C_{CSI,1}$  using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses reaches 1000.

For the filtered ACK and NACK responses if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC only in non-ABS subframes according to the wideband Median CQI<sub>1</sub>+1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF #8 and #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report for subframe set  $C_{CSI,0}$  using PUCCH and for subframe set  $C_{CSI,1}$  using PUSCH. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$

then pass the UE for this test and go to step 9, otherwise go to step 8.

7. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC only in non-ABS subframes according to the wideband Median-CQI<sub>1</sub>-1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF #8 and #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report for subframe set  $C_{CSI,0}$  using PUCCH and for subframe set  $C_{CSI,1}$  using PUSCH. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$

then pass the UE for this test and go to step 9, otherwise go to step 8.

8. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 7) for the other SNR point as appropriate. Otherwise fail the UE.

9. If both tests have not been done, then repeat the same procedure (steps 1 to 8) with test conditions according to the table 9.2.1.4\_C.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

## 9.2.1.4\_C.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.1.4\_C.1.4.2.

## 9.2.1.5

### 9.2.1.5\_E FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for feliCIC

#### 9.2.1.5\_E.1 FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for feliCIC (non-MBSFN ABS)

##### 9.2.1.5\_E.1.1 Test purpose

To verify the variance of the wideband CQI reports - in subframes overlapping with aggressor cell ABS and non-ABS subframes is within the limits defined and a PDSCH BLER of 10% falls between the transport format based median CQI-1 and median CQI or the transport format based median CQI and median CQI +1.

##### 9.2.1.5\_E.1.2 Test applicability

This test applies to E-UTRA FDD UE and CRS interference handling - UE Category  $\geq 2$  - release 11 and forward. Applicability requires support of FGI bit 115.

##### 9.2.1.5\_E.1.3 Minimum conformance requirements

For the parameters specified in Table 9.2.1.5\_E.1.3-1, and using the downlink physical channels specified in tables C.3.2-1 for Cell 1, C.3.3-2 for Cell 2 and Cell 3, and C.3.2-2, the reported CQI value according to RC.2 FDD in Table A.4-1 in subframes overlapping with aggressor cell ABS and non-ABS subframes shall be in the range of  $\pm 1$  of the reported median more than 90% of the time.

For test 1, if the PDSCH BLER in ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets  $C_{CSL0}$  is less than or equal to 0.1, the BLER in ABS subframes using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER in ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in ABS subframes using transport format indicated by (median CQI – 1) shall be less than or equal to 0.1.

For test 2, if the PDSCH BLER in ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets  $C_{CSL0}$  is less than or equal to 0.1, the BLER in ABS subframes using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER in ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in ABS subframes using transport format indicated by (median CQI – 1) shall be less than or equal to 0.1.

For test 2, if the PDSCH BLER in non-ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets  $C_{CSL1}$  is less than or equal to 0.1, the BLER in non-ABS subframes using the transport format indicated by the (median CQI + 2) shall be greater than 0.1. If the PDSCH BLER in non-ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in non-ABS subframes using transport format indicated by (median CQI – 1) shall be less than or equal to 0.1.

Note 6:	Cell 1 is the serving cell. Cell 2 and Cell 3 are the aggressor cells. The number of the CRS ports in Cell 1, Cell 2, and Cell 3 are the same.
Note 7:	This noise is applied in OFDM symbols #1, #2, #3, #5, #6, #8, #9, #10, #12, #13 of a subframe overlapping with the aggressor ABS.
Note 8:	This noise is applied in OFDM symbols #0, #4, #7, #11 of a subframe overlapping with the aggressor ABS.
Note 9:	This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS.
Note 10:	Downlink physical channel setup in Cell 2 and Cell 3 in accordance with Annex TS 36.521-1 [10] C.3.3 applying OCN pattern as defined in TS 36.521-1 [10] Annex A.5.1.5
Note 11:	Reference measurement channel in Cell 1 RC.2 FDD according to Table A.4-1 with one sided dynamic OCN Pattern OP.1 FDD as described in Annex A.5.1.1.
Note 12:	To avoid collisions between HARQ-ACK and wideband CQI it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#4 and #9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#8 and #3.
Note 13:	<i>cqi-pmi-ConfigurationIndex</i> is applied for $C_{CSI,0}$ .
Note 14:	<i>cqi-pmi-ConfigurationIndex2</i> is applied for $C_{CSI,1}$ .

The normative reference for this requirement is TS 36.101 [2] clause 9.2.1.5.

#### 9.2.1.5\_E.1.4 Test description

##### 9.2.1.5\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.48 (without faders) for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Table 9.2.1.5\_E.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 9.2.1.5\_E.1.4.3.

##### 9.2.1.5\_E.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.1.5\_E.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{RNTI}$  to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF#8 and #3 (Table A.4.1-1). The

UE will send ACK/NACK and periodic CQI report for subframe set  $C_{CSI,0}$  using PUCCH and for subframe set  $C_{CSI,1}$  using PUSCH. Continue transmission of the PDSCH until 2000 wideband CQI reports, respectively for subframe set  $C_{CSI,0}$  and for subframe set  $C_{CSI,1}$ , have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband CQI reports.

- Set up a relative frequency distribution for the reported wideband CQI-values for subframe set  $C_{CSI,0}$  and for subframe set  $C_{CSI,1}$ . Calculate respectively the median value (wideband Median CQI is the wideband CQI that is at or crosses 50% distribution from the lower wideband CQI side). These CQI-values are declared as wideband Median CQI<sub>0</sub> and Median CQI<sub>1</sub>.

For Test1

- If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI values for subframe set  $C_{CSI,0}$  are in the range  $(\text{Median CQI}_0 - 1) \leq \text{Median CQI}_0 \leq (\text{Median CQI}_0 + 1)$ , then continue with step 5, otherwise go to step 8.5. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC only in ABS subframes according to the wideband median- CQI<sub>0</sub> value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF#8 and #3 (Table A.4.1-1). For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses reaches 1000.

For the filtered ACK and NACK responses if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 6, otherwise go to step 7.

- The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC only in ABS subframes according to the wideband median- CQI<sub>0</sub>+1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF#8 and #3 (Table A.4.1-1). For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$

then pass the UE for this test and go to step 13, otherwise go to step 8.

- The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC only in ABS subframes according to the wideband median- CQI<sub>0</sub>-1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF#8 and #3 (Table A.4.1-1). For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$

then pass the UE for this test and go to step 13, otherwise go to step 8.

- If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 7) for the other SNR point as appropriate. Otherwise fail the UE.

For Test2

- If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI values for subframe set  $C_{CSI,0}$  are in the range  $(\text{Median CQI}_0 - 1) \leq \text{Median CQI}_0 \leq (\text{Median CQI}_0 + 1)$  AND Median CQI<sub>1</sub> is not equal to 1 or 15, and 1800 or more of the wideband CQI values for subframe set  $C_{CSI,1}$  are in the range  $(\text{Median CQI}_1 - 1) \leq \text{Median CQI}_1 \leq (\text{Median CQI}_1 + 1)$ , then continue with step 5, otherwise go to step 12.
- The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C\_RNTI$  to transmit the DL RMC in ABS subframes according to the wideband median- CQI<sub>0</sub> value and Non-ABS subframes according to the wideband median- CQI<sub>1</sub> value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF#8 and #3 (Table A.4.1-1). For

any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses reaches 1000.

For the filtered ACK and NACK responses in ABS and/or Non-ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 6.

For the filtered ACK and NACK responses only in Non-ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 7.

For the filtered ACK and NACK responses only in ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 8, otherwise go to step 11.

6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS subframes according to the wideband median- CQI<sub>0+1</sub> value and Non-ABS subframes according to the wideband median- CQI<sub>1+2</sub> value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF#8 and #3 (Table A.4.1-1). For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

For the filtered ACK and NACK responses in ABS and/or Non-ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$  then pass the UE for this test and go to step 13.

For the filtered ACK and NACK responses only in ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$  then pass the UE for this test and go to step 9.

For the filtered ACK and NACK responses only in Non-ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$  then pass the UE for this test and go to step 10, otherwise go to step 11.

7. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC only in Non-ABS subframes according to the wideband median- CQI<sub>1+2</sub> value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF#8 and #3 (Table A.4.1-1). For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$  then pass the UE for this test and in step 10, otherwise go to step 11

8. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC only in ABS subframes according to the wideband median- CQI<sub>0+1</sub> value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF#8 and #3 (Table A.4.1-1). For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$  then pass the UE for this test and in step 9, otherwise go to step 11.

9. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC only in Non-ABS subframes according to the wideband median- CQI<sub>1-1</sub> value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF#8 and #3 (Table A.4.1-1). For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then pass the UE for this test and go to step 13, otherwise go to step 12.

10. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC only in ABS subframes according to the wideband median- CQI<sub>0-1</sub> value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL

RMC in uplink SF#8 and #3 (Table A.4.1-1). For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then pass the UE for this test and go to step 13, otherwise go to step 12.

11. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS subframes according to the wideband median- CQI<sub>0-1</sub> value, Non-ABS subframes according to the wideband median- CQI<sub>1-1</sub> value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in uplink SF#8 and #3 (Table A.4.1-1). For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

For the filtered ACK and NACK responses in ABS and/or Non-ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then pass the UE for this test and go to step 13, otherwise go to step 12.

12. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 11) for the other SNR point as appropriate. Otherwise fail the UE.
13. If both tests have not been done, then repeat the same procedure (For Test1 steps 1 to 8, For Test2 steps 1 to 12) with test conditions according to the table 9.2.1.5\_E.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

### 9.2.1.5\_E.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.1.5\_E.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

## 9.2.1.6

### 9.2.1.6\_E TDD CQI Reporting under AWGN conditions – PUCCH 1-0 for f<sub>e</sub>ICIC

#### 9.2.1.6\_E.1 TDD CQI Reporting under AWGN conditions – PUCCH 1-0 for f<sub>e</sub>ICIC (non-MBSFN ABS)

##### 9.2.1.6\_E.1.1 Test purpose

To verify the variance of the wideband CQI reports - in subframes overlapping with aggressor cell ABS and non-ABS subframes is within the limits defined and a PDSCH BLER of 10% falls between the transport format based median CQI-1 and median CQI or the transport format based median CQI and median CQI +1.

##### 9.2.1.6\_E.1.2 Test applicability

This test applies to E-UTRA TDD UE and CRS interference handling and ss-CCH interference handling - UE Category  $\geq 2$  - release 11 and forward. Applicability requires support of FGI bit 115.

##### 9.2.1.6\_E.1.3 Minimum conformance requirements

For the parameters specified in Table 9.2.1.6\_E.1.3-1, and using the downlink physical channels specified in tables C.3.2-1 for Cell 1, C.3.3-2 for Cell 2 and Cell 3, and C.3.2-2, the reported CQI value according to RC.2 TDD in Table A.4-1 in subframes overlapping with aggressor cell ABS and non-ABS subframes shall be in the range of  $\pm 1$  of the reported median more than 90% of the time.

For test 1, if the PDSCH BLER in ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets  $C_{CSL0}$  is less than or equal to 0.1, the BLER in ABS subframes using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER in ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in ABS subframes using transport format indicated by (median CQI – 1) shall be less than or equal to 0.1.

For test 2, if the PDSCH BLER in ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets  $C_{CSL0}$  is less than or equal to 0.1, the BLER in ABS subframes using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER in ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in ABS subframes using transport format indicated by (median CQI – 1) shall be less than or equal to 0.1.

For test 2, if the PDSCH BLER in non-ABS subframes using the transport format indicated by median CQI obtained by reports in CSI subframe sets  $C_{CSL1}$  is less than or equal to 0.1, the BLER in non-ABS subframes using the transport format indicated by the (median CQI + 2) shall be greater than 0.1. If the PDSCH BLER in non-ABS subframes using the transport format indicated by the median CQI is greater than 0.1, the BLER in non-ABS subframes using transport format indicated by (median CQI – 1) shall be less than or equal to 0.1.

Table 9.2.1.6\_E.1.3-1: PUCCH 1-0 static test (TDD)

Note 1:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 2:	ABS pattern as defined in [9].
Note 3:	Time-domain measurement resource restriction pattern for PCell measurements as defined in TS 36.331 [5].
Note 4:	As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in TS 36.331 [5].
Note 5:	Time-domain measurement resource restriction pattern for PCell measurements as defined in TS 36.331 [5].
Note 6:	Cell 1 is the serving cell. Cell 2 and Cell 3 are the aggressor cells. The number of the CRS ports in Cell 1, Cell 2, and Cell 3 is the same.
Note 7:	This noise is applied in OFDM symbols #1, #2, #3, #5, #6, #8, #9, #10, #12, #13 of a subframe overlapping with the aggressor ABS.
Note 8:	This noise is applied in OFDM symbols #0, #4, #7, #11 of a subframe overlapping with the aggressor ABS
Note 9:	This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS.
Note 10:	Downlink physical channel setup in Cell 2 and Cell 3 in accordance with TS 36.521-1 [10] Annex C.3.3 applying OCNG pattern as defined in TS 36.521-1 [10] Annex A.5.2.5.
Note 11:	Reference measurement channel in Cell 1 RC.2 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1.
Note 12:	To avoid collisions between HARQ-ACK and wideband CQI it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#4 and #9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#8 and #3.
Note 13:	<i>cqi-pmi-ConfigurationIndex</i> is applied for $C_{CSI,0}$ .
Note 14:	<i>cqi-pmi-ConfigurationIndex2</i> is applied for $C_{CSI,1}$ .

The normative reference for this requirement is TS 36.101 [2] clause 9.2.1.6.

## 9.2.1.6\_E.1.4 Test description

### 9.2.1.6\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.48 (without faders) for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Table 9.2.1.6\_E.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 9.2.1.6\_E.1.4.3.

### 9.2.1.6\_E.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.1.6\_E.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{RNTI}$  to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 in downlink SF#4 and #9 to schedule UL RMC in subframe #8 and subframe #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report for subframe set  $C_{CSI,0}$  using PUCCH and for

subframe set  $C_{CSI,1}$  using PUSCH. Continue transmission of the PDSCH until 2000 wideband CQI reports, respectively for subframe set  $C_{CSI,0}$  and for subframe set  $C_{CSI,1}$ , have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI reports.

3. Set up a relative frequency distribution for the reported wideband CQI-values for subframe set  $C_{CSI,0}$  and for subframe set  $C_{CSI,1}$ . Calculate respectively the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). These CQI-values are declared as wideband Median CQI<sub>0</sub> and Median CQI<sub>1</sub>.

For Test1

4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI values for subframe set  $C_{CSI,0}$  are in the range  $(\text{Median CQI}_0 - 1) \leq \text{Median CQI}_0 \leq (\text{Median CQI}_0 + 1)$  then continue with step 5, otherwise go to step 8.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{RNTI}$  to transmit the DL RMC only in ABS subframes according to the wideband median- CQI<sub>0</sub> value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #8 and subframe #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses reaches 1000.

For the filtered ACK and NACK responses if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{RNTI}$  to transmit the DL RMC only in ABS subframes according to the wideband median- CQI<sub>0</sub>+1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #8 and subframe #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$

then pass the UE for this test and go to step 13, otherwise go to step 8.

7. The SS shall transmit PDSCH via PDCCH DCI format 1A for  $C_{RNTI}$  to transmit the DL RMC only in ABS subframes according to the wideband median- CQI<sub>0</sub>-1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #8 and subframe #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$

then pass the UE for this test and go to step 13, otherwise go to step 8.

8. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 7) for the other SNR point as appropriate. Otherwise fail the UE.

For Test2

4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI values for subframe set  $C_{CSI,0}$  are in the range  $(\text{Median CQI}_0 - 1) \leq \text{Median CQI}_0 \leq (\text{Median CQI}_0 + 1)$  AND Median CQI<sub>1</sub> is not equal to 1 or 15, and 1800 or more of the wideband CQI values for subframe set  $C_{CSI,1}$  are in the range  $(\text{Median CQI}_1 - 1) \leq \text{Median CQI}_1 \leq (\text{Median CQI}_1 + 1)$ , then continue with step 5, otherwise go to step 12.

5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS subframes according to the wideband median- CQI<sub>0</sub> value and Non-ABS subframes according to the wideband median- CQI<sub>1</sub> value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #8 and subframe #3 (Table A.4.1-2). For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses reaches 1000.

For the filtered ACK and NACK responses in ABS and/or Non-ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 6.

For the filtered ACK and NACK responses only in Non-ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 7.

For the filtered ACK and NACK responses only in ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then go to step 8, otherwise go to step 11.

6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS subframes according to the wideband median- CQI<sub>0+1</sub> value and Non-ABS subframes according to the wideband median- CQI<sub>1+2</sub> value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #8 and subframe #3 (Table A.4.1-2). For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

For the filtered ACK and NACK responses in ABS and/or Non-ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$  then pass the UE for this test and go to step 13.

For the filtered ACK and NACK responses only in ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$  then pass the UE for this test and go to step 9.

For the filtered ACK and NACK responses only in Non-ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$  then pass the UE for this test and go to step 10, otherwise go to step 11.

7. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC only in Non-ABS subframes according to the wideband median- CQI<sub>1+2</sub> value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #8 and subframe #3 (Table A.4.1-2). For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$  then pass the UE for this test and in step 10, otherwise go to step 11

8. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC only in ABS subframes according to the wideband median- CQI<sub>0+1</sub> value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$  then pass the UE for this test and in step 9, otherwise go to step 11.

9. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC only in Non-ABS subframes according to the wideband median- CQI<sub>1-1</sub> value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #8 and subframe #3 (Table A.4.1-2). For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then pass the UE for this test and go to step 13, otherwise go to step 12.

10. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC only in ABS subframes according to the wideband median-  $\text{CQI}_{0-1}$  value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #8 and subframe #3 (Table A.4.1-2). For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then pass the UE for this test and go to step 13, otherwise go to step 12.

11. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS subframes according to the wideband median-  $\text{CQI}_{0-1}$  value, Non-ABS subframes according to the wideband median-  $\text{CQI}_{1-1}$  value, and the SS shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #8 and subframe #3 (Table A.4.1-2). For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

For the filtered ACK and NACK responses in ABS and/or Non-ABS subframes if the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  then pass the UE for this test and go to step 13, otherwise go to step 12.

12. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 11) for the other SNR point as appropriate. Otherwise fail the UE.
13. If both tests have not been done, then repeat the same procedure (For Test1 steps 1 to 8, For Test2 steps 1 to 12) with test conditions according to the table 9.2.1.6\_E.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

### 9.2.1.6\_E.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.16\_E.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

### 9.2.1.7 FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for 256QAM in DL

#### 9.2.1.7.1 Test purpose

The same test purpose as in clause 9.2.1.1.1.

#### 9.2.1.7.2 Test applicability

This test applies to E-UTRA FDD UE release 12 and forward of UE Category 11-12 and DL Category  $\geq 11$  that support 256QAM in DL.

#### 9.2.1.7.3 Minimum conformance requirements

The following requirements apply to UE Category 11-12 and DL Category  $\geq 11$ . For the parameters specified in Table 9.2.1.7.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC.1A FDD in Table A.4-1 shall be in the range of  $\pm 1$  of the reported median more than 90% of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI – 1) shall be less than or equal to 0.1.

In this test, 4-bit CQI Table 2 in Table 7.2.3-2 in TS 36.213 [10], and Modulation and TBS index table 2 in Table 7.1.7.1-1A for PDSCH in TS 36.213 [10] are applied.

**Table 9.2.1.7.3-1: PUCCH 1-0 static test (FDD)**

Parameter		Unit	Test 1		Test 2	
Bandwidth		MHz			10	
PDSCH transmission mode					1	
Downlink power allocation	$\rho_A$	dB			0	
	$\rho_B$	dB			0	
	$\sigma$	dB			0	
Propagation condition and antenna configuration			AWGN (1 x 2)			
SNR (Note 2)		dB	-1	0	20	21
$\hat{I}_{or}^{(j)}$		dB[mW/15kHz]	-99	-98	-78	-77
$N_{oc}^{(j)}$		dB[mW/15kHz]	-98		-98	
Max number of HARQ transmissions			1			
Physical channel for CQI reporting			PUCCH Format 2			
PUCCH Report Type			4			
Reporting periodicity		ms	$N_{pd} = 5$			
<i>cqi-pmi-ConfigurationIndex</i>			6			
Note 1: Reference measurement channel RC.1A FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 FDD as described in Annex A.5.1.1.						
Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.						

The normative reference for this requirement is TS 36.101 [2] clause 9.2.1.7.

#### 9.2.1.7.4 Test description

##### 9.2.1.7.4.1 Initial conditions

Same Initial conditions as defined in clause 9.2.1.1.4.1 for 10MHz BW with the following exceptions:

- Instead of Table 9.2.1.1.3-1, use Table 9.2.1.7.3-1.
- Instead of Clause 9.2.1.1.4.3, use Clause 9.2.1.7.4.3.

##### 9.2.1.7.4.2 Test procedure

Same test procedure as defined in clause 9.2.1.1.4.2 for 10MHz BW with the following exceptions:

- Instead of Table 9.2.1.1.3-1, use Table 9.2.1.7.3-1.
- The SS shall transmit PDSCH via PDCCH DCI format 1 instead 1A.

##### 9.2.1.7.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

**Table 9.2.1.7.4.3-1: PhysicalConfigDedicated-DEFAULT**

#### 9.2.1.7.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.1.7.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

#### 9.2.1.8 TDD CQI Reporting under AWGN conditions – PUCCH 1-0 for 256QAM in DL

##### 9.2.1.8.1 Test purpose

The same test purpose as in clause 9.2.1.2.1.

##### 9.2.1.8.2 Test applicability

This test applies to E-UTRA TDD UE release 12 and forward of UE Category 11-12 and DL Category  $\geq 11$  that supports 256QAM in DL.

##### 9.2.1.8.3 Minimum conformance requirements

The following requirements apply to UE Category 11-12 and UE DL Category  $\geq 11$ . For the parameters specified in Table 9.2.1.8.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC.1A TDD in Table A.4-1 shall be in the range of  $\pm 1$  of the reported median more than 90% of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI – 1) shall be less than or equal to 0.1.

In this test, 4-bit CQI Table 2 in Table 7.2.3-2 in TS 36.213 [10], and Modulation and TBS index table 2 in Table 7.1.7.1-1A for PDSCH in TS 36.213 [10] are applied.

Table 9.2.1.8.3-1: PUCCH 1-0 static test (TDD)

Parameter		Unit	Test 1		Test 2	
Bandwidth		MHz			20	
PDSCH transmission mode					1	
Uplink downlink configuration					2	
Special subframe configuration					4	
Downlink power allocation	$\rho_A$	dB			0	
	$\rho_B$	dB			0	
	$\sigma$	dB			0	
Propagation condition and antenna configuration			AWGN (1 x 2)			
SNR (Note 2)		dB	-1	0	20	21

$N_{oc}^{(j)}$		dB[mW/15kHz]	-98		-98	
Max number of HARQ transmissions			1			
Physical channel for CQI reporting			PUSCH (Note 3)			
PUCCH Report Type			4			
Reporting periodicity		ms	$N_{pd} = 5$			
<i>cqi-pmi-ConfigurationIndex</i>			3			
ACK/NACK feedback mode			Multiplexing			
<p>Note 1: Reference measurement channel RC.1A TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1.</p> <p>Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.</p> <p>Note 3: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#7 and #2.</p>						

The normative reference for this requirement is TS 36.101 [2] clause 9.2.1.8.

#### 9.2.1.8.4 Test description

##### 9.2.1.8.4.1 Initial conditions

Same Initial conditions as in clause 9.2.1.2.4.1 with the following exceptions:

- Instead of Table 9.2.1.2.3-1, use Table 9.2.1.8.3-1.
- Instead of Clause 9.2.1.2.4.3, use Clause 9.2.1.8.4.3.

##### 9.2.1.8.4.2 Test procedure

Same test procedure as in clause 9.2.1.2.4.2 with the following exceptions:

- Instead of Table 9.2.1.2.3-1, use Table 9.2.1.8.3-1.
- The SS shall transmit PDSCH via PDCCH DCI format 1 instead 1A

##### 9.2.1.8.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

### 9.2.1.8.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.1.8.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

## 9.2.2 CQI Reporting under AWGN conditions - PUCCH 1-1 (Cell-Specific Reference Symbols)

### 9.2.2.1 FDD CQI Reporting under AWGN conditions – PUCCH 1-1

#### 9.2.2.1.1 Test purpose

To verify the variance of the wideband spatial differential CQI between codeword #0 and codeword #1 are within the limits defined and for both codeword #0 and codeword #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 - 1$  and median  $CQI_1 - 1$  shall be less than or equal to 0.1 and the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 + 1$  and median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

### 9.2.2.1.2 Test applicability

This test applies to E-UTRA FDD release 8 and forward UEs of Category 2 and onwards.

### 9.2.2.1.3 Minimum conformance requirements

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

The following requirements apply to UE Category  $\geq 2$ . For the parameters specified in table 9.2.2.1.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2.2 in TS 36.213 [10]) shall be used to determine the wideband CQI index for codeword #1 as

$$\text{wideband CQI}_1 = \text{wideband CQI}_0 - \text{Codeword 1 offset level}$$

The wideband CQI<sub>1</sub> shall be within the set {median CQI<sub>1</sub> -1, median CQI<sub>1</sub>, median CQI<sub>1</sub> +1} for more than 90% of the time, where the resulting wideband values CQI<sub>1</sub> shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median CQI<sub>0</sub> - 1 and median CQI<sub>1</sub> - 1 shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median CQI<sub>0</sub> + 1 and median CQI<sub>1</sub> + 1 shall be greater than or equal to 0.1.

**Table 9.2.2.1.3-1: PUCCH 1-1 static test (FDD)**

Parameter	Unit	Test 1		Test 2	
Bandwidth	MHz	10			
PDSCH transmission mode		4			
Downlink power allocation	$\rho_A$	dB		-3	
	$\rho_B$	dB		-3	
	$\sigma$	dB		0	
Propagation condition and antenna configuration		Clause B.1 (2 x 2)			
CodeBookSubsetRestriction bitmap		010000			
SNR (Note 2)	dB	10	11	16	17
$\hat{I}_{or}^{(j)}$	dB[mW/15kHz]	-88	-87	-82	-81
$N_{oc}^{(j)}$	dB[mW/15kHz]	-98		-98	
Max number of HARQ transmissions		1			
Physical channel for CQI/PMI reporting		PUCCH Format 2			
PUCCH Report Type for CQI/PMI		2			
PUCCH Report Type for RI		3			
Reporting periodicity	ms	$N_p = 5$			
<i>cqi-pmi-ConfigurationIndex</i>		6			
<i>ri-ConfigIndex</i>		1 (Note 3)			
Note 1:	Reference measurement channel RC.2 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 FDD as described in Annex A.5.1.1				
Note 2:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.				
Note 3:	It is intended to have UL collisions between RI reports and HARQ-ACK, since the RI reports shall not be used by the eNB in this test.				

The normative reference for this requirement is TS 36.101 [2] clause 9.2.2.1.

#### 9.2.2.1.4 Test description

##### 9.2.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.2.2.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.2.1.4.3.

##### 9.2.2.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.2.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI<sub>0</sub> is defined as Wideband CQI of codeword #0 and wideband CQI<sub>1</sub> is calculated according to clause 9.2.2.1.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI<sub>0</sub> is based on the wideband CQI<sub>0</sub> and wideband median CQI<sub>1</sub> is based on the wideband CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI<sub>1</sub> values are in the range (Median CQI<sub>1</sub> - 1) ≤ Median CQI ≤ (Median CQI<sub>1</sub> + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median- CQI<sub>0</sub> - 1 and the transport format of codeword #1 is according to the wideband median CQI<sub>1</sub> - 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK) ≤ 0.1 for both codeword #0 and codeword #1

then and go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median-CQI<sub>0</sub> + 1 and the transport format of codeword #1 is according to the wideband median-CQI<sub>1</sub> + 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK / (ACK + NACK)) ≥ 0.1 for both codeword #0 and codeword #1

then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.2.2.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.2.2.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

#### 9.2.2.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.2.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

#### 9.2.2.1\_D.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.2.1\_D.4.2.

[TT TBD]

### 9.2.2.2 TDD CQI Reporting under AWGN conditions – PUCCH 1-1

#### 9.2.2.2.1 Test purpose

To verify the variance of the wideband spatial differential CQI between codeword #0 and codeword #1 are within the limits defined and for both codeword #0 and codeword #1, the PDSCH BLER using the transport format indicated by the respective wideband median  $CQI_0 - 1$  and wideband median  $CQI_1 - 1$  shall be less than or equal to 0.1 and the PDSCH BLER using the transport format indicated by the respective wideband median  $CQI_0 + 1$  and wideband median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

#### 9.2.2.2.2 Test applicability

This test applies to E-UTRA TDD release 8 and forward UEs of Category 2 and onwards.

#### 9.2.2.2.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 2$ . For the parameters specified in table 9.2.2.2.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2.2 in TS 36.213 [10]) shall be used to determine the wideband CQI index for codeword #1 as:

$$\text{wideband } CQI_1 = \text{wideband } CQI_0 - \text{Codeword 1 offset level}$$

The wideband  $CQI_1$  shall be within the set  $\{\text{median } CQI_1 - 1, \text{median } CQI_1, \text{median } CQI_1 + 1\}$  for more than 90% of the time, where the resulting wideband values  $CQI_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 - 1$

and median  $CQI_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 + 1$  and median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

**Table 9.2.2.3-1: PUCCH 1-1 static test (TDD)**

Parameter		Unit	Test 1		Test 2

<p>Note 1: Reference measurement channel RC.2 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1</p> <p>Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.</p> <p>Note 3: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#7 and #2.</p> <p>Note 4: RI reporting interval is set to the maximum allowable length of 160ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160ms during performance verification.</p>						

The normative reference for this requirement is TS 36.101 [2] clause 9.2.2.2.

#### 9.2.2.2.4 Test description

##### 9.2.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.2.2.2.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.2.2.4.3.

#### 9.2.2.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.2.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI<sub>0</sub> is defined as Wideband CQI of codeword #0 and wideband CQI<sub>1</sub> is calculated according to clause 9.2.2.2.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI<sub>0</sub> is based on the wideband CQI<sub>0</sub> and wideband median CQI<sub>1</sub> is based on the wideband CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI<sub>1</sub> values are in the range (Median CQI<sub>1</sub> - 1) ≤ Median CQI ≤ (Median CQI<sub>1</sub> + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median- CQI<sub>0</sub>- 1 and the transport format of codeword #1 is according to the wideband median CQI<sub>1</sub>- 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK ) ≤ 0.1

then, and go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median-CQI<sub>0</sub> + 1 and the transport format of codeword #1 is according to the wideband median-CQI<sub>1</sub> + 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX

responses for each codewords respectively. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \geq 0.1$

then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.2.2.2.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.2.2.2.4.3 Message contents

#### 9.2.2.2.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.2.2.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

### 9.2.3 CQI Reporting under AWGN conditions - PUCCH 1-1 (CSI Reference Symbols)

#### 9.2.3.1\_D FDD CQI Reporting under AWGN conditions – PUCCH 1-1 for eDL-MIMO

##### 9.2.3.1\_D.1 Test purpose

To verify the variance of the wideband spatial differential CQI between codeword #0 and codeword #1 are within the limits defined and for both codeword #0 and codeword #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 - 1$  and median  $CQI_1 - 1$  shall be less than or equal to 0.1 and the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 + 1$  and median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

##### 9.2.3.1\_D.2 Test applicability

This test applies to all types of E-UTRA FDD release 10 and forward UEs of Category 2 and onwards that support eDL-MIMO. Applicability requires support for FGI bit 103.

##### 9.2.3.1\_D.3 Minimum conformance requirements

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

The following requirements apply to UE Category  $\geq 2$ . For the parameters specified in table 9.2.3.1\_D.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2 -2 in TS 36.213 [10]) shall be used to determine the wideband CQI index for codeword #1 as:

$$\text{wideband CQI}_1 = \text{wideband CQI}_0 - \text{Codeword 1 offset level}$$

The wideband  $\text{CQI}_1$  shall be within the set  $\{\text{median CQI}_1 - 1, \text{median CQI}_1, \text{median CQI}_1 + 1\}$  for more than 90% of the time, where the resulting wideband values  $\text{CQI}_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 - 1$  and median  $\text{CQI}_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 + 1$  and median  $\text{CQI}_1 + 1$  shall be greater than or equal to 0.1.

**Table 9.2.3.1\_D.3-1: PUCCH 1-1 static test (FDD)**

Parameter	Unit	Test 1		Test 2	
Bandwidth	MHz			10	
PDSCH transmission mode				9	
Downlink power allocation	$\rho_A$	dB			0
	$\rho_B$	dB			0
	$P_c$	dB			-3
	$\sigma$	dB			-3
Cell-specific reference signals		Antenna ports 0, 1			
CSI reference signals		Antenna ports 15,...,18			
Beamforming model		As specified in Annex B.4.3			
CSI-RS periodicity and subframe offset $T_{\text{CSI-RS}} / \Delta_{\text{CSI-RS}}$		5/1			
CSI reference signal configuration		0			
Propagation condition and antenna configuration		Clause B.1 (4 x 2)			
CodeBookSubsetRestriction bitmap		0x0000 0000 0100 0000			
SNR (Note 2)	dB	7	8	13	14
$\hat{I}_{or}^{(j)}$	dB[mW/15kHz]	-91	-90	-85	-84
$N_{oc}^{(j)}$	dB[mW/15kHz]	-98		-98	
Max number of HARQ transmissions		1			
Physical channel for CQI/PMI reporting		PUSCH (Note 3)			
PUCCH Report Type for CQI/PMI		2			
Physical channel for RI reporting		PUCCH Format 2			
PUCCH Report Type for RI		3			
Reporting periodicity	ms	$N_{pd} = 5$			
CQI delay	ms	8			
<i>cqi-pmi-ConfigurationIndex</i>		2			
<i>ri-ConfigIndex</i>		1			
Note 1:	Reference measurement channel RC.7 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 FDD as described in Annex A.5.1.1.				
Note 2:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.				
Note 3:	To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#1 and #6 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#0 and #5.				

The normative reference for this requirement is TS 36.101 [2] clause 9.2.3.1.

### 9.2.3.1\_D.4 Test description

#### 9.2.3.1\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.2.3.1\_D.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.3.1\_D.4.3.

#### 9.2.3.1\_D.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.3.1\_D.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI<sub>0</sub> is defined as Wideband CQI of codeword #0 and wideband CQI<sub>1</sub> is calculated according to clause 9.2.3.1\_D.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI<sub>0</sub> is based on the wideband CQI<sub>0</sub> and wideband median CQI<sub>1</sub> is based on the wideband CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI<sub>1</sub> values are in the range (Median CQI<sub>1</sub> - 1) ≤ Median CQI ≤ (Median CQI<sub>1</sub> + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median- CQI<sub>0</sub>- 1 and the transport format of codeword #1 is according to the wideband median CQI<sub>1</sub>- 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of

responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$  for both codeword #0 and codeword #1

then and go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median-CQI<sub>0</sub> + 1 and the transport format of codeword #1 is according to the wideband median-CQI<sub>1</sub> + 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \geq 0.1$  for both codeword #0 and codeword #1

then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.2.3.1\_D.3-1 for the other Test as appropriate. Otherwise pass the UE.

### 9.2.3.1\_D.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.3.1\_D.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

### 9.2.3.2\_D TDD CQI Reporting under AWGN conditions – PUCCH 1-1 for eDL-MIMO

#### 9.2.3.2\_D.1 Test purpose

To verify the variance of the wideband spatial differential CQI between codeword #0 and codeword #1 are within the limits defined and for both codeword #0 and codeword #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 - 1$  and median  $\text{CQI}_1 - 1$  shall be less than or equal to 0.1 and the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 + 1$  and median  $\text{CQI}_1 + 1$  shall be greater than or equal to 0.1.

#### 9.2.3.2\_D.2 Test applicability

This test applies to all types of E-UTRA TDD release 10 and forward UEs of Category 2 and onwards that support eDL-MIMO. Applicability requires support for FGI bit 104.

#### 9.2.3.2\_D.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 2$ . The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the

transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

For the parameters specified in table 9.2.3.2\_D.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2 -2 in TS 36.213 [10]) shall be used to determine the wideband CQI index for codeword #1 as

$$\text{wideband CQI}_1 = \text{wideband CQI}_0 - \text{Codeword 1 offset level}$$

The wideband  $\text{CQI}_1$  shall be within the set  $\{\text{median CQI}_1 - 1, \text{median CQI}_1, \text{median CQI}_1 + 1\}$  for more than 90% of the time, where the resulting wideband values  $\text{CQI}_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 - 1$  and median  $\text{CQI}_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 + 1$  and median  $\text{CQI}_1 + 1$  shall be greater than or equal to 0.1.

Table 9.2.3.2\_D.3-1: PUCCH 1-1 submode 1 static test (TDD)

PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#7 and #2.</p> <p>Note 4: RI reporting interval is set to the maximum allowable length of 160ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160ms during performance verification.</p>						

The normative reference for this requirement is TS 36.101 [2] clause 9.2.3.2.

### 9.2.3.2\_D.4 Test description

#### 9.2.3.2\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure 47.
2. The parameter settings for the cell are set up according to Table 9.2.3.2\_D.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.3.2\_D.4.3.

#### 9.2.3.2\_D.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.3.2\_D.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI<sub>0</sub> is defined as Wideband CQI of codeword #0 and wideband CQI<sub>1</sub> is calculated according to clause 9.2.3.2\_D.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI<sub>0</sub> is based on the wideband CQI<sub>0</sub> and wideband median CQI<sub>1</sub> is based on the wideband CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI<sub>1</sub> values are in the range (Median CQI<sub>1</sub> - 1) ≤ Median CQI ≤ (Median CQI<sub>1</sub> + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median- CQI<sub>0</sub>- 1 and the transport format of codeword #1 is according to the wideband median CQI<sub>1</sub>- 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK) ≤ 0.1

then, and go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median-CQI<sub>0</sub> + 1 and the transport format of codeword #1 is according to the wideband median-CQI<sub>1</sub> + 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports

from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \geq 0.1$

then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.2.3.2\_D.3-1 for the other Test as appropriate. Otherwise pass the UE.

### 9.2.3.2\_D.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.3.2\_D.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

## 9.2.4 CQI Reporting under AWGN conditions - Single CSI Process

### 9.2.4.1\_F FDD CQI Reporting under AWGN conditions - Single CSI Process for CoMP

#### 9.2.4.1\_F.1 Test purpose

To verify compliance to the minimum requirements for dual codeword transmission being defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*.

#### 9.2.4.1\_F.2 Test applicability

This test applies to all types of E-UTRA FDD category  $\geq 2$  UEs release 11 and forward, supporting Maximum CSI processes of One, Three or Four on a component carrier within a band with PDSCH transmission mode 10.

#### 9.2.4.1\_F.3 Minimum conformance requirements

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

For the parameters specified in table 9.2.4.1\_F-1, and using the downlink physical channels specified in tables C.3.4-1 and C.3.4-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword #1 as

$$\text{wideband CQI}_1 = \text{wideband CQI}_0 - \text{Codeword 1 offset level}$$

The wideband  $\text{CQI}_1$  shall be within the set  $\{\text{median CQI}_1 - 1, \text{median CQI}_1, \text{median CQI}_1 + 1\}$  for more than 90% of the time, where the resulting wideband values  $\text{CQI}_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 - 1$  and median  $\text{CQI}_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 + 1$  and median  $\text{CQI}_1 + 1$  shall be greater than or equal to 0.1.

Table 9.2.4.1\_F.3-1: PUCCH 1-1 static test (FDD)

Timing offset between TPs	us	0			0		
Frequency offset between TPs	Hz	0			0		
Note 1:	Reference measurement channel RC.10 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 FDD as described in Annex A.5.1.1.						
Note 2:	REs for antenna ports 0 and 1 CRS have zero transmission power.						
Note 3:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.						
Note 4:	N/A						
Note 5:	To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#1 and #6 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#0 and #5.						

#### 9.2.4.1\_F.4 Test description

##### 9.2.4.1\_F.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and AWGN noise source(s) to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A. Figure 52 (without faders).
2. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.4 and uplink signals according to Annex H.1 and H.3.2.
3. Propagation conditions are set according to Annex B.0.
4. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.4.1\_F.4.3.

##### 9.2.4.1\_F.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.4.1\_F.3-1 as appropriate.
2. The SS shall transmit PDSCH on TP1 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS shall transmit PDSCH not addressed to UE on TP2. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information on TP1 via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI<sub>0</sub> is defined as Wideband CQI of codeword #0 and wideband CQI<sub>1</sub> is calculated according to clause 9.2.4.1\_F.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI<sub>0</sub> is based on the wideband CQI<sub>0</sub> and wideband median CQI<sub>1</sub> is based on the wideband CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI<sub>1</sub> values are in the range (Median CQI<sub>1</sub> - 1) ≤ Median CQI ≤ (Median CQI<sub>1</sub> + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH on TP1 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median CQI<sub>0</sub> - 1 and the transport format of codeword #1 is according to the wideband median CQI<sub>1</sub> - 1. The SS shall transmit PDSCH not addressed to UE on TP2. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information on TP1 via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio  $NACK / (ACK + NACK) \leq 0.1$  for both codeword #0 and codeword #1 then and go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH on TP1 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median-CQI<sub>0</sub> + 1 and the transport format of codeword #1 is according to the wideband median-CQI<sub>1</sub> + 1. The SS shall transmit PDSCH not addressed to UE on TP2. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information on TP1 via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio  $NACK / (ACK + NACK) \geq 0.1$  for both codeword #0 and codeword #1 then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.2.4.1\_F.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.2.4.1\_F.4.3 Message contents

### 9.2.4.1\_F.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.4.1\_F.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

## 9.2.4.2\_F TDD CQI Reporting under AWGN conditions - Single CSI Process for CoMP

### 9.2.4.2\_F.1 Test purpose

To verify compliance to the minimum requirements for dual codeword transmission being defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*.

### 9.2.4.2\_F.2 Test applicability

This test applies to all types of E-UTRA TDD category  $\geq 2$  UEs release 11 and forward, supporting Maximum CSI processes of One, Three or Four on a component carrier within a band with PDSCH transmission mode 10.

### 9.2.4.2\_F.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 2$ . For the parameters specified in table 9.2.4.2\_F.3-1, and using the downlink physical channels specified in tables C.3.4-1 and C.3.4-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2-2 in TS 36.213) shall be used to determine the wideband CQI index for codeword #1 as

$$\text{wideband CQI}_1 = \text{wideband CQI}_0 - \text{Codeword 1 offset level}$$

The wideband  $\text{CQI}_1$  shall be within the set  $\{\text{median CQI}_1 - 1, \text{median CQI}_1, \text{median CQI}_1 + 1\}$  for more than 90% of the time, where the resulting wideband values  $\text{CQI}_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 - 1$  and median  $\text{CQI}_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 + 1$  and median  $\text{CQI}_1 + 1$  shall be greater than or equal to 0.1.

ACK/NACK feedback mode			Multiplexing	N/A		Multiplexing	N/A	
PDSCH scheduled sub-frames			3,4,8,9			3,4,8,9		
Timing offset between TPs		us	0			0		
Frequency offset between TPs		Hz	0			0		

Note 1:	Reference measurement channel RC.10 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1.
Note 2:	REs for antenna ports 0 and 1 CRS have zero transmission power.
Note 3:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 4:	N/A
Note 5:	To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#7 and #2.
Note 6:	RI reporting interval is set to the maximum allowable length of 160ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160ms during performance verification.

The normative reference for this requirement is TS 36.101 clause 9.2.4.2.

#### 9.2.4.2\_F.4 Test description

##### 9.2.4.2\_F.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.53(without faders).
2. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.4 and uplink signals according to Annex H.1 and H.3.2.
3. Propagation conditions are set according to Annex B.0.
4. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.2.4.2\_F.4.3.

##### 9.2.4.2\_F.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.2.4.2\_F.3-1 as appropriate.
2. The SS shall transmit PDSCH on TP1 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS shall transmit PDSCH not addressed to UE on TP2. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information on TP1 via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe # 2 and subframe #7 (Table A.4.1-2). The UE will send periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI0 is defined as Wideband CQI of codeword #0 and wideband CQI1 is calculated according to clause 9.2.4.2\_F.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI0 is based on the wideband CQI0 and wideband median CQI1 is based on the wideband CQI1.

4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI1 values are in the range (Median CQI1 - 1)  $\leq$  Median CQI  $\leq$  (Median CQI1 + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH on TP1 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median- CQI0 - 1 and the transport format of codeword #1 is according to the wideband median CQI1 -- 1. The SS shall transmit PDSCH not addressed to UE on TP2. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information on TP1 via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio  $\text{NACK} / (\text{ACK} + \text{NACK}) \leq 0.1$  for both codeword #0 and codeword #1 then go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH on TP1 via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband medianCQI0 + 1 and the transport format of codeword #1 is according to the wideband median-CQI1 + 1. The SS shall transmit PDSCH not addressed to UE on TP2. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information on TP1 via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio  $\text{NACK} / (\text{ACK} + \text{NACK}) \geq 0.1$  for both codeword #0 and codeword #1 then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.2.4.2\_F.3-1 for the other Test as appropriate. Otherwise pass the UE.

### 9.2.4.2\_F.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.2.4.2\_F.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

## 9.3 CQI Reporting under fading conditions

### 9.3.1 Frequency-selective scheduling mode

The accuracy of sub-band channel quality indicator (CQI) reporting under frequency selective fading conditions is determined by a double-sided percentile of the reported differential CQI offset level 0 per sub-band, and the relative increase of the throughput obtained when transmitting on any one of the sub-bands with the highest reported differential CQI offset level the corresponding transport format compared to the case for which a fixed format is transmitted on any

sub-band in set of TS 36.213 [10]. To account for sensitivity of the input SNR the sub-band CQI reporting under frequency selective fading conditions is considered to be verified if the reporting accuracy is met for at least one of two SNR levels separated by an offset of 1 dB.

### 9.3.1.1 CQI Reporting under fading conditions – PUSCH 3-0 (Cell-Specific Reference Symbols)

#### 9.3.1.1.1 FDD CQI Reporting under fading conditions – PUSCH 3-0

##### 9.3.1.1.1.1 Test purpose

To verify that preferred sub-bands can be used for frequently-selective scheduling.

##### 9.3.1.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8 and forward.

##### 9.3.1.1.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.1.1.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.1.1.1.3-2 and by the following

- a) a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha$  % of the time but less than  $\beta$  % for each sub-band;
- b) the ratio of the throughput obtained when transmitting a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;
- c) when transmitting a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05.

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI.

**Table 9.3.1.1.1.3-1: Sub-band test for single antenna transmission (FDD)**

#### 9.3.1.1.1.4 Test description

##### 9.3.1.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.3.1.1.1.3-1.

3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.1.1.4.3.

#### 9.3.1.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.1.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. Check if " $2000 * \alpha \% / 100 \leq \text{number of CQI reports with index } 0 \text{ for each full-size subband} \leq 2000 * \beta \% / 100$ ". (2000= No of full-size subband reports, 100 because of %) If yes, continue with step5, otherwise goto step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each TTI randomly selected full-size subband regardless of UE wideband and full-size subband CQI report. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK / (ACK + NACK))  $\geq 0.05$ , pass the UE for this test and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.1.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

$\beta$ [%]	55	55
$\gamma$	1.09	1.09
BLER	0.05	0.05

To pass the test,  $\alpha$  and  $\beta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.3.1.1.2 TDD CQI Reporting under fading conditions – PUSCH 3-0

## 9.3.1.1.2.1 Test purpose

To verify that preferred sub-bands can be used for frequently-selective scheduling.

## 9.3.1.1.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8 and forward.

## 9.3.1.1.2.3 Minimum conformance requirements

For the parameters specified in Table 9.3.1.1.2.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.1.1.2.3-2 and by the following

- a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha$  % of the time but less than  $\beta$  % for each sub-band;
- the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;

- c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05.

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each available downlink transmission instance].

**Table 9.3.1.1.2.3-1: Sub-band test for single antenna transmission (TDD)**

#### 9.3.1.1.2.4 Test description

##### 9.3.1.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.3.1.1.2.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.1.1.2.4.3.

#### 9.3.1.1.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.1.1.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and full-size subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI report for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. For each subband, if subband CQI of index 0 is reported, at least  $\alpha$  % but less than  $\beta$  % of 2000 full-size subband CQI report, then continue to step 5, otherwise, go to step 7.
5. The SS shall send PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each available downlink transmission instance randomly selected full-size subband regardless of UE wideband and subband CQI report. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3 Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the sub-bands in which UE report the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK / (ACK + NACK))  $\geq 0.05$ , pass the UE and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.

8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.1.1.2.3-1 for the other test as appropriate.

#### 9.3.1.2.1\_D.4 Test description

##### 9.3.1.2.1\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.3.1.2.1\_D.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.1.2.1\_D.4.3.

#### 9.3.1.2.1\_D.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.1.2.1\_D.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. Check if " $2000 \cdot \alpha \% / 100 \leq \text{number of CQI reports with index } 0 \text{ for each full-size subband} \leq 2000 \cdot \beta \% / 100$ ". (2000= No of full-size subband reports, 100 because of %) If yes, continue with step5, otherwise goto step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each TTI randomly selected full-size subband regardless of UE wideband and full-size subband CQI report. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK / (ACK + NACK))  $\geq 0.05$ , pass the UE for this test and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.1.2.1\_D.3-1 for the other Test as appropriate. Otherwise pass the UE.

$\alpha$ [%]	2	2
$\beta$ [%]	40	40
$\gamma$	1.09	1.09
UE Category	1-8	1-8
BLER	0.05	0.05

To pass the test,  $\alpha$  and  $\beta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.3.1.2.2\_D TDD CQI Reporting under fading conditions – PUSCH 3-1 for eDL MIMO

## 9.3.1.2.2\_D.1 Test purpose

To verify that preferred sub-bands can be used for frequently-selective scheduling.

#### 9.3.1.2.2\_D.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 10 and forward that supports eDL MIMO. Applicability requires support for FGI bit 103.

#### 9.3.1.2.2\_D.3 Minimum conformance requirements

For the parameters specified in Table 9.3.1.2.2\_D.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.2.2\_D.3-2 and by the following:

- a) a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha$  % of the time but less than  $\beta$  % for each sub-band;
- b) the ratio of the throughput obtained when transmitting a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;
- c) when transmitting a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05.

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI.

9.3.1.2.2\_D.4 Test description

9.3.1.2.2\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.3.1.2.2\_D.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.1.2.2\_D.4.3.

#### 9.3.1.2.2\_D.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.1.2.2\_D.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and full-size subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI report for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. For each subband, if subband CQI of index 0 is reported, at least  $\alpha$  % but less than  $\beta$  % of 2000 full-size subband CQI report, then continue to step 5, otherwise, go to step 7.
5. The SS shall send PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each available downlink transmission instance randomly selected full-size subband regardless of UE wideband and subband CQI report. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3 Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the sub-bands in which UE report the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK / (ACK + NACK))  $\geq 0.05$ , pass the UE and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.

8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.1.2.2\_D.3-1 for the other test as appropriate.

## 9.3.1.2.2\_D.5 Test requirement

**Table 9.3.1.2.2.5-1: Test requirement (TDD)**

Parameter	Test 1	Test 2
$\alpha$ [%]	2	2
$\beta$ [%]	40	40
$\gamma$	1.09	1.09
UE Category	1-8	1-8
BLER	0.05	0.05

To pass the test,  $\alpha$  and  $\beta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.3.1.2.3 FDD CQI Reporting under fading conditions – PUSCH 3-1 for 256QAM in DL

## 9.3.1.2.3.1 Test purpose

To verify that preferred sub-bands can be used for frequently-selective scheduling.

## 9.3.1.2.3.2 Test applicability

This test applies to E-UTRA FDD UE release 12 and forward of UE Category 11-12 and DL Category  $\geq 11$  that supports 256QAM in DL.

## 9.3.1.2.3.3 Minimum conformance requirements

For the parameters specified in Table 9.3.1.2.3.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.2.3.3-2 and by the following

- a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha$  % of the time but less than  $\beta$  % for each sub-band;
- the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;
- when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05.

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. Sub-bands of a size smaller than full size are excluded from the test.

In this test, 4-bit CQI Table 2 in Table 7.2.3-2 in TS 36.213 [10], and Modulation and TBS index table 2 in Table 7.1.7.1-1A for PDSCH in TS 36.213 [10] are applied.

**Table 9.3.1.2.3.3-1: Sub-band test for FDD**

To pass the test,  $\alpha$ ,  $\beta$  and  $\gamma$  must be fulfilled.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.3.1.2.4 TDD CQI Reporting under fading conditions – PUSCH 3-1 for 256QAM in DL

## 9.3.1.2.4.1 Test purpose

To verify that preferred sub-bands can be used for frequently-selective scheduling.

## 9.3.1.2.4.2 Test applicability

This test applies to E-UTRA TDD UE release 12 and forward of UE Category 11-12 and DL Category  $\geq 11$  that supports 256QAM in DL.

## 9.3.1.2.4.3 Minimum conformance requirements

For the parameters specified in Table 9.3.1.2.4.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.2.4.3-2 and by the following

- a) a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha$  % of the time but less than  $\beta$  % for each sub-band;
- b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;
- c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05.

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. Sub-bands of a size smaller than full size are excluded from the test.

In this test, 4-bit CQI Table 2 in Table 7.2.3-2 in TS 36.213 [10], and Modulation and TBS index table 2 in Table 7.1.7.1-1A for PDSCH in TS 36.213 [10] are applied.

**Table 9.3.1.2.4.3-1: Sub-band test for TDD**

## 9.3.1.2.4.5 Test requirement

**Table 9.3.1.2.4.5-1: Test requirement (TDD)**

	Test 1
$\alpha$ [%]	2
$\beta$ [%]	40
$\gamma$	1.09
UE Category	11-12
UE DL Category	$\geq 11$

To pass the test,  $\alpha$  and  $\beta$  and  $\gamma$  must be fulfilled.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.3.1.3 CQI Reporting under fading conditions – PUSCH 3-0 (Cell-Specific Reference Symbols)

## 9.3.1.3.1

## 9.3.1.3.1\_E FDD CQI Reporting under fading conditions – PUSCH 3-0 for feICIC

## 9.3.1.3.1\_E.1 FDD CQI Reporting under fading conditions – PUSCH 3-0 for feICIC (non-MBSFN ABS)

## 9.3.1.3.1\_E.1.1 Test purpose

To verify that preferred sub-bands can be used for frequently-selective scheduling.

## 9.3.1.3.1\_E.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE and CRS interference handling release 11 and forward. Applicability requires support of FGI bit 115.

## 9.3.1.3.1\_E.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.1.3.1\_E.1.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.3.1\_E.1.3-2 and by the following

- a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha$  % of the time but less than  $\beta$  % for each sub-band;
- the ratio of the throughput in ABS subframes obtained when transmitting a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;
- when transmitting a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to  $\epsilon$ .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. T

Sub-band size		RB	6 (full size)			

Note 1:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 2:	ABS pattern as defined in [9]. PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel.
Note 3:	Time-domain measurement resource restriction pattern for PCell measurements as defined in TS 36.331 [5].
Note 4:	As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in TS 36331 [5].
Note 5:	Time-domain measurement resource restriction pattern for PCell measurements as defined in TS 36.331 [5].
Note 6:	Cell 1 is the serving cell. Cell 2 and Cell 3 are the aggressor cells. The number of the CRS ports in Cell 1, Cell 2, and Cell 3 are the same.
Note 7:	This noise is applied in OFDM symbols #1, #2, #3, #5, #6, #8, #9, #10, #12, #13 of a subframe overlapping with the aggressor ABS.
Note 8:	This noise is applied in OFDM symbols #0, #4, #7, #11 of a subframe overlapping with the aggressor ABS.
Note 9:	This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS.
Note 10:	Downlink physical channel setup in Cell 2 and Cell 3 in accordance with TS 36.521-1 [10] Annex C.3.3 applying OCNG pattern as defined in TS 36.521-1 [10] Annex A.5.1.5.
Note 11:	Reference measurement channel in Cell 1 RC.3 FDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/2 FDD as described in Annex A.5.1.1/2.
Note 12:	If the UE reports in an available uplink reporting instance at subframe SF#n based on CQI estimation at a downlink subframe not later than SF#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before SF#(n+4).
Note 13:	The CSI reporting is such that reference subframes belong to $C_{csi,0}$ .

**Table 9.3.1.3.1\_E.1.3-2: Minimum requirement (FDD)**

	Test 1	Test 2
$\alpha$ [%]	2	2
$\beta$ [%]	55	55
$\gamma$	1.1	1.1
$\varepsilon$	0.01	0.01
UE Category	$\geq 1$	$\geq 1$

The normative reference for this requirement is TS 36.101 [2] clause 9.3.1.1.3.

#### 9.3.1.3.1\_E.1.4 Test description

##### 9.3.1.3.1\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.54 for antenna configuration 1x2.
2. The parameter settings for the cell are set up according to Table 9.3.1.3.1\_E.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.

5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 9.3.1.3.1\_E.1.4.3.

#### 9.3.1.3.1\_E.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.1.3.1\_E.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS protected subframes according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband for subframe set  $C_{CSL0}$  have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 10 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 (transmitted in SF#3) with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 10 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values for subframe set  $C_{CSL0}$ . Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI<sub>0</sub>.
4. Check if “ $2000 \cdot \alpha \% / 100 \leq \text{number of CQI reports with index 0 for each full-size subband} \leq 2000 \cdot \beta \% / 100$ ”. (2000= No of full-size subband reports, 100 because of %) If yes, continue with step5, otherwise goto step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS protected subframes according to the wideband Median CQI<sub>0</sub> in each downlink transmission instance randomly selected full-size subband regardless of UE wideband and full-size subband CQI report. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 10 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 (transmitted in SF#3) with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput during ABS according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS protected subframes according to the highest UE reported full-size subband CQI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 10 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 (transmitted in SF#3) with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput during ABS and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK / (ACK + NACK))  $\geq \varepsilon$ , pass the UE for this test and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.1.3.1\_E.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.3.1.3.1\_E.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 5.2A.5.1 with the following exceptions:

$\beta$ [%]	55	55
$\gamma$	1.09	1.09
$\varepsilon$	0.01	0.01
UE Category	$\geq 1$	$\geq 1$

To pass the test,  $\alpha$  and  $\beta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.3.1.3.2

## 9.3.1.3.2\_E TDD CQI Reporting under fading conditions – PUSCH 3-0 for feICIC

## 9.3.1.3.2\_E.1 TDD CQI Reporting under fading conditions – PUSCH 3-0 for feICIC (non-MBSFN ABS)

## 9.3.1.3.2\_E.1.1 Test purpose

To verify that preferred sub-bands can be used for frequently-selective scheduling.

## 9.3.1.3.2\_E.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE and CRS interference handling and ss-CCH interference handling release 11 and forward. Applicability requires support of FGI bit 115.

### 9.3.1.3.2\_E.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.1.3.2\_E.1.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.1.3.2\_E.1.3-2 and by the following

- a) a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha$  % of the time but less than  $\beta$  % for each sub-band;
- b) the ratio of the throughput in ABS subframes obtained when transmitting a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;
- c) when transmitting a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to  $\epsilon$ .

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD.6.

Reporting interval (Note 13)	ms	10					
Reporting mode		PUSCH 3-0					
Sub-band size	RB	6 (full size)					
ACK/NACK feedback mode		Multiplexing		Multiplexing			

Note 1:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.
Note 2:	ABS pattern as defined in [9]. PDSCH other than SIB1/paging and its associated PDCCH/PCFICH are transmitted in the serving cell subframe when the subframe is overlapped with the ABS subframe of aggressor cell and the subframe is available in the definition of the reference channel.
Note 3:	Time-domain measurement resource restriction pattern for PCell measurements as defined in TS 36.331 [5].
Note 4:	As configured according to the time-domain measurement resource restriction pattern for CSI measurements defined in TS 36.331 [5].
Note 5:	Time-domain measurement resource restriction pattern for PCell measurements as defined in TS 36.331 [5].
Note 6:	Cell 1 is the serving cell. Cell 2 and Cell 3 are the aggressor cells. The number of the CRS ports in Cell1, Cell 2, and Cell 3 is the same.
Note 7:	This noise is applied in OFDM symbols #1, #2, #3, #5, #6, #8, #9, #10, #12, #13 of a subframe overlapping with the aggressor ABS.
Note 8:	This noise is applied in OFDM symbols #0, #4, #7, #11 of a subframe overlapping with the aggressor ABS.
Note 9:	This noise is applied in all OFDM symbols of a subframe overlapping with aggressor non-ABS.
Note 10:	Downlink physical channel setup in Cell 2 and Cell 3 in accordance with TS 36.521-1 [10] Annex C.3.3 applying OCNG pattern as defined in TS 36.521-1 [10] Annex A.5.2.5
Note 11:	Reference measurement channel in Cell 1 RC.3 TDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/2 TDD as described in Annex A.5.2.1/2.
Note 12:	If the UE reports in an available uplink reporting instance at subframe SF#n based on CQI estimation at a downlink subframe not later than SF#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before SF#(n+4).
Note 13:	The CSI reporting is such that reference subframes belong to $C_{csi,0}$ .

**Table 9.3.1.3.2\_E.1.3-2: Minimum requirement (TDD)**

	Test 1	Test 2
$\alpha$ [%]	2	2

#### 9.3.1.3.2\_E.1.4 Test description

##### 9.3.1.3.2\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.54 for antenna configuration 1x2.
2. The parameter settings for the cell are set up according to Table 9.3.1.3.2\_E.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 9.3.1.3.2\_E.1.4.3.

### 9.3.1.3.2\_E.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.1.3.2\_E.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS protected subframes according to CQI value 8 and keep it regardless of the wideband and full-size subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI report for each full-size subband for subframe set  $C_{CSI,0}$  have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 (transmitted in DL SF#1) with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 10 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values for subframe set  $C_{CSI,0}$ . Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI<sub>0</sub>.
4. For each subband, if subband CQI of index 0 is reported, at least  $\alpha$  % but less than  $\beta$  % of 2000 full-size subband CQI report, then continue to step 5, otherwise, go to step 7.
5. The SS shall send PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS protected subframes according to the wideband Median CQI<sub>0</sub> in each downlink transmission instance randomly selected full-size subband regardless of UE wideband and subband CQI report. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 (transmitted in DL SF#1) with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput during ABS according to Annex G.5.3 Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in ABS protected subframes according to the highest UE reported full-size subband CQI value in one full-size subband selected among the sub-bands in which UE report the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 (transmitted in DL SF#1) with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput during ABS and (NACK/(ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK/(ACK + NACK))  $\geq \epsilon$ , pass the UE and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.1.3.2\_E.1.3-1 for the other test as appropriate.

### 9.3.1.3.2\_E.1.4.3 Message contents

## 9.3.1.3.2\_E.1.5 Test requirement

Table 9.3.1.3.2\_E.1.5-1: Test requirement (TDD)

	Test 1	Test 2
$\alpha$ [%]	2	2
$\beta$ [%]	55	55
$\gamma$	1.09	1.09
$\epsilon$	0.01	0.01
UE Category	$\geq 1$	$\geq 1$

To pass the test,  $\alpha$  and  $\beta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.3.2 Frequency non-selective scheduling mode

The reporting accuracy of the channel quality indicator (CQI) under frequency non-selective fading conditions is determined by the reporting variance, and the relative increase of the throughput obtained when the transport format transmitted is that indicated by the reported CQI compared to the case for which a fixed transport format configured according to the reported median CQI is transmitted. In addition, the reporting accuracy is determined by a minimum BLER using the transport formats indicated by the reported CQI. To account for sensitivity of the input SNR the CQI reporting under frequency non-selective fading conditions is considered to be verified if the reporting accuracy is met for at least one of two SNR levels separated by an offset of 1 dB.

### 9.3.2.1 CQI Reporting under fading conditions – PUCCH 1-0 (Cell-Specific Reference Symbols)

#### 9.3.2.1.1 FDD CQI Reporting under fading conditions – PUCCH 1-0

##### 9.3.2.1.1.1 Test purpose

To verify that the UE is tracking the channel variations and selecting the largest transport format possible according to the prevailing channel state for frequently non-selective scheduling

##### 9.3.2.1.1.2 Test applicability

This test applies to E-UTRA FDD UE release 8 and forward of UE category  $\geq 2$ .

##### 9.3.2.1.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.2.1.1.3-1 and Table 9.3.2.1.1.3-3, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.2.1.1.3-2 and Table 9.3.2.1.1.3-4 and by the following:

- a) CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $\alpha$  % of the time;
- b) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index and that obtained when transmitting a fixed transport format configured according to the wideband CQI median shall be  $\geq \gamma$ ;
- c) when transmitting the transport format indicated by each reported wideband CQI index, the average BLER for the indicated transport formats shall be greater or equal to 0.02

The applicability of the requirement with 5MHz bandwidth as specified in Table 9.3.2.1.1.3-3 and Table 9.3.2.1.1.3-4 is defined in clause 9.1.1.1.

**Table 9.3.2.1.1.3-1 Fading test for single antenna (FDD)**

The normative reference for this requirement is TS 36.101 [2] clause 9.3.2.1.1.

#### 9.3.2.1.1.4 Test description

##### 9.3.2.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz for tests defined in 9.3.2.1.1.3-1 and 5MHz for tests defined in Table 9.3.2.1.1.3-3, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.3.2.1.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.2.1.1.4.3.

#### 9.3.2.1.1.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.2.1.1.3-1 for 10MHz tests or Table 9.3.2.1.1.3-3 for 5MHz tests as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #1,#3,#5 and subframe #7 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH Continue transmission of the PDSCH until 100000 wideband CQI reports have been gathered. In this process the SS collects wideband CQI reports every 2 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the wideband CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If less than  $(100-\alpha)/100 \cdot 100000$  of the wideband CQI values are in the range  $(\text{Median CQI} - 1) \leq \text{Median CQI} \leq (\text{Median CQI} + 1)$  then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value regardless of UE wideband CQI report. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #1,#3,#5 and subframe #7 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #1,#3,#5 and subframe #7 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{wideband}$ . For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. If the ratio  $(t_{wideband} / t_{median}) \geq \gamma$  and ratio  $(\text{NACK} / (\text{ACK} + \text{NACK}))$  is greater or equal to 0.02, then pass the UE for this test and go to step 8. Otherwise go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.2.1.1.3-1 for 10MHz or table 9.3.2.1.1.3-3 for 5MHz for the other Test as appropriate. Otherwise pass the UE.

## 9.3.2.1.1.5 Test requirement

The applicability of the test requirement with 5MHz bandwidth as specified in Table 9.3.2.1.1.5-2 is defined in clause 9.1.1.1.

**Table 9.3.2.1.1.5-1: Test requirement (10MHz FDD)**

Parameter	Test 1	Test 2
$\alpha$ [%]	20	20
$\gamma$	1.04	1.04
BLER	0.02	0.02
UE category	2-8	2-8

**Table 9.3.2.1.1.5-2: Test requirement (5MHz FDD)**

	Test 1	Test 2
$\alpha$ [%]	20	20
$\gamma$	1.04	1.04
BLER	0.02	0.02
UE Category	2-8	2-8

To pass the test,  $\alpha$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

### 9.3.2.1.1\_1 FDD CQI Reporting under fading conditions - PUCCH 1-0 (Release 9 and forward)

#### 9.3.2.1.1\_1.1 Test purpose

Same test purpose as in clause 9.3.2.1.1.1.

#### 9.3.2.1.1\_1.2 Test applicability

This test applies to E-UTRA FDD UE release 9 and forward of UE category 1.

#### 9.3.2.1.1\_1.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 9.3.2.1.1.3.

#### 9.3.2.1.1\_1.4 Test description

##### 9.3.2.1.1\_1.4.1 Initial conditions

Same initial conditions as in clause 9.3.2.1.1.4.1.

##### 9.3.2.1.1\_1.4.2 Test procedure

Same test procedure as in clause 9.3.2.1.1.4.2.

##### 9.3.2.1.1\_1.4.3 Message contents

Same message contents as in clause 9.3.2.1.1.4.3.

##### 9.3.2.1.1\_1.5 Test requirement

Same test requirements as in clause 9.3.2.1.1.5 with the following exceptions:

Instead of table 9.3.2.1.1.5.1-> use table 9.3.2.1.1\_1.5-1 below for 10MHz bandwidth tests:

**Table 9.3.2.1.1\_1.5-1: Test requirement (FDD)**

Parameter	Test 1	Test 2
$\alpha$ [%]	20	20
$\gamma$	1.04	1.04
BLER	0.02	0.02
UE category	1	1

Or instead of table 9.3.2.1.1.5.2-> use table 9.3.2.1.1\_1.5-2 below for 5MHz bandwidth tests:

**Table 9.3.2.1.1\_1.5-2: Test requirement (5MHz FDD)**

	Test 1	Test 2
$\alpha$ [%]	20	20
$\gamma$	1.04	1.04
BLER	0.02	0.02
UE Category	1	1

### 9.3.2.1.2 TDD CQI Reporting under fading conditions – PUCCH 1-0

#### 9.3.2.1.2.1 Test purpose

To verify that the UE is tracking the channel variations and selecting the transport format according to the prevailing channel state for frequently non-selective scheduling

#### 9.3.2.1.2.2 Test applicability

This test applies to E-UTRA TDD UE release 8 and forward of UE category  $\geq 2$ .

#### 9.3.2.1.2.3 Minimum conformance requirements

For the parameters specified in Table 9.3.2.1.2.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.2.1.2.3-2 and by the following

- a) a CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $\alpha$  % of the time;
- b) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index and that obtained when transmitting a fixed transport format configured according to the wideband CQI median shall be  $\geq \gamma$ ;
- c) when transmitting the transport format indicated by each reported wideband CQI index, the average BLER for the indicated transport formats shall be greater or equal to 0.02

**Table 9.3.2.1.2.3-1: Fading test for single antenna (TDD)**

Parameter		Unit	Test 1		Test 2	
Bandwidth		MHz	10 MHz			
Transmission mode			1 (port 0)			
Downlink power allocation	$\rho_A$	dB	0			
	$\rho_B$	dB	0

#### 9.3.2.1.2.4 Test description

##### 9.3.2.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.3.2.1.2.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.2.1.2.4.3.

##### 9.3.2.1.2.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.2.1.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH Continue transmission of the PDSCH until 100000 wideband CQI reports have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the wideband CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If less than  $(100-\alpha)/100 \cdot 100000$  of the wideband CQI values are in the range  $(\text{Median CQI} - 1) \leq \text{Median CQI} \leq (\text{Median CQI} + 1)$  then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value regardless of UE wideband CQI report. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Declare the throughput as  $t_{wideband}$ . For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses.

If the ratio ( $t_{wideband} / t_{median}$ )  $\geq \gamma$  and ratio (NACK / (ACK + NACK)) is greater or equal to 0.02, then pass the UE and go to step 8. Otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.2.1.2.3-1 for the other test as appropriate.

### 9.3.2.2 CQI Reporting under fading conditions – PUCCH 1-1 (CSI Reference Symbols)

#### 9.3.2.2.1\_D FDD CQI Reporting under fading conditions – PUCCH 1-1 for eDL-MIMO

##### 9.3.2.2.1\_D.1 Test purpose

To verify that the UE is tracking the channel variations and selecting the largest transport format possible according to the prevailing channel state for frequently non-selective scheduling.

##### 9.3.2.2.1\_D.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 10 and forward of Category 2-8 that support eDL-MIMO. Applicability requires support for FGI bit 103.

##### 9.3.2.2.1\_D.3 Minimum conformance requirements

For the parameters specified in Table 9.3.2.2.1\_D.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.2.2.1\_D.3-2 and by the following:

- a) CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $\alpha$  % of the time;
- b) The ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index and that obtained when transmitting a fixed transport format configured according to the wideband CQI median shall be  $\geq \gamma$ ;
- c) When transmitting the transport format indicated by each reported wideband CQI index, the average BLER for the indicated transport formats shall be greater or equal to 0.02.

9.3.2.2.1\_D.4 Test description

9.3.2.2.1\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.3.2.2.1\_D.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.2.2.1\_D.4.3.

#### 9.3.2.2.1\_D.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.2.2.1\_D.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband CQI reports have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the wideband CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If less than  $(100-\alpha)/100 \cdot 2000$  of the wideband CQI values are in the range  $(\text{Median CQI} - 1) \leq \text{Median CQI} \leq (\text{Median CQI} + 1)$  then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value regardless of UE wideband CQI report. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{wideband}$ . For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. If the ratio  $(t_{wideband} / t_{median}) \geq \gamma$  and ratio  $(\text{NACK} / (\text{ACK} + \text{NACK}))$  is greater or equal to 0.02, then pass the UE for this test and go to step 8. Otherwise go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.

8. If both tests have not been done, repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.2.2.1\_D.3-1 for the other test as appropriate.

#### 9.3.2.2.2\_D.4 Test description

##### 9.3.2.2.2\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure 47.
2. The parameter settings for the cell are set up according to Table 9.3.2.2.2\_D.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.2.2.2\_D.4.3.

##### 9.3.2.2.2\_D.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.2.2.2\_D.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband CQI reports have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the wideband CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If less than  $(100-\alpha)/100 \cdot 2000$  of the wideband CQI values are in the range  $(\text{Median CQI} - 1) \leq \text{Median CQI} \leq (\text{Median CQI} + 1)$  then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value regardless of UE wideband CQI report. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput for a duration sufficient to achieve statistical significance according to Annex G clause G.3. Declare the throughput as  $t_{wideband}$ . For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. The responses are then filtered as follows: for the

sequence of responses for each HARQ process, discard all the statDTX responses.

If the ratio  $(t_{wideband} / t_{median}) \geq \gamma$  and ratio  $(NACK / (ACK + NACK))$  is greater or equal to 0.02, then pass the UE and go to step 8. Otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.2.2.2\_D.3-1 for the other test as appropriate.

Table 9.3.2.2.2\_D.5-1: Test requirement (TDD)

	Test 1	Test 2
$\alpha$ [%]	20	20
$\gamma$	1.04	1.04
UE Category	$\geq 2$	$\geq 2$
BLER	0.02	0.02

To pass the test,  $\alpha$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

### 9.3.3 Frequency-selective interference

The accuracy of sub-band channel quality indicator (CQI) reporting under frequency selective interference conditions is determined by a double-sided percentile of the reported differential CQI offset level +2 for a preferred sub-band, and the relative increase of the throughput obtained when transmitting on any one of the sub-bands with the highest reported differential CQI offset level the corresponding transport format compared to the case for which a fixed format is transmitted on any sub-band in set of TS 36.213 [10]. The purpose is to verify that preferred sub-bands are used for frequently-selective scheduling under frequency-selective interference conditions.

### 9.3.3.1 CQI Reporting under fading conditions and frequency-selective interference – PUSCH 3-0 (Cell-Specific Reference Symbols)

#### 9.3.3.1.1 FDD CQI Reporting under fading conditions and frequency-selective interference – PUSCH 3-0

##### 9.3.3.1.1.1 Test purpose

To verify that preferred sub-bands can be used for frequently-selective scheduling with frequency-selective interference situation.

##### 9.3.3.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8 and forward.

##### 9.3.3.1.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.3.1.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.3.1.1.3-2 and by the following:

- a) a sub-band differential CQI offset level of +2 shall be reported at least  $\alpha$  % for at least one of the sub-bands of full size at the channel edges;
- b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. Sub-bands of a size smaller than full size are excluded from the test.

**Table 9.3.3.1.1.3-1 Sub-band test for single antenna transmission (FDD)**

Parameter	Unit	Test 1	Test 2

#### 9.3.3.1.1.4 Test description

##### 9.3.3.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, interfering source and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.21.
2. The parameter settings for the cell are set up according to Table 9.3.3.1.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.3.1.1.4.3.

#### 9.3.3.1.1.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.3.1.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If for at least one of the full-size subbands at the channel edges, a subband differential CQI offset level of +2 is reported in  $\alpha$  % or more of 2000 reports, then continue with step 5, otherwise fail the UE.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC on an each TTI randomly selected full-size subband using the transport format according to the wideband median-CQI value regardless of UE wideband or subband CQI report. Note that each full-size subband shall be selected in the equal probability The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3.

Declare the throughput as  $t_{median}$ .

6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the sub-bands in which UE reports the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . Count the number of NACKs, ACKs and statDTXs on the UL during the test interval.  
If  $t_{subband} / t_{median} \geq \gamma$ , then pass the UE for this test and go to step 7. Otherwise fail the UE.
7. If both tests have not been done, then repeat the same procedure (steps 1 to 6) with test conditions according to the table 9.3.3.1.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.3.3.1.2.4 Test description

##### 9.3.3.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and interfering source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.21.
2. The parameter settings for the cell are set up according to Table 9.3.3.1.2.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.3.1.2.4.3.

#### 9.3.3.1.2.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.3.1.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If for at least one of the full-size subbands at the channel edges, a subband differential CQI offset level of +2 is reported in  $\alpha$  % or more of 2000 reports, then continue with step 5, otherwise fail the UE.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in an each available downlink transmission instance randomly selected full-size subband using the transport format according to the wideband median-CQI value regardless of UE wideband or subband CQI report. Note that each full-size subband shall be selected in the equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the sub-bands in which UE reports the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . Count the number of NACKs, ACKs and statDTXs on the UL during the test interval. If  $t_{subband} / t_{median} \geq \gamma$ , then pass the UE for this test and go to step 7. Otherwise fail the UE.

7. If both tests have not been done, then repeat the same procedure (steps 1 to 6) with test conditions according to the table 9.3.3.1.2.3-1 for the other Test as appropriate. Otherwise pass the UE.

$\alpha$ [%]	40	40
$\gamma$	1.50	1.50

### 9.3.4 UE-selected subband CQI

The accuracy of UE-selected subband channel quality indicator (CQI) reporting under frequency-selective fading conditions is determined by the relative increase of the throughput obtained when transmitting on the UE-selected subbands with the corresponding transport format compared to the case for which a fixed format is transmitted on any subband in set  $S$  of TS 36.213 [10]. The purpose is to verify that correct subbands are accurately reported for frequency-selective scheduling. To account for sensitivity of the input SNR the subband CQI reporting under frequency-selective fading conditions is considered to be verified if the reporting accuracy is met for at least one of two SNR levels separated by an offset of 1 dB.

### 9.3.4.1 CQI Reporting under fading conditions – PUSCH 2-0 (Cell-Specific Reference Symbols)

#### 9.3.4.1.1 FDD CQI Reporting under fading conditions – PUSCH 2-0

##### 9.3.4.1.1.1 Test purpose

To verify that UE-selected sub-bands can be used for frequently-selective scheduling.

##### 9.3.4.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 9 and forward. Applicability requires support for FGI bit 1.

##### 9.3.4.1.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.4.1.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.4.1.1.3-2 and by the following:

- a) the ratio of the throughput obtained when transmitting on a randomly selected subband among the best  $M$  subbands reported by the UE the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected subband in set  $S$  shall be  $\geq \gamma$ ;

The requirements only apply for subbands of full size and the random scheduling across the subbands is done by selecting a new subband in each TTI for FDD. The transport block size TBS (wideband CQI median) is that resulting from the code rate which is closest to that indicated by the wideband CQI median and the  $N_{PRB}$  entry in Table 7.1.7.2.1-1 of TS 36.213 [10] that corresponds to the subband size.

#### 9.3.4.1.1.4 Test description

##### 9.3.4.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.3.4.1.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.4.1.1.4.3.

##### 9.3.4.1.1.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.4.1.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and L\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC on a randomly selected full-size subband using the transport format according to the wideband median-CQI value regardless of UE wideband or subband CQI report. Note that each full-size subband shall be selected in the equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and L\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in one full-size subband selected among the M subbands reported by the UE and with the corresponding TBS. Differential CQI offset level is selected from {1, 2, 3, 4}. Note that the SS shall send PDSCH in the same full-size subband until

next UE report is available. In case when same full-size subbands are reported subsequently, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 5 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4.

Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . Count the number of NACKs, ACKs and statDTXs on the UL during the test interval.

If  $t_{subband} / t_{median} \geq \gamma$ , then pass the UE for this test and go to step 7. Otherwise go to step 6.

6. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 5) for the other SNR point as appropriate. Otherwise fail the UE.
7. If both tests have not been done, then repeat the same procedure (steps 1 to 5) with test conditions according to the table 9.3.4.1.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.3.4.1.2.4 Test description

##### 9.3.4.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.3.4.1.2.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.4.1.2.4.3.

##### 9.3.4.1.2.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.4.1.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC on a randomly selected full-size subband using the transport format according to the wideband median-CQI value regardless of UE wideband or subband CQI report. Note that each full-size subband shall be selected in the equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in one full-size subband selected among the M subbands reported by the UE and with the corresponding TBS. Differential CQI offset level is selected from {1, 2, 3, 4}. Note that the SS shall send PDSCH in the same full-size until next UE report is available. In case when same full-size subbands are reported subsequently, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ .

Count the number of NACKs, ACKs and statDTXs on the UL during the test interval.

If  $t_{subband} / t_{median} \geq \gamma$ , then pass the UE for this test and go to step 7. Otherwise go to step 6.

6. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 5) for the other SNR point as appropriate. Otherwise fail the UE.
7. If both tests have not been done, then repeat the same procedure (steps 1 to 6) with test conditions according to the table 9.3.4.1.2.3-1 for the other Test as appropriate. Otherwise pass the UE.

##### 9.3.4.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.3.4.2.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.4.2.1.4.3.

##### 9.3.4.2.1.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.4.2.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #1, #3, #5 and subframe #7 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. In this process the SS collects wideband CQI reports and also cases where UE transmits nothing in its wideband CQI timing are counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC on a randomly selected full-size subband using the transport format according to the wideband median-CQI value regardless of UE wideband or subband CQI report. Note that each full-size subband shall be selected in the equal probability. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #1, #3, #5 and subframe #7 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in the full-size subband reported by the UE and with the corresponding TBS. When the UE reports a non-full-size SB, the SS schedules the recent reported SB for bandwidth part with  $j=1$  and with the corresponding TBS. Note that the SS shall send PDSCH in the same full-size subband until next subband UE report is available. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #1, #3, #5 and subframe #7 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . Count the number of NACKs, ACKs and statDTXs on the UL during the test interval.

If  $t_{subband} / t_{median} \geq \gamma$ , then pass the UE for this test and go to step 7. Otherwise go to step 6.

6. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 5) for the other SNR point as appropriate. Otherwise fail the UE.
7. If both tests have not been done, then repeat the same procedure (steps 1 to 6) with test conditions according to the table 9.3.4.2.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.3.4.2.2 TDD CQI Reporting under fading conditions – PUCCH 2-0

##### 9.3.4.2.2.1 Test purpose

To verify that UE-selected sub-bands can be used for frequently-selective scheduling.

##### 9.3.4.2.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 9 and forward. Applicability requires support for FGI bit 2.

##### 9.3.4.2.2.3 Minimum conformance requirements

For the parameters specified in Table 9.3.4.2.2.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.4.2.2.3-2 and by the following:

- a) the ratio of the throughput obtained when transmitting on subbands reported by the UE the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected subband in set  $S$  shall be  $\geq \gamma$ ;

The requirements only apply for subbands of full size and the random scheduling across the subbands is done by selecting a new subband in each available downlink transmission instance for TDD. The transport block size TBS (wideband CQI median) is that resulting from the code rate which is closest to that indicated by the wideband CQI median and the  $N_{\text{PRB}}$  entry in Table 7.1.7.2.1-1 of TS 36.213 [10] that corresponds to the subband size.

#### 9.3.4.2.2.4 Test description

##### 9.3.4.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 9.3.4.2.2.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.4.2.2.4.3.

##### 9.3.4.2.2.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.4.2.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. In this process the SS collects wideband CQI reports and also cases where UE transmits nothing in its wideband CQI timing are counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC on a randomly selected full-size subband using the transport format according to the wideband median-CQI value regardless of UE wideband or subband CQI report. Note that each full-size subband shall be selected in the equal probability. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC in the full-size subband reported by the UE and with the corresponding TBS. When the UE reports a non-full-size SB, the SS schedules the recent reported SB for bandwidth part with  $j=1$  and with the corresponding TBS. Note that the SS shall send PDSCH in the same full-size subband until next subband UE report is available. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . Count the number of NACKs, ACKs and

statDTXs on the UL during the test interval.

If  $t_{subband} / t_{median} \geq \gamma$ , then pass the UE for this test and go to step 7. Otherwise go to step 6.

6. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 5) for the other SNR point as appropriate. Otherwise fail the UE.
7. If both tests have not been done, then repeat the same procedure (steps 1 to 6) with test conditions according to the table 9.3.4.2.2.3-1 for the other Test as appropriate. Otherwise pass the UE.

## 9.3.5 Additional requirements for enhanced receiver Type A

### 9.3.5.1 PUCCH 1-0 (Cell-Specific Reference Symbol)

#### 9.3.5.1.1 FDD CQI Reporting under fading conditions - PUCCH 1-0 - Enhanced Performance Requirement Type A

##### 9.3.5.1.1.1 Test purpose

The purpose of the test is to verify that the reporting of the channel quality is based on the receiver of the enhanced Type A. Performance requirements are specified in terms of the relative increase of the throughput obtained when the transport format is that indicated by the reported CQI subject to an interference model compared to the case with a white Gaussian noise model, and a requirement on the minimum BLER of the transmitted transport formats indicated by the reported CQI subject to an interference model.

##### 9.3.5.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 11 and forward that support enhanced receiver Type A.

##### 9.3.5.1.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.5.1.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.5.1.1.3-2 and by the following

- a) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP and that obtained when transmitting the transport format indicated by each reported wideband CQI index subject to a white Gaussian noise source shall be  $\geq \gamma$ ;
- b) when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP, the average BLER for the indicated transport formats shall be greater than or equal to 2%.

**Table 9.3.5.1.1.3-1: Fading test for single antenna (FDD)**

Parameter	Unit	Cell 1	Cell 2

The number of the CRS ports in both cells is the same. Interfering cell is fully loaded.</p> <p>Note 6: Both cells are time-synchronous.</p> <p>Note 7: Static channel is used for the interference model. In case for white Gaussian noise model Cell 2 is not present.</p> <p>Note 8: SINR corresponds to <math>\hat{E}_s / N_{oc}</math> of Cell 1 as defined in clause 8.1.1.</p>			

**Table 9.3.5.1.1.3-2: Minimum requirement (FDD)**

$\gamma$	1.8
UE Category	1-8

The normative reference for this requirement is TS 36.101 [2] clause 9.3.5.1.1.

#### 9.3.5.1.1.4 Test description

##### 9.3.5.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.50.
2. The parameter settings for the cell 1 are set up according to Table 9.3.5.1.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.5.1.1.4.3.

##### 9.3.5.1.1.4.2 Test procedure

1. Set the cell 1 and 2 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.5.1.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #1,#3,#5 and subframe #7 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{wideband\_interference}}$ . The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses.
3. Deactivate i.e., stop transmitting anything from the cell 2 and set the cell 1 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.5.1.1.3-1 as appropriate.
4. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #1,#3,#5 and subframe #7 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{wideband\_gaussian\_noise}}$ .
5. If the ratio  $(t_{\text{wideband\_interference}} / t_{\text{wideband\_gaussian\_noise}}) \geq \gamma$  and ratio (NACK / (ACK + NACK)) calculated in step 2 is greater or equal to 0.02, then pass the UE for this test. Otherwise fail the UE.

### 9.3.5.1.2 TDD CQI Reporting under fading conditions - PUCCH 1-0 - Enhanced Performance Requirement Type A

#### 9.3.5.1.2.1 Test purpose

The purpose of the test is to verify that the reporting of the channel quality is based on the receiver of the enhanced Type A. Performance requirements are specified in terms of the relative increase of the throughput obtained when the transport format is that indicated by the reported CQI subject to an interference model compared to the case with a white Gaussian noise model, and a requirement on the minimum BLER of the transmitted transport formats indicated by the reported CQI subject to an interference model.

#### 9.3.5.1.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 11 and forward that support enhanced receiver Type A.

#### 9.3.5.1.2.3 Minimum conformance requirements

For the parameters specified in Table 9.3.5.1.2.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.5.1.2.3-2 and by the following

- a) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP and that obtained when transmitting the transport format indicated by each reported wideband CQI index subject to a white Gaussian noise source shall be  $\geq \gamma$ ;
- b) when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP, the average BLER for the indicated transport formats shall be greater than or equal to 2%.

**Table 9.3.5.1.2.3-1: Fading test for single antenna (TDD)**

Parameter	Unit	Cell 1	Cell 2

#### 9.3.5.1.2.4 Test description

##### 9.3.5.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.50.
2. The parameter settings for the cell 1 are set up according to Table 9.3.5.1.2.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.5.1.2.4.3.

##### 9.3.5.1.2.4.2 Test procedure

1. Set the cell 1 and 2 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.5.1.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{wideband\_interference}}$ . The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses.
3. Deactivate i.e., stop transmitting anything from the cell 2 and set the cell 1 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.5.1.2.3-1 as appropriate.
4. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{wideband\_gaussian\_noise}}$ .
5. If the ratio  $(t_{\text{wideband\_interference}} / t_{\text{wideband\_gaussian\_noise}}) \geq \gamma$  and ratio (NACK / (ACK + NACK)) calculated in step 2 is greater or equal to 0.02, then pass the UE for this test. Otherwise fail the UE.

### 9.3.5.2 PUCCH 1-1 (CSI Reference Symbol)

#### 9.3.5.2.1 FDD CQI Reporting under fading conditions - PUCCH 1-1 - Enhanced Performance Requirement Type A

##### 9.3.5.2.1.1 Test purpose

The purpose of the test is to verify that the reporting of the channel quality is based on the receiver of the enhanced Type A. Performance requirements are specified in terms of the relative increase of the throughput obtained when the transport format is that indicated by the reported CQI subject to an interference model compared to the case with a white Gaussian noise model, and a requirement on the minimum BLER of the transmitted transport formats indicated by the reported CQI subject to an interference model.

##### 9.3.5.2.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 11 and forward of Category  $\geq 2$  that support enhanced receiver Type A.

##### 9.3.5.2.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.5.2.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.5.2.1.3-2 and by the following

- a) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP and that obtained when transmitting the transport format indicated by each reported wideband CQI index subject to a white Gaussian noise source shall be  $\geq \gamma$ ;
- b) when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP, the average BLER for the indicated transport formats shall be greater than or equal to 2%.

#### 9.3.5.2.1.4 Test description

##### 9.3.5.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.51.
2. The parameter settings for the cell 1 are set up according to Table 9.3.5.2.1.5-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.5.2.1.4.3.

##### 9.3.5.2.1.4.2 Test procedure

1. Set the cell 1 and 2 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.5.2.1.5-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{wideband\_interference}}$ . The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses.
3. Deactivate i.e., stop transmitting anything from the cell 2 and set the cell 1 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.5.2.1.5-1 as appropriate.
4. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{wideband\_gaussian\_noise}}$ .

5. If the ratio ( $t_{\text{wideband\_interference}} / t_{\text{wideband\_gaussian\_noise}}$ )  $\geq \gamma$  in Table 9.3.5.2.1.5-2 and ratio (NACK / (ACK + NACK)) calculated in step 2 is greater or equal to 0.02, then pass the UE for this test. Otherwise fail the UE.

UE Category	$\geq 2$

### 9.3.5.2.2 TDD CQI Reporting under fading conditions - PUCCH 1-1 - Enhanced Performance Requirement Type A

#### 9.3.5.2.2.1 Test purpose

The purpose of the test is to verify that the reporting of the channel quality is based on the receiver of the enhanced Type A. Performance requirements are specified in terms of the relative increase of the throughput obtained when the transport format is that indicated by the reported CQI subject to an interference model compared to the case with a white Gaussian noise model, and a requirement on the minimum BLER of the transmitted transport formats indicated by the reported CQI subject to an interference model.

#### 9.3.5.2.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 11 and forward of Category  $\geq 2$  that support enhanced receiver Type A.

#### 9.3.5.2.2.3 Minimum conformance requirements

For the parameters specified in Table 9.3.5.2.2.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in 9.3.5.2.2.3-2 and by the following

- the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP and that obtained when transmitting the transport format indicated by each reported wideband CQI index subject to a white Gaussian noise source shall be  $\geq \gamma$ ;
- when transmitting the transport format indicated by each reported wideband CQI index subject to an interference source with specified DIP, the average BLER for the indicated transport formats shall be greater than or equal to 2%.

Table 9.3.5.2.2.3-1: Fading test for single antenna (TDD)

Parameter	Unit	Cell 1	Cell 2

Reporting mode		PUCCH 1-1	N/A
Reporting periodicity	ms	$N_{pd} = 5$	N/A
CQI delay	ms	10	N/A
Physical channel for CQI/PMI reporting		PUSCH (Note 3)	N/A
PUCCH Report Type for CQI/PMI		2	N/A
Physical channel for RI reporting		PUCCH Format 2	N/A
PUCCH Report Type for RI		3	N/A
$cqi-pmi-ConfigurationIndex$		3	N/A
$ri-ConfigIndex$		805 (Note 9)	N/A
Max number of HARQ transmissions		1	N/A
ACK/NACK feedback mode		Multiplexing	N/A
<p>Note 1: If the UE reports in an available uplink reporting instance at subframe SF#n based on CQI estimation at a downlink SF not later than SF#(n-4), this reported wideband CQI cannot be applied at the eNB downlink before SF#(n+4)</p> <p>Note 2: Reference measurement channel RC.11 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1.</p> <p>Note 3: To avoid collisions between CQI/ PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI/ PMI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#2 and #7.</p> <p>Note 4: The respective received power spectral density of each interfering cell relative to <math>N_{oc}</math> is defined by its associated DIP value as</p>			

	specified in clause B.5.1.
Note 5:	Two cells are considered in which Cell 1 is the serving cell and Cell 2 is the interfering cell. Interfering cell is fully loaded.
Note 6:	Both cells are time-synchronous.
Note 7:	Static channel is used for the interference model. In case for white Gaussian noise model Cell 2 is not present.
Note 8:	SINR corresponds to $\hat{E}_s / N_{oc}$ of Cell 1 as defined in clause 8.1.1.
Note 9:	RI reporting interval is set to the maximum allowable length of 160ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160ms during performance verification and the reported CQI in subframe SF#7 of the previous frame is applied in downlink subframes until a new CQI (after CQI/PMI dropping) is available.

**Table 9.3.5.2.2.3-2: Minimum requirement (TDD)**

$\gamma$	1.8
UE Category	$\geq 2$

The normative reference for this requirement is TS 36.101 [2] clause 9.3.5.2.2.

#### 9.3.5.2.2.4 Test description

##### 9.3.5.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.51.
2. The parameter settings for the cell 1 are set up according to Table 9.3.5.2.2.5-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.5.2.2.4.3.

##### 9.3.5.2.2.4.2 Test procedure

1. Set the cell 1 and 2 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.5.2.2.5-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as

$t_{\text{wideband\_interference}}$  · The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses.

3. Deactivate i.e., stop transmitting anything from the cell 2 and set the cell 1 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.5.2.2.5-1 as appropriate.
4. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as

$t_{\text{wideband\_gaussian\_noise}}$  ·

5. If the ratio ( $t_{\text{wideband\_interference}} / t_{\text{wideband\_gaussian\_noise}}$ )  $\geq \gamma$  in Table 9.3.5.2.2.5-2 and ratio (NACK / (ACK + NACK)) calculated in step 2 is greater or equal to 0.02, then pass the UE for this test. Otherwise fail the UE.

#### 9.3.5.2.2.4.3 Message contents

$\gamma$	1.79
UE Category	$\geq 2$

### 9.3.6 CQI Reporting under fading conditions (With multiple CSI processes)

#### 9.3.6.1\_F FDD CQI Reporting under fading conditions with CSI processes for CoMP

##### 9.3.6.1\_F.1 FDD CQI Reporting under fading conditions with Single CSI process for CoMP

###### 9.3.6.1\_F.1.1 Test purpose

The purpose of the test is to verify the reporting accuracy of the CQI and the UE processing capability for single CSI process.

###### 9.3.6.1\_F.1.2 Test applicability

This test applies to all types of E-UTRA FDD UEs release 11 and forward, supporting Maximum CSI processes of One on a component carrier within a band with PDSCH transmission mode 10.

###### 9.3.6.1\_F.1.3 Minimum conformance requirements

Each CSI process is associated with a CSI-RS resource and a CSI-IM resource as shown in Table 9.3.6.1\_F.1.3-1. For UE supports one CSI process, CSI process 2 is configured and the corresponding requirements shall be fulfilled. For UE supports three CSI processes, CSI processes 0, 1 and 2 are configured and the corresponding requirements shall be fulfilled. For UE supports four CSI processes, CSI processes 0, 1, 2 and 3 are configured and the corresponding requirements shall be fulfilled. And the Table 9.3.6.1\_F.1.3-1 is valid for FDD and TDD.

**Table 9.3.6.1\_F.1.3-1: Configuration of CSI processes**

	<b>CSI process 0</b>	<b>CSI process 1</b>	<b>CSI process 2</b>	<b>CSI process 3</b>
CSI-RS resource	CSI-RS signal 0	CSI-RS signal 1	CSI-RS signal 0	CSI-RS signal 1
CSI-IM resource	CSI-IM resource 0	CSI-IM resource 0	CSI-IM resource 1	CSI-IM resource 2

For the parameters specified in Table 9.3.6.1\_F.1.3-2, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.6.1\_F.1.3-3 and by the following:

- a) a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha$  % of the time but less than  $\beta$  % for each sub-band for CSI process 1, 2, or 3;
- b) a CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $\delta$  % of the time for CSI process 0;
- c) the difference of the median CQIs of the reported wideband CQI for configured CSI processes shall be greater or equal to the values as in Table 9.3.6.1\_F.1.3-4;
- d) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;
- e) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.02.

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. Sub-bands of a size smaller than full size are excluded from the test.

Table 9.3.6.1\_F.1.3-2: Fading test for FDD

Note 2: 3 symbols allocated to PDCCH.						
Note 3: Reference measurement channel RC.12 FDD according to Table A.4-1. PDSCH transmission is scheduled on subframe 2, 3, 4, 7, 8 and 9 from TP1.						
Note 4: TM10 OCNG as specified in A.5.1.8 is transmitted on subframe 1 and 6 from TP1.						
Note 5: TM10 OCNG as specified in A.5.1.8 is transmitted on subframe 1, 2, 3, 4, 6, 7, 8 and 9 from TP2.						
Note 6: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#2 and #7.						
Note 7: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.						
Note 8: PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF#1 and #6 to allow aperiodic CQI/PMI/RI to be transmitted in uplink SF#0 and #5.						
Note 9: For these sub-bands which are not selected for PDSCH transmission, TM10 OCNG should be transmitted.						

Note 10: PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF#2 and #7 to allow aperiodic CQI/PMI/RI to be transmitted in uplink SF#1 and #6.

**Table 9.3.6.1\_F.1.3-3: Minimum requirement (FDD)**

	CSI process 0	CSI process 1	CSI process 2	CSI process 3

#### 9.3.6.1\_F.1.4 Test description

##### 9.3.6.1\_F.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.52.
2. The parameter settings for the cell are set up according to Table 9.3.6.1\_F.1.3-2.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.6.1\_F.1.4.3.

##### 9.3.6.1\_F.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.6.1\_F.1.3-2 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered for CSI process 2. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback for CSI process 2 via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.

3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. Check if “ $2000 * \alpha \% / 100 \leq \text{number of CQI reports with index 0 for each full-size subband} \leq 2000 * \beta \% / 100$ ” for CSI process 2. (2000= No of full-size subband reports, 100 because of %) If yes, continue with step5, otherwise goto step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each TTI randomly selected full-size subband regardless of UE wideband and full-size subband CQI report based on CSI process 2. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI based on CSI process 2. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and  $(\text{NACK} / (\text{ACK} + \text{NACK})) \geq 0.02$ , pass the UE for this test and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.6.1\_F.1.3-2 for the other Test as appropriate. Otherwise pass the UE.

UE Category	$\geq 1$

To pass the test,  $\alpha$  and  $\beta$  and  $\delta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one or the other SNR point within one test must be fulfilled.

## 9.3.6.1\_F.2 FDD CQI Reporting under fading conditions with Three CSI processes for CoMP

## 9.3.6.1\_F.2.1 Test purpose

The purpose of the test is to verify the reporting accuracy of the CQI and the UE processing capability for Three CSI processes.

## 9.3.6.1\_F.2.2 Test applicability

This test applies to all types of E-UTRA FDD UEs release 11 and forward, supporting Maximum CSI processes of Three on a component carrier within a band with PDSCH transmission mode 10.

## 9.3.6.1\_F.2.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 9.3.6.1\_F.1.3.

### 9.3.6.1\_F.2.4 Test description

#### 9.3.6.1\_F.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.52.
2. The parameter settings for the cell are set up according to Table 9.3.6.1\_F.1.3-2.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.6.1\_F.2.4.3.

#### 9.3.6.1\_F.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.6.1\_F.1.3-2 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered for each of CSI process 0, 1 and 2. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe subframe #1 and subframe #6 to carry the PUSCH CQI feedback for CSI process 1 and 2 via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. But for CSI process 0, SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUCCH CQI feedback. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. Check if " $2000 \cdot \alpha \% / 100 \leq$  number of CQI reports with index 0 for each full-size subband  $\leq 2000 \cdot \beta \% / 100$ " for CSI process 1 and 2. And check if the number of CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $2000 \cdot \delta \% / 100$  for CSI process 0. And check if the difference of the median CQIs of the reported wideband CQI for configured CSI processes 0, 1 and 2 shall be greater or equal to the values as in Table 9.3.6.1\_F.2.5-2. ( $2000 =$  No of full-size subband reports, 100 because of %).. If yes, continue with step 5, otherwise goto step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each TTI randomly selected full-size subband regardless of UE wideband and full-size subband CQI report based on CSI process 2. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #1 and subframe #6 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. But for CSI process 0, SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUCCH CQI feedback. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .

6. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI based on CSI process 2. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #1 and subframe #6 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. But for CSI process 0, SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUCCH CQI feedback. Measure the average throughput and  $(\text{NACK} / (\text{ACK} + \text{NACK}))$  according to Annex G.5.3. Declare the throughput as  $t_{\text{subband}}$ . If the ratio  $(t_{\text{subband}} / t_{\text{median}}) \geq \gamma$  and  $(\text{NACK} / (\text{ACK} + \text{NACK})) \geq 0.02$ , pass the UE for this test and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to table 9.3.6.1\_F.1.3-2 for the other Test as appropriate. Otherwise pass the UE.

UE Category	$\geq 1$		

Table 9.3.6.1\_F.2.5-2: Minimum median CQI difference between configured CSI processes (FDD)

	CSI process 1	CSI process 2
CSI process 0	N/A	1
UE Category	$\geq 1$	

To pass the test,  $\alpha$  and  $\beta$  and  $\delta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one or the other SNR point within one test must be fulfilled.

### 9.3.6.1\_F.3 FDD CQI Reporting under fading conditions with Four CSI processes for CoMP

#### 9.3.6.1\_F.3.1 Test purpose

The purpose of the test is to verify the reporting accuracy of the CQI and the UE processing capability for Four CSI processes.

#### 9.3.6.1\_F.3.2 Test applicability

This test applies to all types of E-UTRA FDD UEs release 11 and forward, supporting Maximum CSI processes of Four on a component carrier within a band with PDSCH transmission mode 10.

#### 9.3.6.1\_F.3.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 9.3.6.1\_F.1.3.

#### 9.3.6.1\_F.3.4 Test description

##### 9.3.6.1\_F.3.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.52.
2. The parameter settings for the cell are set up according to Table 9.3.6.1\_F.1.3-2.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.6.1\_F.3.4.3.

##### 9.3.6.1\_F.3.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.6.1\_F.1.3-2 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered for each of CSI process 0, 1, 2, and 3. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #1 and subframe #6 to carry the PUSCH CQI feedback for CSI process 1, 2, and 3 via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. But for CSI process 0, SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUCCH CQI feedback. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.

4. Check if “ $2000 * \alpha \% / 100 \leq$  number of CQI reports with index 0 for each full-size subband  $\leq 2000 * \beta \% / 100$ ” for CSI process 1, 2 and 3. And check if the number of CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $2000 * \delta \% / 100$  for CSI process 0. And check if the difference of the median CQIs of the reported wideband CQI for configured CSI processes 0, 1, 2 and 3 shall be greater or equal to the values as in Table 9.3.6.1\_F.3.5-2. (2000= No of full-size subband reports, 100 because of %). If yes, continue with step 5, otherwise goto step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each TTI randomly selected full-size subband regardless of UE wideband and full-size subband CQI report based on CSI process 2. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #1 and subframe #6 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. But for CSI process 0, SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUCCH CQI feedback. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI based on CSI process 2. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #1 and subframe #6 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. But for CSI process 0, SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUCCH CQI feedback. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK / (ACK + NACK))  $\geq 0.02$ , pass the UE for this test and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to table 9.3.6.1\_F.1.3-2 for the other Test as appropriate. Otherwise pass the UE.

#### 9.3.6.1\_F.3.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exception:

## 9.3.6.1\_F.3.5 Test requirement

Table 9.3.6.1\_F.3.5-1: Test requirement (FDD)

	CSI process 0	CSI process 1	CSI process 2	CSI process 3
$\alpha$ [%]	N/A	2	2	2
$\beta$ [%]	N/A	40	40	40
$\delta$ [%]	10	N/A	N/A	N/A
$\gamma$	N/A	N/A	1.01	N/A
UE Category	$\geq 1$			

Table 9.3.6.1\_F.3.5-2: Minimum median CQI difference between configured CSI processes (FDD)

	CSI process 1	CSI process 2	CSI process 3
CSI process 0	N/A	1	3
UE Category	$\geq 1$		

To pass the test,  $\alpha$  and  $\beta$  and  $\delta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one or the other SNR point within one test must be fulfilled.

### 9.3.6.2\_F TDD CQI Reporting under fading conditions with CSI processes for CoMP

#### 9.3.6.2\_F.1 TDD CQI Reporting under fading conditions with Single CSI process for CoMP

##### 9.3.6.2\_F.1.1 Test purpose

The purpose of the test is to verify the reporting accuracy of the CQI and the UE processing capability for single CSI process.

##### 9.3.6.2\_F.1.2 Test applicability

This test applies to all types of E-UTRA TDD UEs release 11 and forward, supporting Maximum CSI processes of One on a component carrier within a band with PDSCH transmission mode 10.

##### 9.3.6.2\_F.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.6.2\_F.1.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.6.2\_F.1.3-2 and by the following:

- a) a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha$  % of the time but less than  $\beta$  % for each sub-band for CSI process 1, 2, or 3;
- b) a CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $\delta$  % of the time for CSI process 0;
- c) the difference of the median CQIs of the reported wideband CQI for configured CSI processes shall be greater or equal to the values as in Table 9.3.6.2\_F.1.3-3;
- d) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;
- e) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.02.

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD, each available downlink transmission instance for TDD. Sub-bands of a size smaller than full size are excluded from the test.

PMI for subframe 4 and 9		0x0000 0000 0000 0001	100000	0x0000 0000 0000 0001	100000
PMI for subframe 3 and 8		0x0000 0000 0001 0000	100000	0x0000 0000 0001 0000	100000
Max number of HARQ transmissions		1	N/A	1	N/A
ACK/NACK feedback mode		Multiplexing	N/A	Multiplexing	N/A
Note 1:	If the UE reports in an available uplink reporting instance at subframe SF#n based on CQI estimation at a downlink SF not later than SF#(n-4), this reported wideband CQI cannot be applied at the eNB downlink before SF#(n+4)				
Note 2:	3 symbols allocated to PDCCH				
Note 3:	Reference measurement channel RC.12 TDD according to Table A.4-1. PDSCH transmission is scheduled on subframe 4 and 9 from TP1.				
Note 4:	TM10 OCNG is transmitted as specified in A.5.2.8 on subframe 3 and 8 from TP1.				
Note 5:	TM10 OCNG is transmitted as specified in A.5.2.8 on subframe 3, 4, 8 and 9 from TP2				
Note 6:	To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#7 and #2.				
Note 7:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.				
Note 8:	PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF#3 and #8 to allow aperiodic CQI/PMI/RI to be transmitted in uplink SF#7 and #2.				
Note 9:	For these sub-bands which are not selected for PDSCH transmission, TM10 OCNG should be transmitted.				
Note 10:	RI reporting interval is set to the maximum allowable length of 160ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160ms during performance verification and the reported CQI in subframe SF#7 of the previous frame is applied in downlink subframes until a new CQI (after CQI/PMI dropping) is available.

The normative reference for this requirement is TS 36.101 [2] clause 9.3.6.2.

#### 9.3.6.2\_F.1.4 Test description

##### 9.3.6.2\_F.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.52.
2. The parameter settings for the cell are set up according to Table 9.3.6.2\_F.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.6.2\_F.1.4.3.

##### 9.3.6.2\_F.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.6.2\_F.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to CQI value 10 and keep it regardless of the wideband and full-size subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI report for each full-size subband have been gathered for CSI process 2. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback for CSI process 2 via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.

4. Check if “ $2000 * \alpha \% / 100 \leq$  number of CQI reports with index 0 for each full-size subband  $\leq 2000 * \beta \% / 100$ ” for CSI process 2. (2000= No of full-size subband reports, 100 because of %). If yes, continue with step 5, otherwise goto step 7.
5. The SS shall send PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each available downlink transmission instance randomly selected full-size subband regardless of UE wideband and subband CQI report based on CSI process 2. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3 Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the sub-bands in which UE report the highest full-size subband CQI based on CSI process 2. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK / (ACK + NACK))  $\geq 0.02$ , pass the UE and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to table 9.3.6.2\_F.1.3-1 for the other test as appropriate.

$\gamma$	1.01
UE Category	$\geq 1$

To pass the test,  $\alpha$  and  $\beta$  and  $\delta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.3.6.2\_F.1.5 TDD CQI Reporting under fading conditions with Three CSI processes for CoMP

## 9.3.6.2\_F.2.1 Test purpose

The purpose of the test is to verify the reporting accuracy of the CQI and the UE processing capability for Three CSI processes.

## 9.3.6.2\_F.2.2 Test applicability

This test applies to all types of E-UTRA TDD UEs release 11 and forward, supporting Maximum CSI processes of Three on a component carrier within a band with PDSCH transmission mode 10.

## 9.3.6.2\_F.2.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 9.3.6.2\_F.1.3.

### 9.3.6.2\_F.2.4 Test description

#### 9.3.6.2\_F.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.52.
2. The parameter settings for the cell are set up according to Table 9.3.6.2\_F.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.6.2\_F.2.4.3.

#### 9.3.6.2\_F.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.6.2\_F.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to CQI value 10, and keep it regardless of the wideband and full-size subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI report for each full-size subband have been gathered for each of CSI process 0, 1 and 2. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback for CSI process 1 and 2 via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. But for CSI process 0, SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUCCH CQI feedback. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. Check if " $2000 \cdot \alpha \% / 100 \leq \text{number of CQI reports with index } 0 \text{ for each full-size subband} \leq 2000 \cdot \beta \% / 100$ " for CSI process 1 and 2. And check if the number of CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $2000 \cdot \delta \% / 100$  for CSI process 0. And check if the difference of the median CQIs of the reported wideband CQI for configured CSI processes 0, 1 and 2 shall be greater or equal to the values as in Table 9.3.6.2\_F.2.5-2.  
(2000= No of full-size subband reports, 100 because of %) If yes, continue with step5, otherwise goto step 7.
5. The SS shall send PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each available downlink transmission instance randomly selected full-size subband regardless of UE wideband and subband CQI report based on CSI process 2. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4.  
Measure the average throughput according to Annex G.5.3 Declare the throughput as  $t_{median}$ .

6. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the sub-bands in which UE report the highest full-size subband CQI based on CSI process 2. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and L\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and  $(\text{NACK} / (\text{ACK} + \text{NACK}))$  according to Annex G.5.3. Declare the throughput as  $t_{\text{subband}}$ . If the ratio  $(t_{\text{subband}} / t_{\text{median}}) \geq \gamma$  and  $(\text{NACK} / (\text{ACK} + \text{NACK})) \geq \text{FFS}$ , pass the UE and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.3.6.2\_F.1.3-1 for the other test as appropriate.

	CSI process 1	CSI process 2
CSI process 0	N/A	1
UE Category	$\geq 1$	

To pass the test,  $\alpha$  and  $\beta$  and  $\delta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

### 9.3.6.2\_F.3 TDD CQI Reporting under fading conditions with Four CSI processes for CoMP

#### 9.3.6.2\_F.3.1 Test purpose

The purpose of the test is to verify the reporting accuracy of the CQI and the UE processing capability for Four CSI processes.

#### 9.3.6.2\_F.3.2 Test applicability

This test applies to all types of E-UTRA TDD UEs release 11 and forward, supporting Maximum CSI processes of Four on a component carrier within a band with PDSCH transmission mode 10.

#### 9.3.6.2\_F.3.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 9.3.6.2\_F.1.3.

#### 9.3.6.2\_F.3.4 Test description

##### 9.3.6.2\_F.3.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.52.
2. The parameter settings for the cell are set up according to Table 9.3.6.2\_F.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.6.2\_F.3.4.3.

##### 9.3.6.2\_F.3.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.6.2\_F.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to CQI value 10 and keep it regardless of the wideband and full-size subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI report for each full-size subband have been gathered for each of CSI process 0, 1, 2, and 3. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback for CSI process 1, 2, and 3 via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. But for CSI process 0, SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUCCH CQI feedback. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.

4. Check if “ $2000 \cdot \alpha \% / 100 \leq$  number of CQI reports with index 0 for each full-size subband  $\leq 2000 \cdot \beta \% / 100$ ” for CSI process 1, 2 and 3. And check if the number of CQI index not in the set {median CQI -1, median CQI, median CQI +1} shall be reported at least  $2000 \cdot \delta \% / 100$  for CSI process 0. And check if the difference of the median CQIs of the reported wideband CQI for configured CSI processes 0, 1, 2 and 3 shall be greater or equal to the values as in Table 9.3.6.2\_F.3.5-2. (2000= No of full-size subband reports, 100 because of %). If yes, continue with step 5, otherwise goto step 7.
5. The SS shall send PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each available downlink transmission instance randomly selected full-size subband regardless of UE wideband and subband CQI report based on CSI process 2. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3 Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the sub-bands in which UE report the highest full-size subband CQI based on CSI process 2. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #2 and subframe #7 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK / (ACK + NACK))  $\geq 0.02$ , pass the UE and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to table 9.3.6.2\_F.1.3-1 for the other test as appropriate.

$\gamma$	N/A	N/A	1.01	N/A
UE Category	≥1			

**Table 9.3.6.2\_F.3.5-2: Minimum median CQI difference between configured CSI processes (TDD)**

	CSI process 1	CSI process 2	CSI process 3
<b>CSI process 0</b>	N/A	1	3
UE Category	≥1		

To pass the test,  $\alpha$  and  $\beta$  and  $\delta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one or the other SNR point within one test must be fulfilled.

## 9.3.7 PUSCH 3-2 for eDL MIMO Enhancement

### 9.3.7.1 FDD CQI Reporting under fading conditions - PUSCH 3-2 for eDL MIMO Enhancement

#### 9.3.7.1.1 Test purpose

The purpose of the test is to verify the reporting accuracy of the sub band CQI and sub band PMI operation.

#### 9.3.7.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE releases 12 and forward that support eDL-MIMO Enhancement. Applicability requires support for FGI bit 103.

#### 9.3.7.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.7.1.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.7.1.3-2 and by the following.

- a) the ratio of the throughput obtained when transmitting based on UE PUSCH 3-2 reported wideband CQI and subband PMI and that obtained when transmitting based on PUSCH 3-1 reported wideband CQI and wideband PMI shall be  $\geq \alpha$ ;
- b) The ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS based on UE PUSCH 3-2 reported subband CQI and subband PMI and that obtained when transmitting on a randomly selected sub-band in set S based on PUSCH 1-2 reported wideband CQI and subband PMI shall be  $\geq \beta$ ;

The transport block sizes TBS for wideband CQI and subband CQI are selected according to RC.16 FDD for test 1 and according to RC.17 FDD for test 2.

#### 9.3.7.1.4 Test description

##### 9.3.7.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.3.7.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.7.1.4.3.

#### 9.3.7.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.7.1.3-1 as appropriate.

For Test1

2. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC according to the wideband and subband CQI value sent by the UE and according to the wideband and subband PMI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports, wideband PMI reports, full-size subband CQI reports, and full-size subband PMI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC according to the wideband CQI value and wideband PMI value. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH 3-1 CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{wideband}$ .
4. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit to 0 to schedule UL RMC in every subframe (Table A.4.1-1).
5. The SS shall transmit an RRC Connection Reconfiguration message to set reporting mode according to Table 9.3.7.1.3-1.
6. The UE shall transmit RRC Connection Reconfiguration Complete message.
7. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC according to the wideband CQI value and subband PMI value. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH 3-2 CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ .
8. If the ratio  $(t_{subband} / t_{wideband}) \geq \alpha$  which is specified in Table 9.3.7.1.5-1, pass the UE for this test and go to step 16. Otherwise, go to step 15.

For Test2

9. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband and subband CQI value sent by the UE and according to the wideband and subband PMI value sent by

the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports, wideband PMI reports, full-size subband CQI reports, and full-size subband PMI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and  $I_{MCS}=29$  and  $N_{PRB}$  allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.

10. The SS shall send PDSCH via PDCCH DCI format 2C for  $C_{RNTI}$  to transmit the DL RMC according to the wideband CQI value and subband PMI value in each available downlink transmission instance randomly selected full-size subband. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH 1-2 CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and  $I_{MCS}=29$  and  $N_{PRB}$  allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{wideband}$ .
11. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit to 0 to schedule UL RMC in every subframe (Table A.4.1-1).
12. The SS shall transmit an RRC Connection Reconfiguration message to set reporting mode according to Table 9.3.7.1.3-1.
13. The UE shall transmit RRC Connection Reconfiguration Complete message.
14. The SS shall transmit PDSCH via PDCCH DCI format 2C for  $C_{RNTI}$  to transmit the DL RMC according to the highest UE reported full-size subband CQI value and full-size subband PMI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI and full-size subband PMI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #0 and subframe #5 to carry the PUSCH 3-2 CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and  $I_{MCS}=29$  and  $N_{PRB}$  allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{wideband}) \geq \beta$  which is specified in Table 9.3.7.1.5-1, pass the UE for this test and go to step 16. Otherwise, go to step 15.
15. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 14) for the other SNR point as appropriate. Otherwise fail the UE.
16. If both tests have not been done, then repeat the same procedure (steps 1 to 15) with test conditions according to the Table 9.3.7.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

## 9.3.7.1.5 Test requirement

Table 9.3.7.1.5-1: Test requirement (FDD)

	Test 1	Test 2
$\alpha$	1.04	-
$\beta$	-	1.14
UE Category	$\geq 2$	$\geq 2$

To pass the test,  $\alpha$  and  $\beta$  must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

### 9.3.7.2 TDD CQI Reporting under fading conditions - PUSCH 3-2 for eDL MIMO Enhancement

#### 9.3.7.2.1 Test purpose

The purpose of the test is to verify the reporting accuracy of the sub band CQI and sub band PMI operation.

#### 9.3.7.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE releases 12 and forward that support eDL-MIMO Enhancement. Applicability requires support for FGI bit 103.

#### 9.3.7.2.3 Minimum conformance requirements

For the parameters specified in Table 9.3.7.2.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.3.7.2.3-2 and by the following.

- a) the ratio of the throughput obtained when transmitting based on UE PUSCH 3-2 reported wideband CQI and subband PMI and that obtained when transmitting based on PUSCH 3-1 reported wideband CQI and wideband PMI shall be  $\geq \alpha$ ;
- b) The ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS based on UE PUSCH3-2 reported subband CQI and subband PMI and that obtained when transmitting on a randomly selected sub-band in set S based on PUSCH 1-2 reported wideband CQI and subband PMI shall be  $\geq \beta$ ;

The transport block sizes TBS for wideband CQI and subband CQI are selected according to RC.14 TDD for test 1 and RC.15 TDD for test 2.

Table 9.3.7.2.3-1: Sub-band test for TDD

Parameter		Unit	Test 1		Test 2	
Bandwidth		MHz	10MHz

#### 9.3.7.2.4 Test description

##### 9.3.7.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.3.7.2.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.7.2.4.3.

#### 9.3.7.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.3.7.2.3-1 as appropriate.

For Test1

2. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC according to the wideband and subband CQI value sent by the UE and according to the wideband and subband PMI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports, wideband PMI reports, full-size subband CQI reports, and full-size subband PMI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #3 and subframe #8 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC according to the wideband CQI value and wideband PMI value. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #3 and subframe #8 to carry the PUSCH 3-1 CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{wideband}$ .
4. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit to 0 to schedule UL RMC in subframe#3 and #8 (Table A.4.1-2).
5. The SS shall transmit an RRC Connection Reconfiguration message to set reporting mode according to Table 9.3.7.2.3-1.
6. The UE shall transmit RRC Connection Reconfiguration Complete message.
7. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC according to the wideband CQI value and subband PMI value. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #3 and subframe #8 to carry the PUSCH 3-2 CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ .
8. If the ratio  $(t_{subband} / t_{wideband}) \geq \alpha$  which is specified in Table 9.3.7.2.5-1, pass the UE for this test and go to step 16. Otherwise, go to step 15.

For Test2

9. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband and subband CQI value sent by the UE and according to the wideband and subband PMI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports, wideband PMI reports, full-size subband CQI reports, and full-size subband PMI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #3 and subframe #8 to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
10. The SS shall send PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband CQI value and subband PMI value in each available downlink transmission instance randomly selected full-size subband. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #3 and subframe #8 to carry the PUSCH 1-2 CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{wideband}$ .
11. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit to 0 to schedule UL RMC in subframe#3 and #8 (Table A.4.1-2).
12. The SS shall transmit an RRC Connection Reconfiguration message to set reporting mode according to Table 9.3.7.2.3-1.
13. The UE shall transmit RRC Connection Reconfiguration Complete message.
14. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value and full-size subband PMI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI and full-size subband PMI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission in subframe #3 and subframe #8 to carry the PUSCH 3-2 CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{wideband}) \geq \beta$  which is specified in Table 9.3.7.2.5-1, pass the UE for this test and go to step 16. Otherwise, go to step 15.
15. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 14) for the other SNR point as appropriate. Otherwise fail the UE.
16. If both tests have not been done, then repeat the same procedure (steps 1 to 15) with test conditions according to the Table 9.3.7.2.3-1 for the other Test as appropriate. Otherwise pass the UE.

## 9.3.7.2.5 Test requirement

**Table 9.3.7.2.3-1: Test requirement (TDD)**

	Test 1	Test 2
$\alpha$	1.04	-
$\beta$	-	1.14
UE Category	$\geq 2$	$\geq 2$

To pass the test,  $\alpha$  and  $\beta$  must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.3.8 Additional requirements for enhanced receiver Type B

## 9.3.8.1 PUCCH 1-1 (Cell-Specific Reference Symbols)

## 9.3.8.1.1 FDD CQI Reporting under fading conditions - PUCCH 1-1 (Cell-Specific Reference Symbols) TM4 - Enhanced Receiver Type B

## 9.3.8.1.1.1 Test purpose

The purpose of the test is to verify that the reporting of the channel quality based on the receiver of the enhanced Type B meets a minimum performance. Performance requirements are specified in terms of the relative throughput obtained when the transport format is that indicated by the reported CQI with NeighCellsInfo-r12 configured compared to the case without NeighCellsInfo-r12 configured. Cell 1 is the serving cell, and Cell 2 and Cell 3 are the interference cells.

## 9.3.8.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD release 12 and forward UE of Category  $\geq 2$  that support enhanced performance requirement Type B.

## 9.3.8.1.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.8.1.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.8.1.1.3-2 and by the following

- a) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index subject to interference sources with NeighCellsInfo-r12 configured and that obtained when transmitting the transport format indicated by each reported wideband CQI index subject to interference sources without NeighCellsInfo-r12 configured shall be  $\geq \gamma$ ;

#### 9.3.8.1.1.4 Test description

##### 9.3.8.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.48.
2. The parameter settings for the cell 1 are set up according to Table 9.3.8.1.1.-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.8.1.1.4.3.

#### 9.3.8.1.1.4.2 Test procedure

1. Set the cell 1, 2 and 3 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.8.1.1.5-1 as appropriate.
2. [SS shall not setup NAICS-AssistanceInfo for the next test step.]
3. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The UE will send ACK/NACK and periodic CQI, PMI and RI report using PUCCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{NAICS\_OFF}}$ .
4. SS shall setup NAICS-AssistanceInfo as per TS 36.508 [7] clause 5.2A.6.1.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The UE will send ACK/NACK and periodic CQI, PMI and RI report using PUCCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{NAICS\_ON}}$ . The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses.
6. If the ratio  $(t_{\text{NAICS\_ON}} / t_{\text{NAICS\_OFF}}) \geq \gamma$  then pass the UE for this test. Otherwise fail the UE.
7. The SS shall release all NAICS configuration in the UE using procedure in TS 36.508 [7] clause 5.2A.6.1 with the condition NAICS\_RELEASE.

## 9.3.8.1.2 TDD CQI Reporting under fading conditions - PUCCH 1-1 (Cell-Specific Reference Symbols) TM4 - Enhanced Receiver Type B

## 9.3.8.1.2.1 Test purpose

The purpose of the test is to verify that the reporting of the channel quality based on the receiver of the enhanced Type B meets a minimum performance. Performance requirements are specified in terms of the relative throughput obtained

when the transport format is that indicated by the reported CQI with NeighCellsInfo-r12 configured compared to the case without NeighCellsInfo-r12 configured. Cell 1 is the serving cell, and Cell 2 and Cell 3 are the interference cells.

#### 9.3.8.1.2.2 Test applicability

This test applies to all types of E-UTRA TDD release 12 and forward UE of Category  $\geq 2$  that support enhanced performance requirement Type B.

#### 9.3.8.1.2.3 Minimum conformance requirements

For the parameters specified in Table 9.3.8.1.2.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.8.1.2.3-2 and by the following:

- a) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index subject to interference sources with NeighCellsInfo-r12 configured and that obtained when transmitting the transport format indicated by each reported wideband CQI index subject to interference sources without NeighCellsInfo-r12 configured shall be  $\geq \gamma$ ;

#### 9.3.8.1.2.4 Test description

##### 9.3.8.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.48.
2. The parameter settings for the cell 1 are set up according to Table 9.3.8.1.2.-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.8.1.2.4.3.

##### 9.3.8.1.2.4.2 Test procedure

1. Set the cell 1, 2 and 3 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.8.1.2.5-1 as appropriate.
2. [SS shall not setup NAICS-AssistanceInfo for the next test step.]
3. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{NAICS\_OFF}}$ .
4. SS shall setup NAICS-AssistanceInfo as per TS 36.508 [7] clause 5.2A.6.1.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{NAICS\_ON}}$ . The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses.
6. If the ratio  $(t_{\text{NAICS\_ON}} / t_{\text{NAICS\_OFF}}) \geq \gamma$  then pass the UE for this test. Otherwise fail the UE.
7. The SS shall release all NAICS configuration in the UE using procedure in TS 36.508 [7] clause 5.2A.6.1 with the condition NAICS\_RELEASE.

### 9.3.8.2 PUCCH 1-1 (CSI Reference Symbols)

#### 9.3.8.2.1 FDD CQI Reporting under fading conditions - PUCCH 1-1 (CSI Reference Symbol) TM9 - Enhanced Receiver Type B

**Editor's notes: This test case is incomplete. The following items are missing or incomplete:**

**- Test Tolerances are undefined**

##### 9.3.8.2.1.1 Test purpose

The purpose of the test is to verify that the reporting of the channel quality based on the receiver of the enhanced Type B meets a minimum performance. Performance requirements are specified in terms of the relative throughput obtained when the transport format is that indicated by the reported CQI with NeighCellsInfo-r12 configured compared to the case without NeighCellsInfo-r12 configured. Cell 1 is the serving cell, and Cell 2 and Cell 3 are the interference cells.

##### 9.3.8.2.1.2 Test applicability

This test applies to all types of E-UTRA FDD release 12 and forward UE of Category  $\geq 2$  that support enhanced performance requirement Type B.

##### 9.3.8.2.1.3 Minimum conformance requirements

For the parameters specified in Table 9.3.8.2.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.8.2.1.3-2 and by the following

- a) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index subject to interference sources with NeighCellsInfo-r12 configured and that obtained when transmitting the transport format indicated by each reported wideband CQI index subject to interference sources without NeighCellsInfo-r12 configured shall be  $\geq \gamma$ ;

#### 9.3.8.2.1.4 Test description

##### 9.3.8.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.48.
2. The parameter settings for the cell 1 are set up according to Table 9.3.8.2.1.-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.8.1.1.4.3.

##### 9.3.8.2.1.4.2 Test procedure

1. Set the cell 1, 2 and 3 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.8.2.1.5-1 as appropriate.
2. SS shall not setup NAICS-AssistanceInfo for the next test step.
3. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI, PMI and RI report using PUCCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{NAICS\_OFF}}$ .
4. SS shall setup NAICS-AssistanceInfo as per TS 36.508 [7] clause 5.2A.6.1.
5. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI, PMI and RI report using PUCCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{NAICS\_ON}}$ . The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses.
6. If the ratio  $(t_{\text{NAICS\_ON}} / t_{\text{NAICS\_OFF}}) \geq \gamma$  then pass the UE for this test. Otherwise fail the UE.

7. The SS shall release all NAICS configuration in the UE using procedure in TS 36.508 [7] clause 5.2A.6.1 with the condition NAICS\_RELEASE.

<p>Note 1: If the UE reports in an available uplink reporting instance at subframe SF#n based on CQI estimation at a downlink SF not later than SF#(n-4), this reported wideband CQI cannot be applied at the eNB downlink before SF#(n+4).</p> <p>Note 2: Reference measurement channel RC.11 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 FDD as described in Annex A.5.1.1.</p> <p>Note 3: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#1 and #6 to allow periodic CQI/ PMI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#0 and #5.</p> <p>Note 4: All cells are time-synchronous.</p> <p>Note 5: NeighCellsInfo-r12 is described in subclause 6.3.2 of TS 36.331 [5].</p>					

**Table 9.3.8.2.1.5-2: Test requirement (FDD)**

	Test
$\gamma$	0.925 + TT
UE Category	$\geq 2$

### 9.3.8.2.2 TDD CQI Reporting under fading conditions - PUCCH 1-1 (CSI Reference Symbol) TM9 - Enhanced Receiver Type B

Editor's notes: This test case is incomplete. The following items are missing or incomplete:

- Test Tolerances are undefined

#### 9.3.8.2.2.1 Test purpose

The purpose of the test is to verify that the reporting of the channel quality based on the receiver of the enhanced Type B meets a minimum performance. Performance requirements are specified in terms of the relative throughput obtained when the transport format is that indicated by the reported CQI with NeighCellsInfo-r12 configured compared to the case without NeighCellsInfo-r12 configured. Cell 1 is the serving cell, and Cell 2 and Cell 3 are the interference cells.

#### 9.3.8.2.2.2 Test applicability

This test applies to all types of E-UTRA TDD release 12 and forward UE of Category  $\geq 2$  that support enhanced performance requirement Type B.

#### 9.3.8.2.2.3 Minimum conformance requirements

For the parameters specified in Table 9.3.8.2.2.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.3.8.2.2.3-2 and by the following:

- a) the ratio of the throughput obtained when transmitting the transport format indicated by each reported wideband CQI index subject to interference sources with NeighCellsInfo-r12 configured and that obtained when transmitting the transport format indicated by each reported wideband CQI index subject to interference sources without NeighCellsInfo-r12 configured shall be  $\geq \gamma$ ;

#### 9.3.8.2.2.4 Test description

##### 9.3.8.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS and faders to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.48.
2. The parameter settings for the cell 1 are set up according to Table 9.3.8.2.2.-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.3.8.2.2.4.3.

##### 9.3.8.2.2.4.2 Test procedure

1. Set the cell 1, 2 and 3 parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.3.8.2.2.5-1 as appropriate.
2. SS shall not setup NAICS-AssistanceInfo for the next test step.
3. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{NAICS\_OFF}}$ .
4. SS shall setup NAICS-AssistanceInfo as per TS 36.508 [7] clause 5.2A.6.1.
5. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the wideband CQI value reported from UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using

PUSCH. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{\text{NAICS\_ON}}$ . The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses.

6. If the ratio  $(t_{\text{NAICS\_ON}} / t_{\text{NAICS\_OFF}}) \geq \gamma$  then pass the UE for this test. Otherwise fail the UE.
7. The SS shall release all NAICS configuration in the UE using procedure in TS 36.508 [7] clause 5.2A.6.1 with the condition NAICS\_RELEASE.

At eNB, CQI report collection shall be skipped every 160ms during performance verification and the reported CQI in subframe SF#7 of the previous frame is applied in downlink subframes until a new CQI (after CQI/PMI dropping) is available.
Note 6:	NeighCellsInfo-r12 is described in subclause 6.3.2 of TS 36.331 [5].

**Table 9.3.8.2.2-2: Minimum requirement (TDD)**

	Test 1
$\gamma$	0.925 + TT
UE Category	$\geq 2$

## 9.4 Reporting of Precoding Matrix Indicator (PMI)

The minimum performance requirements of PMI reporting are defined based on the precoding gain, expressed as the relative increase in throughput when the transmitter is configured according to the UE reports compared to the case when the transmitter is using random precoding. When the transmitter uses random precoding, for each PDSCH allocation a precoder is randomly generated and applied to the PDSCH. A fixed transport format (FRC) configured.

The requirements for transmission mode 6 and transmission mode 9 with 4 TX are specified in terms of the ratio

$$\gamma = \frac{t_{ue}}{t_{rnd}}$$

In the definition of  $\gamma$ , for PUSCH 3-1 single PMI and PUSCH 1-2 multiple PMI requirements,  $t_{rnd}$  is 60% of the maximum throughput obtained at  $SNR_{rnd}$  using random precoding, and  $t_{ue}$  the throughput measured at  $SNR_{rnd}$  with precoders configured according to the UE reports.

For the PUCCH 2-1 single PMI requirement,  $t_{rnd}$  is 60% of the maximum throughput obtained at  $SNR_{rnd}$  using random precoding on a randomly selected full-size subband in set S subbands, and  $t_{ue}$  the throughput measured at  $SNR_{rnd}$  with both the precoder and the preferred full-size subband applied according to the UE reports;

For PUSCH 2-2 multiple PMI requirements,  $t_{rnd}$  is 60% of the maximum throughput obtained at  $SNR_{rnd}$  using random precoding on a randomly selected full-size subband in set S subbands, and  $t_{ue}$  the throughput measured at  $SNR_{rnd}$  with both the subband precoder and a randomly selected full-size subband (within the preferred subbands) applied according to the UE reports.

The requirements for transmission mode 9 with 8 TX and transmission mode 9 with 4TX enhanced codebook are specified in terms of the ratio

$$\gamma = \frac{t_{ue, follow1, follow2}}{t_{rnd1, rnd2}}$$

In the definition of  $\gamma$ , for PUSCH 3-1 single PMI and PUSCH 1-2 multiple PMI requirements,  $t_{follow1, follow2}$  is 70% of the maximum throughput obtained at  $SNR_{follow1, follow2}$  using the precoders configured according to the UE reports, and  $t_{rnd1, rnd2}$  is the throughput measured at  $SNR_{follow1, follow2}$  with random precoding.

## 9.4.1 Single PMI

### 9.4.1.1 PMI Reporting – PUSCH 3-1 (Single PMI) (Cell-Specific Reference Symbols)

#### 9.4.1.1.1 FDD PMI Reporting – PUSCH 3-1 (Single PMI)

##### 9.4.1.1.1.1 Test purpose

To test the accuracy of the Precoding Matrix Indicator (PMI) reporting such that the system throughput is maximized based on the precoders configured according to the UE reports.

##### 9.4.1.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 8 and forward.

##### 9.4.1.1.1.3 Minimum conformance requirements

For the parameters specified in Table 9.4.1.1.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.4.1.1.1.3-2.

**Table 9.4.1.1.1.3-1: PMI test for single-layer (FDD)**

Parameter		Unit	Test 1
Bandwidth		MHz	10
Transmission mode			6
Propagation channel			EVA5
Precoding granularity		PRB	50
Correlation and antenna configuration			Low 2 x 2
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3
	$\sigma$	dB	0
$N_{oc}^{(j)}$		dB[mW/15kHz]	-98
Reporting mode			PUSCH 3-1

Measurement channel			R.10 FDD
OCNG Pattern			OP.1 FDD
Max number of HARQ transmissions			4
Redundancy version coding sequence			{0,1,2,3}
Note 1: For random precoder selection, the precoder shall be updated in each TTI (1 ms granularity) Note 2: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4).			

**Table 9.4.1.1.1.3-2: Minimum requirement (FDD)**

Parameter	Test 1
$\gamma$	1.1
UE Category	$\geq 1$

The normative reference for this requirement is TS 36.101 [2] clause 9.4.1.1.1.

#### 9.4.1.1.1.4 Test description

##### 9.4.1.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.4.1.1.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.1.1.1.4.3.

##### 9.4.1.1.1.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.4.1.1.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC with randomly selected precoding matrix from codebook (Table 6.3.4.2.3-1 in TS 36.211 [8]) every subframe regardless of PMI reports from the UE. Note that each precoding matrix shall be selected in equal probabilities. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Establish  $t_{md}$  and  $SNR_{md}$  according to annex G.5.2
3. Set SNR to  $SNR_{md}$ . The SS shall transmit PDSCH with precoding matrix according to PMI report from the UE. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4 every subframe. Measure  $t_{ue}$  according to Annex G.5.3
4. Calculate  $\gamma = \frac{t_{ue}}{t_{md}}$ . If the ratio (throughput /  $t_{md}$ )  $\geq \gamma$  which is specified in table 9.4.1.1.1.5-1, then the test is pass. Otherwise, the test is fail.

#### 9.4.1.1.1.5 Test requirement

**Table 9.4.1.1.1.5-1: Test requirement (FDD)**

Parameter	Test 1
$\gamma$	1.09

The ratio of throughput using precoding matrix of PMI reports from the UE to using random precoding matrix shall equal or exceed the value specified in table 9.4.1.1.1.5.

#### 9.4.1.1.2 TDD PMI Reporting – PUSCH 3-1 (Single PMI)

##### 9.4.1.1.2.1 Test purpose

To test the accuracy of the Precoding Matrix Indicator (PMI) reporting such that the system throughput is maximized based on the precoders configured according to the UE reports.

##### 9.4.1.1.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 8 and forward.

##### 9.4.1.1.2.3 Minimum conformance requirements

For the parameters specified in Table 9.4.1.1.2.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in 9.4.1.1.2.3-2.

**Table 9.4.1.1.2.3-1: PMI test for single-layer (TDD)**

Parameter	Unit	Test 1	
Bandwidth	MHz	10	
Transmission mode		6	
Uplink downlink configuration		1	
Special subframe configuration		4	
Propagation channel		EVA5	
Precoding granularity	PRB	50	
Correlation and antenna configuration		Low 2 x 2	
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3
	$\sigma$	dB	0
$N_{oc}^{(j)}$	dB[mW/15kHz]	-98	
Reporting mode		PUSCH 3-1	
Reporting interval	ms	1	
Minimum PMIdelay (Node-2)	ms	10 or 11	
Measurement channel		R.10 TDD	
OCNG Pattern		OP.1 TDD	
Max number of HARQ transmissions		4	
Redundancy version coding sequence		{0,1,2,3}	
ACK/NACK feedback mode		Multiplexing	
Note 1: For random precoder selection, the precoder shall be updated in each available downlink transmission instance Note 2: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4)			

**Table 9.4.1.1.2.3-2: Minimum requirement (TDD)**

Parameter	Test 1
$\gamma$	1.1
UE Category	$\geq 1$

The normative reference for this requirement is TS 36.101 [2] clause 9.4.1.1.2.

#### 9.4.1.1.2.4 Test description

##### 9.4.1.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.4.1.1.2.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.1.1.2.4.3.

#### 9.4.1.1.2.4.2 Test procedure

1. Set the bandwidth, propagation condition, antenna configuration and measurement channel parameters according to Table 9.4.1.1.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC with randomly selected precoding matrix from codebook (Table 6.3.4.2.3-1 in TS 36.211 [8]) every subframe regardless of PMI reports from the UE. Note that each precoding matrix shall be selected in equal probabilities. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Establish  $t_{md}$  and  $SNR_{md}$  according to annex G.5.2.
3. Set SNR to  $SNR_{md}$ . The SS shall transmit PDSCH with precoding matrix according to PMI report from the UE. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure  $t_{ue}$  according to Annex G.5.3
4. Calculate  $\gamma = \frac{t_{ue}}{t_{md}}$

#### 9.4.1.1.2.4.3 Message contents

**Table 9.4.1.1.2.5-1: Test requirement (TDD)**

Parameter	Test 1
$\gamma$	1.09

9.4.1.2 PMI Reporting – PUCCH 2-1 (Single PMI) (Cell-Specific Reference Symbols)

9.4.1.2.1 FDD PMI Reporting – PUCCH 2-1 (Single PMI)

9.4.1.2.1.1 Test purpose

To test the accuracy of the Precoding Matrix Indicator (PMI) reporting such that the system throughput is maximized based on the precoders configured according to the UE reports.

9.4.1.2.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 9 and forward. Applicability requires support for FGI bit 2.

9.4.1.2.1.3 Minimum conformance requirements

For the parameters specified in Table 9.4.1.2.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.4.1.2.1.3-2.

**Table 9.4.1.2.1.3-1: PMI test for single-layer (FDD)**

Parameter		Unit	Test 1
Bandwidth		MHz	10
Transmission mode			6
Propagation channel			EVA5
Correlation and antenna configuration			Low 4 x 2
Downlink power allocation	$\rho_A$	dB	-6
	$\rho_B$	dB	-6
	$\sigma$	dB	3
$N_{oc}^{(j)}$		dB[mW/15kHz]	-98
PMI delay		ms	8 or 9
Reporting mode			PUCCH 2-1 (Note 6)
Reporting periodicity		ms	$N_p = 2$
Physical channel for CQI reporting			PUSCH (Note 3)
PUCCH Report Type for wideband CQI/PMI			2
PUCCH Report Type for subband CQI			1
Measurement channel			R.14-1 FDD
OCNG Pattern			OP.1/2 FDD
Precoding granularity		PRB	6 (full size)
Number of bandwidth parts ( $J$ )			3
K			1
<i>cqi-pmi-ConfigIndex</i>			1
Max number of HARQ transmissions			4
Redundancy version coding sequence			{0,1,2,3}
<p>Note 1: For random precoder selection, the precoder shall be updated every two TTI (2 ms granularity)</p> <p>Note 2: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4).</p> <p>Note 3: To avoid collisions between HARQ-ACK and wideband CQI/PMI or subband CQI, it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#1, #3, #7 and #9 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#5, #7, #1 and #3.</p> <p>Note 4: Reports for the short subband (having 2RBs in the last bandwidth part) are to be disregarded and instead data is to be transmitted on the most recently used subband for bandwidth part with <math>j=1</math>.</p> <p>Note 5: In the case where wideband PMI is reported, data is to be transmitted on the most recently used subband.</p> <p>Note 6: The bit field for PMI confirmation in DCI format 1B shall be mapped to "0" and TPMI information shall indicate the codebook index used in Table 6.3.4.2.3-2 of TS 36.211 [4] according to the latest PMI report on PUCCH.</p>			

**Table 9.4.1.2.1.3-2: Minimum requirement (FDD)**

	Test 1
$\gamma$	1.2

#### 9.4.1.2.1.4 Test description

##### 9.4.1.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.4.1.2.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.1.2.1.4.3.

##### 9.4.1.2.1.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.4.1.2.1.3-1 as appropriate.
2. The SS shall transmit every subframe PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC (R.14-1 FDD) on a randomly selected full-size subband with a randomly selected precoding matrix from the codebook (Table 6.3.4.2.3-2 in TS 36.211 [8]), regardless of the SB and PMI reports from the UE. Note that each full-size subband and each precoding matrix shall be selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. The SS shall transmit PDCCH DCI format 0 in downlink SF#1, #3, #7 and #9 to schedule UL RMC in uplink subframes #5, #7, #1 and #3 (Table A.4.1-1). The UE will send ACK/NACK and periodic CSI reports using PUSCH.  
Establish  $t_{md}$  and  $SNR_{md}$  according to annex G.5.2.
3. Set SNR to  $SNR_{md}$ . The SS shall transmit every subframe PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC (R.14-1 FDD) on the full-size subband and with the latest precoding matrix reported by the UE. When the UE reports a non-full-size subband, the SS schedules the recent reported subband for bandwidth part with  $j=1$  with the latest reported precoding matrix. Note that the SS shall send PDSCH in the same full-size subband and with the latest reported precoding matrix until next UE subband report is available. The SS sends downlink MAC padding bits on the DL RMC.  
The SS shall transmit PDCCH DCI format 0 in downlink SF#1, #3, #7 and #9 to schedule UL RMC in uplink subframes #5, #7, #1 and #3 (Table A.4.1-1). The UE will send ACK/NACK and periodic CSI reports using PUSCH. Measure  $t_{ue}$  according to Annex G.5.3.
4. Calculate  $\gamma = \frac{t_{ue}}{t_{md}}$ . If the ratio (throughput /  $t_{md}$ )  $\geq \gamma$  which is specified in table 9.4.1.2.2.5-1, then the test is pass. Otherwise, the test is fail.

Table 9.4.1.2.2.3-2: Minimum requirement (TDD)

Parameter	Test 1
$\gamma$	1.2
UE Category	$\geq 1$

The normative reference for this requirement is TS 36.101 [2] clause 9.4.1.2.2.

#### 9.4.1.2.2.4 Test description

##### 9.4.1.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.4.1.2.2.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.1.2.2.4.3.

##### 9.4.1.2.2.4.2 Test procedure

1. Set the bandwidth, propagation condition, antenna configuration and measurement channel parameters according to Table 9.4.1.2.2.3-1 as appropriate.
2. The SS shall transmit every subframe PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC (R.14-1 TDD) on a randomly selected full-size subband with a randomly selected precoding matrix from the codebook (Table 6.3.4.2.3-2 in TS 36.211 [8]), regardless of the SB and PMI reports from the UE. Note that each full-size subband and each precoding matrix shall be selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC.  
The SS shall transmit PDCCH DCI format 0 in downlink SF#4 and #9 to schedule UL RMC in uplink subframes #8 and #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CSI reports using PUSCH.  
Establish  $t_{md}$  and  $SNR_{md}$  according to annex G.5.2.
3. Set SNR to  $SNR_{md}$ . The SS shall transmit every subframe PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC (R.14-1 TDD) on the full-size subband and with the latest precoding matrix reported by the UE. When the UE reports a non-full-size subband, the SS schedules the recent reported subband for bandwidth part with  $j=1$  with the latest reported precoding matrix. Note that the SS shall send PDSCH in the same full-size subband and with the latest reported precoding matrix until next UE subband report is available. The SS sends downlink MAC padding bits on the DL RMC.  
The SS shall transmit PDCCH DCI format 0 in downlink SF#4 and #9 to schedule UL RMC in uplink subframes #8 and #3 (Table A.4.1-2). The UE will send ACK/NACK and periodic CSI reports using PUSCH.  
Measure  $t_{ue}$  according to Annex G.5.3.
4. Calculate  $\gamma = \frac{t_{ue}}{t_{md}}$ . If the ratio (throughput /  $t_{md}$ )  $\geq \gamma$  which is specified in table 9.4.1.2.2.5-1, then the test is pass. Otherwise, the test is fail.

### 9.4.1.3 PMI Reporting – PUSCH 3-1 (Single PMI) (CSI Reference Symbols)

#### 9.4.1.3.1

##### 9.4.1.3.1\_D FDD Reporting of PMI – PUSCH 3-1 (Single PMI) for eDL MIMO

###### 9.4.1.3.1\_D.1 Test purpose

To test the accuracy of the Precoding Matrix Indicator (PMI) reporting such that the system throughput is maximized based on the precoders configured according to the UE reports.

###### 9.4.1.3.1\_D.2 Test applicability

This test applies to all types of E-UTRA FDD UE release 10 and forward that support eDL-MIMO. Applicability requires support for FGI bit 103.

###### 9.4.1.3.1\_D.3 Minimum conformance requirements

For the parameters specified in Table 9.4.1.3.1\_D.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.4.1.3.1\_D.3-2.

**Table 9.4.1.3.1\_D.3-1: PMI test for single-layer (FDD)**

Parameter	Unit	Test 1	
Bandwidth	MHz	10

9.4.1.3.1\_D.4 Test description

9.4.1.3.1\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.4.1.3.1\_D.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.1.3.1\_D.4.3.

#### 9.4.1.3.1\_D.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.4.1.3.1\_D.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC with randomly selected precoding matrix from codebook (Table 6.3.4.2.3-2 in TS 36.211 [8]) every subframe regardless of PMI reports from the UE. Note that each precoding matrix shall be selected in equal probabilities. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Establish  $t_{md}$  and  $SNR_{md}$  according to annex G.5.2
3. Set SNR to  $SNR_{md}$ . The SS shall transmit PDSCH with precoding matrix according to PMI report from the UE. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4 in subframe #0, #5. Measure  $t_{ue}$  according to Annex G.5.3
4. Calculate  $\gamma = \frac{t_{ue}}{t_{md}}$ . If the ratio (throughput /  $t_{md}$ )  $\geq \gamma$  which is specified in table 9.4.1.3.1\_D.5-1, then the test is pass. Otherwise, the test is fail.

## 9.4.1.3.1\_D.5 Test requirement

Table 9.4.1.3.1\_D.5-1: Test requirement (FDD)

Parameter	Test 1
$\gamma$	1.19

The ratio of throughput using precoding matrix of PMI reports from the UE to using random precoding matrix shall equal or exceed the value specified in table 9.4.1.1.1\_D.5.

## 9.4.1.3.2\_D TDD Reporting of PMI – PUSCH 3-1 (Single PMI) for eDL-MIMO

## 9.4.1.3.2\_D.1 Test purpose

To test the accuracy of the Precoding Matrix Indicator (PMI) reporting such that the system throughput is maximized based on the precoders configured according to the UE reports.

## 9.4.1.3.2\_D.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 10 and forward that support eDL-MIMO. Applicability requires support for FGI bit 104.

## 9.4.1.3.2\_D.3 Minimum conformance requirements

For the parameters specified in Table 9.4.1.3.2\_D.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.4.1.3.2\_D.3-2.

Table 9.4.1.3.2\_D.3-1: PMI test for single-layer (TDD)

Parameter	Unit	Test 1	
Bandwidth	MHz	10	
Transmission mode		9	
Uplink downlink configuration		1	
Special subframe configuration		4	
Propagation channel		EVA5	
Precoding granularity	PRB	50	
Antenna configuration		8 x 2	
Correlation modelling		High, Cross polarized	
Cell-specific reference signals		Antenna ports 0,1	
CSI reference signals		Antenna ports 15,...,22	
Beamforming model		Annex B.4.3	
CSI-RS periodicity and subframe offset $T_{\text{CSI-RS}} / \Delta_{\text{CSI-RS}}$		5/ 4	
CSI-RS reference signal configuration		0

#### 9.4.1.3.2\_D.4 Test description

##### 9.4.1.3.2\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure 47.
2. The parameter settings for the cell are set up according to Table 9.4.1.3.2\_D.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.1.3.2\_D.4.3.

##### 9.4.1.3.2\_D.4.2 Test procedure

1. Set the bandwidth, propagation condition, antenna configuration and measurement channel parameters according to Table 9.4.1.3.2\_D.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC with randomly selected precoding matrix from codebook (Table 7.2.4-1 in TS 36.213 [10]) every subframe regardless of PMI reports from the UE. Note that each precoding matrix shall be selected in equal probabilities. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Establish  $t_{rd}$  and  $SNR_{rd}$  according to annex G.5.2.
3. Set SNR to  $SNR_{rd}$ . The SS shall transmit PDSCH with precoding matrix according to PMI report from the UE. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure  $t_{ue}$  according to Annex G.5.3
4. Calculate  $\gamma = \frac{t_{ue}}{t_{rd}}$ . If the ratio (throughput /  $t_{rd}$ )  $\geq \gamma$  which is specified in table 9.4.1.3.2\_D.5-1, then the test is pass. Otherwise, the test is fail.

Max number of HARQ transmissions		4	
Redundancy version coding sequence		{0,1,2,3}	
Note 1:	For random precoder selection, the precoder shall be updated in each TTI (1 ms granularity)		
Note 2:	If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4).		
Note 3:	To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH.		
Note 4:	PDSCH_RA= 0 dB, PDSCH_RB= 0 dB in order to have the same PDSCH and OCNG power per subcarrier at the receiver.		
Note 5:	Randomization of the principle beam direction shall be used as specified in B.2.3A.4		

**Table 9.4.1.4.1.3-2: Minimum requirement (FDD)**

Parameter	Test 1
$\gamma$	1.8
UE Category	$\geq 1$

The normative reference for this requirement is TS 36.101 [2] clause 9.4.1.4.1.

#### 9.4.1.4.1.4 Test description

##### 9.4.1.4.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.4.1.4.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in 9.4.1.4.1.4.3.

##### 9.4.1.4.1.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.4.1.4.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC with randomly selected precoding matrix from codebook (Table 7.2.4-0A in TS 36.213 [10]) every subframe regardless of PMI reports from the UE. Note that each precoding matrix shall be selected in equal probabilities. The SS sends downlink MAC padding bits on the DL RMC. The SS shall transmit PDCCH DCI format 0 in downlink SF#3 and #8 to schedule to schedule UL RMC in subframe #2 and #7 (Table A.4.1-1). Establish  $t_{rd}$  and  $SNR_{rd}$  according to annex G.5.2.
3. Set SNR to  $SNR_{rd}$ . The SS shall transmit PDSCH with precoding matrix according to PMI report from the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS shall transmit PDCCH DCI format 0 in downlink SF#3 and #8 to schedule to schedule UL RMC in subframe #2 and #7 (Table A.4.1-1). Measure the average throughput. Measure  $t_{ue}$  according to Annex G.5.3.

$$\gamma = \frac{t_{ue}}{t_{rd}}$$

4. Calculate

## 9.4.1.4.1.5 Test requirement

Table 9.4.1.4.1.5 -1: Test requirement (FDD)

Parameter	Test 1
$\gamma$	1.79
UE Category	$\geq 1$

The ratio of throughput using precoding matrix of PMI reports from the UE to using random precoding matrix shall equal or exceed the value specified in Table 9.4.1.4.1.5-1.

#### 9.4.1.4.2 TDD PMI Reporting with 4Tx enhanced codebook – PUCCH 1-1 (Single PMI) for eDL MIMO Enhancement

##### 9.4.1.4.2.1 Test purpose

To verify reporting accuracy of the Precoding Matrix Indicator (PMI) reporting with 4Tx enhanced codebook (Single PMI) for eDL MIMO Enhancement.

##### 9.4.1.4.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 12 and forward that support eDL-MIMO Enhancement. Applicability requires support for FGI bit 103.

##### 9.4.1.4.2.3 Minimum conformance requirements

For the parameters specified in Table 9.4.1.4.2.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.4.1.4.2.3-2.

Table 9.4.1.4.2.3-1: PMI test for single-layer (TDD)

Parameter		Unit	Test 1
Bandwidth		MHz	10
Transmission mode			9
Uplink downlink configuration			1
Special subframe configuration			4
Propagation channel			EPA5
Precoding granularity		PRB	50
Correlation and antenna configuration			High XP 4 x 2
Beamforming model			Annex B.4.3
Cell-specific reference signals			Antenna ports 0,1
CSI reference signals			Antenna ports 15,...,18
CSI-RS periodicity and subframe offset $T_{\text{CSI-RS}} / I_{\text{CSI-RS}}$			5/ 4
CSI-RS reference signal configuration			6
CodeBookSubsetRestriction bitmap			0x0000 0000 0000 FFFF 0000 00FF
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0
	$P_c$	dB	-3
	$\sigma$	dB	-3
$N_{oc}^{(j)}$		dB[mW/15kHz]	-98
Reporting mode			PUCCH 1-1 submode1
Reporting interval		ms	5
PMI delay (Note 2)		ms	15
Physical channel for CQI/PMI reporting			PUSCH (Note 3)
PUCCH Report Type for CQI/second PMI			2b
Physical channel for RI reporting			PUSCH
PUCCH Report Type for RI/first PMI			5
<i>cqi-pmi-ConfigurationIndex</i>			4
<i>ri-ConfigIndex</i>			1
Measurement channel			R.60 TDD
OCNG Pattern			OP.1 TDD
Max number of HARQ transmissions			4
Redundancy version coding sequence			{0,1,2,3}
ACK/NACK feedback mode			Multiplexing
<p>Note 1: For random precoder selection, the precoder shall be updated in each TTI (1 ms granularity)</p> <p>Note 2: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4).</p> <p>Note 3: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH.</p> <p>Note 4: PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF#4 and #9 to allow aperiodic CQI/PMI/RI to be transmitted on uplink SF#3 and #8.</p> <p>Note 5: Randomization of the principle beam direction shall be used as specified in B.2.3A.4.</p>			

**Table 9.4.1.4.2.3-2: Minimum requirement (TDD)**

Parameter	Test 1
$\gamma$	1.8
UE Category	$\geq 1$

The normative reference for this requirement is TS 36.101 [2] clause 9.4.1.4.2.

#### 9.4.1.4.2.4 Test description

##### 9.4.1.4.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.4.1.4.2.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.1.4.2.4.3.

##### 9.4.1.4.2.4.2 Test procedure

1. Set the bandwidth, propagation condition, antenna configuration and measurement channel parameters according to Table 9.4.1.4.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC with randomly selected precoding matrix from codebook (Table 7.2.4-0A in TS 36.213 [10]) every subframe regardless of PMI reports from the UE. Note that each precoding matrix shall be selected in equal probabilities. The SS sends downlink MAC padding bits on the DL RMC. The SS shall transmit PDCCH DCI format 0 in downlink SF#4 and #9 to schedule to schedule UL RMC in subframe #3 and #8 (Table A.4.1-2). Establish  $t_{rd}$  and  $SNR_{rd}$  according to annex G.5.2
3. Set SNR to  $SNR_{rd}$ . The SS shall transmit PDSCH with precoding matrix according to PMI report from the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS shall transmit PDCCH DCI format 0 in downlink SF#4 and #9 to schedule to schedule UL RMC in subframe #3 and #8 (Table A.4.1-2). Measure  $t_{ue}$  according to Annex G.5.3
4. Calculate  $\gamma = \frac{t_{ue}}{t_{rd}}$

#### 9.4.1.4.2.5 Test requirement

**Table 9.4.1.4.2.5 -1: Test requirement (FDD)**

Parameter	Test 1
$\gamma$	1.79
UE Category	$\geq 1$

The ratio of throughput using precoding matrix of PMI reports from the UE to using random precoding matrix shall equal or exceed the value specified in Table 9.4.1.4.2\_G.5-1.

## 9.4.2 Multiple PMI

### 9.4.2.1 PMI Reporting – PUSCH 1-2 (Multiple PMI) (Cell-Specific Reference Symbols)

#### 9.4.2.1.1 FDD PMI Reporting – PUSCH 1-2 (Multiple PMI)

##### 9.4.2.1.1.1 Test purpose

To test the accuracy of the Precoding Matrix Indicator (PMI) reporting such that the system throughput is maximized based on the precoders configured according to the UE reports.

##### 9.4.2.1.1.2 Test applicability

This test applies to E-UTRA FDD UE release 8 of UE category 2-5.

##### 9.4.2.1.1.3 Minimum conformance requirements

For the parameters specified in Table 9.4.2.1.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.4.2.1.1.3-2.

**Table 9.4.2.1.1.3-1 PMI test for single-layer (FDD)**

Parameter		Unit	Test 1
Bandwidth		MHz	20
Transmission mode			6
Propagation channel			EPA5
Precoding granularity (only for reporting and following PMI)		PRB	8
Correlation and antenna configuration			Low 2 x 2
Downlink power allocation	$\rho_A$	dB	-3
	$\rho_B$	dB	-3
	$\sigma$	dB	0
$N_{oc}^{(j)}$		dB[mW/15kHz]	-98
Reporting mode			PUSCH 1-2
Reporting interval		ms	1
PMI delay		ms	8
Measurement channel			R.30 FDD
OCNG Pattern			OP.1 FDD
Max number of HARQ transmissions			4
Redundancy version coding sequence			{0,1,2,3}
Note 1: For random precoder selection, the precoders shall be updated in each TTI (1 ms granularity)			
Note 2: If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4)			

**Table 9.4.2.1.1.3-2: Minimum requirement (FDD)**

Parameter	Test 1
$\gamma$	1.2
UE Category	2-5

The normative reference for this requirement is TS 36.101 [2] clause 9.4.2.1.1.

#### 9.4.2.1.1.4 Test description

##### 9.4.2.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 20MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.4.2.1.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0

5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.2.1.1.4.3.

#### 9.4.2.1.1.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.4.2.1.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC with randomly selected precoding matrix from codebook (Table 6.3.4.2.3-1 in TS 36.211 [8]) every subframe regardless of PMI reports from the UE. Note that each precoding matrix shall be selected in equal probabilities. The SS sends downlink MAC padding bits on the DL RMC SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Establish  $t_{md}$  and  $SNR_{md}$  according to annex G.5.2
3. Set SNR to  $SNR_{md}$ . The SS shall transmit PDSCH with precoding matrix according to PMI report from the UE. The SS sends downlink MAC padding bits on the DL RMC SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4 every subframe. Measure the average throughput. Measure  $t_{ue}$  according to Annex G.5.3

4. Calculate  $\gamma = \frac{t_{ue}}{t_{md}}$

9.4.2.1.1\_1.4 Test description

9.4.2.1.1\_1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.4.2.1.1\_1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.2.1.1\_1.4.3.

#### 9.4.2.1.1\_1.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.4.2.1.1\_1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC (R.11-3 FDD for UE Category 1 with allocation centred within the transmission bandwidth configuration or R.11 FDD for UE Category 2-8) with randomly selected precoding matrix from codebook (Table 6.3.4.2.3-1 in TS 36.211 [8]) every subframe regardless of PMI reports from the UE. Note that each precoding matrix shall be selected in equal probabilities. The SS sends downlink MAC padding bits on the DL RMC SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Establish  $t_{md}$  and  $SNR_{md}$  according to annex G.5.2
3. Set SNR to  $SNR_{md}$ . The SS shall transmit PDSCH via PDCCH DCI format 1B for C-RNTI to transmit the DL RMC (R.11-3 FDD for UE Category 1 with allocation centred within the transmission bandwidth configuration or R.11 FDD for UE Category 2-8) with precoding matrix according to PMI report from the UE. The SS sends downlink MAC padding bits on the DL RMC SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4 every subframe. Measure the average throughput.  
Measure  $t_{ue}$  according to Annex G.5.3
4. Calculate  $\gamma = \frac{t_{ue}}{t_{md}}$

#### 9.4.2.1.2.4 Test description

##### 9.4.2.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 20MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.

2. The parameter settings for the cell are set up according to Table 9.4.2.1.2.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.2.1.2.4.3.

#### 9.4.2.1.2.4.2 Test procedure

1. Set the bandwidth, propagation condition, antenna configuration and measurement channel parameters according to Table 9.4.2.1.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC with randomly selected precoding matrix from codebook (Table 6.3.4.2.3-1 in TS 36.211 [8]) every subframe regardless of PMI reports from the UE. Note that each precoding matrix shall be selected in equal probabilities. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Establish  $t_{md}$  and  $SNR_{md}$  according to annex G.5.2
3. Set SNR to  $SNR_{md}$ . The SS shall transmit PDSCH with precoding matrix according to PMI report from the UE. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure  $t_{ue}$  according to Annex G.5.3
4. Calculate  $\gamma = \frac{t_{ue}}{t_{md}}$

9.4.2.1.2\_1.4 Test description

9.4.2.1.2\_1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.4.2.1.2\_1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.2.1.2\_1.4.3.

#### 9.4.2.1.2\_1.4.2 Test procedure

1. Set the bandwidth, propagation condition, antenna configuration and measurement channel parameters according to Table 9.4.2.1.2\_1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC (R.11-3 TDD for UE Category 1 with allocation centred within the transmission bandwidth configuration or R.11 TDD for UE Category 2-8) with randomly selected precoding matrix from codebook (Table 6.3.4.2.3-1 in TS 36.211 [8]) every subframe regardless of PMI reports from the UE. Note that each precoding matrix shall be selected in equal probabilities. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Establish  $t_{md}$  and  $SNR_{md}$  according to annex G.5.2
3. Set SNR to  $SNR_{md}$ . The SS shall transmit PDSCH via PDCCH DCI format 1B for C-RNTI to transmit the DL RMC (R.11-3 TDD for UE Category 1 with allocation centred within the transmission bandwidth configuration or R.11 TDD for UE Category 2-8) with precoding matrix according to PMI report from the UE. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure  $t_{ue}$  according to Annex G.5.3

4. Calculate  $\gamma = \frac{t_{ue}}{t_{md}}$

#### 9.4.2.2.1.4 Test description

##### 9.4.2.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.4.2.2.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.

4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.2.2.1.4.3.

#### 9.4.2.2.1.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.4.2.2.1.3-1 as appropriate.
2. The SS shall transmit every subframe PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC (R.14-2 FDD) on a randomly selected full-size subband with a randomly selected precoding matrix from the codebook (Table 6.3.4.2.3-2 in TS 36.211 [8]), regardless of the SB and PMI reports from the UE. Note that each full-size subband and each precoding matrix shall be selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC.  
The SS shall transmit PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. The UE will send aperiodic CSI report on PUSCH.  
Establish  $t_{md}$  and  $SNR_{md}$  according to annex G.5.2.
3. Set SNR to  $SNR_{md}$ . The SS shall transmit every subframe PDSCH via PDCCH DCI format 1B for C\_RNTI to transmit the DL RMC (R.14-2 FDD) on one full-size subband selected among the M preferred subbands and the corresponding subband precoding matrix reported by the UE. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same M preferred subbands are reported subsequently, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC.  
The SS shall transmit PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. The UE will send aperiodic CSI report on PUSCH.  
Measure  $t_{ue}$  according to Annex G.5.3.

4. Calculate  $\gamma = \frac{t_{ue}}{t_{md}}$

**Table 9.4.2.3.1\_D.3-2: Minimum requirement (FDD) for eDL-MIMO**

Parameter	Test 1
$\gamma$	1.3
UE Category	$\geq 1$

The normative reference for this requirement is TS 36.101 [2] clause 9.4.2.3.1.

#### 9.4.2.3.1\_D.4 Test description

##### 9.4.2.3.1\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.4.2.3.1\_D.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.2.3.1\_D.4.3.

##### 9.4.2.3.1\_D.4.2 Test procedure

1. Set the parameters of bandwidth, the propagation condition, antenna configuration and measurement channel according to Table 9.4.2.3.1\_D.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC with randomly selected precoding matrix from codebook (Table 6.3.4.2.3-2 in TS 36.211 [8]) every subframe regardless of PMI reports from the UE. Note that each precoding matrix shall be selected in equal probabilities. The SS sends downlink MAC padding bits on the DL RMC SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Establish  $t_{md}$  and  $SNR_{md}$  according to annex G.5.2
3. Set SNR to  $SNR_{md}$ . The SS shall transmit PDSCH with precoding matrix according to PMI report from the UE. The SS sends downlink MAC padding bits on the DL RMC SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4 in subframe #0, #5. Measure the average throughput. Measure  $t_{ue}$  according to Annex G.5.3
4. Calculate  $\gamma = \frac{t_{ue}}{t_{md}}$ . If the ratio (throughput /  $t_{md}$ )  $\geq \gamma$  which is specified in table 9.4.2.3.1\_D.5-1, then the test is pass. Otherwise, the test is fail.

## 9.4.2.3.4 TDD PMI Reporting with 4Tx enhanced codebook - PUSCH 1-2 (Multiple PMI) for eDL-MIMO Enhancement

## 9.4.2.3.4.1 Test purpose

To verify reporting accuracy of the Precoding Matrix Indicator (PMI) reporting with 4Tx enhanced codebook (Multiple PMI) for eDL MIMO Enhancement.

## 9.4.2.3.4.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 12 and forward that support eDL-MIMO Enhancement. Applicability requires support for FGI bit 103.

## 9.4.2.3.4.3 Minimum conformance requirements

For the parameters specified in Table 9.4.2.3.4.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in 9.4.2.3.4.3-2.

Table 9.4.2.3.4.3-1: PMI test for dual-layer (TDD) for eDL-MIMO Enhancement

Parameter	Unit	Test 1	
Bandwidth	MHz	10	
Transmission mode		9	
Uplink downlink configuration		1	
Special subframe configuration		4	
Propagation channel		EVA5	
Precoding granularity (only for reporting and following PMI)	PRB	6	
Correlation and antenna configuration		XP High 4 x 2	
Beamforming model		Annex B.4.3	
Cell-specific reference signals		Antenna ports 0,1	
CSI reference signals		Antenna ports 15,...,18	
CSI-RS periodicity and subframe offset $T_{\text{CSI-RS}} / I_{\text{CSI-RS}}$		5/ 4	
CSI-RS reference signal configuration		4	
CodeBookSubsetRestriction bitmap		0x0000 0000 FFFF 0000 FFFF 0000	
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0
	$P_c$	dB	-3
	$\sigma$	dB	-3
$N_{oc}^{(j)}$	dB[mW/15kHz]	-98	
Reporting mode		PUSCH1-2	
Reporting interval	ms	5	
PMI delay (Note 2)	ms	10	
Measurement channel		R.61-1 TDD for UE Category 1, R.61 TDD for UE Category 2-8	
Rank Number of PDSCH		2	
OCNG Pattern		OP.1 TDD	
Max number of HARQ transmissions		4	
Redundancy version coding sequence		{0,1,2,3}	
ACK/NACK feedback mode		Multiplexing	
Note 1:	For random precoder selection, the precoder shall be updated in each TTI (1 ms granularity)		
Note 2:	If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI estimation at a downlink SF not later than SF#(n-4), this reported PMI cannot be applied at the eNB downlink before SF#(n+4).		
Note 3:	One/two sided dynamic OCNG Pattern OP.1/2 TDD as described in Annex A.5.1.1/2 shall be used.		
Note 4:	PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF#4 and #9 to allow aperiodic CQI/PMI/RI to be transmitted on uplink SF#3 and #8.		
Note 5:	Randomization of the principle beam direction shall be used as specified in B.2.3A.4.		

**Table 9.4.2.3.4.3-2: Minimum requirement (TDD) for eDL-MIMO Enhancement**

Parameter	Test 1
$\gamma$	1.2
UE Category	$\geq 1$

The normative reference for this requirement is TS 36.101 [2] clause 9.4.2.3.4.

#### 9.4.2.3.4.4 Test description

##### 9.4.2.3.4.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.11.
2. The parameter settings for the cell are set up according to Table 9.4.2.3.4.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.4.2.3.4.4.3.

##### 9.4.2.3.4.4.2 Test procedure

1. Set the bandwidth, propagation condition, antenna configuration and measurement channel parameters according to Table 9.4.2.3.4.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC with randomly selected precoding matrix from codebook (Table 6.3.4.2.3-2 in TS 36.213 [10]) every subframe regardless of PMI reports from the UE. Note that each precoding matrix shall be selected in equal probabilities. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Establish  $t_{md}$  and  $SNR_{md}$  according to annex G.5.2
3. Set SNR to  $SNR_{md}$ . The SS shall transmit PDSCH with precoding matrix according to PMI report from the UE. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure  $t_{ue}$  according to Annex G.5.3

4. Calculate  $\gamma = \frac{t_{ue}}{t_{md}}$

##### 9.4.2.3.4.4.3 Message contents

## 9.4.2.3.4.5 Test requirement

**Table 9.4.2.3.4.5-1: Test requirement (TDD) for eDL-MIMO Enhancement**

Parameter	Test 1
$\gamma$	1.19
UE Category	$\geq 1$

## 9.5 Reporting of Rank Indicator (RI)

The purpose of this test is to verify that the reported rank indicator accurately represents the channel rank. The accuracy of RI (CQI) reporting is determined by the relative increase of the throughput obtained when transmitting based on the reported rank compared to the case for which a fixed rank is used for transmission. Transmission mode 4 is used with the specified CodebookSubSetRestriction.

For fixed rank 1 transmission, the RI and PMI reporting is restricted to two single-layer precoders, For fixed rank 2 transmission, the RI and PMI reporting is restricted to one two-layer precoder, For follow RI transmission, the RI and PMI reporting is restricted to select the union of these precoders. Channels with low and high correlation are used to ensure that RI reporting reflects the channel condition.

### 9.5.1 RI Reporting (Cell-Specific Reference Symbols)

#### 9.5.1.1 FDD RI Reporting– PUCCH 1-1

##### 9.5.1.1.1 Test purpose

To verify that the reported rank indicator accurately represents the channel rank.

##### 9.5.1.1.2 Test applicability

This test applies to E-UTRA FDD UE release 8 and 9 of UE category from 2 to 5.

##### 9.5.1.1.3 Minimum conformance requirements

The minimum performance requirement in Table 9.5.1.1.3-2 is defined as

- a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be  $\geq \gamma_1$ ;
- b) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be  $\geq \gamma_2$ ;

For the parameters specified in Table 9.5.1.1.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.5.1.1.3-2.

Table 9.5.1.1.3-1: RI Test (FDD)

Parameter	Unit	Test 1	Test 2	Test 3
Bandwidth	MHz		10	
PDSCH transmission mode			4	
Downlink power allocation	$\rho_A$	dB	-3	
	$\rho_B$	dB	-3	
	$\sigma$	dB	0	
CodeBookSubsetRestriction bitmap		000011 for fixed RI = 1 010000 for fixed RI = 2 010011 for UE reported RI		
Propagation condition and antenna configuration		2 x 2 EPA5		
Antenna correlation		Low	Low	High
RI configuration		Fixed RI=2 and follow RI	Fixed RI=1 and follow RI	Fixed RI=2 and follow RI
SNR	dB	0	20	20
$N_{oc}^{(j)}$	dB[mW/15kHz]	-98	-98	-98
$\hat{I}_{or}^{(j)}$	dB[mW/15kHz]	-98	-78	-78
Maximum number of HARQ transmissions		1		
Reporting mode		PUCCH 1-1 (Note 4)		
Physical channel for CQI/PMI reporting		PUCCH Format 2		
PUCCH Report Type for CQI/PMI		2		
Physical channel for RI reporting		PUSCH (Note 3)		
PUCCH Report Type for RI		3		
Reporting periodicity	ms	$N_p = 5$		
PMI and CQI delay	ms	8		
<i>ccqi-pmi-ConfigurationIndex</i>		6		
<i>ri-ConfigurationIndex</i>		1 (Note 5)		
Note 1:	If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI and CQI estimation at a downlink subframe not later than SF#(n-4), this reported PMI and wideband CQI cannot be applied at the eNB downlink before SF#(n+4).			
Note 2:	Reference measurement channel RC.2 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 FDD as described in Annex A.5.1.1.			
Note 3:	To avoid collisions between RI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#4 and #9 to allow periodic RI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#8 and #3.			
Note 4:	The bit field for precoding information in DCI format 2 shall be mapped as: - For reported RI = 1 and PMI = 0 >> precoding information bit field index = 1 - For reported RI = 1 and PMI = 1 >> precoding information bit field index = 2 - For reported RI = 2 and PMI = 0 >> precoding information bit field index = 0			
Note 5:	To avoid the ambiguity of SS behaviour when applying CQI and PMI during rank switching, RI reports are to be applied at the SS with one subframe delay in addition to Note 1 to align with CQI and PMI reports.			

Table 9.5.1.1.3-2: Minimum requirement (FDD)

Parameter	Test 1	Test 2	Test 3
$\gamma_1$	N/A	1.05	N/A
$\gamma_2$	1	N/A	1.1
UE Category	2-5	2-5	2-5

The normative reference for this requirement is TS 36.101 [2] clause 9.5.1.1.

#### 9.5.1.1.4 Test description

##### 9.5.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.5.1.1.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.5.1.1.4.3.

##### 9.5.1.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration, antenna correlation, CodeBookSubsetRestriction for fixed Rank and the SNR according to Table 9.5.1.1.3-1 as appropriate.
2. The SS shall send PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to the UE reported CQI, PMI and RI. In case of CQI reports for two codewords (codeword #0 and #1), the CQI offset level for codeword #1 is selected from {0,1,2,3,-4,-3,-2,-1}. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #3 and #8 (Table A.4.1-1). Measure the  $t_{fix}$  according to annex G.5.3.
3. Propagation conditions are set according to Annex B.1.
4. The SS sends uplink scheduling information via PDCCH DCI format 0 to schedule UL RMC in every subframe (Table A.4.1-1).
5. The SS shall transmit an RRC Connection Reconfiguration message to set codebookSubsetRestriction as for UE reported RI according to Table 9.5.1.1.3-1.
6. The UE shall transmit RRC Connection Reconfiguration Complete message.
7. Propagation conditions are set according to Table 9.5.1.1.3-1.
8. The SS shall send PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to the UE reported CQI, PMI and RI. In case of CQI reports for two codewords (codeword #0 and #1), the CQI offset level for codeword #1 is selected from {0,1,2,3,-4,-3,-2,-1}. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #3 and #8 (Table A.4.1-1). Measure  $t_{reported}$  according to Annex G.5.3  
If the ratio ( $t_{reported} / t_{fix}$ ) satisfies the requirement in Table 9.5.1.1.5-1, then pass the UE for this test and go to step 9. Otherwise, fail the UE.
9. If all tests have not been done, then repeat the same procedure (steps 1 to 8) with test conditions according to the Table 9.5.1.1.3-2 for the other Tests as appropriate. Otherwise pass the UE.

- Instead of Table 9.5.1.1.5-1 → use Table 9.5.1.1\_1.5-1.

#### 9.5.1.1\_1.4.1 Initial conditions

Same initial conditions as in clause 9.5.1.1.4.1.

#### 9.5.1.1\_1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration, antenna correlation, CodeBookSubsetRestriction for fixed Rank and the SNR according to Table 9.5.1.1\_1.3-1 as appropriate.
2. The SS shall send PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to the UE reported CQI, PMI and RI. In case of CQI reports for two codewords (codeword #0 and #1), the CQI offset level for codeword #1 is selected from {0,1,2,3,-4,-3,-2,-1}. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #3 and #8 (Table A.4.1-1). Measure the  $t_{fix}$  according to annex G.5.3.
3. Propagation conditions are set according to Annex B.1.
4. For Test 3 the SS repeats steps 1 to 3 to get two values for  $t_{fix}$ , one value for fixed Rank 1 case and the other value for fixed Rank 2 case.
5. The SS sends uplink scheduling information via PDCCH DCI format 0 to schedule UL RMC in every subframe (Table A.4.1-1).
6. The SS shall transmit an RRC Connection Reconfiguration message to set codebookSubsetRestriction as for UE reported RI according to Table 9.5.1.1\_1.3-1.
7. The UE shall transmit RRC Connection Reconfiguration Complete message.
8. Propagation conditions are set according to Table 9.5.1.1\_1.3-1.
9. The SS shall send PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to the UE reported CQI, PMI and RI. In case of CQI reports for two codewords (codeword #0 and #1), the CQI offset level for codeword #1 is selected from {0,1,2,3,-4,-3,-2,-1}. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #3 and #8 (Table A.4.1-1). Measure  $t_{reported}$  according to Annex G.5.3
10. For Test 1 and Test 2 if the ratio ( $t_{reported} / t_{fix}$ ) satisfies the requirement in Table 9.5.1.1\_1.5-1, then pass the UE for Test 1 and Test 2.
11. For Test 3 if the ratio ( $t_{reported} / t_{fix}$ ) satisfies at least one of the  $\gamma_1$  or  $\gamma_2$  requirements in Table 9.5.1.1\_1.5-1, then pass the UE for Test 3.
12. For a complete test case to pass the UE has to pass all test cases 1, 2 and 3. Otherwise, fail the UE.
13. If all tests have not been done, then repeat the same procedure (steps 1 to 12) with test conditions according to the Table 9.5.1.1\_1.3-2 for the other Tests as appropriate.

#### 9.5.1.1\_1.4.3 Message contents

Same message contents as in clause 9.5.1.1.4.3.

#### 9.5.1.1\_1.5 Test requirement

Same test requirements as in clause 9.5.1.1.5 with the following exceptions:

- Instead of Table 9.5.1.1.5-1 → use Table 9.5.1.1\_1.5-1

**Table 9.5.1.1\_1.5-1: Test requirement (FDD)**

Parameter	Test 1	Test 2	Test 3
$\gamma_1$	N/A	1.04	0.89 (Note 1)
$\gamma_2$	0.99	N/A	1.09 (Note 1)
UE Category	2-8	2-8	2-8
Note 1: For Test 3, the minimum requirements shall be fulfilled for at least one of $\gamma_1$ or $\gamma_2$ .			

## 9.5.1.1\_2 FDD RI Reporting– PUCCH 1-1 (Release 11)

### 9.5.1.1\_2.1 Test purpose

Same test purpose as in clause 9.5.1.1.1.

### 9.5.1.1\_2.2 Test applicability

This test applies to E-UTRA FDD UE release 11 and forward of UE category  $\geq 2$ .

### 9.5.1.1\_2.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 9.5.1.1.3 with the following exceptions:

- Instead of Table 9.5.1.1.3-1 → use Table 9.5.1.1\_2.3-1.
- Instead of Table 9.5.1.1.3-2 → use Table 9.5.1.1\_2.3-2.

Table 9.5.1.1\_2.3-1: RI Test (FDD)

Parameter	Unit	Test 1	Test 2	Test 3
Bandwidth	MHz		10	
PDSCH transmission mode			4	
Downlink power allocation	$\rho_A$	dB	-3	
	$\rho_B$	dB	-3	
	$\sigma$	dB	0	
Propagation condition and antenna configuration		2 x 2 EPA5		
CodeBookSubsetRestriction bitmap		000011 for fixed RI = 1 010000 for fixed RI = 2 010011 for UE reported RI		
Antenna correlation		Low	Low	High
RI configuration		Fixed RI=2 and follow RI	Fixed RI=1 and follow RI	Fixed RI=1 and follow RI
SNR	dB	0	20	20

UE Category	$\geq 2$	$\geq 2$	$\geq 2$

### 9.5.1.2 TDD RI Reporting – PUSCH 3-1

#### 9.5.1.2.1 Test purpose

To verify that the reported rank indicator accurately represents the channel rank.

#### 9.5.1.2.2 Test applicability

This test applies to E-UTRA TDD UE release 8 and 9, which support UE Category from 2 to 5.

#### 9.5.1.2.3 Minimum conformance requirements

The minimum performance requirement in Table 9.5.1.2.3-2 is defined as

- a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be  $\geq \gamma_1$ ;
- b) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be  $\geq \gamma_2$ ;

For the parameters specified in Table 9.5.1.2.3-1, and using the downlink physical channels specified in Annex C, the minimum requirements are specified in Table 9.5.1.2.3-2.

**Table 9.5.1.2.3-1: RI Test (TDD)**

Parameter	Unit	Test 1	Test 2	Test 3
Bandwidth	MHz		10	
PDSCH transmission mode			4	
Downlink power allocation	$\rho_A$	dB	-3	
	$\rho_B$	dB	-3	
	$\sigma$	dB	0	
Uplink downlink configuration			2	
Special subframe configuration			4	
Propagation condition and antenna configuration			2 x 2 EPA5

SNR	dB	0	20	20
$N_{oc}^{(j)}$	dB[mW/15kHz]	-98	-98	-98
$\hat{I}_{or}^{(j)}$	dB[mW/15kHz]	-98	-78	-78
Maximum number of HARQ transmissions		1		
Reporting mode		PUSCH 3-1 (Note 3)		
Reporting interval	ms	5		
PMI and CQI delay	ms	10 or 11		
ACK/NACK feedback mode		Bundling		
Note 1:	If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI and CQI estimation at a downlink subframe not later than SF#(n-4), this reported PMI and wideband CQI cannot be applied at the eNB downlink before SF#(n+4).			
Note 2:	Reference measurement channel RC.2 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1.			
Note 3:	Reported wideband CQI and PMI are used and sub-band CQI is discarded.			

**Table 9.5.1.2.3-2: Minimum requirement (TDD)**

Parameter	Test 1	Test 2	Test 3
$\gamma_1$	N/A	1.05	N/A
$\gamma_2$	1	N/A	1.1
UE Category	2-5	2-5	2-5

The normative reference for this requirement is TS 36.101 [2] clause 9.5.1.2.

#### 9.5.1.2.4 Test description

##### 9.5.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.

2. The parameter settings for the cell are set up according to Table 9.5.1.2.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.5.1.2.4.3.

#### 9.5.1.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration, antenna correlation, CodeBookSubsetRestriction for fixed Rank and the SNR according to Table 9.5.1.2.3-1 as appropriate.
2. The SS shall send PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to the UE reported CQI (wideband CQI), PMI and RI. The SS sends downlink MAC padding bits on the DL RMC. The SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the  $t_{fix}$  according to annex G.5.3
3. Propagation conditions are set according to Annex B.1.
4. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit to 0 to schedule UL RMC in subframe#2 and #7 (Table A.4.1-2).
5. The SS shall transmit an RRC Connection Reconfiguration message to set codebookSubsetRestriction as for UE reported RI according to Table 9.5.1.2.3-1.
6. The UE shall transmit RRC Connection Reconfiguration Complete message.
7. Propagation conditions are set according to Table 9.5.1.2.3-1.
8. The SS shall send PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to the UE reported CQI (wideband CQI), PMI and RI. The SS sends downlink MAC padding bits on the DL RMC. The SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure  $t_{reported}$  according to Annex G.5.3  
If the ratio ( $t_{reported} / t_{fix}$ ) satisfies the requirement in Table 9.5.1.2.5-1, then pass the UE for this test and go to step 9. Otherwise, fail the UE.
9. If all tests have not been done, then repeat the same procedure (steps 1 to 8) with test conditions according to the Table 9.5.1.2.3-2 for the other Tests as appropriate. Otherwise pass the UE.

Note 1:	For Test 3, the minimum requirements shall be fulfilled for at least one of $\gamma_1$ or $\gamma_2$ .		

#### 9.5.1.2\_1.4 Test description

##### 9.5.1.2\_1.4.1 Initial conditions

Same initial conditions as in clause 9.5.1.2.4.1.

##### 9.5.1.2\_1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration, antenna correlation, CodeBookSubsetRestriction for fixed Rank and the SNR according to Table 9.5.1.2\_1.3-1 as appropriate.
2. The SS shall send PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to the UE reported CQI (wideband CQI), PMI and RI. The SS sends downlink MAC padding bits on the DL RMC. The SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request

bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the  $t_{fix}$  according to annex G.5.3

3. Propagation conditions are set according to Annex B.1.
4. For Test 3 the SS repeats steps 1 to 3 to get two values for  $t_{fix}$ , one value for fixed Rank 1 case and the other value for fixed Rank 2 case.
5. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit to 0 to schedule UL RMC in subframe#2 and #7 (Table A.4.1-2).
6. The SS shall transmit an RRC Connection Reconfiguration message to set codebookSubsetRestriction as for UE reported RI according to Table 9.5.1.2\_1.3-1.
7. The UE shall transmit RRC Connection Reconfiguration Complete message.
8. Propagation conditions are set according to Table 9.5.1.2\_1.3-1.
9. The SS shall send PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC according to the UE reported CQI (wideband CQI), PMI and RI. The SS sends downlink MAC padding bits on the DL RMC. The SS schedules the UL transmission to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure  $t_{reported}$  according to Annex G.5.3
10. For Test 1 and Test 2 if the ratio ( $t_{reported} / t_{fix}$ ) satisfies the requirement in Table 9.5.1.2\_1.5-1, then pass the UE for Test 1 and Test 2.
11. For Test 3 if the ratio ( $t_{reported} / t_{fix}$ ) satisfies at least one of the  $\gamma_1$  or  $\gamma_2$  requirements in Table 9.5.1.2\_1.5-1, then pass the UE for Test 3.
12. For a complete test case to pass the UE has to pass all test cases 1, 2 and 3. Otherwise, fail the UE
13. If all tests have not been done, then repeat the same procedure (steps 1 to 12) with test conditions according to the Table 9.5.1.2\_1.3-2 for the other Tests as appropriate.

#### 9.5.1.2\_1.4.3 Message contents

Same message contents as in clause 9.5.1.2.4.3.

#### 9.5.1.2\_1.5 Test requirement

Same test requirements as in clause 9.5.1.2.5 with the following exceptions:

- Instead of Table 9.5.1.2.5-1 → use Table 9.5.1.2\_1.5-1

**Table 9.5.1.2\_1.5-1: Test requirement (TDD)**

Parameter	Test 1	Test 2	Test 3

## 9.5.2 RI Reporting (CSI Reference Symbols)

### 9.5.2.1

#### 9.5.2.1\_D FDD RI Reporting- PUCCH 1-1 for eDL-MIMO

##### 9.5.2.1\_D.1 Test purpose

To verify that the reported rank indicator accurately represents the channel rank.

##### 9.5.2.1\_D.2 Test applicability

This test applies to E-UTRA FDD UE release 10 and forward of Category 2-8 that support eDL-MIMO. Applicability requires support for FGI bit 103.

##### 9.5.2.1\_D.3 Minimum conformance requirements

The minimum performance requirement in Table 9.5.2.1\_D.3-2 is defined as

- a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be  $\geq \gamma_1$ ;
- b) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be  $\geq \gamma_2$ ;

For the parameters specified in Table 9.5.2.1\_D.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.5.2.1\_D.3-2.

Table 9.5.2.1\_D.3-1: RI Test (FDD) for eDL-MIMO

Parameter	Unit	Test 1	Test 2	Test 3
Bandwidth	MHz		10	
PDSCH transmission mode			9

Maximum number of HARQ transmissions		1		
Reporting mode		PUCCH 1-1		
Physical channel for CQI/PMI reporting		PUSCH (Note 3)		
PUCCH Report Type for CQI/PMI		2		
Physical channel for RI reporting		PUCCH Format 2		
PUCCH Report Type for RI		3		
Reporting periodicity	ms	$N_{pd} = 5$		
PMI and CQI delay	ms	8		
<i>cqi-pmi-ConfigurationIndex</i>		2		
<i>ri-ConfigurationInd</i>		1 (Note 4)		
Note 1:	If the UE reports in an available uplink reporting instance at subframe SF#n based on PMI and CQI estimation at a downlink subframe not later than SF#(n-4), this reported PMI and wideband CQI cannot be applied at the eNB downlink before SF#(n+4).			
Note 2:	Reference measurement channel RC.9 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 FDD as described in Annex A.5.1.1.			
Note 3:	To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#1 and #6 to allow periodic CQI/ PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#0 and #5.			
Note 4:	To avoid the ambiguity of TE behaviour when applying CQI and PMI during rank switching, RI reports are to be applied at the TE with one subframe delay in addition to Note 1 to align with CQI and PMI reports.			

Table 9.5.2.1\_D.3-2: Minimum requirement (FDD) for eDL-MIMO

The normative reference for this requirement is TS 36.101 [2] clause 9.5.2.1.

#### 9.5.2.1\_D.4 Test description

##### 9.5.2.1\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.5.2.1\_D.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.5.2.1\_D.4.3.

##### 9.5.2.1\_D.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration, antenna correlation, CodeBookSubsetRestriction for fixed Rank and the SNR according to Table 9.5.2.1\_D.3-1 as appropriate.
2. The SS shall send PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the UE reported CQI, PMI and RI. In case of CQI reports for two codewords (codeword #0 and #1), the CQI offset level for codeword #1 is selected from {0,1,2,3,-4,-3,-2,-1}. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and #5 (Table A.4.1-1). Measure the  $t_{fix}$  according to annex G.5.3.
3. Propagation conditions are set according to Annex B.1.
4. The SS sends uplink scheduling information via PDCCH DCI format 0 to schedule UL RMC in every subframe (Table A.4.1-1).
5. The SS shall transmit an RRC Connection Reconfiguration message to set codebookSubsetRestriction as for UE reported RI according to Table 9.5.2.1\_D.3-1.
6. The UE shall transmit RRC Connection Reconfiguration Complete message.
7. Propagation conditions are set according to Table 9.5.2.1\_D.3-1.
8. The SS shall send PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the UE reported CQI, PMI and RI. In case of CQI reports for two codewords (codeword #0 and #1), the CQI offset level for codeword #1 is selected from {0,1,2,3,-4,-3,-2,-1}. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and #5 (Table A.4.1-1). Measure  $t_{reported}$  according to Annex G.5.3

If the ratio ( $t_{reported} / t_{fix}$ ) satisfies the requirement in Table 9.5.2.1\_D.5-1, then pass the UE for this test and go to step 9. Otherwise, fail the UE.

9. If all tests have not been done, then repeat the same procedure (steps 1 to 8) with test conditions according to the Table 9.5.2.1\_D.3-2 for the other Tests as appropriate. Otherwise pass the UE.

UE Category	2-8	2-8	2-8

## 9.5.2.2\_D TDD RI Reporting- PUCCH 1-1 for eDL-MIMO

## 9.5.2.2\_D.1 Test purpose

To verify that the reported rank indicator accurately represents the channel rank.

## 9.5.2.2\_D.2 Test applicability

This test applies to E-UTRA TDD UE Release 10 and forward of Category 2-8 that support eDL-MIMO. Applicability requires support for FGI bit 103.

## 9.5.2.2\_D.3 Minimum conformance requirements

The minimum performance requirement in Table 9.5.2.2\_D.3-2 is defined as:

- a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be  $\geq \gamma_1$ ;
- b) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be  $\geq \gamma_2$ ;

For the parameters specified in Table 9.5.2.2\_D.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.5.2.2\_D.3-2.

Table 9.5.2.2\_D.3-1: RI Test (TDD) for eDL-MIMO

#### 9.5.2.2\_D.4 Test description

##### 9.5.2.2\_D.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.10.
2. The parameter settings for the cell are set up according to Table 9.5.2.2\_D.3-1.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.5.2.2\_D.4.3.

##### 9.5.1.2\_D.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration, antenna correlation, CodeBookSubsetRestriction for fixed Rank and the SNR according to Table 9.5.2.2\_D.3-1 as appropriate.
2. The SS shall send PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the UE reported CQI (wideband CQI), PMI and RI. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #3 and #8 (Table A.4.1-2). Measure the  $t_{fix}$  according to annex G.5.3
3. Propagation conditions are set according to Annex B.1.
4. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit to 0 to schedule UL RMC in subframe#3 and #8 (Table A.4.1-2).
5. The SS shall transmit an RRC Connection Reconfiguration message to set codebookSubsetRestriction as for UE reported RI according to Table 9.5.2.2\_D.3-1.
6. The UE shall transmit RRC Connection Reconfiguration Complete message.
7. Propagation conditions are set according to Table 9.5.2.2\_D.3-1.
8. The SS shall send PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the UE reported CQI (wideband CQI), PMI and RI. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #3 and subframe #8 (Table A.4.1-2). Measure  $t_{reported}$  according to Annex G.5.3  
If the ratio ( $t_{reported} / t_{fix}$ ) satisfies the requirement in Table 9.5.2.2\_D.5-1, then pass the UE for this test and go to step 9. Otherwise, fail the UE.
9. If all tests have not been done, then repeat the same procedure (steps 1 to 8) with test conditions according to the Table 9.5.2.2\_D.3-2 for the other Tests as appropriate. Otherwise pass the UE.

## 9.5.3 RI Reporting (two CSI subframe sets are configured)

## 9.5.3.1\_C FDD RI Reporting – PUCCH 1-0 for eICIC

## 9.5.3.1\_C.1 FDD RI Reporting – PUCCH 1-0 for eICIC (non-MBSFN ABS)

## 9.5.3.1\_C.1.1 Test purpose

To verify that the reported rank indicator accurately represents the channel rank under time domain resource restriction i.e. in case two CSI subframe sets are configured.

## 9.5.3.1\_C.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE - Category 2-8 - release 10 and forward. Applicability requires support for FGI bit 115.

### 9.5.3.1\_C.1.3 Minimum conformance requirements

The minimum performance requirement in Table 9.5.3.1\_C.1.3-2 is defined as

- a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be  $\geq \gamma_1$

For the parameters specified in Table 9.5.3.1\_C.1.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.5.3.1\_C.1.3-2.

Table 9.5.3.1\_C.1.3-1: RI Test (FDD)

#### 9.5.3.1\_C.1.4 Test description

##### 9.5.3.1\_C.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, FigureA.40.
2. The parameter settings for the cell are set up according to Table 9.5.3.1\_C.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.

5. Ensure the UE is in State 3A-RF (in Cell 1) according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.5.3.1\_C.1.4.3.

#### 9.5.3.1\_C.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration, antenna correlation, CodeBookSubsetRestriction for fixed Rank and the SNR according to Table 9.5.3.1\_C.1.3-1 and C.3.3-1 of Annex C.3.3 as appropriate.
2. The SS shall send PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to the UE reported CQI and RI. In case of CQI reports for two codewords (codeword #0 and #1), the CQI offset level for codeword #1 is selected from {0,1,2,3,-4,-3,-2,-1}. The SS sends downlink MAC padding bits on the DL RMC.
3. Measure the  $t_{fix}$  according to annex G.5.3.
4. Propagation conditions are set according to Annex B.1.
5. The SS sends uplink scheduling information via PDCCH DCI format 0 to schedule UL RMC in every subframe (Table A.4.1-1).
6. The SS shall transmit an RRC Connection Reconfiguration message to set codebookSubsetRestriction as for UE reported RI according to Table 9.5.3.1\_C.1.3-1.
7. The UE shall transmit RRC Connection Reconfiguration Complete message.
8. Propagation conditions are set according to Table 9.5.3.1\_C.1.3-1.
9. The SS shall send PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to the UE reported CQI and RI. In case of CQI reports for two codewords (codeword #0 and #1), the CQI offset level for codeword #1 is selected from {0,1,2,3,-4,-3,-2,-1}. The SS sends downlink MAC padding bits on the DL RMC.
10. Measure  $t_{reported}$  according to Annex G.5.3  
If the ratio ( $t_{reported} / t_{fix}$ ) satisfies the requirement in Table 9.5.3.1\_C.1.5-1, then pass the UE for this test and go to step 11. Otherwise, fail the UE.
11. If all tests have not been done, then repeat the same procedure (steps 1 to 10) with test conditions according to the Table 9.5.3.1\_C.1.3-1 for the other Tests as appropriate. Otherwise pass the UE.

	Test 1	Test 2
$\gamma$	0.89	1.04
UE Category	2-8	2-8

## 9.5.3.2\_C TDD RI Reporting – PUCCH 1-0 for eICIC

## 9.5.3.2\_C.1 TDD RI Reporting – PUCCH 1-0 for eICIC (non-MBSFN ABS)

## 9.5.3.2\_C.1.1 Test purpose

To verify that the reported rank indicator accurately represents the channel rank under time domain resource restriction i.e. in case two CSI subframe sets are configured.

### 9.5.3.2\_C.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE - Category 2-8 -release 10 and forward. Applicability requires support for FGI bit 115.

### 9.5.3.2\_C.1.3 Minimum conformance requirements

The minimum performance requirement in Table 9.5.3.2\_C.1.3-2 is defined as:

- a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be  $\geq \gamma_1$ .

For the parameters specified in Table 9.5.3.2\_C.1.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.5.3.2\_C.1.3-2.

Table 9.5.3.2\_C.1.3-1: RI Test (TDD)

#### 9.5.3.2\_C.1.4 Test description

##### 9.5.3.2\_C.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.40.
2. The parameter settings for the cell are set up according to Table 9.5.3.2\_C.1.3-1.

3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.5.3.2\_C.1.4.3.

#### 9.5.3.2\_C.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration, antenna correlation, CodeBookSubsetRestriction for fixed Rank and the SNR according to Table 9.5.3.2\_C.1.3-1 and C.3.3-1 of Annex C.3.3 as appropriate.
2. The SS shall send PDSCH in via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to the UE reported CQI and RI. In case of CQI reports for two codewords (codeword #0 and #1), the CQI offset level for codeword #1 is selected from {0,1,2,3,-4,-3,-2,-1}. The SS sends downlink MAC padding bits on the DL RMC.  
The SS sends uplink scheduling information via PDCCH DCI format 0 in subframe #9 with CQI request bit set to 0 to schedule UL RMC in subframe #3 (Table A.4.1-2).
3. Measure the  $t_{fix}$  according to annex G.5.3.
4. Propagation conditions are set according to Annex B.1.
5. The SS sends uplink scheduling information via PDCCH DCI format 0 to schedule UL RMC in subframe #3 and #8 (Table A.4.1-2).
6. The SS shall transmit an RRC Connection Reconfiguration message to set codebookSubsetRestriction as for UE reported RI according to Table 9.5.3.2\_C.1.3-1.
7. The UE shall transmit RRC Connection Reconfiguration Complete message.
8. Propagation conditions are set according to Table 9.5.3.2\_C.1.3-1.
9. The SS shall send PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to the UE reported CQI and RI. In case of CQI reports for two codewords (codeword #0 and #1), the CQI offset level for codeword #1 is selected from {0,1,2,3,-4,-3,-2,-1}. The SS sends downlink MAC padding bits on the DL RMC.  
The SS sends uplink scheduling information via PDCCH DCI format 0 in subframe #9 with CQI request bit set to 0 to schedule UL RMC in subframe #3 (Table A.4.1-2).
10. Measure  $t_{reported}$  according to Annex G.5.3  
If the ratio ( $t_{reported} / t_{fix}$ ) satisfies the requirement in Table 9.5.3.2\_C.1.5-1, then pass the UE for this test and go to step 11. Otherwise, fail the UE.
11. If all tests have not been done, then repeat the same procedure (steps 1 to 10) with test conditions according to the Table 9.5.3.2\_C.1.3-1 for the other Tests as appropriate. Otherwise pass the UE.

UE Category	2-8	2-8

## 9.5.4 RI Reporting (two CSI subframe sets and CRS assistance information are configured)

### 9.5.4.1\_E FDD RI Reporting – PUCCH 1-0 for feICIC

#### 9.5.4.1\_E.1 FDD RI Reporting – PUCCH 1-0 for feICIC (non-MBSFN ABS)

##### 9.5.4.1\_E.1.1 Test purpose

To verify that the reported rank indicator accurately represents the channel rank under time domain resource restriction i.e. in case two CSI subframe sets are configured.

##### 9.5.4.1\_E.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE and CRS interference handling – UE Category  $\geq 2$  release 11 and forward. Applicability requires support of FGI bit 115.

##### 9.5.4.1\_E.1.3 Minimum conformance requirements

The minimum performance requirement in Table 9.5.4.1\_E.1.3-2 is defined as:

- a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be  $\geq \gamma_1$ .
- b) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be  $\geq \gamma_2$ ;

In Table 9.5.4.1\_E.1.3-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information [5] including Cell 2 and Cell 3 is provided.

Table 9.5.4.1\_E.1.3-1: RI Test (FDD)

#### 9.5.4.1\_E1.4 Test description

##### 9.5.4.1\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.48 for antenna configuration 2x2.

2. The parameter settings for the cell are set up according to Table 9.5.4.1\_E.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF (in Cell 1) according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 9.5.4.1\_E.1.4.3.

#### 9.5.4.1\_E.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration, antenna correlation, CodeBookSubsetRestriction for fixed Rank and the SNR according to Table 9.5.4.1\_E.1.3-1 as appropriate.
2. Set the Cell 2 and Cell 3 as defined in Table 9.5.4.1\_E.1.3-1 and according to Annex C3.3.
3. The SS shall send PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to the UE reported CQI and RI. In case of CQI reports for two codewords (codeword #0 and #1), the CQI offset level for codeword #1 is selected from {0,1,2,3,-4,-3,-2,-1}. The SS sends downlink MAC padding bits on the DL RMC.
4. Measure  $t_{fix}$  during ABS according to annex G.5.3.
5. Propagation conditions are set according to Annex B.1.
6. The SS sends uplink scheduling information via PDCCH DCI format 0 to schedule UL RMC in every subframe (Table A.4.1-1).
7. The SS shall transmit an RRC Connection Reconfiguration message to set codebookSubsetRestriction as for UE reported RI according to Table 9.5.4.1\_E.1.3-1.
8. The UE shall transmit RRC Connection Reconfiguration Complete message.
9. Propagation conditions are set according to Table 9.5.4.1\_E.1.3-1.
10. The SS shall send PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to the UE reported CQI and RI. In case of CQI reports for two codewords (codeword #0 and #1), the CQI offset level for codeword #1 is selected from {0,1,2,3,-4,-3,-2,-1}. The SS sends downlink MAC padding bits on the DL RMC.
11. Measure  $t_{reported}$  during ABS according to Annex G.5.3  
If the ratio ( $t_{reported} / t_{fix}$ ) satisfies the requirement in Table 9.5.4.1\_E.1.5-1, then pass the UE for this test and go to step 12. Otherwise, fail the UE.
12. If all tests have not been done, then repeat the same procedure (steps 1 to 11) with test conditions according to the Table 9.5.4.1\_E.1.3-1 for the other Tests as appropriate. Otherwise pass the UE.

#### 9.5.4.1\_E.1.4.3 Message contents

$\gamma_1$	N/A	1.04	0.89
$\gamma_2$	1.04	N/A	N/A
UE Category	$\geq 2$	$\geq 2$	$\geq 2$

## 9.5.4.2\_E TDD RI Reporting – PUCCH 1-0 for feICIC

## 9.5.4.2\_E.1 TDD RI Reporting – PUCCH 1-0 for feICIC (non-MBSFN ABS)

## 9.5.4.2\_E.1.1 Test purpose

To verify that the reported rank indicator accurately represents the channel rank under time domain resource restriction i.e. in case two CSI subframe sets are configured.

## 9.5.4.2\_E.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE and CRS interference handling and ss-CCH interference handling – UE Category  $\geq 2$  release 11 and forward. Applicability requires support of FGI bit 115.

## 9.5.4.2\_E.1.3 Minimum conformance requirements

The minimum performance requirement in Table 9.5.4.2\_E.1.3-2 is defined as:

- a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be  $\geq \gamma_1$ .
- b) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be  $\geq \gamma_2$ ;

In Table 9.5.4.2\_E.1.3-1, Cell 1 is the serving cell, and Cell 2 and Cell 3 are the aggressor cells. The downlink physical channel setup for Cell 1 is according to Annex C.3.2 and for Cell 2 and Cell 3 is according to Annex C.3.3, respectively. The CRS assistance information [5] including Cell 2 and Cell 3 is provided.

#### 9.5.4.2\_E.1.4 Test description

##### 9.5.4.2\_E.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.48 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Table 9.5.4.2\_E.1.3-1.

3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2 with exceptions listed in 5.2A.5. Message contents are defined in clause 9.5.4.2\_E.1.4.3.

#### 9.5.4.2\_E.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration, antenna correlation, CodeBookSubsetRestriction for fixed Rank and the SNR according to Table 9.5.4.2\_E.1.3-1 as appropriate.
2. Set the Cell 2 and Cell 3 as defined in Tables 9.5.4.2\_E.1.3-1 and according to Annex C3.3.
3. The SS shall send PDSCH in via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to the UE reported CQI and RI. In case of CQI reports for two codewords (codeword #0 and #1), the CQI offset level for codeword #1 is selected from {0,1,2,3,-4,-3,-2,-1}. The SS sends downlink MAC padding bits on the DL RMC.  
The SS sends uplink scheduling information via PDCCH DCI format 0 in subframe #4 and #9 with CQI request bit set to 0 to schedule UL RMC in subframe #8 and #3 (Table A.4.1-2).
4. Measure  $t_{fix}$  during ABS according to annex G.5.3.
5. Propagation conditions are set according to Annex B.1.
6. The SS sends uplink scheduling information via PDCCH DCI format 0 to schedule UL RMC in subframe #3 and #8 (Table A.4.1-2).
7. The SS shall transmit an RRC Connection Reconfiguration message to set codebookSubsetRestriction as for UE reported RI according to Table 9.5.4.2\_E.1.3-1.
8. The UE shall transmit RRC Connection Reconfiguration Complete message.
9. Propagation conditions are set according to Table 9.5.4.2\_E.1.3-1.
10. The SS shall send PDSCH via PDCCH DCI format 2A for C\_RNTI to transmit the DL RMC according to the UE reported CQI and RI. In case of CQI reports for two codewords (codeword #0 and #1), the CQI offset level for codeword #1 is selected from {0,1,2,3,-4,-3,-2,-1}. The SS sends downlink MAC padding bits on the DL RMC.  
The SS sends uplink scheduling information via PDCCH DCI format 0 in subframe #4 and #9 with CQI request bit set to 0 to schedule UL RMC in subframe #8 and #3 (Table A.4.1-2).
11. Measure  $t_{reported}$  during ABS according to Annex G.5.3  
If the ratio ( $t_{reported} / t_{fix}$ ) satisfies the requirement in Table 9.5.4.2\_E.1.5-1, then pass the UE for this test and go to step 12. Otherwise, fail the UE.
12. If all tests have not been done, then repeat the same procedure (steps 1 to 11) with test conditions according to the Table 9.5.4.2\_E.1.3-1 for the other Tests as appropriate. Otherwise pass the UE.

$\gamma_1$	N/A	1.04	0.89
$\gamma_2$	1.04	N/A	N/A
UE Category	$\geq 2$	$\geq 2$	$\geq 2$

## 9.5.5 RI Reporting (with CSI processes)

## 9.5.5.1\_F FDD RI Reporting with CSI processes for CoMP

## 9.5.5.1\_F.1 FDD RI Reporting with Single CSI process for CoMP

## 9.5.5.1\_F.1.1 Test purpose

To verify that the reported rank indicator accurately represents the channel rank with one CSI process configured.

## 9.5.5.1\_F.1.2 Test applicability

This test applies to all types of E-UTRA FDD category  $\geq 2$  UEs release 11 and forward, supporting Maximum CSI processes of One on a component carrier within a band with PDSCH transmission mode 10.

## 9.5.5.1\_F.1.3 Minimum conformance requirements

Each CSI process is associated with a CSI-RS resource and a CSI-IM resource as shown in Table 9.5.5.1\_F.1.3-1. For UE supports one CSI process CSI process 0 is configured for Test 1 and Test 2, but CSI process 1 is not configured for Test 2. The corresponding  $\gamma$  requirements for Test 1 and Test 2 shall be fulfilled. The requirement on reported RI for CSI process 1 in Test 2 is not applicable.

For UE supports multiple CSI processes, CSI process 0 is configured for Test 1 and CSI processes 0 and 1 are configured for Test 2. The corresponding  $\gamma$  requirements for Test 1 and Test 2 shall be fulfilled, and also the requirement on reported RI for CSI process 1 in Test 2.

The minimum performance requirement in Table 9.5.5.1\_F.1.3-2 is defined as:

- The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be  $\geq \gamma_1$ .
- The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be  $\geq \gamma_2$ ;
- For Test 2, the RI reported for CSI process 1 shall be the same as the most recent RI reported for CSI process 0 if UE is configured with multiple CSI processes.

For the parameters specified in Table 9.5.5.1\_F.1.3-2, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.5.5.1\_F.1.3-3.

**Table 9.5.5.1\_F.1.3-1: Configuration of CSI processes**

	CSI process 0	CSI process 1
CSI-RS resource	CSI-RS signal 0	CSI-RS signal 1
CSI-IM resource	CSI-IM resource 0	CSI-IM resource 1

	<i>ri-ConfigIndex</i>		N/A	N/A	N/A	1
CSI process for PDSCH scheduling			CSI process 0		CSI process 0	
Cell ID			0	6	0	6
Quasi-co-located CSI-RS			CSI-RS 0	CSI-RS 1	CSI-RS 0	CSI-RS 1
Quasi-co-located CRS			Same Cell ID as Cell 1	Same Cell ID as Cell 2	Same Cell ID as Cell 1	Same Cell ID as Cell 2
PMI for subframe 2, 3, 4, 7, 8 and 9			010000 for fixed RI = 2 010011 for UE reported RI	100000	000011 for fixed RI = 1 010011 for UE reported RI	N/A
PMI for subframe 1 and 6			100000	100000	100000	N/A
Max number of HARQ transmissions			1	N/A	1	N/A
Note 1:	If the UE reports in an available uplink reporting instance at subframe SF#n based on CQI estimation at a downlink SF not later than SF#(n-4), this reported wideband CQI cannot be applied at the eNB downlink before SF#(n+4).					
Note 2:	3 symbols allocated to PDCCH.					
Note 3:	Reference measurement channel RC.13 FDD according to Table A.4-1. PDSCH transmission is scheduled on subframe 2, 3, 4, 7, 8 and 9 from TP1.					
Note 4:	TM10 OCNG is transmitted as specified in A.5.1.8 is transmitted on subframe 1 and 6 from TP1.					
Note 5:	TM10 OCNG is transmitted as specified in A.5.1.8 is transmitted on subframe 1, 2, 3, 4, 6, 7, 8 and 9 from TP2 for Test 1; TP2 is blanked for Test 2.					
Note 6:	To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#1 and #6 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#0 and #5.					
Note 7:	If UE supports multiple CSI processes, CSI process 0 is configured as 'RI-reference CSI process' for CSI process 1.					
Note 8:	PDCCH DCI format 0 with a trigger for aperiodic CQI shall be transmitted in downlink SF#1 and #6 to allow aperiodic CQI/PMI/RI to be transmitted in uplink SF#0 and #5.					
Note 9:	If UE supports one CSI process, CSI process 1 is not configured in Test 2.					

**Table 9.5.5.1\_F.1.3-3: Minimum requirements for RI Reporting with Single CSI process for CoMP (FDD)**

	Test 1	Test 2
$\gamma_1$	N/A	1.0
$\gamma_2$	1.0	N/A
UE Category	$\geq 2$	$\geq 2$

The normative reference for this requirement is TS 36.101 [2] clause 9.5.5.1.

#### 9.5.5.1\_F.1.4 Test description

##### 9.5.5.1\_F.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Table 9.5.5.1\_F.1.3-2.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.5.5.1\_F.1.4.3.

#### 9.5.5.1\_F.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration, antenna correlation, CodeBookSubsetRestriction, PMI for subframe for fixed Rank and the SNR according to Table 9.5.5.1\_F.1.3-2 and C.3.2-1 of Annex C.3.2 as appropriate.
2. The SS shall send PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the UE reported CQI (wideband CQI), PMI and RI. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and #5 (Table A.4.1-1).
3. Measure the  $t_{fix}$  (fixed Rank 1 or fixed Rank 2) according to annex G.5.3.
4. Propagation conditions are set according to Annex B.1.
5. The SS sends uplink scheduling information via PDCCH DCI format 0 to schedule UL RMC in every subframe (Table A.4.1-1).
6. The SS shall transmit an RRC Connection Reconfiguration message to set codebookSubsetRestriction as for UE reported RI according to Table 9.5.5.1\_F.1.3-1.
7. The UE shall transmit RRC Connection Reconfiguration Complete message.
8. Propagation conditions are set according to Table 9.5.5.1\_F.1.3-1.
9. The SS shall send PDSCH via PDCCH DCI format 2D for C\_RNTI to transmit the DL RMC according to the UE reported CQI (wideband CQI), PMI and RI. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and #5 (Table A.4.1-1).
10. Measure  $t_{reported}$  according to Annex G.5.3  
If the ratio ( $t_{reported} / t_{fix}$ ) satisfies the requirement in Table 9.5.5.1\_F.1.5-1, then pass the UE for this test and go to step 11. Otherwise, fail the UE.
11. If all tests have not been done, then repeat the same procedure (steps 1 to 10) with test conditions according to the Table 9.5.5.1\_F.1.3-1 for the other Tests as appropriate. Otherwise pass the UE.

## 9.5.5.1\_F.2 FDD RI Reporting with Multiple CSI processes for CoMP

**Editor's Note:** The test procedure to test the reported RI requirement for CSI process 1 in Test 2 for multiple CSI process is TBD

## 9.5.5.1\_F.2.1 Test purpose

To verify that the reported rank indicator accurately represents the channel rank with multiple CSI process configured.

## 9.5.5.1\_F.2.2 Test applicability

This test applies to all types of E-UTRA FDD category  $\geq 2$  UEs release 11 and forward, supporting Maximum CSI processes of Three or Four on a component carrier within a band with PDSCH transmission mode 10.

## 9.5.5.1\_F.2.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 9.5.5.1\_F.1.3

## 9.5.5.1\_F.2.4 Test description

## 9.5.5.1\_F.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1.

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Table 9.5.5.1\_F.2.3-2.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.5.5.1\_F.2.4.3.

#### 9.5.5.1\_F.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration, antenna correlation, CodeBookSubsetRestriction, PMI for subframe for fixed Rank and the SNR according to Table 9.5.5.1\_F.1.3-2 and C.3.2-1 of Annex C.3.2 as appropriate.
2. The SS shall send PDSCH via PDCCH DCI format 2D for  $C\_RNTI$  to transmit the DL RMC according to the UE reported CQI (wideband CQI), PMI and RI. The SS sends downlink MAC padding bits on the DL RMC. The transport format to be used is defined in Annex A.4 Table A.4-1. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and #5 (Table A.4.1-1).
3. Measure the  $t_{fix}$  (fixed Rank 1 or fixed Rank 2) according to annex G.5.3.
4. Propagation conditions are set according to Annex B.1.
5. The SS sends uplink scheduling information via PDCCH DCI format 0 to schedule UL RMC in every subframe (Table A.4.1-1).
6. The SS shall transmit an RRC Connection Reconfiguration message to set codebookSubsetRestriction as for UE reported RI according to Table 9.5.5.1\_F.1.3-2.
7. The UE shall transmit RRC Connection Reconfiguration Complete message.
8. Propagation conditions are set according to Table 9.5.5.1\_F.1.3-2.
9. The SS shall send PDSCH via PDCCH DCI format 2D for  $C\_RNTI$  to transmit the DL RMC according to the UE reported CQI (wideband CQI), PMI and RI. The SS sends downlink MAC padding bits on the DL RMC. The transport format to be used is defined in Annex A.4 Table A.4-1. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and #5 (Table A.4.1-1).
10. Measure  $t_{reported}$  according to Annex G.5.3  
If the ratio ( $t_{reported} / t_{fix}$ ) satisfies the requirement in Table 9.5.5.1\_F.2.5-1, then pass the UE for this test and go to step 11. Otherwise, fail the UE.
11. If all tests have not been done, then repeat the same procedure (steps 1 to 10) with test conditions according to the Table 9.5.5.1\_F.1.3-2 for the other Tests as appropriate. Otherwise pass the UE.

## 9.5.5.1\_F.2.5 Test requirement

**Table 9.5.5.1\_F.2.5-1: Test requirements for RI Reporting with Multiple CSI processes for CoMP (FDD)**

	Test 1	Test 2
$\gamma_1$	N/A	0.99
$\gamma_2$	0.99	N/A
UE Category	$\geq 2$	$\geq 2$

## 9.5.5.2\_F TDD RI Reporting with CSI processes for CoMP

## 9.5.5.2\_F.1 TDD RI Reporting with Single CSI process for CoMP

## 9.5.5.2\_F.1.1 Test purpose

To verify that the reported rank indicator accurately represents the channel rank with one CSI process configured.

## 9.5.5.2\_F.1.2 Test applicability

This test applies to all types of E-UTRA TDD category  $\geq 2$  UEs release 11 and forward, supporting Maximum CSI processes of One on a component carrier within a band with PDSCH transmission mode 10.

## 9.5.5.2\_F.1.3 Minimum conformance requirements

Each CSI process is associated with a CSI-RS resource and a CSI-IM resource as shown in Table 9.5.5.2\_F.1.3-1. For UE supports one CSI process CSI process 0 is configured for Test 1 and Test 2, but CSI process 1 is not configured for Test 2. The corresponding  $\gamma$  requirements for Test 1 and Test 2 shall be fulfilled. The requirement on reported RI for CSI process 1 in Test 2 is not applicable.

For UE supports multiple CSI processes, CSI process 0 is configured for Test 1 and CSI processes 0 and 1 are configured for Test 2. The corresponding  $\gamma$  requirements for Test 1 and Test 2 shall be fulfilled, and also the requirement on reported RI for CSI process 1 in Test 2.

The minimum performance requirement in Table 9.5.5.2\_F.1.3-2 is defined as:

- a) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 1 shall be  $\geq \gamma_1$ .
- b) The ratio of the throughput obtained when transmitting based on UE reported RI and that obtained when transmitting with fixed rank 2 shall be  $\geq \gamma_2$ ;
- c) For Test 2, the RI reported for CSI process 1 shall be the same as the most recent RI reported for CSI process 0 if UE is configured with multiple CSI processes

For the parameters specified in Table 9.5.5.2\_F.1.3-2, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.5.5.2\_F.1.3-3.

**Table 9.5.5.2\_F.1.3-1: Configuration of CSI processes**

	<b>CSI process 0</b>	<b>CSI process 1</b>
CSI-RS resource	CSI-RS signal 0	CSI-RS signal 1
CSI-IM resource	CSI-IM resource 0	CSI-IM resource 1

#### 9.5.5.2\_F.1.4 Test description

##### 9.5.5.2\_F.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Table 9.5.5.2\_F.1.3-2.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.5.5.2\_F.1.4.3.

##### 9.5.5.2\_F.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration, antenna correlation, CodeBookSubsetRestriction, PMI for subframe for fixed Rank and the SNR according to Table 9.5.5.2\_F.1.3-1 as and C.3.3-1 of Annex C.3.3 as appropriate.

2. The SS shall send PDSCH in via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the UE reported CQI (wideband CQI), PMI and RI. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 to schedule UL RMC in subframe #2 and #7 (Table A.4.1-2).
3. Measure the  $t_{fix}$  according to annex G.5.3.
4. Propagation conditions are set according to Annex B.1.
5. The SS sends uplink scheduling information via PDCCH DCI format 0 to schedule UL RMC in subframe #2 and #7 (Table A.4.1-2).
6. The SS shall transmit an RRC Connection Reconfiguration message to set codebookSubsetRestriction as for UE reported RI according to Table 9.5.5.2\_F.1.3-1.
7. The UE shall transmit RRC Connection Reconfiguration Complete message.
8. Propagation conditions are set according to Table 9.5.5.2\_F.1.3-1.
9. The SS shall send PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the UE reported CQI (wideband CQI), PMI and RI. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 in subframe #2 and #7 (Table A.4.1-2).
10. Measure  $t_{reported}$  according to Annex G.5.3.  
If the ratio ( $t_{reported} / t_{fix}$ ) satisfies the requirement in Table 9.5.5.2\_F.1.5-1, then pass the UE for this test and go to step 12. Otherwise, fail the UE.
11. If all tests have not been done, then repeat the same procedure (steps 1 to 10) with test conditions according to the Table 9.5.5.2\_F.1.3-1 for the other Tests as appropriate. Otherwise pass the UE.

## 9.5.5.2\_F.1.5 Test requirement

**Table 9.5.5.2\_F.1.5-1: Test requirements for RI Reporting with Single CSI process for CoMP (FDD)**

	Test 1	Test 2
$\gamma_1$	N/A	0.99
$\gamma_2$	0.99	N/A
UE Category	$\geq 2$	$\geq 2$

## 9.5.5.2\_F.2 TDD RI Reporting with Multiple CSI processes for CoMP

**Editor's Note: The test procedure to test the reported RI requirement for CSI process 1 in Test 2 for multiple CSI process is TBD**

## 9.5.5.2\_F.2.1 Test purpose

To verify that the reported rank indicator accurately represents the channel rank with Multiple CSI processes configured.

## 9.5.5.2\_F.2.2 Test applicability

This test applies to all types of E-UTRA TDD category  $\geq 2$  UEs release 11 and forward, supporting Maximum CSI processes of Three or Four on a component carrier within a band with PDSCH transmission mode 10.

## 9.5.5.2\_F.2.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 9.5.5.2\_F.1.3

## 9.5.5.2\_F.2.4 Test description

## 9.5.5.2\_F.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2.

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.40 for antenna configuration 2x2.
2. The parameter settings for the cell are set up according to Table 9.5.5.2\_F.2.3-2.
3. Downlink signals are initially set up according to Annex C.1 and Annex C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.5.5.2\_F.2.4.3.

## 9.5.5.2\_F.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration, antenna correlation, CodeBookSubsetRestriction, PMI for subframe for fixed Rank and the SNR according to Table 9.5.5.2\_F.1.3-2 as and C.3.3-1 of Annex C.3.3 as appropriate.

2. The SS shall send PDSCH in via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the UE reported CQI (wideband CQI), PMI and RI. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 to schedule UL RMC in subframe #2 and #7 (Table A.4.1-2).
3. Measure the  $t_{fix}$  according to annex G.5.3.
4. Propagation conditions are set according to Annex B.1.
5. The SS sends uplink scheduling information via PDCCH DCI format 0 to schedule UL RMC in subframe #2 and #7 (Table A.4.1-2).
6. The SS shall transmit an RRC Connection Reconfiguration message to set codebookSubsetRestriction as for UE reported RI according to Table 9.5.5.2\_F.1.3-2.
7. The UE shall transmit RRC Connection Reconfiguration Complete message.
8. Propagation conditions are set according to Table 9.5.5.2\_F.1.3-2.
9. The SS shall send PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC according to the UE reported CQI (wideband CQI), PMI and RI. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 to schedule UL RMC in subframe #2 and #7 (Table A.4.1-2).
10. Measure  $t_{reported}$  according to Annex G.5.3  
If the ratio ( $t_{reported} / t_{fix}$ ) satisfies the requirement in Table 9.5.5.2\_F.2.5-1, then pass the UE for this test and go to step 12. Otherwise, fail the UE.
11. If all tests have not been done, then repeat the same procedure (steps 1 to 10) with test conditions according to the Table 9.5.5.2\_F.1.3-2 for the other Tests as appropriate. Otherwise pass the UE.

$\gamma_1$	N/A	0.99
$\gamma_2$	0.99	N/A
UE Category	$\geq 2$	$\geq 2$

## 9.6 Additional requirements for carrier aggregation

This clause includes requirements for the reporting of channel state information (CSI) with the UE configured for carrier aggregation. The purpose is to verify that the channel state for each cell is correctly reported with multiple cells configured for periodic reporting.

Unless otherwise stated, the logical carriers PCC / SCC are mapped on physical frequencies as defined in Table 9.6-1.

**Table 9.6-1: PCC/SCCs frequency mapping**

CA Configuration	PCC-SCC mapping	Notes
Intra-band CA	CC1-CC2	1
Inter-band CA (CA_x-y)	Bx-By (if not supported by the UE, then By-Bx)	2
Note 1:	Notation CCI-CCj means PCC on component carrier CCI and SCC on component carrier CCj, with CCI/j frequencies defined in the corresponding intra-band contiguous / non-contiguous CA band in TS 36.508.	
Note 2:	Notation Bi-Bj means PCC on component Band i and SCC on component Band j, with single Band i/j frequencies defined in TS 36.508.	

### 9.6.1 Periodic reporting on multiple cells (Cell-Specific Reference Symbols)

#### 9.6.1.1\_A FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for CA

##### 9.6.1.1\_A.1 FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for CA(2DL CA)

###### 9.6.1.1\_A.1.1 Test purpose

To verify that the UE reports different CQI indices for Pcell and Scell if each cell experiences a different SNR.

###### 9.6.1.1\_A.1.2 Test applicability

This test applies to

all types of E-UTRA FDD release 10 and forward UE of category 3 or higher that support inter-band OR intra-band contiguous DL CA.

This test also applies to all types of E-UTRA FDD release 11 and forward UE of category 3 or higher that support intra-band non contiguous DL CA.

###### 9.6.1.1\_A.1.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 3$ . For the parameters specified in Table 9.6.1.1\_A.1.3-1 and Table 9.6.1.1\_A.1.3-2, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of Pcell and Scell reported shall be such that

$$\text{wideband CQI}_{\text{Pcell}} - \text{wideband CQI}_{\text{Scell}} \geq 2$$

for more than 90% of the time.

**Table 9.6.1.1\_A.1.3-1: Parameters for PUCCH 1-0 static test on multiple cells (FDD)**

Parameter		Unit	Pcell	Scell
PDSCH transmission mode				1
Downlink power allocation	$\rho_A$	dB		0
	$\rho_B$	dB		0
Propagation condition and antenna configuration			AWGN (1 x 2)	
SNR		dB	10	4
$\hat{I}_{or}^{(j)}$		dB[mW/15kHz]	-88	-94
$N_{oc}^{(j)}$		dB[mW/15kHz]	-98	-98
Physical channel for CQI reporting			PUCCH Format 2	
PUCCH Report Type			4	
Reporting periodicity		Ms	$N_{pd} = 10$	
<i>cqi-pmi-ConfigurationIndex</i>			11	16 [shift of 5 ms relative to Pcell]
Note 1: 3 symbols are allocated to PDCCH. No PDSCH for user data is scheduled for the UE with one sided dynamic OCNG Pattern OP.1 FDD as described in Annex A.5.1.1.				

**Table 9.6.1.1\_A.1.3-2: PUCCH 1-0 static test (FDD)**

Test number	Bandwidth combination
1	10MHz for both cells
2	20MHz for both cells
3	5MHz for both cells
4	5MHz for PCell and 10MHz for SCell
5	5MHz for PCell and 15MHz for SCell
Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 9.1.1.2.	

The normative reference for this requirement is TS 36.101 [2] clause 9.6.1.1.

#### 9.6.1.1\_A.1.4 Test description

##### 9.6.1.1\_A.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum Wgap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 9.6.1.1\_A.1.4.1-1.

CA Capability to be tested: Select one according to Table 9.6.1.1\_A.1.4.1-1

**Table 9.6.1.1\_A.1.4.1-1: Test point selection for PUCCH 1-0 static test**

CA Applicability	Bandwidth combination				
	10+10	20+20	5+5	5+10	5+15

Inter-band CA (two bands) (CA2_A2)	Test 1	Test 2	Test 3	Test4	Test 5
Intra-band contiguous CA (CA2_C)	Test 1	Test 2	Test 3	Test4	Test 5
Intra-band non-contiguous CA (with two sub-blocks) (CA2_N2)	Test 1	Test 2	Test 3	Test4	Test 5
Note 1: Only one test point is tested. Select the first UE supported CA bandwidth combination (moving from left to right) and then choose any one of the UE supported CA capabilities.					

1. Connect the SS and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure group A.45 as appropriate.
2. The parameter settings for the cell are set up according to Table 9.6.1.1\_A.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.6.1.1\_A.1.4.3.

#### 9.6.1.1\_A.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents for *RadioResourceConfigDedicatedSCell-r10-DEFAULT* are defined Table 9.6.1.1\_A.1.4.3-4, *PhysicalConfigDedicatedSCell-r10-DEFAULT* is defined in Table 9.6.1.1\_A.1.4.3-5, *CQI-ReportConfigSCell-r10-DEFAULT* is defined in Table 9.6.1.1\_A.1.4.3-6, *CQI-ReportPeriodic-r10-DEFAULT* is defined in Table 9.6.1.1\_A.1.4.3-7.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration and the SNR according to Table 9.6.1.1\_A.1.3-1 as appropriate.
5. The SS shall start gathering CQI reports. No PDSCH for user data is scheduled for the UE.
6. Continue gathering CQI reports until 2000 wideband CQI reports have been gathered for each P-Cell and S-Cell. For each CSI report calculate the respective difference  $CQI_{P,S} = \text{wideband } CQI_{Pcell} - \text{wideband } CQI_{Scell}$ .
7. If more than 1800 values of  $CQI_{P,S}$  are  $\geq 2$  pass the UE. Otherwise fail the UE.

#### 9.6.1.1\_A.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.6.1.1\_A.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

#### 9.6.1.1\_A.2 FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for CA (3DL CA)

##### 9.6.1.1\_A.2.1 Test purpose

To verify that the UE reports different CQI indices for Pcell and Scells if each cell experiences a different SNR.

##### 9.6.1.1\_A.2.2 Test applicability

This test case applies to all types of E-UTRA FDD release 10 and forward UE of category 5 or higher that support 3DL Intra-band contiguous CA or 3DL Inter-band CA, or 3DL with Intra-band contiguous and Inter-band CA.

This test case also applies to all types of E-UTRA FDD release 11 and forward UE of category 5 or higher that support 3DL with Intra-band non-contiguous and Inter-band CA, or 3DL with Intra-band non-contiguous and Intra-band contiguous CA.

##### 9.6.1.1\_A.2.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 5$ . For the parameters specified in Table 9.6.1.1\_A.2.3-1 and Table 9.6.1.1\_A.2.3-2, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of Pcell and Scell1 reported, and the difference between the wideband CQI indices of SCell1 and SCell2 reported shall be such that

$$\text{wideband CQI}_{\text{Pcell}} - \text{wideband CQI}_{\text{Scell1}} \geq 2$$

$$\text{wideband CQI}_{\text{Scell1}} - \text{wideband CQI}_{\text{Scell2}} \geq 2$$

for more than 90% of the time.

**Table 9.6.1.1\_A.2.3-1: Parameters for PUCCH 1-0 static test on multiple cells (FDD, 3 DL CA)**

Parameter	Unit	Pcell	Scell1	Scell2
PDSCH transmission mode		1		
Downlink power allocation	$\rho_A$	dB	0	
	$\rho_B$	dB	0	
Propagation condition and antenna configuration		AWGN (1 x 2)		
SNR	dB	12	6	0
$\hat{I}_{or}^{(j)}$	dB[mW/15kHz]	-86	-92	-98
$N_{oc}^{(j)}$	dB[mW/15kHz]	-98	-98	-98
Physical channel for CQI reporting		PUCCH Format 2		
PUCCH Report Type		4		
Reporting periodicity	ms	$N_{pd} = 20$		
<i>cqi-pmi-ConfigurationIndex</i>		21	26 [shift of 5 ms relative to Pcell]	31 [shift of 10 ms relative to Pcell]
Note 1: 3 symbols are allocated to PDCCH. No PDSCH for user data is scheduled for the UE with one sided dynamic OCNG Pattern OP.1 FDD as described in Annex A.5.1.1.				

**Table 9.6.1.1\_A.2.3-2: PUCCH 1-0 static test (FDD, 3DL CA)**

Test number	Bandwidth combination (MHz)
1	3x20
2	20+20+15
3	20+20+10
4	20+15+15
5	20+15+10
6	20+10+10
7	15+15+10
8	20+10+5
9	20+15+5
Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 9.1.1.2.	

The normative reference for this requirement is TS 36.101 [2] clause 9.6.1.1.

#### 9.6.1.1\_A.2.4 Test description

##### 9.6.1.1\_A.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum Wgap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 9.6.1.1\_A.2.4.1-1.

CA Capability to be tested: Select one according to Table 9.6.1.1\_A.2.4.1-1.

Table 9.6.1.1\_A.2.4.1-1: Test point selection for PUCCH 1-0 static test

CA Applicability	Bandwidth combination								
	3x20	20+20+15	20+20+10	20+15+15	20+15+10	20+10+10	15+15+10	20+10+5	20+15+5
Intra-band contiguous (CA_C)	Test 1	Test 2	Test 3	Test4	Test5	Test6	Test7	Test8	Test9
Inter-band (CA_A_2)	Test 1	Test 2	Test 3	Test4	Test5	Test6	Test7	Test8	Test9
Inter-band (CA_A_3)	Test 1	Test 2	Test 3	Test4	Test5	Test6	Test7	Test8	Test9
Intra-band non-contiguous (CA_N)	Test 1	Test 2	Test 3	Test4	Test5	Test6	Test7	Test8	Test9
Note 1: Only one test point is tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.									

1. Connect the SS and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.59 without faders.
2. The parameter settings for the cell are set up according to Table 9.6.1.1\_A.2.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.6.1.1\_A.2.4.3.

#### 9.6.1.1\_A.2.4.2 Test procedure

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4. Message contents for *RadioResourceConfigDedicatedSCell-r10-DEFAULT* are defined Table 9.6.1.1\_A.2.4.3-4, *PhysicalConfigDedicatedSCell-r10-DEFAULT* is defined in Table 9.6.1.1\_A.2.4.3-5, *CQI-ReportConfigSCell-r10-DEFAULT* is defined in Table 9.6.1.1\_A.2.4.3-6, *CQI-ReportPeriodic-r10-DEFAULT* is defined in Table 9.6.1.1\_A.2.4.3-7.
3. SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration and the SNR according to Table 9.6.1.1\_A.2.3-1 as appropriate.
5. The SS shall start gathering CQI reports. No PDSCH for user data is scheduled for the UE.
6. Continue gathering CQI reports until 2000 wideband CQI reports have been gathered for each P-Cell and S-Cells. For each CSI report calculate the respective difference  $CQI_{P,S1} = \text{wideband } CQI_{Pcell} - \text{wideband } CQI_{Scell1}$  and the respective difference  $CQI_{S1,S2} = \text{wideband } CQI_{Scell1} - \text{wideband } CQI_{Scell2}$ .
7. If more than 1800 values of  $CQI_{P,S1} \geq 2$  and more than 1800 values of  $CQI_{S1,S2} \geq 2$ , pass the UE. Otherwise fail the UE.

#### 9.6.1.1\_A.2.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.6.1.1\_A.2.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

#### 9.6.1.1\_A.3 FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for CA (4DL CA)

##### 9.6.1.1\_A.3.1 Test purpose

To verify that the UE reports different CQI indices for Pcell and Scells if each cell experiences a different SNR.

## 9.6.1.1\_A.3.2 Test applicability

This test case applies to all types of E-UTRA FDD release 11 and forward UE of category 8 or higher that support 4DL Intra-band contiguous CA or 4DL Inter-band CA, or 4DL with Intra-band contiguous and Inter-band CA.

This test case also applies to all types of E-UTRA FDD release 11 and forward UE of category 8 or higher that support 4DL with Intra-band non-contiguous and Inter-band CA, or 4DL with Intra-band non-contiguous and Intra-band contiguous CA.

## 9.6.1.1\_A.3.3 Minimum conformance requirements

The following requirements for 4DL CA apply to UE Category  $\geq 8$ . For CA with 4 DL CC, for the parameters specified in Table 9.6.1.1\_A.3.3-1 and Table 9.6.1.1\_A.3.3-2, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of PCell and SCell1 reported, and the difference between the wideband CQI indices of SCell 1 and SCell2, and SCell 1 and SCell 3 reported shall be such that

$$\text{wideband CQI}_{\text{PCell}} - \text{wideband CQI}_{\text{SCell1}} \geq 2$$

$$\text{wideband CQI}_{\text{SCell1}} - \text{wideband CQI}_{\text{SCell2}} \geq 2$$

$$\text{wideband CQI}_{\text{SCell1}} - \text{wideband CQI}_{\text{SCell3}} \geq 2$$

for more than 90% of the time.

**Table 9.6.1.1\_A.3.3-1: Parameters for PUCCH 1-0 static test on multiple cells (FDD, 3 and 4 DL CA)**

Parameter	Unit	Pcell	Scell1	Scell2, 3
PDSCH transmission mode		1		
Downlink power allocation	$\rho_A$	0		
	$\rho_B$	0		
Propagation condition and antenna configuration		AWGN (1 x 2)		
SNR	dB	12	6	0
$\hat{I}_{or}^{(j)}$	dB[mW/15kHz]	-86	-92	-98
$N_{oc}^{(j)}$	dB[mW/15kHz]	-98	-98	-98
Physical channel for CQI reporting		PUCCH Format 2		
PUCCH Report Type		4		
Reporting periodicity	ms	$N_{pd} = 20$		
<i>cqi-pmi-ConfigurationIndex</i>		21	26 (shift of 5 ms relative to Pcell)	31 for Scell2 (shift of 10 ms relative to Pcell) , 36 for Scell3 (shift of 15ms relative to Pcell)
Note 1: 3 symbols are allocated to PDCCH. No PDSCH for user data is scheduled for the UE with one sided dynamic OCNG Pattern OP.1 FDD as described in Annex A.5.1.1.				

**Table 9.6.1.1\_A.3.3-2: PUCCH 1-0 static test (FDD, 4DL CA)**

Test number	Bandwidth combination (MHz)
1	4x20
2	20+20+20+10
3	20+20+10+10
Note 1:	The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 9.1.1.2. The test coverage for different number of component carriers is defined in 9.1.1.3.
Note 2:	If more than one cell can be configured as PCell, choose one with the smallest bandwidth as PCell. If all the cells which can be configured as PCell have the same bandwidth, randomly choose one as PCell. Randomly associate the other cells to SCell 1, SCell 2 and SCell3.

The normative reference for this requirement is TS 36.101 [2] clause 9.6.1.1.

#### 9.6.1.1\_A.3.4 Test description

##### 9.6.1.1\_A.3.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum Wgap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 9.6.1.1\_A.3.4.1-1.

CA Capability to be tested: Select one according to Table 9.6.1.1\_A.3.4.1-1.

**Table 9.6.1.1\_A.3.4.1-1: Test point selection for PUCCH 1-0 static test**

CA Applicability	Bandwidth combination		
	4x20	20+20+20+10	20+20+10+10
Intra-band contiguous (CA_C)	Test 1	Test 2	Test 3
Inter-band (CA_A_2)	Test 1	Test 2	Test 3
Inter-band (CA_A_3)	Test 1	Test 2	Test 3
Intra-band non-contiguous (CA_N)	Test 1	Test 2	Test 3
Note 1: Only one test point is tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.			

1. Connect the SS and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.59 without faders.
2. The parameter settings for the cell are set up according to Table 9.6.1.1\_A.3.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.6.1.1\_A.3.4.3.

##### 9.6.1.1\_A.3.4.2 Test procedure

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4. Message contents for *RadioResourceConfigDedicatedSCell-r10-DEFAULT* are defined Table 9.6.1.1\_A.3.4.3-4, *PhysicalConfigDedicatedSCell-r10-DEFAULT* is defined in Table 9.6.1.1\_A.3.4.3-5, *CQI-ReportConfigSCell-r10-DEFAULT* is defined in Table 9.6.1.1\_A.3.4.3-6, *CQI-ReportPeriodic-r10-DEFAULT* is defined in Table 9.6.1.1\_A.3.4.3-7.
3. SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).

4. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration and the SNR according to Table 9.6.1.1\_A.3.3-1 as appropriate.
5. The SS shall start gathering CQI reports. No PDSCH for user data is scheduled for the UE.
6. Continue gathering CQI reports until 2000 wideband CQI reports have been gathered for each P-Cell and S-Cells. For each CSI report calculate the respective difference  $CQI_{P,S1} = \text{wideband } CQI_{Pcell} - \text{wideband } CQI_{Scell1}$ , the respective difference  $CQI_{S1-S2} = \text{wideband } CQI_{Scell1} - \text{wideband } CQI_{Scell2}$  and the respective difference  $CQI_{S1-S3} = \text{wideband } CQI_{Scell1} - \text{wideband } CQI_{Scell3}$ .
7. If more than 1800 values of  $CQI_{P,S1}$  are  $\geq 2$ , more than 1800 values of  $CQI_{S1-S2}$  are  $\geq 2$  and more than 1800 values of  $CQI_{S1-S3}$  are  $\geq 2$ , pass the UE. Otherwise fail the UE.9.6.1.1\_A.3.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

## 9.6.1.1\_A.3.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.6.1.1\_A.3.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

## 9.6.1.2\_A TDD CQI Reporting under AWGN conditions – PUCCH 1-0 for CA

## 9.6.1.2\_A.1 TDD CQI Reporting under AWGN conditions – PUCCH 1-0 for CA (2DL CA)

## 9.6.1.2\_A.1.1 Test purpose

To verify that the UE reports different CQI indices for Pcell and Scell if each cell experiences a different SNR.

## 9.6.1.2\_A.1.2 Test applicability

This test applies to all types of E-UTRA TDD UE release 10 and forward with category 3 or higher that support intra-band contiguous DL CA or inter band DL CA.

This test applies to all types of E-UTRA TDD UE release 11 and forward with category 3 or higher that support intra-band non-contiguous DL CA.

## 9.6.1.2\_A.1.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 3$ . For the parameters specified in Table 9.6.1.2\_A.1.3-1 and Table 9.6.1.2\_A.1.3-2, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of Pcell and Scell reported shall be such that

$$\text{wideband CQI}_{\text{Pcell}} - \text{wideband CQI}_{\text{Scell}} \geq 2$$

for more than 90% of the time.

**Table 9.6.1.2\_A.1.3-1: PUCCH 1-0 static test on multiple cells (TDD, 2 DL CA)**

Parameter	Unit	Pcell	Scell
PDSCH transmission mode			1
Uplink downlink configuration			2
Special subframe configuration			4
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0
Propagation condition and antenna configuration		AWGN (1 x 2)	
SNR	dB	10	4
$\hat{I}_{or}^{(j)}$	dB[mW/15kHz]	-88	-94
$N_{oc}^{(j)}$	dB[mW/15kHz]	-98	-98
Physical channel for CQI reporting		PUCCH Format 2	
PUCCH Report Type		4	
Reporting periodicity	ms	$N_{pd} = 10$	
<i>cqi-pmi-ConfigurationIndex</i>		8	13 [shift of 5 ms relative to Pcell]

Note 1: 3 symbols are allocated to PDCCH. No PDSCH for user data is scheduled for the UE with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1.

**Table 9.6.1.2\_A.1.3-2: PUCCH 1-0 static test (TDD, 2 DL CA)**

Test number	Bandwidth combination
1	20MHz for both cells
2	15MHz for PCell and 20MHz for SCell
Note 1:	The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 9.1.1.2.

The normative reference for this requirement is TS 36.101 [2] clause 9.6.1.2.

#### 9.6.1.2\_A.1.4 Test description

##### 9.6.1.2\_A.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum Wgap for Intra-band non-contiguous CA otherwise Mid Range as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 9.6.1.2\_A.1.4.1-1.

CA Capability to be tested: Select one according to Table 9.6.1.2\_A.1.4.1-1.

**Table 9.6.1.2\_A.1.4.1-1: Test point selection for CQI Reporting under AWGN conditions – PUCCH 1-0 for 2DL CA**

CA Capability	Bandwidth Combination	
	20+20	20+15
Inter-band CA (two bands) (CA2_A2)	Test 1	N/A
Intra-band contiguous CA (CA2_C)	Test 1	Test 2
Intra-band non-contiguous CA (with two sub-blocks) (CA2_N2)	Test 1	N/A
Note 1: Only one test point is tested. Select the first Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.		

1. Connect the SS and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure group A.45 as appropriate.
2. The parameter settings for the cell are set up according to Table 9.6.1.2\_A.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.6.1.2\_A.1.4.3.

##### 9.6.1.2\_A.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents for *RadioResourceConfigDedicatedSCell-r10-DEFAULT* are defined Table 9.6.1.2\_A.1.4.3-4, *PhysicalConfigDedicatedSCell-r10-DEFAULT* is defined in Table 9.6.1.2\_A.1.4.3-5, *CQI-ReportConfigSCell-*

*r10-DEFAULT* is defined in Table 9.6.1.2\_A.1.4.3-6, *CQI-ReportPeriodic-r10-DEFAULT* is defined in Table 9.6.1.2\_A.1.4.3-7.

3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration and the SNR according to Table 9.6.1.2\_A.1.3-1 as appropriate.
5. The SS shall start gathering CQI reports. No PDSCH for user data is scheduled for the UE.
6. Continue gathering CQI reports until 2000 wideband CQI reports have been gathered for each P-Cell and S-Cell. For each CSI report calculate the respective difference  $CQI_{P,S} = \text{wideband } CQI_{P_{cell}} - \text{wideband } CQI_{S_{cell}}$ .
7. If more than 1800 values of  $CQI_{P,S}$  are  $\geq 2$  pass the UE. Otherwise fail the UE.

## 9.6.1.2\_A.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.6.1.2\_A.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

### 9.6.1.2\_A.2 TDD CQI Reporting under AWGN conditions – PUCCH 1-0 for CA (3DL CA)

#### 9.6.1.2\_A.2.1 Test purpose

To verify that the UE reports different CQI indices for Pcell and SCells if each cell experiences a different SNR.

#### 9.6.1.2\_A.2.2 Test applicability

This test case applies to all types of E-UTRA TDD release 10 and forward UE of category 5 or higher that support 3DL Intra-band contiguous CA or 3DL Inter-band CA, or 3DL with Intra-band contiguous and Inter-band CA.

This test case also applies to all types of E-UTRA TDD release 11 and forward UE of category 5 or higher that support 3DL Intra-band non-contiguous CA or 3DL with Intra-band non-contiguous and Inter-band CA, or 3DL with Intra-band non-contiguous and Intra-band contiguous CA.

#### 9.6.1.2\_A.2.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 5$ . For the parameters specified in Table 9.6.1.2\_A.2.3-1 and Table 9.6.1.2\_A.2.3-2, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of Pcell and Scell1 reported, and the difference between the wideband CQI indices of SCell1 and SCell2 reported shall be such that

$$\text{wideband CQI}_{\text{Pcell}} - \text{wideband CQI}_{\text{Scell1}} \geq 2$$

$$\text{wideband CQI}_{\text{Scell1}} - \text{wideband CQI}_{\text{Scell2}} \geq 2$$

for more than 90% of the time.

**Table 9.6.1.2\_A.2.3-1: Parameters for PUCCH 1-0 static test on multiple cells (TDD, 3 DL CA)**

Parameter		Unit	Pcell	Scell1	Scell2
PDSCH transmission mode				1	
Uplink downlink configuration				2	
Special subframe configuration				4	
Downlink power allocation	$\rho_A$	dB		0	
	$\rho_B$	dB		0	
Propagation condition and antenna configuration			AWGN (1 x 2)		
SNR		dB	12	6	0
$\hat{I}_{or}^{(j)}$		dB[mW/15kHz]	-86	-92	-98
$N_{oc}^{(j)}$		dB[mW/15kHz]	-98	-98	-98
Physical channel for CQI reporting			PUCCH Format 2		
PUCCH Report Type			4		
Reporting periodicity		ms	$N_{pd} = 20$		
<i>cqi-pmi-ConfigurationIndex</i>			18	23 [shift of 5 ms relative to Pcell]	28 [shift of 10 ms relative to Pcell]
Note 1: 3 symbols are allocated to PDCCH. No PDSCH for user data is scheduled for the UE with one sided dynamic OCN Pattern OP.1 TDD as described in Annex A.5.2.1.					

**Table 9.6.1.2\_A.2.3-2: PUCCH 1-0 static test (TDD, 3DL CA)**

Test number	Bandwidth combination (MHz)
1	3x20
2	20+20+15
Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 9.1.1.2.	

The normative reference for this requirement is TS 36.101 [2] clause 9.6.1.2.

#### 9.6.1.2\_A.2.4 Test description

##### 9.6.1.2\_A.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum Wgap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 9.6.1.2\_A.2.4.1-1.

CA Capability to be tested: Select one according to Table 9.6.1.2\_A.2.4.1-1

**Table 9.6.1.2\_A.2.4.1-1: Test point selection for PUCCH 1-0 static test**

CA Applicability	Bandwidth combination	
	3x20	20+20+15
Intra-band contiguous (CA_C)	Test 1	Test 2
Inter-band (CA_A_2)	Test 1	Test 2
Inter-band (CA_A_3)	Test 1	Test 2
Intra-band non-contiguous (CA_N)	Test 1	Test 2
Note 1: Only one test point is tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.		

1. Connect the SS and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.59 without faders.
2. The parameter settings for the cell are set up according to Table 9.6.1.2\_A.2.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.6.1.2\_A.2.4.3.

## 9.6.1.2\_A.2.4.2 Test procedure

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4. Message contents for *RadioResourceConfigDedicatedSCell-r10-DEFAULT* are defined Table 9.6.1.2\_A.2.4.3-4, *PhysicalConfigDedicatedSCell-r10-DEFAULT* is defined in Table 9.6.1.2\_A.2.4.3-5, *CQI-ReportConfigSCell-r10-DEFAULT* is defined in Table 9.6.1.2\_A.2.4.3-6, *CQI-ReportPeriodic-r10-DEFAULT* is defined in Table 9.6.1.2\_A.2.4.3-7.
3. SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration and the SNR according to Table 9.6.1.2\_A.2.3-1 as appropriate.
5. The SS shall start gathering CQI reports. No PDSCH for user data is scheduled for the UE.
6. Continue gathering CQI reports until 2000 wideband CQI reports have been gathered for each P-Cell and S-Cells. For each CSI report calculate the respective difference  $CQI_{P,S1} = \text{wideband } CQI_{P_{cell}} - \text{wideband } CQI_{S_{cell1}}$  and the respective difference  $CQI_{S1,S2} = \text{wideband } CQI_{S_{cell1}} - \text{wideband } CQI_{S_{cell2}}$ .
7. If more than 1800 values of  $CQI_{P,S1}$  are  $\geq 2$  and more than 1800 values of  $CQI_{S1,S2}$  are  $\geq 2$ , pass the UE. Otherwise fail the UE.

## 9.6.1.2\_A.2.4.3 Message contents

#### 9.6.1.2\_A.2.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.6.1.2\_A.2.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

#### 9.6.1.3 TDD-FDD CA for FDD PCell

##### 9.6.1.3.1 TDD FDD CA CQI Reporting under AWGN conditions – PUCCH 1-0 for FDD PCell (2DL CA)

###### 9.6.1.3.1.1 Test purpose

To verify that the UE reports different CQI indices for FDD PCell and SCell if each cell experiences a different SNR.

###### 9.6.1.3.1.2 Test applicability

This test applies to all types of E-UTRA FDD and TDD UE release 12 and forward that support 2DL CA with FDD as PCell (UE categories 5 and onwards).

###### 9.6.1.3.1.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 3$ . For TDD-FDD CA with FDD PCell with 2 DL CC, for the parameters specified in Table 9.6.1.3.1.3-1 and Table 9.6.1.3.1.3-2, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of Pcell and Scell reported shall be such that

$$\text{wideband CQI}_{\text{Pcell}} - \text{wideband CQI}_{\text{Scell}} \geq 2$$

for more than 90% of the time.

**Table 9.6.1.3.1.3-1: PUCCH 1-0 static test on multiple cells (TDD-FDD CA with FDD PCell, 2DL CA)**

Parameter		Unit	PCell	SCell
PDSCH transmission mode				1
Uplink downlink configuration			N/A	2
Special subframe configuration			N/A	4
Downlink power allocation	$\rho_A$	dB	0	
	$\rho_B$	dB	0	
Propagation condition and antenna configuration			AWGN (1 x 2)	
SNR		dB	10	4
$\hat{I}_{or}^{(j)}$		dB[mW/15kHz]	-88	-94
$N_{oc}^{(j)}$		dB[mW/15kHz]	-98	-98
Physical channel for CQI reporting			PUCCH Format 2	
PUCCH Report Type			4	
Reporting periodicity		ms	$N_{pd} = 10$	
<i>cqi-pmi-ConfigurationIndex</i>			9	14 (shift of 5 ms relative to Pcell)
Note 1: 3 symbols are allocated to PDCCH. No PDSCH for user data is scheduled for the UE with one sided dynamic OCNG Pattern OP.1 FDD and OP.1 TDD as described in Annex A.5.1.1 and A.5.2.1.				

**Table 9.6.1.3.1.3-2: PUCCH 1-0 static test (TDD-FDD CA with FDD PCell, 2DL CA)**

Test number	Bandwidth combination
1	20MHz for FDD cell and 20MHz for TDD cell
2	10MHz for FDD cell and 20MHz for TDD cell
3	15MHz for FDD cell and 20MHz for TDD cell
Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 9.1.1.2A. The test coverage for different number of component carriers is defined in 9.1.1.3.	

The normative reference for this requirement is TS 36.101 [2] clause 9.6.1.3.

#### 9.6.1.3.1.4 Test description

##### 9.6.1.3.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum Wgap for Intra-band non-contiguous CA otherwise Mid Range as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 9.6.1.3.1.4.1-1.

CA Capability to be tested: Select one according to Table 9.6.1.3.1.4.1-1.

**Table 9.6.1.3.1.4.1-1: Test point selection for CQI Reporting under AWGN conditions – PUCCH 1-0 for FDD PCell (2DL CA)**

CA Applicability	Bandwidth combination		
	20+20	10+20	15+20
Inter-band CA (two bands) (CA2_A2)	Test 1	Test 2	Test3
Note 1: Only one test point is tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.			

1. Connect the SS and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure group A.45 as appropriate.
2. The parameter settings for the cell are set up according to Table 9.6.1.3.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.6.1.3.1.4.3.

#### 9.6.1.3.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents for *RadioResourceConfigDedicatedSCell-r10-DEFAULT* are defined Table 9.6.1.3.1.4.3-4, *PhysicalConfigDedicatedSCell-r10-DEFAULT* is defined in Table 9.6.1.3.1.4.3-5, *CQI-ReportConfigSCell-r10-DEFAULT* is defined in Table 9.6.1.3.1.4.3-6, *CQI-ReportPeriodic-r10-DEFAULT* is defined in Table 9.6.1.3.1.4.3-7, *TDD-Config-DEFAULT* is defined in Table 9.6.1.3.1.4.3-8.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration and the SNR according to Table 9.6.1.3.1.3-1 as appropriate.
5. The SS shall start gathering CQI reports. No PDSCH for user data is scheduled for the UE.
6. Continue gathering CQI reports until 2000 wideband CQI reports have been gathered for each P-Cell and S-Cell. For each CSI report calculate the respective difference  $CQI_{P,S} = \text{wideband } CQI_{Pcell} - \text{wideband } CQI_{Scell}$ .
7. If more than 1800 values of  $CQI_{P,S}$  are  $\geq 2$  pass the UE. Otherwise fail the UE.

#### 9.6.1.3.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.6.1.3.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

#### 9.6.1.3.2 TDD FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for FDD PCell (3DL CA)

##### 9.6.1.3.2.1 Test purpose

To verify that the UE reports different CQI indices for FDD PCell and SCells if each cell experiences a different SNR.

## 9.6.1.3.2.2 Test applicability

This test applies to all types of E-UTRA FDD and TDD UE release 12 and forward that support 3DL CA with FDD as PCell (UE categories 5 and onwards).

## 9.6.1.3.2.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 5$ . For TDD-FDD CA with FDD PCell with 3DL CC, for the parameters specified in Table 9.6.1.3.2.3-1 and Table 9.6.1.3.2.3-2, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of Pcell and SCell1 reported, and the difference between the wideband CQI indices of SCell1 and SCell2 reported shall be such that

$$\text{wideband CQI}_{\text{Pcell}} - \text{wideband CQI}_{\text{Scell1}} \geq 2$$

$$\text{wideband CQI}_{\text{Scell1}} - \text{wideband CQI}_{\text{Scell2}} \geq 2$$

for more than 90% of the time.

**Table 9.6.1.3.2.3-1: Parameters for PUCCH 1-0 static test on multiple cells (TDD-FDD CA with FDD PCell, 3DL CA)**

Parameter		Unit	PCell	SCell1	SCell2
PDSCH transmission mode				1	
Uplink downlink configuration			N/A	2 if Scell1 is TDD Cell N/A if Scell1 is FDD Cell	2
Special subframe configuration			N/A	4 if Scell1 is TDD Cell N/A if Scell1 is FDD Cell	4
Downlink power allocation	$\rho_A$	dB	0		
	$\rho_B$	dB	0		
Propagation condition and antenna configuration			AWGN (1 x 2)		
SNR		dB	12	6	0
$\hat{I}_{or}^{(j)}$		dB[mW/15kHz]	-86	-92	-98
$N_{oc}^{(j)}$		dB[mW/15kHz]	-98	-98	-98
Physical channel for CQI reporting			PUCCH Format 2		
PUCCH Report Type			4		
Reporting periodicity		ms	$N_{pd} = 20$		
<i>cqi-pmi-ConfigurationIndex</i>			19	24 (shift of 5 ms relative to Pcell)	29 (shift of 10 ms relative to Pcell)
Note 1: 3 symbols are allocated to PDCCH. No PDSCH for user data is scheduled for the UE with one sided dynamic OCNB Pattern OP.1 FDD and OP.1 TDD as described in Annex A.5.1.1 and A.5.2.1.					

**Table 9.6.1.3.2.3-2: PUCCH 1-0 static test (TDD-FDD CA with FDD PCell, 3DL CA)**

Test number	Bandwidth combination (MHz)
1	20MHz for FDD cell and 2x20MHz for TDD cell
2	15MHz for FDD cell and 2x20MHz for TDD cell
3	10MHz for FDD cell and 2x20MHz for TDD cell
4	2x20MHz for FDD cell and 20MHz for TDD cell
5	20+15MHz for FDD cell and 20MHz for TDD cell
6	20+10MHz for FDD cell and 20MHz for TDD cell
Note 1:	The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 9.1.1.2A. The test coverage for different number of component carriers is defined in 9.1.1.3.
Note 2:	If more than one cell can be configured as PCell, choose one with the smallest bandwidth as PCell. If all the cells which can be configured as PCell have the same bandwidth, randomly choose one as PCell. Randomly associate the other cells to SCell 1 and SCell 2.

The normative reference for this requirement is TS 36.101 [2] clause 9.6.1.3.

#### 9.6.1.3.2.4 Test description

##### 9.6.1.3.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum Wgap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 9.6.1.3.2.4.1-1.

CA Capability to be tested: Select one according to Table 9.6.1.3.2.4.1-1

**Table 9.6.1.3.2.4.1-1: Test point selection for CQI Reporting under AWGN conditions – PUCCH 1-0 for FDD PCell (3DL CA)**

CA Applicability	Bandwidth combination						
	FDD cell	20	15	10	2x20	20+15	20+10
	TDD cell	2x20	2x20	2x20	20	20	20
Inter-band CA (two bands) (CA3_A2)	Test 1	Test 2	Test 3	Test 4	Test 5	Test 6	Test 6
Inter-band CA (three bands) (CA3_A3)	Test 1	Test 2	Test 3	Test 4	Test 5	Test 6	Test 6
Intra-band non-contiguous CA (with two sub-blocks) (CA3_N2)	Test 1	Test 2	Test 3	Test 4	Test 5	Test 6	Test 6
Note 1:	Only one test point is tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.						

1. Connect the SS and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.59 without faders.
2. The parameter settings for the cell are set up according to Table 9.6.1.3.2.3-1.

3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.6.1.3.2.4.3.

#### 9.6.1.3.2.4.2 Test procedure

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4. Message contents for *RadioResourceConfigDedicatedSCell-r10-DEFAULT* are defined Table 9.6.1.3.2.4.3-4, *PhysicalConfigDedicatedSCell-r10-DEFAULT* is defined in Table 9.6.1.3.2.4.3-5, *CQI-ReportConfigSCell-r10-DEFAULT* is defined in Table 9.6.1.3.2.4.3-6, *CQI-ReportPeriodic-r10-DEFAULT* is defined in Table 9.6.1.3.2.4.3-7, *TDD-Config-DEFAULT* is defined in Table 9.6.1.3.2.4.3-8.
3. SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration and the SNR according to Table 9.6.1.3.2.3-1 as appropriate.
5. The SS shall start gathering CQI reports. No PDSCH for user data is scheduled for the UE.
6. Continue gathering CQI reports until 2000 wideband CQI reports have been gathered for each P-Cell and S-Cells. For each CSI report calculate the respective difference  $CQI_{P,S1} = \text{wideband } CQI_{P_{cell}} - \text{wideband } CQI_{S_{cell1}}$  and the respective difference  $CQI_{S1,S2} = \text{wideband } CQI_{S_{cell1}} - \text{wideband } CQI_{S_{cell2}}$ .
7. If more than 1800 values of  $CQI_{P,S1}$  are  $\geq 2$  and more than 1800 values of  $CQI_{S1,S2}$  are  $\geq 2$ , pass the UE. Otherwise fail the UE.

#### 9.6.1.3.2.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.6.1.3.2.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

#### 9.6.1.4 TDD-FDD CA for TDD PCell

##### 9.6.1.4.1 TDD FDD CA CQI Reporting under AWGN conditions – PUCCH 1-0 for TDD PCell (2DL CA)

###### 9.6.1.4.1.1 Test purpose

To verify that the UE reports different CQI indices for TDD PCell and SCell if each cell experiences a different SNR.

###### 9.6.1.4.1.2 Test applicability

This test applies to all types of E-UTRA FDD and TDD UE release 12 and forward that support 2DL CA with TDD PCell (UE categories 5 and onwards).

### 9.6.1.4.1.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 3$ . For TDD-FDD CA with TDD PCell with 2 DL CC, for the parameters specified in Table 9.6.1.4.1.3-1 and Table 9.6.1.4.1.3-2, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of Pcell and SCell reported shall be such that

$$\text{wideband CQI}_{\text{Pcell}} - \text{wideband CQI}_{\text{SCell}} \geq 2$$

for more than 90% of the time.

**Table 9.6.1.4.1.3-1: PUCCH 1-0 static test on multiple cells (TDD-FDD CA with TDD PCell, 2 DL CA)**

Parameter		Unit	PCell	SCell
PDSCH transmission mode				1
Uplink downlink configuration			2	N/A
Special subframe configuration			4	N/A
Downlink power allocation	$\rho_A$	dB	0	
	$\rho_B$	dB	0	
Propagation condition and antenna configuration			AWGN (1 x 2)	
SNR		dB	10	4
$\hat{I}_{or}^{(j)}$		dB[mW/15kHz]	-88	-94
$N_{oc}^{(j)}$		dB[mW/15kHz]	-98	-98
Physical channel for CQI reporting			PUCCH Format 2	
PUCCH Report Type			4	
Reporting periodicity		ms	$N_{pd} = 10$	
<i>cqi-pmi-ConfigurationIndex</i>			8	13 (shift of 5 ms relative to Pcell)
Note 1: 3 symbols are allocated to PDCCH. No PDSCH for user data is scheduled for the UE with one sided dynamic OCNG Pattern OP.1 FDD and OP.1 TDD as described in Annex A.5.1.1 and A.5.2.1.				

**Table 9.6.1.4.1.3-2: PUCCH 1-0 static test (TDD-FDD CA with TDD PCell, 2 DL CA)**

Test number	Bandwidth combination
1	20MHz for TDD cell and 20MHz for FDD cell
2	20MHz for TDD cell and 10MHz for FDD cell
3	20MHz for TDD cell and 15MHz for FDD cell
Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 9.1.1.2A. The test coverage for different number of component carriers is defined in 9.1.1.3.	

The normative reference for this requirement is TS 36.101 [2] clause 9.6.1.4.

#### 9.6.1.4.1.4 Test description

##### 9.6.1.4.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum Wgap for Intra-band non-contiguous CA otherwise Mid Range as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 9.6.1.4.1.4.1-1.

CA Capability to be tested: Select one according to Table 9.6.1.4.1.4.1-1.

**Table 9.6.1.4.1.4.1-1: Test point selection for CQI Reporting under AWGN conditions – PUCCH 1-0 for TDD PCell (2DL CA)**

CA Applicability	Bandwidth combination		
	20+20	20+10	20+15
Inter-band CA (two bands) (CA2_A2)	Test 1	Test 2	Test3
Note 1: Only one test point is tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.			

1. Connect the SS and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure group A.45 as appropriate.
2. The parameter settings for the cell are set up according to Table 9.6.1.4.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.6.1.4.1.4.3.

#### 9.6.1.4.1.4.2 Test procedure

1. Configure SCC according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCC as per TS 36.508 [7] clause 5.2A.4. Message contents for *RadioResourceConfigDedicatedSCell-r10-DEFAULT* are defined Table 9.6.1.4.1.4.3-4, *PhysicalConfigDedicatedSCell-r10-DEFAULT* is defined in Table 9.6.1.4.1.4.3-5, *CQI-ReportConfigSCell-r10-DEFAULT* is defined in Table 9.6.1.4.1.4.3-6, *CQI-ReportPeriodic-r10-DEFAULT* is defined in Table 9.6.1.4.1.4.3-7, *TDD-Config-DEFAULT* is defined in Table 9.6.1.4.1.4.3-8.
3. SS activates SCC by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration and the SNR according to Table 9.6.1.4.1.3-1 as appropriate.
5. The SS shall start gathering CQI reports. No PDSCH for user data is scheduled for the UE.
6. Continue gathering CQI reports until 2000 wideband CQI reports have been gathered for each P-Cell and S-Cell. For each CSI report calculate the respective difference  $CQI_{P,S} = \text{wideband } CQI_{Pcell} - \text{wideband } CQI_{Scell}$ .
7. If more than 1800 values of  $CQI_{P,S}$  are  $\geq 2$  pass the UE. Otherwise fail the UE.

#### 9.6.1.4.1.4.3 Message contents

#### 9.6.1.4.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.6.1.4.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

#### 9.6.1.4.2 TDD FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for TDD PCell (3DL CA)

##### 9.6.1.4.2.1 Test purpose

To verify that the UE reports different CQI indices for TDD PCell and SCells if each cell experiences a different SNR.

##### 9.6.1.4.2.2 Test applicability

This test applies to all types of E-UTRA FDD and TDD UE release 12 and forward that support 3DL CA with TDD as PCell (UE categories 5 and onwards).

##### 9.6.1.4.2.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 5$ . For TDD-FDD CA with TDD PCell with 3 DL CC, for the parameters specified in Table 9.6.1.4.2.3-1 and Table 9.6.1.4.2.3-2, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2 on each cell, the difference between the wideband CQI indices of Pcell and SCell1 reported, and the difference between the wideband CQI indices of SCell1 and SCell2 reported shall be such that

$$\text{wideband CQI}_{\text{Pcell}} - \text{wideband CQI}_{\text{Scell1}} \geq 2$$

$$\text{wideband CQI}_{\text{Scell1}} - \text{wideband CQI}_{\text{Scell2}} \geq 2$$

for more than 90% of the time.

**Table 9.6.1.4.2.3-1: Parameters for PUCCH 1-0 static test on multiple cells (TDD-FDD CA with TDD PCell, 3DL CA)**

Parameter		Unit	PCell	SCell1	SCell2
PDSCH transmission mode				1

PUCCH Report Type			4		
Reporting periodicity		ms	$N_{pd} = 20$		
<i>cqi-pmi-ConfigurationIndex</i>			18	23 (shift of 5 ms relative to Pcell)	28 (shift of 10 ms relative to Pcell)
Note 1: 3 symbols are allocated to PDCCH. No PDSCH for user data is scheduled for the UE with one sided dynamic OCNB Pattern OP.1 FDD and OP.1 TDD as described in Annex A.5.1.1 and A.5.2.1.					

**Table 9.6.1.4.2.3-2: PUCCH 1-0 static test (TDD-FDD CA with TDD PCell, 3DL CA)**

Test number	Bandwidth combination (MHz)
1	2x20MHz for TDD cell and 20MHz for FDD cell
2	2x20MHz for TDD cell and 15MHz for FDD cell
3	2x20MHz for TDD cell and 10MHz for FDD cell
Note 1: The applicability of requirements for different CA configurations and bandwidth combination sets is defined in 9.1.1.2A. The test coverage for different number of component carriers is defined in 9.1.1.3.	

The normative reference for this requirement is TS 36.101 [2] clause 9.6.1.4.

#### 9.6.1.4.2.4 Test description

##### 9.6.1.4.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Maximum Wgap for Intra-band non-contiguous CA, otherwise Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: Select one according to Table 9.6.1.4.2.4.1-1.

CA Capability to be tested: Select one according to Table 9.6.1.4.2.4.1-1.

**Table 9.6.1.4.2.4.1-1: Test point selection for CQI Reporting under AWGN conditions – PUCCH 1-0 for TDD PCell (3DL CA)**

CA Applicability	Bandwidth combination		
	2x20+20	2x20+15	2x20+10
Inter-band CA (two bands) (CA3_A2)	Test 1	Test 2	Test 3
Inter-band CA (three bands) (CA3_A3)	Test 1	Test 2	Test 3
Intra-band non-contiguous CA (with two sub-blocks) (CA3_N2)	Test 1	Test 2	Test 3
Note 1: Only one test point is tested. Select the largest aggregated CA bandwidth combination supported by the UE among the UE supported CA capabilities.			

1. Connect the SS and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.59 without faders.
2. The parameter settings for the cell are set up according to Table 9.6.1.4.2.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.6.1.4.2.4.3.

#### 9.6.1.4.2.4.2 Test procedure

1. Configure SCCs according to Annex C.0, C.1 and Annex C.3.2 for all downlink physical channels.
2. The SS shall configure SCCs as per TS 36.508 [7] clause 5.2A.4. Message contents for *RadioResourceConfigDedicatedSCell-r10-DEFAULT* are defined Table 9.6.1.4.2.4.3-4, *PhysicalConfigDedicatedSCell-r10-DEFAULT* is defined in Table 9.6.1.4.2.4.3-5, *CQI-ReportConfigSCell-r10-DEFAULT* is defined in Table 9.6.1.4.2.4.3-6, *CQI-ReportPeriodic-r10-DEFAULT* is defined in Table 9.6.1.4.2.4.3-7, *TDD-Config-DEFAULT* is defined in Table 9.6.1.4.2.4.3-8.
3. SS activates SCCs by sending the activation MAC-CE (Refer TS 36.321 [13], clauses 5.13, 6.1.3.8). Wait for at least 2 seconds (Refer TS 36.133, clauses 8.3.3.2).
4. Set the parameters of bandwidth, reference channel, propagation condition, antenna configuration and the SNR according to Table 9.6.1.4.2.3-1 as appropriate.
5. The SS shall start gathering CQI reports. No PDSCH for user data is scheduled for the UE.
6. Continue gathering CQI reports until 2000 wideband CQI reports have been gathered for each P-Cell and S-Cells. For each CSI report calculate the respective difference  $CQI_{P,S1} = \text{wideband } CQI_{Pcell} - \text{wideband } CQI_{Scell1}$  and the respective difference  $CQI_{S1,S2} = \text{wideband } CQI_{Scell1} - \text{wideband } CQI_{Scell2}$ .
7. If more than 1800 values of  $CQI_{P,S1}$  are  $\geq 2$  and more than 1800 values of  $CQI_{S1,S2}$  are  $\geq 2$ , pass the UE. Otherwise fail the UE.

#### 9.6.1.4.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

#### 9.6.1.4.2.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.6.1.4.2.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

## 9.7 CSI reporting for UE DL category 0

The number of receiver antennas  $N_{RX}$  assumed for the minimum performance requirement in this clause is 1.

### 9.7.1 CQI reporting definition under AWGN conditions

#### 9.7.1.1 FDD and Half duplex FDD CQI reporting definition under AWGN conditions for UE category 0

##### 9.7.1.1.1 Test purpose

To verify the variance of the wideband CQI reports is within the limits defined and a PDSCH BLER of 10% falls between the transport format based median CQI-1 and median CQI or the transport format based median CQI and median CQI +1.

##### 9.7.1.1.2 Test applicability

This test applies to E-UTRA FDD UE release 12 and forward of UE category 0.

##### 9.7.1.1.3 Minimum conformance requirements

The following requirements apply to DL UE Category 0. For the parameters specified in Table 9.7.1.1.3-1 and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to TBD in Table A.4-1 shall be in the range of  $\pm 1$  of the reported median more than 90% of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI - 1) shall be less than or equal to 0.1.

**Table 9.7.1.1.3-1: PUCCH 1-0 static test (FDD and half-duplex FDD)**

Note 1: Reference measurement channel RC.16 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 FDD as described in Annex A.5.1.1.						
Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.						

The normative reference for this requirement is TS 36.101 [2] clause 9.7.1.1.

#### 9.7.1.1.4 Test description

##### 9.7.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz for tests defined in 9.7.1.1.3-1 as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure A.9 using only main UE Tx/Rx antenna.
2. The parameter settings for the cell are set up according to Table 9.7.1.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.7.1.1.4.3.

##### 9.7.1.1.4.2 Test procedure

Same test procedure as in clause 9.2.1.1.4.2 with the following exceptions:

- Instead of Table 9.2.1.1.3-1 → use Table 9.7.1.1.3-1.

## 9.7.1.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

**Table 9.7.1.1.4.3-1: PhysicalConfigDedicated-DEFAULT**

Derivation Path: 36.508 clause 5.5.1.2

}			

## 9.7.1.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.7.1.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

## 9.7.1.2 TDD CQI reporting definition under AWGN conditions for UE category 0

## 9.7.1.2.1 Test purpose

To verify the variance of the wideband CQI reports is within the limits defined and a PDSCH BLER of 10% falls between the transport format based median CQI-1 and median CQI or the transport format based median CQI and median CQI +1.

## 9.7.1.2.2 Test applicability

This test applies to E-UTRA TDD UE release 12 and forward of UE category 0.

## 9.7.1.2.3 Minimum conformance requirements

The following requirements apply to DL UE Category 0. For the parameters specified in Table 9.7.1.2.3-1 and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC.16 TDD in Table A.4-1 shall be in the range of  $\pm 1$  of the reported median more than 90% of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER using the transport format indicated by the

median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI – 1) shall be less than or equal to 0.1.

**Table 9.7.1.2.3-1: PUCCH 1-0 static test (TDD)**

Parameter		Unit	Test 1		Test 2	
Bandwidth		MHz	10			
PDSCH transmission mode			1

$N_{oc}^{(j)}$		dB[mW/15kHz]	-98		-98	
Max number of HARQ transmissions			1			
Physical channel for CQI reporting			PUSCH (Note 3)			
PUCCH Report Type			4			
Reporting periodicity		ms	$N_{pd} = 5$			
<i>cqi-pmi-ConfigurationIndex</i>			3			
ACK/NACK feedback mode			Multiplexing			
<p>Note 1: Reference measurement channel RC.16 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1.</p> <p>Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.</p> <p>Note 3: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#7 and #2.</p>						

The normative reference for this requirement is TS 36.101 [2] clause 9.7.1.2.

#### 9.7.1.2.4 Test description

##### 9.7.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz for tests defined in 9.7.1.2.3-1 as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure A.9 using only main UE Tx/Rx antenna.
2. The parameter settings for the cell are set up according to Table 9.7.1.2.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.

5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.7.1.2.4.3.

#### 9.7.1.2.4.2 Test procedure

Same test procedure as in clause 9.2.1.2.4.2 with the following exceptions:

- Instead of Table 9.2.1.2.3-1 → use Table 9.7.1.2.3-1.

#### 9.7.1.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

#### 9.7.1.2.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.7.1.2.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

## 9.7.2 CQI reporting under fading conditions

### 9.7.2.1 FDD and Half duplex FDD CQI reporting definition under fading conditions for UE category 0

#### 9.7.2.1.1 Test purpose

To verify that preferred sub-bands can be used for frequency-selective scheduling.

#### 9.7.2.1.2 Test applicability

This test applies to E-UTRA FDD UE release 12 and forward of UE category 0.

#### 9.7.2.1.3 Minimum conformance requirements

For the parameters specified in Table 9.7.2.1.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.7.2.1.3-2 and by the following

- a) a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha$  % of the time but less than  $\beta$  % for each sub-band;
- b) the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;
- c) when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05.

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each TTI for FDD and in each available downlink transmission instance for half-duplex FDD.

**Table 9.7.2.1.3-1: Sub-band test for single antenna transmission (FDD and half-duplex FDD)**

Parameter		Unit	Test 1		Test 2	
Bandwidth		MHz	10 MHz			
Transmission mode			1 (port 0)			
Downlink power allocation	$\rho_A$	dB	0			
	$\rho_B$	dB	0			
	$\sigma$	dB	0			
SNR (Note 3)		dB	8	9	13	14
$\hat{I}_{or}^{(j)}$		dB[mW/15kHz]	-90	-89	-85	-84
$N_{oc}^{(j)}$		dB[mW/15kHz]	-98		-98	
Propagation channel			Clause B.2.4 with $\tau_d = 0.45 \mu\text{s}$ , $a = 1$ , $f_D = 5 \text{ Hz}$			
Antenna configuration			1 x 1			
Reporting interval		ms	8			
CQI delay		ms	8			
Reporting mode			PUSCH 3-0			
Sub-band size		RB	6 (full size)			
Max number of HARQ transmissions			1			
<p>Note 1: If the UE reports in an available uplink reporting instance at subframe SF#n based on CQI estimation at a downlink subframe not later than SF#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before SF#(n+4)</p> <p>Note 2: Reference measurement channel RC.16 FDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/2 FDD as described in Annex A.5.1.1/2.</p> <p>Note 3: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.</p>						

**Table 9.7.2.1.3-2: Minimum requirement (FDD and half-duplex FDD)**

	Test 1	Test 2
$\alpha$ [%]	2	2
$\beta$ [%]	55	55
$\gamma$	1.1	1.1
UE DL Category	0	0

The normative reference for this requirement is TS 36.101 [2] clause 9.7.2.1.

#### 9.7.2.1.4 Test description

##### 9.7.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz for tests defined in 9.7.2.1.3-1 as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure A.9(using only main UE Tx/Rx antenna).
2. The parameter settings for the cell are set up according to Table 9.7.2.1.3-1.

3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.7.2.1.4.3.

#### 9.7.2.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.7.2.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband and subband CQI value sent by the UE. Continue transmission of the PDSCH until 2000 wideband CQI reports and full-size subband CQI reports for each full-size subband have been gathered. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 8 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. In this process the SS collects wideband CQI reports every 8 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI and full-size subband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. Check if “ $2000 \cdot \alpha \% / 100 \leq \text{number of CQI reports with index 0 for each full-size subband} \leq 2000 \cdot \beta \% / 100$ ”. (2000= No of full-size subband reports, 100 because of %) If yes, continue with step5, otherwise goto step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value in an each TTI randomly selected full-size subband regardless of UE wideband and full-size subband CQI report. Note that each full-size subband is selected in equal probability. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 8 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput according to Annex G.5.3. Declare the throughput as  $t_{median}$ .
6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the highest UE reported full-size subband CQI value in one full-size subband selected among the subbands in which UE reports the highest full-size subband CQI. Subband differential CQI offset level is selected from {0, 1, 2, -1}. Note that the SS shall send PDSCH in the same full-size subband until next UE report is available. In case when same full-size subbands are reported subsequently as subbands with highest full-size subband CQI, the SS shall select for transmission a different subband with respect to the last selection. The SS sends downlink MAC padding bits on the DL RMC. SS schedules the UL transmission every 8 ms to carry the PUSCH CQI feedback via PDCCH DCI format 0 with CQI request bit set to 1 and I\_MCS=29 and N\_PRB allocated to be less or equal to 4. Measure the average throughput and (NACK / (ACK + NACK)) according to Annex G.5.3. Declare the throughput as  $t_{subband}$ . If the ratio  $(t_{subband} / t_{median}) \geq \gamma$  and (NACK / (ACK + NACK))  $\geq 0.05$ , pass the UE for this test and go to step 8. Otherwise, go to step 7.
7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.7.2.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

### 9.7.2.1.5 Test requirement

**Table 9.7.2.1.5-1: Test requirement (FDD and half-duplex FDD)**

Parameter	Test 1	Test 2
$\alpha$ [%]	2	2
$\beta$ [%]	55	55
$\gamma$	1.09	1.09
BLER	0.05	0.05

To pass the test,  $\alpha$  and  $\beta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.7.2.2 TDD CQI reporting definition under fading conditions for UE category 0

### 9.7.2.2.1 Test purpose

To verify that preferred sub-bands can be used for frequency-selective scheduling.

### 9.7.2.2.2 Test applicability

This test applies to E-UTRA TDD UE release 12 and forward of UE category 0.

### 9.7.2.2.3 Minimum conformance requirements

For the parameters specified in Table 9.7.2.2.3-1, and using the downlink physical channels specified in Annex C.3.2, the minimum requirements are specified in Table 9.7.2.2.3-2 and by the following:

- a sub-band differential CQI offset level of 0 shall be reported at least  $\alpha$  % of the time but less than  $\beta$  % for each sub-band;
- the ratio of the throughput obtained when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS and that obtained when transmitting the TBS indicated by the reported wideband CQI median on a randomly selected sub-band in set  $S$  shall be  $\geq \gamma$ ;
- when transmitting on a randomly selected sub-band among the sub-bands with the highest differential CQI offset level the corresponding TBS, the average BLER for the indicated transport formats shall be greater or equal to 0.05.

The requirements only apply for sub-bands of full size and the random scheduling across the sub-bands is done by selecting a new sub-band in each available downlink transmission instance for TDD.

**Table 9.7.2.2.3-1: Sub-band test for single antenna transmission (TDD)**

Parameter		Unit	Test 1		Test 2	
Bandwidth		MHz	10 MHz			
Transmission mode			1 (port 0)			
Downlink power allocation	$\rho_A$	dB	0			
	$\rho_B$	dB	0			
	$\sigma$	dB	0

ACK/NACK feedback mode			Multiplexing			
Note 1: If the UE reports in an available uplink reporting instance at subframe SF#n based on CQI estimation at a downlink subframe not later than SF#(n-4), this reported subband or wideband CQI cannot be applied at the eNB downlink before SF#(n+4)						
Note 2: Reference measurement channel RC.16 TDD according to Table A.4-1 with one/two sided dynamic OCNG Pattern OP.1/2 TDD as described in Annex A.5.2.1/2.						
Note 3: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.						

**Table 9.7.2.2.3-2: Minimum requirement (TDD)**

	Test 1	Test 2
$\alpha$ [%]	2	2
$\beta$ [%]	55	55
$\gamma$	1.1	1.1
UE DL Category	0	0

The normative reference for this requirement is TS 36.101 [2] clause 9.7.2.2.

#### 9.7.2.2.4 Test description

##### 9.7.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz for tests defined in 9.7.2.2.3-1 as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure A.9(using only main UE Tx/Rx antenna).
2. The parameter settings for the cell are set up according to Table 9.7.2.2.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.7.2.2.4.3.

##### 9.7.2.2.4.2 Test procedure

Same test procedure as in clause 9.3.1.1.2.4.2 with the following exceptions:

- Instead of Table 9.3.1.1.2.3-1 → use Table 9.7.2.2.3-1.

##### 9.7.2.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

**Table 9.7.2.2.4.3-1: PhysicalConfigDedicated-DEFAULT**

Derivation Path: 36.508 clause 5.5.1.2			
Information Element	Value/remark	Comment	Condition
PhysicalConfigDedicated-DEFAULT ::= SEQUENCE {

}			
}			

### 9.7.2.2.5 Test requirement

Table 9.7.2.2.5-1: Test requirement (TDD)

Parameter	Test 1	Test 2
$\alpha$ [%]	2	2
$\beta$ [%]	55	55
$\gamma$	1.09	1.09
BLER	0.05	0.05

To pass the test,  $\alpha$  and  $\beta$  and  $\gamma$  and BLER must be fulfilled.

To pass the test, Test 1 and Test 2 must be passed.

To pass the test, one **or** the other SNR point within one test must be fulfilled.

## 9.8 CSI reporting for UE DL category M1

The number of receiver antennas  $N_{RX}$  assumed for the minimum performance requirement in this clause is 1.

### 9.8.1 CQI reporting definition under AWGN conditions

#### 9.8.1.1 FDD and Half duplex FDD CQI reporting definition under AWGN conditions for UE category M1

Editor's notes: The following items are missing or incomplete: Value of test parameters SNR,  $\hat{I}_{or}^{(j)}$ , Reporting periodicity and *cqi-pmi-ConfigurationIndex* are yet within brackets.

##### 9.8.1.1.1 Test purpose

To verify the variance of the wideband CQI reports is within the limits defined and a PDSCH BLER of 10% falls between the transport format based median CQI-1 and median CQI or the transport format based median CQI and median CQI +1.

### 9.8.1.1.2 Test applicability

This test applies to E-UTRA FDD UE release 13 and forward of UE category M1.

### 9.8.1.1.3 Minimum conformance requirements

The following requirements apply to DL UE Category M1. For the parameters specified in Table 9.8.1.1.3-1 and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to [RC.23] FDD in Table A.4-1 shall be in the range of  $\pm 1$  of the reported median more than 90% of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI – 1) shall be less than or equal to 0.1.

**Table 9.8.1.1.3-1: PUCCH 1-0 static test (FDD and half-duplex FDD)**

Parameter	Unit	Test 1	
Bandwidth	MHz	10	
PDSCH transmission mode		1	
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0
	$\sigma$	dB	0
	$\delta$	dB	0
Propagation condition and antenna configuration		AWGN (1 x 1)	
SNR (Note 2)	dB	[5]	[6]
$\hat{I}_{or}^{(j)}$	dB[mW/15kHz]	[-93]	[-92]
$N_{oc}^{(j)}$	dB[mW/15kHz]	-98	-98
Max number of HARQ transmissions		1	
Physical channel for CQI reporting		PUCCH Format 2	
PUCCH Report Type		4	
Reporting periodicity	ms	$N_{pd} = [40]$	
<i>cqi-pmi-ConfigurationIndex</i>		[41]	
Frequency hopping		Disabled	
Starting OFDM symbol (startSymbolLBR)		3	
PDSCH repetition level		1	
M-PDCCH repetition level		1	
Beamforming Precoder for MPDCCH		Annex B.4.4	
Precoder update granularity for MPDCCH		Frequency domain: 1 PRB Time domain: 1ms	
Note 1: Reference measurement channel [RC.23] FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.2 FDD as described in Annex A.5.1.1.			
Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.			
Note 3: For each test, DC subcarrier puncturing shall be considered.			

The normative reference for this requirement is TS 36.101 [2] clause 9.8.1.1.

### 9.8.1.1.4 Test description

#### 9.8.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and MPDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz for tests defined in 9.8.1.1.3-1 as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure A.9 using only main UE Tx/Rx antenna.
2. The parameter settings for the cell are set up according to Table 9.8.1.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF-CE according to TS 36.508 [7] clause 5.2A.2AA. Message contents are defined in clause 9.8.1.1.4.3.

#### 9.8.1.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.8.1.1.3-1.
2. The SS shall transmit PDSCH via MPDCCH DCI format 6-1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. Continue transmission of the PDSCH until 2000 wideband CQI reports have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the wideband CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI values are in the range (Median CQI - 1)  $\leq$  Median CQI  $\leq$  (Median CQI + 1) then continue with step 5, otherwise go to step 8.
5. The SS shall transmit PDSCH via MPDCCH DCI format 6-1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses reaches 1000.

For the filtered ACK and NACK responses if the ratio (NACK / ACK + NACK)  $\leq$  0.1 then go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via MPDCCH DCI format 6-1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI+1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio (NACK /ACK + NACK) > 0.1

then pass the UE for this test and go to step 9, otherwise go to step 8.

7. The SS shall transmit PDSCH via MPDCCH DCI format 6-1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI-1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio (NACK /ACK + NACK)  $\leq$  0.1

then pass the UE for this test and go to step 9, otherwise go to step 8.

8. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 7) for the other SNR point as appropriate. Otherwise fail the UE.
9. If both tests have not been done, then repeat the same procedure (steps 1 to 8) with test conditions according to the Table 9.8.1.1.3-1. Otherwise pass the UE.

#### 9.8.1.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the condition CEModeA and the following exceptions:

**Table 9.8.1.1.4.3-1: PhysicalConfigDedicated-DEFAULT**

Derivation Path: 36.508 clause 5.5.1.2			
Information Element	Value/remark	Comment	Condition
PhysicalConfigDedicated-DEFAULT ::= SEQUENCE {			
cqi-ReportConfig	<i>CQI-ReportConfig-DEFAULT</i>		
}			

**Table 9.8.1.1.4.3-2: CQI-ReportConfig-DEFAULT**

Derivation Path: 36.508 clause 4.6.3			
Information Element	Value/remark	Comment	Condition
CQI-ReportConfig-DEFAULT ::= SEQUENCE {			
cqi-ReportModeAperiodic	Not present		
nomPDSCH-RS-EPRE-Offset	0		
cqi-ReportPeriodic CHOICE {			
setup SEQUENCE {			
cqi-PUCCH-ResourceIndex	0

cqi-FormatIndicatorPeriodic CHOICE {			
widebandCQI	NULL		
}			
ri-ConfigIndex	NULL	(see Table 7.2.2-1B in TS 36.213)	
simultaneousAckNackAndCQI	FALSE		
}			
}			

#### 9.8.1.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.8.1.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

## 9.9 CSI reporting for 4Rx UE

### 9.9.1 CQI Reporting under AWGN conditions

The reporting accuracy of the channel quality indicator (CQI) under frequency non-selective conditions is determined by the reporting variance and the BLER performance using the transport format indicated by the reported CQI median. The purpose is to verify that the reported CQI values are in accordance with the CQI definition given in TS 36.213 [10]. To account for sensitivity of the input SNR the reporting definition is considered to be verified if the reporting accuracy is met for at least one of two SNR levels separated by an offset of 1 dB.

### 9.9.1.1 CQI reporting under AWGN conditions - PUCCH 1-0 with Rank 1 (Cell-Specific Reference Symbols)

#### 9.9.1.1.1 FDD CQI Reporting under AWGN conditions – PUCCH 1-0 with Rank 1 1x4

Editor's notes: This test case is incomplete. The following items are missing or are incomplete:

- Some test parameters in Table 9.9.1.1.3-1 are still in square brackets
- Connection diagram in Annex A of TS 36.508 is TBD

##### 9.9.1.1.1.1 Test purpose

To verify the variance of the wideband CQI reports is within the limits defined and a PDSCH BLER of 10% falls between the transport format based median CQI-1 and median CQI or the transport format based median CQI and median CQI +1.

##### 9.2.1.1.1.2 Test applicability

This test applies to all types of E-UTRA FDD release 10 and forward UEs that support 4 Rx antenna ports.

##### 9.2.1.1.1.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 1$ . For the parameters specified in Table 9.9.1.1.3-1, using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC.1 FDD / RC.4 FDD in Table A.4-1 shall be in the range of  $\pm 1$  of the reported median more than 90% of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI – 1) shall be less than or equal to 0.1.

**Table 9.9.1.1.3-1: PUCCH 1-0 static test (FDD)**

Parameter	Unit	Test 1		Test 2	
Bandwidth	MHz	10			
PDSCH transmission mode		1			
Downlink power allocation	$\rho_A$	dB	0		
	$\rho_B$	dB	0		
	$\sigma$	dB	0

Physical channel for CQI reporting		PUCCH Format 2			
PUCCH Report Type		4			
Reporting periodicity	ms	$N_{pd} = 5$			
<i>cqi-pmi-ConfigurationIndex</i>		6			
Note 1:	Reference measurement channel RC.1 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 FDD as described in Annex A.5.1.1, except for category 1 UE use RC.4 FDD with two sided dynamic OCNG Pattern OP.2 FDD as described in Annex A.5.1.2.				
Note 2:	For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.				

The normative reference for this requirement is TS 36.101 [2] clause 9.9.1.1.1.

#### 9.9.1.1.1.4 Test description

##### 9.9.1.1.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector(s) as shown in TS 36.508 [7] Annex A, Figure TBD.
2. The parameter settings for the cell are set up according to Table 9.9.1.1.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.9.1.1.1.4.3.

##### 9.9.1.1.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.9.1.1.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. Continue transmission of the PDSCH until 2000 wideband CQI reports have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the wideband CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI values are in the range (Median CQI - 1)  $\leq$  Median CQI  $\leq$  (Median CQI + 1) then continue with step 5, otherwise go to step 8.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses reaches 1000.

For the filtered ACK and NACK responses if the ratio (NACK / ACK + NACK)  $\leq$  0.1 then go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI+1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio (NACK /ACK + NACK) > 0.1

then pass the UE for this test and go to step 9, otherwise go to step 8.

7. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI-1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$

then pass the UE for this test and go to step 9, otherwise go to step 8.

8. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 7) for the other SNR point as appropriate. Otherwise fail the UE.
9. If both tests have not been done, then repeat the same procedure (steps 1 to 8) with test conditions according to the table 9.9.1.1.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.9.1.1.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

#### 9.9.1.1.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.9.1.1.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

#### 9.9.1.1.2 TDD CQI Reporting under AWGN conditions – PUCCH 1-0 with Rank 1 1x4

**Editor's notes: This test case is incomplete. The following items are missing or are incomplete:**

- Some test parameters in Table 9.9.1.1.2.3-1 are still in square brackets

- Connection diagram in Annex A of TS 36.508 is TBD

#### 9.9.1.1.2.1 Test purpose

To verify the variance of the wideband CQI reports is within the limits defined and a PDSCH BLER of 10% falls between the transport format based on wideband median CQI-1 and wideband median CQI or the transport format based on wideband median CQI and wideband median CQI +1.

#### 9.9.1.1.2.2 Test applicability

This test applies to all types of E-UTRA TDD release 10 and forward UEs that support 4 Rx antenna ports.

#### 9.9.1.1.2.3 Minimum conformance requirements

The following requirements apply to UE Category  $\geq 1$ . For the parameters specified in Table 9.9.1.1.2.3-1, using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported CQI value according to RC.1/RC.4 TDD in Table A.4-1 shall be in the range of  $\pm 1$  of the reported median more than 90% of the time. If the PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI + 1) shall be greater than 0.1. If the PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI - 1) shall be less than or equal to 0.1.

**Table 9.9.1.1.2.3-1: PUCCH 1-0 static test (TDD)**

Parameter		Unit	Test 1		Test 2

ACK/NACK feedback mode			Multiplexing			
Note 1: Reference measurement channel RC.1 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1, except for category 1 UE use RC.4 TDD with two sided dynamic OCNG Pattern OP.2 TDD as described in Annex A.5.2.2. Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level. Note 3: To avoid collisions between CQI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#7 and #2.						

The normative reference for this requirement is TS 36.101 [2] clause 9.9.1.1.2.

#### 9.9.1.1.2.4 Test description

##### 9.9.1.1.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure TBD.
2. The parameter settings for the cell are set up according to Table 9.9.1.1.2.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.9.1.1.2.4.3.

##### 9.9.1.1.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.9.1.1.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to CQI value 8 and keep it regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband CQI reports have been gathered. In this process the SS collects wideband CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband CQI reports.
3. Set up a relative frequency distribution for the reported wideband CQI-values, Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side). This CQI-value is declared as wideband Median CQI value.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI values are in the range (Median CQI - 1) ≤ Median CQI ≤ (Median CQI + 1) then continue with step 5, otherwise go to step 8.
5. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses. *In case statDTX cannot be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses reaches 1000.

For the filtered ACK and NACK responses if the ratio (NACK / (ACK + NACK)) ≤ 0.1 then go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI+1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2).

The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX cannot be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) > 0.1$

then pass the UE for this test and go to step 9, otherwise go to step 8.

7. The SS shall transmit PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to the wideband median-CQI-1 value and shall not react to the UE's wideband CQI reports. The SS sends downlink MAC padding bits on the DL RMC. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH, transmitted by the SS, record and filter the ACK, NACK and statDTX responses as in step 5 until 1000 filtered ACK+NACK responses are gathered. *In case statDTX cannot be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK*

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \leq 0.1$

then pass the UE for this test and go to step 9, otherwise go to step 8.

8. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 7) for the other SNR point as appropriate. Otherwise fail the UE.
9. If both tests have not been done, then repeat the same procedure (steps 1 to 8) with test conditions according to the table 9.9.1.1.2.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.9.1.1.2.4.3 Message contents

#### 9.9.1.1.2.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.9.1.1.2.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

#### 9.9.1.2 CQI reporting under AWGN conditions - PUCCH 1-1 with Rank 2 (CSI Reference Symbols)

##### 9.9.1.2.1 FDD CQI Reporting under AWGN conditions – PUCCH 1-1 with Rank 2 4x4

**Editor's notes: This test case is incomplete. The following items are missing or are incomplete:**

- Some test parameters in Table 9.9.1.2.1.3-1 are still in square brackets
- Connection diagram in Annex A of TS 36.508 is TBD

##### 9.9.1.2.1.1 Test purpose

To verify the variance of the wideband spatial differential CQI between codeword #0 and codeword #1 are within the limits defined and for both codeword #0 and codeword #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 - 1$  and median  $CQI_1 - 1$  shall be less than or equal to 0.1 and the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 + 1$  and median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

##### 9.9.1.2.1.2 Test applicability

This test applies to all types of E-UTRA FDD release 10 and forward UEs of Category 2 and onwards that support eDL-MIMO and 4 Rx antenna ports. Applicability requires support for FGI bit 103.

##### 9.9.1.2.1.3 Minimum conformance requirements

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

The following requirements apply to UE Category  $\geq 2$ . For the parameters specified in table 9.9.1.2.1.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword #1 as

$$\text{wideband } CQI_1 = \text{wideband } CQI_0 - \text{Codeword 1 offset level}$$

The wideband  $CQI_1$  shall be within the set  $\{\text{median } CQI_1 - 1, \text{median } CQI_1, \text{median } CQI_1 + 1\}$  for more than 90% of the time, where the resulting wideband values  $CQI_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 - 1$  and median  $CQI_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 + 1$  and median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

Note 1:		Reference measurement channel RC.7 FDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 FDD as described in Annex A.5.1.1.				
Note 2:		For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.				
Note 3:		To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#1 and #6 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#0 and #5.				

The normative reference for this requirement is TS 36.101 [2] clause 9.9.1.2.1.

#### 9.9.1.2.1.4 Test description

##### 9.9.1.2.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure TBD.
2. The parameter settings for the cell are set up according to Table 9.9.1.2.1.3-1.

3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.9.1.2.1.4.3.

#### 9.9.1.2.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.9.1.2.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI<sub>0</sub> is defined as Wideband CQI of codeword #0 and wideband CQI<sub>1</sub> is calculated according to clause 9.9.1.2.1.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI<sub>0</sub> is based on the wideband CQI<sub>0</sub> and wideband median CQI<sub>1</sub> is based on the wideband CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI<sub>1</sub> values are in the range (Median CQI<sub>1</sub> - 1) ≤ Median CQI ≤ (Median CQI<sub>1</sub> + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median- CQI<sub>0</sub>- 1 and the transport format of codeword #1 is according to the wideband median CQI<sub>1</sub>- 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK) ≤ 0.1 for both codeword #0 and codeword #1

then and go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median-CQI<sub>0</sub> + 1 and the transport format of codeword #1 is according to the wideband median-CQI<sub>1</sub> + 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK) ≥ 0.1 for both codeword #0 and codeword #1

then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.9.1.2.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.9.1.2.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.9.1.2.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

#### 9.9.1.2.2 TDD CQI Reporting under AWGN conditions – PUCCH 1-1 with Rank 2 8x4

**Editor's notes: This test case is incomplete. The following items are missing or are incomplete:**

- Some test parameters in Table 9.9.1.2.2.3-1 are still in square brackets
- Connection diagram in Annex A of TS 36.508 is TBD

##### 9.9.1.2.2.1 Test purpose

To verify the variance of the wideband spatial differential CQI between codeword #0 and codeword #1 are within the limits defined and for both codeword #0 and codeword #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 - 1$  and median  $\text{CQI}_1 - 1$  shall be less than or equal to 0.1 and the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 + 1$  and median  $\text{CQI}_1 + 1$  shall be greater than or equal to 0.1.

##### 9.9.1.2.2.2 Test applicability

This test applies to all types of E-UTRA TDD release 10 and forward UEs of Category 2 and onwards that support eDL-MIMO and 4 Rx antenna ports. Applicability requires support for FGI bit 104.

### 9.9.1.2.2.3 Minimum conformance requirements

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

The following requirements apply to UE Category  $\geq 2$ . For the parameters specified in table 9.9.1.2.2.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword #1 as

$$\text{wideband CQI}_1 = \text{wideband CQI}_0 - \text{Codeword 1 offset level}$$

The wideband  $\text{CQI}_1$  shall be within the set  $\{\text{median CQI}_1 - 1, \text{median CQI}_1, \text{median CQI}_1 + 1\}$  for more than 90% of the time, where the resulting wideband values  $\text{CQI}_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 - 1$  and median  $\text{CQI}_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 + 1$  and median  $\text{CQI}_1 + 1$  shall be greater than or equal to 0.1.

Table 9.9.1.2.2.3-1: PUCCH 1-1 submode 1 static test (TDD)

Parameter		Unit	Test 1		Test 2	
Bandwidth		MHz			10	
PDSCH transmission mode					9

CSI reference signal configuration					0	
Propagation condition and antenna configuration					Clause B.1 (8 x 4)	
Beamforming Model					As specified in Section B.4.3	
CodeBookSubsetRestriction bitmap					0x0000 0000 0020 0000 0000 0001 0000	
SNR (Note 2)		dB	[2]	[3]	[8]	[9]
$\hat{I}_{or}^{(j)}$		dB[mW/15kHz]	[-96]	[-95]	[-90]	[-89]
$N_{oc}^{(j)}$		dB[mW/15kHz]	-98		-98	
Max number of HARQ transmissions					1	
Physical channel for CQI/PMI reporting					PUSCH (Note 3)	
PUCCH Report Type for CQI/second PMI					2b	
Physical channel for RI reporting					PUSCH	
PUCCH Report Type for RI/ first PMI					5	
Reporting periodicity		ms			$N_{pd} = 5$	
CQI delay		ms			10 or 11	
<i>cqi-pmi-ConfigurationIndex</i>					3	
<i>ri-ConfigIndex</i>					805 (Note 4)	
ACK/NACK feedback mode					Multiplexing	
Note 1:		Reference measurement channel RC.7 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1.				
Note 2:		For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.				
Note 3:		To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#7 and #2.				
Note 4:		RI reporting interval is set to the maximum allowable length of 160ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160ms during performance verification.				

The normative reference for this requirement is TS 36.101 [2] clause 9.9.1.2.2.

#### 9.9.1.2.2.4 Test description

##### 9.9.1.2.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure TBD.
2. The parameter settings for the cell are set up according to Table 9.9.1.2.2.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.9.1.2.2.4.3.

#### 9.9.1.2.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.9.1.2.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI<sub>0</sub> is defined as Wideband CQI of codeword #0 and wideband CQI<sub>1</sub> is calculated according to clause 9.9.1.2.2.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI<sub>0</sub> is based on the wideband CQI<sub>0</sub> and wideband median CQI<sub>1</sub> is based on the wideband CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI<sub>1</sub> values are in the range (Median CQI<sub>1</sub> - 1) ≤ Median CQI ≤ (Median CQI<sub>1</sub> + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median- CQI<sub>0</sub>- 1 and the transport format of codeword #1 is according to the wideband median CQI<sub>1</sub>- 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK) ≤ 0.1

then, and go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median-CQI<sub>0</sub> + 1 and the transport format of codeword #1 is according to the wideband median-CQI<sub>1</sub> + 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule

UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK.* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \geq 0.1$

then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.9.1.2.2.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.9.1.2.2.4.3 Message contents

#### 9.9.1.2.2.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.9.1.2.2.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

### 9.9.1.3 CQI Reporting under AWGN conditions - PUCCH 1-1 (Cell-Specific Reference Symbols)

#### 9.9.1.3.1 FDD CQI Reporting under AWGN conditions – PUCCH 1-1 with rank 4 4x4

Editor's notes: This test case is incomplete. The following items are missing or are incomplete:

- Some test parameters in Table 9.9.1.3.1.3-1 are still in square brackets
- Connection diagram in Annex A of TS 36.508 is TBD
- Reference measurement channel RC.21 FDD is missing in Annex A

##### 9.9.1.3.1.1 Test purpose

To verify the variance of the wideband spatial differential CQI between codeword #0 and codeword #1 are within the limits defined and for both codeword #0 and codeword #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 - 1$  and median  $CQI_1 - 1$  shall be less than or equal to 0.1 and the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 + 1$  and median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

##### 9.9.1.3.1.2 Test applicability

This test applies to all types of E-UTRA FDD release 10 and forward UEs of Category 5 and onwards that support 4 Rx antenna ports.

##### 9.9.1.3.1.3 Minimum conformance requirements

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

The following requirements apply to UE Category  $\geq 5$ . For the parameters specified in table 9.9.1.3.1.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword #1 as

$$\text{wideband } CQI_1 = \text{wideband } CQI_0 - \text{Codeword 1 offset level}$$

The wideband  $CQI_1$  shall be within the set  $\{\text{median } CQI_1 - 1, \text{median } CQI_1, \text{median } CQI_1 + 1\}$  for more than 90% of the time, where the resulting wideband values  $CQI_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 - 1$  and median  $CQI_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 + 1$  and median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

The normative reference for this requirement is TS 36.101 [2] clause 9.9.1.3.1.

#### 9.9.1.3.1.4 Test description

##### 9.9.1.3.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure TBD.
2. The parameter settings for the cell are set up according to Table 9.9.1.3.1.3-1.
3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.9.1.3.1.4.3.

## 9.9.1.3.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.9.1.3.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI<sub>0</sub> is defined as Wideband CQI of codeword #0 and wideband CQI<sub>1</sub> is calculated according to clause 9.9.1.3.1.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI<sub>0</sub> is based on the wideband CQI<sub>0</sub> and wideband median CQI<sub>1</sub> is based on the wideband CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI<sub>1</sub> values are in the range (Median CQI<sub>1</sub> - 1) ≤ Median CQI ≤ (Median CQI<sub>1</sub> + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median- CQI<sub>0</sub>- 1 and the transport format of codeword #1 is according to the wideband median CQI<sub>1</sub>- 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK) ≤ 0.1 for both codeword #0 and codeword #1

then and go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median-CQI<sub>0</sub> + 1 and the transport format of codeword #1 is according to the wideband median-CQI<sub>1</sub> + 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK) ≥ 0.1 for both codeword #0 and codeword #1

then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.9.1.3.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

## 9.9.1.3.1.4.3 Message contents

}			

#### 9.9.1.3.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.9.1.3.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

#### 9.9.1.3.2 TDD CQI Reporting under AWGN conditions – PUCCH 1-1 with rank 4 4x4

**Editor's notes: This test case is incomplete. The following items are missing or are incomplete:**

- Some test parameters in Table 9.9.1.3.2.3-1 are still in square brackets
- Connection diagram in Annex A of TS 36.508 is TBD
- Reference measurement channel RC.21 TDD is missing in Annex A

#### 9.9.1.3.2.1 Test purpose

To verify the variance of the wideband spatial differential CQI between codeword #0 and codeword #1 are within the limits defined and for both codeword #0 and codeword #1, the PDSCH BLER using the transport format indicated by the respective wideband median  $CQI_0 - 1$  and wideband median  $CQI_1 - 1$  shall be less than or equal to 0.1 and the PDSCH BLER using the transport format indicated by the respective wideband median  $CQI_0 + 1$  and wideband median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

#### 9.9.1.3.2.2 Test applicability

This test applies to all types of E-UTRA TDD release 10 and forward UEs of Category 5 and onwards that support 4 Rx antenna ports.

#### 9.9.1.3.2.3 Minimum conformance requirements

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

The following requirements apply to UE Category  $\geq 5$ . For the parameters specified in table 9.9.1.3.2.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword #1 as

$$\text{wideband } CQI_1 = \text{wideband } CQI_0 - \text{Codeword 1 offset level}$$

The wideband  $CQI_1$  shall be within the set  $\{\text{median } CQI_1 - 1, \text{median } CQI_1, \text{median } CQI_1 + 1\}$  for more than 90% of the time, where the resulting wideband values  $CQI_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 - 1$  and median  $CQI_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 + 1$  and median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

<p>Note 1: Reference measurement channel RC.21 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1.</p> <p>Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.</p> <p>Note 3: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink subframe SF#7 and #2.</p> <p>Note 4: RI reporting interval is set to the maximum allowable length of 160ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160ms during performance verification.</p>						

The normative reference for this requirement is TS 36.101 [2] clause 9.9.1.3.2.

#### 9.9.1.3.2.4 Test description

##### 9.9.1.3.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure TBD.
2. The parameter settings for the cell are set up according to Table 9.9.1.3.2.3-1.

3. Downlink signals are initially set up according to Annex C0, C.1 and Annex C.3.2 and uplink signals according to Annex H1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.9.1.3.2.4.3.

#### 9.9.1.3.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference Channel, the propagation condition, antenna configuration and the SNR according to Table 9.9.1.3.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI<sub>0</sub> is defined as Wideband CQI of codeword #0 and wideband CQI<sub>1</sub> is calculated according to clause 9.9.1.3.2.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI<sub>0</sub> is based on the wideband CQI<sub>0</sub> and wideband median CQI<sub>1</sub> is based on the wideband CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI<sub>1</sub> values are in the range (Median CQI<sub>1</sub> - 1) ≤ Median CQI ≤ (Median CQI<sub>1</sub> + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median- CQI<sub>0</sub>- 1 and the transport format of codeword #1 is according to the wideband median CQI<sub>1</sub>- 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.  
  
If the ratio (NACK /ACK + NACK ) ≤ 0.1  
  
then, and go to step 6, otherwise go to step 7.
6. The SS shall transmit PDSCH via PDCCH DCI format 2 for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median-CQI<sub>0</sub> + 1 and the transport format of codeword #1 is according to the wideband median-CQI<sub>1</sub> + 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK)  $\geq$  0.1

then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.9.1.3.2.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.9.1.3.2.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.9.1.3.2.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

#### 9.9.1.4 CQI reporting under AWGN conditions - PUCCH 1-1 with Rank 3 (CSI Reference Symbols)

##### 9.9.1.4.1 FDD CQI Reporting under AWGN conditions – PUCCH 1-1 with Rank 3 4x4

**Editor's notes: This test case is incomplete. The following items are missing or are incomplete:**

- Some test parameters in Table 9.9.1.4.1.3-1 are still in square brackets
- Connection diagram in Annex A of TS 36.508 is TBD
- Reference measurement channel RC.22 FDD is missing in Annex A

##### 9.9.1.4.1.1 Test purpose

To verify the variance of the wideband spatial differential CQI between codeword #0 and codeword #1 are within the limits defined and for both codeword #0 and codeword #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 - 1$  and median  $CQI_1 - 1$  shall be less than or equal to 0.1 and the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 + 1$  and median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

##### 9.9.1.4.1.2 Test applicability

This test applies to all types of E-UTRA FDD release 10 and forward UEs of Category 5 and onwards that support eDL-MIMO and 4 Rx antenna ports. Applicability requires support for FGI bit 103.

##### 9.9.1.4.1.3 Minimum conformance requirements

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

The following requirements apply to UE Category  $\geq 5$ . For the parameters specified in table 9.9.1.4.1.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword #1 as

$$\text{wideband } CQI_1 = \text{wideband } CQI_0 - \text{Codeword 1 offset level}$$

The wideband  $CQI_1$  shall be within the set  $\{\text{median } CQI_1 - 1, \text{median } CQI_1, \text{median } CQI_1 + 1\}$  for more than 90% of the time, where the resulting wideband values  $CQI_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $CQI_0 - 1$  and median  $CQI_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER

using the transport format indicated by the respective median  $CQI_0 + 1$  and median  $CQI_1 + 1$  shall be greater than or equal to 0.1.

**Table 9.9.1.4.1.3-1: PUCCH 1-1 static test (FDD)**

#### 9.9.1.4.1.4 Test description

##### 9.9.1.4.1.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure TBD.
2. The parameter settings for the cell are set up according to Table 9.9.1.4.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.9.1.4.1.4.3.

#### 9.9.1.4.1.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.9.1.4.1.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are also counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI<sub>0</sub> is defined as Wideband CQI of codeword #0 and wideband CQI<sub>1</sub> is calculated according to clause 9.9.1.4.1.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI<sub>0</sub> is based on the wideband CQI<sub>0</sub> and wideband median CQI<sub>1</sub> is based on the wideband CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI<sub>1</sub> values are in the range (Median CQI<sub>1</sub> - 1) ≤ Median CQI ≤ (Median CQI<sub>1</sub> + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median- CQI<sub>0</sub>- 1 and the transport format of codeword #1 is according to the wideband median CQI<sub>1</sub>- 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK) ≤ 0.1 for both codeword #0 and codeword #1

then and go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median-CQI<sub>0</sub> + 1 and the transport format of codeword #1 is according to the wideband median-CQI<sub>1</sub> + 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #0 and subframe #5 (Table A.4.1-1). The UE will send ACK/NACK and periodic CQI

report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \geq 0.1$  for both codeword #0 and codeword #1

then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.9.1.4.1.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.9.1.4.1.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.9.1.4.1.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

#### 9.9.1.4.2 TDD CQI Reporting under AWGN conditions – PUCCH 1-1 with Rank 3 4x4

**Editor's notes: This test case is incomplete. The following items are missing or are incomplete:**

- Some test parameters in Table 9.9.1.4.2.3-1 are still in square brackets
- Connection diagram in Annex A of TS 36.508 is TBD
- Reference measurement channel RC.22 TDD is missing in Annex A

#### 9.9.1.4.2.1 Test purpose

To verify the variance of the wideband spatial differential CQI between codeword #0 and codeword #1 are within the limits defined and for both codeword #0 and codeword #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 - 1$  and median  $\text{CQI}_1 - 1$  shall be less than or equal to 0.1 and the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 + 1$  and median  $\text{CQI}_1 + 1$  shall be greater than or equal to 0.1.

#### 9.9.1.4.2.2 Test applicability

This test applies to all types of E-UTRA TDD release 10 and forward UEs of Category 5 and onwards that support eDL-MIMO and 4 Rx antenna ports. Applicability requires support for FGI bit 103.

#### 9.9.1.4.2.3 Minimum conformance requirements

The minimum requirements for dual codeword transmission are defined in terms of a reporting spread of the wideband CQI value for codeword #1, and their BLER performance using the transport format indicated by the reported CQI median of codeword #0 and codeword #1. The precoding used at the transmitter is a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The propagation condition assumed for the minimum performance requirement is defined in subclause B.1.

The following requirements apply to UE Category  $\geq 5$ . For the parameters specified in table 9.9.1.4.2.3-1, and using the downlink physical channels specified in tables C.3.2-1 and C.3.2-2, the reported offset level of the wideband spatial differential CQI for codeword #1 (Table 7.2-2 in TS 36.213 [6]) shall be used to determine the wideband CQI index for codeword #1 as

$$\text{wideband CQI}_1 = \text{wideband CQI}_0 - \text{Codeword 1 offset level}$$

The wideband  $\text{CQI}_1$  shall be within the set  $\{\text{median CQI}_1 - 1, \text{median CQI}_1, \text{median CQI}_1 + 1\}$  for more than 90% of the time, where the resulting wideband values  $\text{CQI}_1$  shall be used to determine the median CQI values for codeword #1. For both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 - 1$  and median  $\text{CQI}_1 - 1$  shall be less than or equal to 0.1. Furthermore, for both codewords #0 and #1, the PDSCH BLER using the transport format indicated by the respective median  $\text{CQI}_0 + 1$  and median  $\text{CQI}_1 + 1$  shall be greater than or equal to 0.1.

Table 9.9.1.4.2.3-1: PUCCH 1-1 submode 1 static test (TDD)

Parameter		Unit	Test 1		Test 2	
Bandwidth		MHz	10

CQI delay		ms	10 or 11			
<i>cqi-pmi-ConfigurationIndex</i>			3			
<i>ri-ConfigIndex</i>			805 (Note 4)			
ACK/NACK feedback mode			Multiplexing			
<p>Note 1: Reference measurement channel RC.22 TDD according to Table A.4-1 with one sided dynamic OCNG Pattern OP.1 TDD as described in Annex A.5.2.1.</p> <p>Note 2: For each test, the minimum requirements shall be fulfilled for at least one of the two SNR(s) and the respective wanted signal input level.</p> <p>Note 3: To avoid collisions between CQI/PMI reports and HARQ-ACK it is necessary to report both on PUSCH instead of PUCCH. PDCCH DCI format 0 shall be transmitted in downlink SF#3 and #8 to allow periodic CQI/PMI to multiplex with the HARQ-ACK on PUSCH in uplink SF#7 and #2.</p> <p>Note 4: RI reporting interval is set to the maximum allowable length of 160ms to minimise collisions between RI, CQI/PMI and HARQ-ACK reports. In the case when all three reports collide, it is expected that CQI/PMI reports will be dropped, while RI and HARQ-ACK will be multiplexed. At eNB, CQI report collection shall be skipped every 160ms during performance verification.</p>						

The normative reference for this requirement is TS 36.101 [2] clause 9.9.1.4.2.

#### 9.9.1.4.2.4 Test description

##### 9.9.1.4.2.4.1 Initial conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range as defined in TS 36.508 [7] clause 4.3.1.2.

Channel Bandwidths to be tested: 10MHz, as defined in TS 36.508 [7] clause 4.3.1.2

1. Connect the SS, faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure TBD.
2. The parameter settings for the cell are set up according to Table 9.9.1.4.2.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 9.9.1.4.2.4.3.

#### 9.9.1.4.2.4.2 Test procedure

1. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 9.9.1.4.2.3-1 as appropriate.
2. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing both according to CQI value 8 and keep them regardless of the wideband CQI value sent by the UE. The SS sends downlink MAC padding bits on the DL RMC. The SS shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. Continue transmission of the PDSCH until 2000 wideband and wideband spatial differential CQI reports have been gathered. In this process the SS collects wideband and wideband spatial differential CQI reports every 5 ms and also cases where UE transmits nothing in its CQI timing are counted as wideband and wideband spatial differential CQI reports respectively.
3. From each wideband CQI report, wideband CQI<sub>0</sub> is defined as Wideband CQI of codeword #0 and wideband CQI<sub>1</sub> is calculated according to clause 9.9.1.4.2.3. Codeword 1 offset level is selected from {0,1,2,3,-4,-3,-2,-1}. Set up a relative frequency distribution for the wideband CQI-values, reported. Calculate the median value (wideband Median CQI is the CQI that is at or crosses 50% distribution from the lower wideband CQI side) for each codewords. Wideband Median CQI<sub>0</sub> is based on the wideband CQI<sub>0</sub> and wideband median CQI<sub>1</sub> is based on the wideband CQI<sub>1</sub>.
4. If Median CQI is not equal to 1 or 15 and 1800 or more of the wideband CQI<sub>1</sub> values are in the range (Median CQI<sub>1</sub> - 1) ≤ Median CQI ≤ (Median CQI<sub>1</sub> + 1) then continue with step 5, otherwise go to step 7.
5. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median- CQI<sub>0</sub>- 1 and the transport format of codeword #1 is according to the wideband median CQI<sub>1</sub>- 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio (NACK /ACK + NACK) ≤ 0.1

then, and go to step 6, otherwise go to step 7.

6. The SS shall transmit PDSCH via PDCCH DCI format 2C for C\_RNTI to transmit the DL RMC including two codewords with spatial multiplexing where the transport format of codeword #0 is according to the wideband median-CQI<sub>0</sub> + 1 and the transport format of codeword #1 is according to the wideband median-CQI<sub>1</sub> + 1. The SS sends downlink MAC padding bits on the DL RMC. The SS shall not react to the any wideband CQI reports from UE and shall use a fixed precoding matrix specified by the bitmap parameter *codebookSubsetRestriction*. The SS sends uplink scheduling information via PDCCH DCI format 0 with CQI request bit set to 0 to schedule

UL RMC in subframe #2 and subframe #7 (Table A.4.1-2). The UE will send ACK/NACK and periodic CQI report using PUSCH. For any PDSCH transmitted by the SS, record the associated ACK, NACK and statDTX responses for each codewords respectively. *In case statDTX can not be differentiated from NACK due to multiplexing effect, evaluate the feedback as a NACK.* The responses are then filtered as follows: for the sequence of responses for each HARQ process, discard all the statDTX responses. Continue to gather data until the number of filtered ACK+NACK responses for each codewords reaches 1000.

If the ratio  $(\text{NACK} / \text{ACK} + \text{NACK}) \geq 0.1$

then pass the UE for this test and go to step 8, otherwise go to step 7.

7. If both SNR points of the test have not been tested, then repeat the same procedure (steps 1 to 6) for the other SNR point as appropriate. Otherwise fail the UE.
8. If both tests have not been done, then repeat the same procedure (steps 1 to 7) with test conditions according to the table 9.9.1.4.2.3-1 for the other Test as appropriate. Otherwise pass the UE.

#### 9.9.1.4.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clause 4.6 with the following exceptions:

#### 9.9.1.4.2.5 Test requirement

The pass fail decision is as specified in the test procedure in clause 9.9.1.4.2.4.2.

There are no parameters in the test setup or measurement process whose variation impacts the results so there are no applicable test tolerances for this test.

## 10 MBMS Performance

### 10.1 FDD MBMS performance (Fixed Reference Channel)

#### 10.1.1 Test purpose

This test verifies the performance of FDD MBMS with a given SNR for which the average BLER remains below a given reference value.

#### 10.1.2 Test applicability

This test applies to all types of E-UTRA FDD UE supporting MBMS release 9 and forward.

#### 10.1.3 Minimum conformance requirements

The parameters specified in Table 10.1.3-1 are valid for all FDD tests unless otherwise stated. For the requirements defined in this section, the difference between CRS EPRE and the MBSFN RS EPRE should be set to 0 dB as the UE

demodulation performance might be different when this condition is not met (e.g. in scenarios where power offsets are present, such as scenarios when reserved cells are present).

**Table 10.1.3-1: Common Test Parameters (FDD)**

Parameter	Unit	Value
Number of HARQ processes	Processes	None
Subcarrier spacing	kHz	15 kHz
Allocated subframes per Radio Frame (Note 1)		6 subframes
Number of OFDM symbols for PDCCH		2
Cyclic Prefix		Extended
Note 1: For FDD mode, up to 6 subframes (#1/2/3/6/7/8) are available for MBMS, in line with TS 36.331.		

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for MBMS.

For the parameters specified in Table 10.1.3-1 and Table 10.1.3-2 and Annex A.3.8.1, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.1.3-3.

**Table 10.1.3-2: Test Parameters for Testing**

Parameter	Unit	Test 1-4	
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port	dBm/15kHz	-98	
Note 1: $P_B = 0$			

**Table 10.1.3-3: Minimum performance**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation condition	Correlation Matrix and antenna	Reference value		MBMS UE Category
						BLER (%)	SNR(dB)	
1	10 MHz	R.37 FDD	OP.4 FDD	MBSFN channel model (Table B.2.6-1)	1x2 low	1	4.1	$\geq 1$
2	10 MHz	R.38 FDD	OP.4 FDD				11.0	$\geq 1$
3	10 MHz	R.39 FDD	OP.4 FDD				20.1	$\geq 2$
	5 MHz	R.39-1 FDD	OP.4 FDD				20.5	1

The normative reference for this requirement is TS 36.101 [2] clause 10.1.

## 10.1.4 Test description

### 10.1.4.1 Initial conditions

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: As specified per test number in Table 10.1.3-3 as defined in TS 36.508 [7] clause 4.3.1.

1. Connect the SS, the faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 10.1.3-1.
3. The downlink signals are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0.
5. Ensure the UE is in State 2A-RF according to TS 36.508 [7] clause 5.2A.1A. Message contents are defined in clause 10.1.4.3.
6. SS transmits *MBSFNAreaConfiguration* message. Message content is defined in clause 10.1.4.3.
7. Wait for a period equal to the MCCH modification period to make sure the UE has received the *MBSFNAreaConfiguration* message.
8. SS continues with the generic procedures described in TS 36.508 [7] clause 4.5.3A.3 and 4.5.4.3 and ensures the UE is in State 4 according to TS 36.508 [7] clause 4.5.4 and the UE test loop Mode C is activated. Message contents are defined in clause 10.1.4.3.
9. SS is configured to include 10 MBMS packets in one TB.

#### 10.1.4.2 Test procedure

1. Initialise the variables  $M_{tot}$  and  $M_{ok}$  as 0. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 10.1.5-1 as appropriate.
2. SS shall send MBMS Packets on the MTCH radio bearer for the test time specified in Table G.6.4-1. SS stores the number of the transmitted MBMS Packets on the MTCH in the current test iteration in the variable  $M_{tot}$ .
3. SS shall send a "UE TEST LOOP MODE C MBMS PACKET COUNTER REQUEST" message and wait for the UE to respond with a "UE TEST LOOP MODE C MBMS PACKET COUNTER RESPONSE" reporting the received MBMS Packet counter value. Message contents are defined in clause 10.1.4.3. SS calculates the variable  $M_{ok}$  as (current counter value - counter value at last test iteration).
4. SS shall compute the BLER as the following:

$$\text{The BLER} = (M_{tot} - M_{ok}) / M_{tot}$$

5. Repeat steps from 1 to 4 for each subtest in Table 10.1.5-1 as appropriate.

#### 10.1.4.3 Message contents

Message contents are according to TS 36.508 [7] clauses 4.4, 4.6 and 4.7A with following exceptions:

### 10.1.5 Test requirement

For the parameters specified in Table 10.1.3-1, Table 10.1.3-2, Annex A.3.8.1, and SNR in Table 10.1.5-1, the value for the BLER in step 4 shall be below the test limit in Annex G.6.3 for all subtests shown in Table 10.1.5-1.

**Table 10.1.5-1: Test requirement**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation condition	Correlation Matrix and antenna	Reference value		MBMS UE Category
						BLER (%)	SNR(dB)	
1	10 MHz	R.37 FDD	OP.4 FDD	MBSFN channel model (Table B.2.6-1)	1x2 low	1	5	≥1
2	10 MHz	R.38 FDD	OP.4 FDD				11.9	≥1
3	10 MHz	R.39 FDD	OP.4 FDD				21.0	≥2
	5 MHz	R.39-1 FDD	OP.4 FDD				21.4	1

## 10.1\_1 FDD MBMS performance (Fixed Reference Channel) (Release 13 and forward)

### 10.1\_1.1 Test purpose

Same test purpose as in clause 10.1.1.

### 10.1\_1.2 Test applicability

This test applies to all types of E-UTRA FDD UE supporting MBMS release 13 and forward.

### 10.1\_1.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 10.1.3 with the following exceptions:

- Instead of Table 10.1.3-3 → use Table 10.1\_1.3-1.

**Table 10.1\_1.3-1: Minimum performance**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation condition	Correlation Matrix and antenna	Reference value		MBMS UE Category
						BLER (%)	SNR(dB)	
4	1.4 MHz	R.40 FDD	OP.4 FDD	MBSFN channel model (Table B.2.6-1)	1x2 low	1	6.6	≥1

## 10.1\_1.4 Test description

### 10.1\_1.4.1 Initial conditions

Same initial conditions as in clause 10.1.4.1 with the following exceptions:

- Instead of Table 10.1.3-3 → use Table 10.1\_1.3-1.

### 10.1\_1.4.2 Test procedure

Same test procedure as in clause 10.1\_1.4.2 with the following exceptions:

- Instead of Table 10.1.5-1 → use Table 10.1\_1.5-1.

### 10.1\_1.4.3 Message contents

Same message contents as in clause 10.1.4.3 for Test number 1.

## 10.1\_1.5 Test requirement

Same test requirements as in clause 10.1.5 with the following exceptions:

- Instead of Table 10.1.5-1 → use Table 10.1\_1.5-1.

**Table 10.1\_1.5-1: Test requirement**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation condition	Correlation Matrix and antenna	Reference value		MBMS UE Category
						BLER (%)	SNR(dB)	
4	1.4 MHz	R.40 FDD	OP.4 FDD	MBSFN channel model (Table B.2.6-1)	1x2 low	1	7.5	≥1

## 10.2 TDD MBMS performance (Fixed Reference Channel)

### 10.2.1 Test purpose

This test verifies the performance of TDD MBMS with a given SNR for which the average BLER remains below a given reference value.

### 10.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE supporting MBMS release 9 and forward.

### 10.2.3 Minimum conformance requirements

The parameters specified in Table 10.2.3-1 are valid for all TDD tests unless otherwise stated. For the requirements defined in this section, the difference between CRS EPRE and the MBSFN RS EPRE should be set to 0 dB as the UE demodulation performance might be different when this condition is not met (e.g. in scenarios where power offsets are present, such as scenarios when reserved cells are present).

**Table 10.2.3-1: Common Test Parameters (TDD)**

Parameter	Unit	Value
Number of HARQ processes	Processes	None
Subcarrier spacing	kHz	15 kHz
Allocated subframes per Radio Frame (Note 1)		5 subframes
Number of OFDM symbols for PDCCH		2
Cyclic Prefix		Extended
Note 1: For TDD mode, in line with TS 36.331, Uplink-Downlink Configuration 5 is proposed, up to 5 subframes (#3/4/7/8/9) are available for MBMS.		

The receive characteristic of MBMS is determined by the BLER. The requirement is valid for all RRC states for which the UE has capabilities for MBMS.

For the parameters specified in Table 10.2.3-1 and Table 10.2.3-2 and Annex A.3.8.2, the average downlink SNR shall be below the specified value for the BLER shown in Table 10.2.3-3.

**Table 10.2.3-2: Test Parameters for Testing**

Parameter	Unit	Test 1-4	
Downlink power allocation	$\rho_A$	dB	0
	$\rho_B$	dB	0 (Note 1)
	$\sigma$	dB	0
$N_{oc}$ at antenna port	dBm/15kHz	-98	
Note 1: $P_B = 0$ .			

**Table 10.2.3-3: Minimum performance**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation condition	Correlation Matrix and antenna	Reference value		MBMS UE Category
						BLER (%)	SNR(dB)	
1	10 MHz	R.37 TDD	OP.4 TDD	MBSFN channel model (Table B.2.6-1)	1x2 low	1	3.4	$\geq 1$
2	10 MHz	R.38 TDD	OP.4 TDD				11.1	$\geq 1$
3	10 MHz	R.39 TDD	OP.4 TDD			20.1	$\geq 2$	
	5MHz	R.39-1 TDD	OP.4 TDD			20.5	1	

The normative reference for this requirement is TS 36.101 [2] clause 10.2.

## 10.2.4 Test description

### 10.2.4.1 Initial conditions

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range, as defined in TS 36.508 [7] clause 4.3.1.

Channel Bandwidths to be tested: As specified per test number in Table 10.2.3-3 as defined in TS 36.508 [7] clause 4.3.1.

1. Connect the SS, the faders and AWGN noise source to the UE antenna connector (s) as shown in TS 36.508 [7] Annex A, Figure A.9.
2. The parameter settings for the cell are set up according to Table 10.2.3-1.
3. The downlink signals are initially set up according to Annex C.1 and Annex C.3.2 and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B clause B.0.
5. Ensure the UE is in State 2A-RF according to TS 36.508 [7] clause 5.2A.1A. Message contents are defined in clause 10.2.4.3.
6. SS transmits *MBSFNAreaConfiguration* message. Message content is defined in clause 10.2.4.3.
7. Wait for a period equal to the MCCH modification period to make sure the UE has received the *MBSFNAreaConfiguration* message.
8. SS continues with the generic procedures described in TS 36.508 [7] clause 4.5.3A.3 and 4.5.4.3 and ensures the UE is in State 4 according to TS 36.508 [7] clause 4.5.4 and the UE test loop Mode C is activated. Message contents are defined in clause 10.2.4.3.
9. SS is configured to include 10 MBMS packets in one TB.

### 10.2.4.2 Test procedure

1. Initialise the variables  $M_{tot}$  and  $M_{ok}$  as 0. Set the parameters of bandwidth, reference channel, the propagation condition, antenna configuration and the SNR according to Table 10.2.5-1 as appropriate.
2. SS shall send MBMS Packets on the MTCH radio bearer for the test time specified in Table G.6.4-1. SS stores the number of the transmitted MBMS Packets on the MTCH in the current test iteration in the variable  $M_{tot}$ .
3. SS shall send a "UE TEST LOOP MODE C MBMS PACKET COUNTER REQUEST" message and wait for the UE to respond with a "UE TEST LOOP MODE C MBMS PACKET COUNTER RESPONSE" reporting the received MBMS Packet counter value. Message contents are defined in clause 10.2.4.3. SS calculates the variable  $M_{ok}$  as (current counter value - counter value at last test iteration).
4. SS shall compute the BLER as the following:  

$$\text{The BLER} = (M_{tot} - M_{ok}) / M_{tot}$$
5. Repeat steps from 1 to 4 for each subtest in Table 10.2.5-1 as appropriate.

### 10.2.4.3 Message contents

Message contents are according to TS 36.508 [7] clauses 4.4, 4.6 and 4.7A with following exceptions:

## 10.2.5 Test requirement

For the parameters specified in Table 10.2.3-1, Table 10.2.3-2, Annex A.3.8.2, and SNR in Table 10.2.5-1, the value for the BLER in step 4 shall be below the test limit in Annex G.6.3 for all subtests shown in Table 10.2.5-1.

Table 10.2.5-1: Test requirement

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation condition	Correlation Matrix and antenna	Reference value		MBMS UE Category
						BLER (%)	SNR(dB)	
1	10 MHz	R.37 TDD	OP.4 TDD	MBSFN channel model (Table B.2.6-1)	1x2 low	1	4.3	≥1
2	10 MHz	R.38 TDD	OP.4 TDD				12	≥1
3	10 MHz	R.39 TDD	OP.4 TDD				21.0	≥2
	5MHz	R.39-1 TDD	OP.4 TDD				21.4	1

## 10.2\_1 TDD MBMS performance (Fixed Reference Channel) (Release 13 and forward)

### 10.2.1 Test purpose

Same test purpose as in clause 10.2.1.

### 10.2.2 Test applicability

This test applies to all types of E-UTRA TDD UE supporting MBMS release 13 and forward.

### 10.2.3 Minimum conformance requirements

Same minimum conformance requirements as in clause 10.2.3 with the following exceptions:

- Instead of Table 10.2.3-3 → use Table 10.2\_1.3-1.

Table 10.2\_1.3-1: Minimum performance

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation condition	Correlation Matrix and antenna	Reference value		MBMS UE Category
						BLER (%)	SNR(dB)	
4	1.4 MHz	R.40 TDD	OP.4 TDD	MBSFN channel model (Table B.2.6-1)	1x2 low	1	5.8	≥1

The normative reference for this requirement is TS 36.101 [2] clause 10.2.

### 10.2.4 Test description

#### 10.2.4.1 Initial conditions

Same initial conditions as in clause 10.2.4.1 with the following exceptions:

- Instead of Table 10.2.3-3 → use Table 10.2\_1.3-1.

#### 10.2\_1.4.2 Test procedure

Same test procedure as in clause 10.2.4.2 with the following exceptions:

- Instead of Table 10.2.5-1 → use Table 10.2\_1.5-1.

### 10.2.4.3 Message contents

Same message contents as in clause 10.2.4.3 for Test number 1.

### 10.2\_1.5 Test requirement

Same test requirements as in clause 10.2.5 with the following exceptions:

- Instead of Table 10.2.5-1 → use Table 10.2\_1.5-1.

**Table 10.2\_1.5-1: Test requirement**

Test number	Bandwidth	Reference Channel	OCNG Pattern	Propagation condition	Correlation Matrix and antenna	Reference value		MBMS UE Category
						BLER (%)	SNR(dB)	
4	1.4 MHz	R.40 TDD	OP.4 TDD	MBSFN channel model (Table B.2.6-1)	1x2 low	1	6.7	≥1

## 11 Performance Requirement (ProSe Direct Discovery)

This clause contains the performance requirements for the Sidelink physical channels specified for ProSe Direct Discovery.

### 11.1 General

#### 11.1.1 Applicability of requirements

The requirements in this clause are applicable to UEs that support ProSe Direct Discovery. Some of the tests defined in this clause are applicable only to UEs that additionally support transmission and reception of Sidelink synchronization signal (indicated using *disc-SLSS*). The test case applicability is in according to table 11.1.1-1 depending on UE capability.

**Table 11.1.1-1: ProSe Direct Discovery test applicability**

	ProSe Direct Discovery without support of SLSS	ProSe Direct Discovery with support of SLSS
<b>FDD</b>	11.2.1, 11.3.1, 11.5.1	11.3.1, 11.4.1, 11.5.1
<b>TDD</b>	11.2.2, 11.3.2, 11.5.2	11.2.2, 11.3.2, 11.5.2

For maximum Sidelink Processes test specified in clause 11.5, the UE is required to only meet the test for the maximum channel bandwidth over the ProSe operating bands supported by the UE.

#### 11.1.2 Reference DRX configuration

**Table 11.1.2-1: Reference DRX configuration**

Parameter	Value	Comments
onDurationTimer	psf1	
drx-InactivityTimer	psf1	
drx-RetransmissionTimer	psf1	
longDRX-CycleStartOffset	sf2560, 0	
shortDRX	disabled	
NOTE 1: For further information see clause 6.3.2 in TS 36.331.		

## 11.2 Demodulation of PSDCH (single link performance)

The purpose of the requirements in this subclause is to verify the PSDCH demodulation performance with a single active PSDCH link under different operating scenarios and channel conditions.

The active cell(s), when present, are specified in the test parameters specific to the test.

### 11.2.1 FDD PSDCH Single Link Performance (ProSe Direct Discovery)

**Editor's note: This test case is not complete. Following aspects are either missing or not yet determined:**

- ProSe UE authentication is not handled in the test case and is still under investigation.
- Test time is FFS.
- Test system uncertainties and test tolerances is TBD
- Connection Diagram is FFS
- UL and DL RMC for cell1 is TBD

#### 11.2.1.1 Test Purpose

This test verifies the PSDCH demodulation performance with a single PSDCH link with a given SNR for which the average BLER remains below a given reference value under different channel conditions.

#### 11.2.1.2 Test Applicability

This test case applies to all types of E-UTRA FDD UE release 12 and forward which support ProSe Direct Discovery.

#### 11.2.1.3 Minimum Conformance Requirements

The minimum requirements are specified in Table 11.2.1.3-2 with the test parameters specified in Table 11.2.1.3-1. The receiver UE under test is associated with Cell 1.

Table 11.2.1.3-1: Test Parameters

Parameter		Unit	Test 1	
Discovery resource pool configuration			As specified in Table A.7.1.1-1 (Configuration #1-FDD)	
DRX configuration			As specified in Table 11.1.2-1	
$N_{oc}$ at antenna port (NOTE 3)		dBm/15kHz	-98	
Active cell(s)			Cell 1 (Serving cell)	
Cell 1	Cyclic prefix		Normal	
	Cell ID		0	
	Downlink power allocation	$\rho_A$	dB	0
		$\rho_B$	dB	0 (NOTE 1)
		$\sigma$	dB	0
	OCNG Pattern (NOTE 2)			OP.1 FDD
	Propagation channel			AWGN
	Antenna configuration			1x2
RSRP		dBm/15kHz	-92	
Active Sidelink UE(s)			Sidelink UE 1	
Sidelink UE 1	Sidelink Transmissions		PSDCH	
	PSDCH RB allocation		PRB pairs $\{2i..2i+1\}$ , where $i$ is chosen randomly uniformly from $[0,11]$ in each discovery period.	
	Time offset (NOTE 4)		$\mu$ s	+1
	Frequency offset (NOTE 5)		Hz	+200
	Propagation Channel			EPA5
	Antenna configuration			1x2 Low
NOTE 1: $P_B = 0$ .				
NOTE 2: OCNG is used to fully allocate the available resource blocks to virtual UEs.				
NOTE 3: Applicable to both DL channel and ProSe Direct Discovery Subframes on UL.				
NOTE 4: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE.				
NOTE 5: Frequency offset of Sidelink UE with respect to Cell 1 uplink frequency.				

Table 11.2.1.3-2: Minimum performance

Test num.	Sidelink UE	Band-width	Reference channel	Reference value	
				BLER of PSDCH (%)	SNR (dB)
1	1	5 MHz	D.1 FDD	30	4.6

The normative reference for this requirement is TS 36.101 [2] clause 11.2.1

## 11.2.1.4 Test Description

### 11.2.1.4.1 Initial Conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range for Cell1, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 11.2.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure TBD.
2. The parameter settings for the cell are set up according to Table 11.2.1.3-1.

3. Downlink signals are initially set up according to Annex C.0, C.1 and C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 2A-RF according to TS 36.508 [7] clause 5.2A.1A. Message contents exceptions are defined in clause 11.2.1.4.3.
6. SS continues with the generic procedures described in TS 36.508 [7] clause 4.5.3A.3 and 4.5.4.3 and ensures the UE is in State 4 according to TS 36.508 [7] clause 4.5.4 and the UE test loop Mode D is activated.

#### 11.2.1.4.2 Test Procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table TBD. The SS sends downlink MAC padding bits on the DL RMC.
2. SS sends uplink scheduling information via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table TBD. When the UE has no payload data to send, it transmits uplink MAC padding bits on the UL RMC.
3. Set the parameters of bandwidth, propagation condition, antenna configuration and the SNR for cell1 according to Table 11.2.1.3-1.
4. SS transmits PSDCH to transmit the SL RMC according to Table 11.2.1.3-2. Set the Sidelink signal level, bandwidth, propagation condition, antenna configuration and SNR according to Table 11.2.1.3-1 and Table 11.2.1.3-2.
5. SS shall transmit an RRCConnectionReconfiguration message to configure DRX. Message contents exceptions are defined in clause 11.2.1.4.3.
6. The UE shall transmit RRCConnectionReconfigurationComplete message.
7. Initialise the variables  $P_{tot}$  and  $P_{ok}$  as 0.
8. SS shall send SL Discovery Packets (MAC padding bits) on the SL RMC for the test time [FFS]. SS stores the number of the transmitted Discovery Packets in the current test iteration in the variable  $P_{tot}$ .
9. SS shall send (on the available PDSCH) a “UE TEST LOOP PROSE MODE D SIDELINK DIRECT DISCOVERY PACKET COUNTER REQUEST” message and wait for the UE to respond (on the available PUSCH) with a “UE TEST LOOP PROSE MODE D SIDELINK DIRECT DISCOVERY PACKET COUNTER RESPONSE” reporting the received Sidelink direct discovery packet counter value.
10. SS calculates the variable  $P_{ok}$  as (current counter value - counter value at last test iteration).
11. SS shall compute the BLER as following:

$$BLER = ((P_{tot} - P_{ok}) / P_{tot}) * 100\%$$

#### 11.2.1.4.3 Message Contents

Message contents are according to TS 36.508 [7] clauses TBD with following exceptions:

##### **Table 11.2.1.4.3-1: ACTIVATE TEST MODE: FDD PSDCH Single Link Performance for ProSe Direct Discovery**

Derivation Path: 36.508[7], Table 4.7A-1, condition UE TEST LOOP MODE D
---

##### **Table 11.2.1.4.3-2: CLOSE UE TEST LOOP: FDD PSDCH Single Link Performance for ProSe Direct Discovery**

Derivation Path: 36.508[7], Table 4.7A-3, condition UE TEST LOOP MODE D
---

**Table 11.2.1.4.3-3: MAC-MainConfig-RBC: DRX config for PSDCH Single Link Performance for ProSe Direct Discovery**

Derivation Path: TS 36.508 [7] clause 4.8.2.1.5, Table 4.8.2.1.5-1 MAC-MainConfig-RBC			
Information Element	Value/remark	Comment	Condition

}			
}			
timeAlignmentTimerDedicated	sf2560		
}			

### 11.2.1.5 Test Requirement

For the parameters specified in Table 11.2.1.3-1 and SNR in Table 11.2.1.5-1, the BLER obtained in step 11 shall be below the test limit in Annex TBD.

**Table 11.2.1.5-1: Test Requirements**

Test num.	Sidelink UE	Band-width	Reference channel	Reference value	
				BLER of PSDCH (%)	SNR (dB)
1	1	5 MHz	D.1 FDD	30	4.6 + TT

## 11.2.2 TDD PSDCH Single Link Performance (ProSe Direct Discovery)

Editor's note: This test case is not complete. Following aspects are either missing or not yet determined:

- ProSe UE authentication is not handled in the test case and is still under investigation.
- Test time is FFS.
- Test system uncertainties and test tolerances is TBD
- Connection Diagram is FFS
- UL and DL RMC for cell1 is TBD

### 11.2.2.1 Test Purpose

This test verifies the PSDCH demodulation performance with a single PSDCH link with a given SNR for which the average BLER remains below a given reference value under different channel conditions.

### 11.2.2.2 Test Applicability

This test case applies to all types of E-UTRA TDD UE release 12 and forward which support ProSe Direct Discovery.

### 11.2.2.3 Minimum Conformance Requirements

The minimum requirements are specified in Table 11.2.2.3-2 with the test parameters specified in Table 11.2.2.3-1. The receiver UE under test is associated with Cell 1.

**Table 11.2.2.3-1: Test Parameters**

Parameter		Unit	Test 1	
Discovery resource pool configuration			As specified in Table A.7.1.2-1 (Configuration #1-TDD)	
DRX configuration			As specified in Table 11.1.2-1	
$N_{oc}$ at antenna port (NOTE 5)		dBm/15kHz	-98	
Active cell(s)			Cell 1 (Serving cell)	
Cell 1	Cyclic prefix		Normal	
	Uplink downlink configuration (NOTE 3)		0	
	Special subframe configuration (NOTE 4)		4	
	Cell ID		0	
	Downlink power allocation	$\rho_A$	dB	0
		$\rho_B$	dB	0 (NOTE 1)
		$\sigma$	dB	0
	OCNG Pattern <small>NOTE 2</small>		OP.1 TDD	
	Propagation channel		AWGN	
Antenna configuration		1x2		
RSRP	dBm/15kHz	-92		
Active Sidelink UE(s)			Sidelink UE 1	
Sidelink UE 1	Sidelink Transmissions		PSDCH	
	RB allocation		PRB pairs $\{2i..2i+1\}$ , where $i$ is chosen randomly uniformly from $[0,11]$ in each discovery period.	
	Time offset (NOTE 6)	$\mu$ s	+1	
	Frequency offset (NOTE 7)	Hz	+200	
	Propagation Channel		EPA5	
	Antenna configuration		1x2 Low	
NOTE 1: $P_B = 0$ .				
NOTE 2: OCNG is used to fully allocate the available resource blocks to virtual UEs.				
NOTE 3: As specified in Table 4.2-2 in TS 36.211 [8].				
NOTE 4: As specified in Table 4.2-1 in TS 36.211 [8].				
NOTE 5: Applicable to both DL subframes and UL subframes configured for ProSe Direct Discovery.				
NOTE 6: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE.				
NOTE 7: Frequency offset of Sidelink UE with respect to Cell 1 uplink frequency.				

**Table 11.2.2.3-2: Minimum performance**

Test num.	Sidelink UE	Band-width	Reference channel	Reference value	
				BLER of PSDCH (%)	SNR (dB)
1	1	5 MHz	D.1 TDD	30	4.6

The normative reference for this requirement is TS 36.101 [2] clause 11.2.2.

### 11.2.2.4 Test Description

#### 11.2.2.4.1 Initial Conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range for Cell1, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 11.2.2.3-2 as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure TBD.
2. The parameter settings for the cell are set up according to Table 11.2.2.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 2A-RF according to TS 36.508 [7] clause 5.2A.1A. Message contents exceptions are defined in clause 11.2.2.4.3.
6. SS continues with the generic procedures described in TS 36.508 [7] clause 4.5.3A.3 and 4.5.4.3 and ensures the UE is in State 4 according to TS 36.508 [7] clause 4.5.4 and the UE test loop Mode D is activated.

#### 11.2.2.4.2 Test Procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table TBD. The SS sends downlink MAC padding bits on the DL RMC.
2. SS sends uplink scheduling information via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table TBD. When the UE has no payload data to send, it transmits uplink MAC padding bits on the UL RMC.
3. Set the parameters of bandwidth, propagation condition, antenna configuration and the SNR for cell1 according to Table 11.2.2.3-1.
4. SS transmits PSDCH to transmit the SL RMC according to Table 11.2.2.3-2. Set the Sidelink signal level, bandwidth, propagation condition, antenna configuration and SNR according to Table 11.2.2.3-1 and Table 11.2.2.3-2.
5. SS shall transmit an RRCConnectionReconfiguration message to configure DRX. Message contents exceptions are defined in clause 11.2.2.4.3.
6. The UE shall transmit RRCConnectionReconfigurationComplete message.
7. Initialise the variables  $P_{tot}$  and  $P_{ok}$  as 0.
8. SS shall send SL Discovery Packets (MAC padding bits) on the SL RMC for the test time [FFS]. SS stores the number of the transmitted Discovery Packets in the current test iteration in the variable  $P_{tot}$ .
9. SS shall send (on the available PDSCH) a “UE TEST LOOP PROSE MODE D SIDELINK DIRECT DISCOVERY PACKET COUNTER REQUEST” message and wait for the UE to respond (on the available PUSCH) with a “UE TEST LOOP PROSE MODE D SIDELINK DIRECT DISCOVERY PACKET COUNTER RESPONSE” reporting the received Sidelink direct discovery packet counter value.
10. SS calculates the variable  $P_{ok}$  as (current counter value - counter value at last test iteration).
11. SS shall compute the BLER as following:

$$BLER = ((P_{tot} - P_{ok}) / P_{tot}) * 100\%$$

#### 11.2.2.4.3 Message Contents

Message contents are according to TS 36.508 [7] clauses TBD with following exceptions:

### 11.2.2.5 Test Requirement

For the parameters specified in Table 11.2.2.3-1 and SNR in Table 11.2.2.5-1, the BLER obtained in step 11 shall be below the test limit in Annex TBD.

**Table 11.2.2.5-1: Test Requirements**

Test num.	Sidelink UE	Band-width	Reference channel	Reference value	
				BLER of PSDCH (%)	SNR (dB)
1	1	5 MHz	D.1 TDD	30	4.6 + TT

## 11.3 Power imbalance performance with two links

The purpose of the requirements in this subclause is to check the demodulation performance when receiving PSDCH transmissions from two Sidelink UEs with power imbalance in one subframe.

### 11.3.1 FDD Power imbalance performance with two links

**Editor's note:** This test case is not complete. Following aspects are either missing or not yet determined:

- Test system uncertainties and test tolerances is TBD
- Connection Diagram is FFS

- Test procedure is TBD
- Message contents are TBD

### 11.3.1.1 Test Purpose

This test verifies the PSDCH demodulation performance in the presence of two links which exhibit power imbalance in one subframe.

### 11.3.1.2 Test Applicability

This test case applies to all types of E-UTRA FDD UE release 12 and forward which support ProSe Direct Discovery.

### 11.3.1.3 Minimum Conformance Requirements

The minimum requirements are specified in Table 11.3.1.3-2 with the test parameters specified in Table 11.3.1.3-1. The receiver UE under test is associated with Cell 1. The Sidelink UE 1 and 2 are synchronized to Cell 1 and transmit PSDCH on adjacent RBs.

**Table 11.3.1.3-1: Test Parameters**

Parameter		Unit	Test 1	
Discovery resource pool configuration			As specified in Table A.7.1.1-1 (Configuration #1-FDD)	
DRX configuration			As specified in Table 11.1.2-1	
$N_{oc}$ at antenna port (NOTE 3)		dBm/15kHz	-98	
Active cell(s)			Cell 1 (Serving cell)	
Cell 1	Cyclic prefix		Normal	
	Cell ID		0	
	Downlink power allocation	$\rho_A$	dB	0
		$\rho_B$	dB	0 (NOTE 1)
		$\sigma$	dB	0
	OCNG Pattern (NOTE 2)		OP.1 FDD	
	Propagation channel		AWGN	
	Antenna configuration		1x2	
RSRP	dBm/15kHz	-92		
Active Sidelink UE(s)			Sidelink UE 1, Sidelink UE 2	
Sidelink UE 1	Sidelink Transmissions		PSDCH	
	PSDCH RB allocation		PRB pairs {4..5}	
	Time offset (NOTE 3)	$\mu$ s	0	
	Frequency offset (NOTE 4)	Hz	0	
	Propagation Channel		AWGN	
	Antenna configuration		1x2 Low	
Sidelink UE 2	Sidelink Transmissions		PSDCH	
	PSDCH RB allocation		PRB pairs {6..7}	
	Time offset (w.r.t. Cell 1 DL)	$\mu$ s	0	
	Frequency offset (w.r.t. Cell 1 UL)	Hz	0	
	Propagation Channel		AWGN	
	Antenna configuration		1x2 Low	
NOTE 1: $P_B = 0$ .				
NOTE 2: OCNG is used to fully allocate the available resource blocks to virtual UEs.				
NOTE 3: Applicable to both DL channel and ProSe Direct Discovery Subframes on UL.				
NOTE 4: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE.				
NOTE 5: Frequency offset of Sidelink UE with respect to Cell 1 uplink frequency.				

**Table 11.3.1.3-2: Minimum performance**

Test num.	Band-width	Sidelink UE	Reference channel	Reference value	
				BLER of PSDCH (%)	SNR (dB)
1	5 MHz	1	D.1 FDD	(NOTE 1)	24.3
		2	D.1 FDD	30	6.9

NOTE 1: There is no BLER requirement for Sidelink UE 1.

The normative reference for this requirement is TS 36.101 [2] clause 11.3.1

#### 11.3.1.4 Test Description

TBD

#### 11.3.1.5 Test Requirement

For the parameters specified in Table 11.3.1.3-1 and SNR in Table 11.3.1.5-1, the BLER obtained in step 11 shall be below the test limit in Annex TBD.

**Table 11.3.1.5-1: Test Requirements**

Test num.	Band-width	Sidelink UE	Reference channel	Reference value	
				BLER of PSDCH (%)	SNR (dB)
1	5 MHz	1	D.1 FDD	(NOTE 1)	24.3+TT
		2	D.1 FDD	30	6.9+TT

NOTE 1: There is no BLER requirement for Sidelink UE 1.

### 11.3.2 TDD Power imbalance performance with two links

**Editor's note: This test case is not complete. Following aspects are either missing or not yet determined:**

- Test system uncertainties and test tolerances is TBD
- Connection Diagram is FFS
- Test procedure is TBD

#### 11.3.2.1 Test Purpose

This test verifies the PSDCH demodulation performance in the presence of two links which exhibit power imbalance in one subframe.

#### 11.3.2.2 Test Applicability

This test case applies to all types of E-UTRA TDD UE release 12 and forward which support ProSe Direct Discovery.

#### 11.3.2.3 Minimum Conformance Requirements

The minimum requirements are specified in Table 11.3.2.3-2 with the test parameters specified in Table 11.3.2.3-1. The receiver UE under test is associated with Cell 1. The Sidelink UE 1 and 2 are synchronized to Cell 1 and transmit PSDCH on adjacent RBs.

Table 11.3.2.3-1: Test Parameters

Parameter		Unit	Test 1	
Discovery resource pool configuration			As specified in Table A.7.1.2-1 (Configuration #1-TDD)	
DRX configuration			As specified in Table 11.1.2-1	
$N_{oc}$ at antenna port (NOTE 5)		dBm/15kHz	-98	
Active cell(s)			Cell 1 (Serving cell)	
Cell 1	Cyclic prefix		Normal	
	Uplink downlink configuration (NOTE 3)		0	
	Special subframe configuration (NOTE 4)		4	
	Cell ID		0	
	Downlink power allocation	$\rho_A$	dB	0
		$\rho_B$	dB	0 (NOTE 1)
		$\sigma$	dB	0
	OCNG Pattern <small>NOTE 2</small>		OP.1 TDD	
	Propagation channel		AWGN	
Antenna configuration		1x2		
RSRP	dBm/15kHz	-92		
Active Sidelink UE(s)			Sidelink UE 1, Sidelink UE 2	
Sidelink UE 1	Sidelink Transmissions		PSDCH	
	PSDCH RB allocation		PRB pairs {4..5}	
	Time offset (NOTE 6)	$\mu$ s	0	
	Frequency offset (NOTE 7)	Hz	0	
	Propagation Channel		AWGN	
	Antenna configuration		1x2 Low	
Sidelink UE 2	Sidelink Transmissions		PSDCH	
	RB allocation		PRB pairs {6..7}	
	Time offset (NOTE 6)	$\mu$ s	0	
	Frequency offset (NOTE 7)	Hz	0	
	Propagation Channel		AWGN	
	Antenna configuration		1x2 Low	
NOTE 1: $P_B = 0$ .				
NOTE 2: OCNG is used to fully allocate the available resource blocks to virtual UEs.				
NOTE 3: As specified in Table 4.2-2 in TS 36.211 [4].				
NOTE 4: As specified in Table 4.2-1 in TS 36.211 [4].				
NOTE 5: Applicable to both DL subframes and UL subframes configured for ProSe Direct Discovery.				
NOTE 6: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE.				
NOTE 7: Frequency offset of Sidelink UE with respect to Cell 1 uplink frequency.				

Table 11.3.2.3-2: Minimum performance

Test num.	Band-width	Sidelink UE	Reference channel	Reference value	
				BLER of PSDCH (%)	SNR (dB)
1	5 MHz	1	D.1 TDD	(NOTE 1)	24.3
		2	D.1 TDD	30	6.9
NOTE 1: There is no BLER requirement for Sidelink UE 1.					

The normative reference for this requirement is TS 36.101 [2] clause 11.3.2

### 11.3.2.4 Test Description

TBD

### 11.3.2.5 Test Requirement

For the parameters specified in Table 11.3.2.3-1 and SNR in Table 11.3.2.5-1, the BLER obtained in step 11 shall be below the test limit in Annex TBD.

**Table 11.3.2.5-1: Test Requirements**

Test num.	Band-width	Sidelink UE	Reference channel	Reference value	
				BLER of PSDCH (%)	SNR (dB)
1	5 MHz	1	D.1 FDD	(NOTE 1)	24.3+TT
		2	D.1 FDD	30	6.9+TT

NOTE 1: There is no BLER requirement for Sidelink UE 1.

## 11.4 Multiple timing reference test

The purpose of this test is to check the demodulation performance when receiving from two Sidelink UEs that follow different timing references and transmitting on different resources (non-overlapping in time).

### 11.4.1 FDD Multiple timing reference test

**Editor's note:** This test case is not complete. Following aspects are either missing or not yet determined:

- Test time is FFS.
- Test system uncertainties and test tolerances is TBD
- Connection Diagram is FFS
- Test procedure is TBD
- Message contents are TBD

#### 11.4.1.1 Test Purpose

This test verifies the demodulation performance when receiving from two Sidelink UEs that follow different timing references and transmitting on different resources (non-overlapping in time) with a given SNR for which the average BLER remains below a given reference value.

#### 11.4.1.2 Test Applicability

This test case applies to all types of E-UTRA FDD UE release 12 and forward which support ProSe Direct Discovery.

#### 11.4.1.3 Minimum Conformance Requirements

The test parameters are specified in Table 11.4.1-1. Sidelink UE 2 and the receiver UE under test are associated with Cell 1. Sidelink UE 1 and 3 are associated with another cell and use a different timing, and UE 1 acts as a synchronization reference. The minimum requirements are specified in Table 11.4.1-2.

Table 11.4.1-1: Test Parameters

Parameter		Unit	Test 1	
Discovery resource pool configuration			As specified in Table A.7.1.1-2 (Configuration #2-FDD)	
DRX configuration			As specified in Table 11.1.2-1	
$N_{oc}$ at antenna port (NOTE 3)		dBm/15kHz	-98	
Active cell(s)			Cell 1 (Serving cell)	
Cell 1	Cyclic prefix		Normal	
	Cell ID		0	
	Downlink power allocation	$\rho_A$	dB	0
		$\rho_B$	dB	0 (NOTE 1)
		$\sigma$	dB	0
	OCNG Pattern <small>NOTE 2</small>		OP.1 FDD	
	Propagation channel		AWGN	
Antenna configuration		1x2		
RSRP	dBm/15kHz	-92		
Active Sidelink UE(s)			Sidelink UEs 1, 2, 3	
Sidelink UE 1	Sidelink Transmissions		SLSS	
	networkControlledSyncTx		ON	
	slssid		30	
	Time offset (NOTE 4)	$\mu$ s	3511	
	Frequency offset (NOTE 5)	Hz	-100	
	Propagation channel		EPA5	
	Antenna configuration		1x2 Low	
$\widehat{E}_s$ of SLSS at antenna port	dBm/15kHz	-82		
Sidelink UE 2	Sidelink Transmissions		PSDCH	
	Resource pool used for transmissions		<i>discRxPool(0)</i>	
	RB allocation		PRB pairs $\{2i..2i+1\}$ , where $i$ is chosen randomly uniformly from $[0,11]$ in each discovery period.	
	Time offset (NOTE 4)	$\mu$ s	+1	
	Frequency offset (NOTE 5)	Hz	+200	
	Propagation Channel		EPA5	
	Antenna configuration		1x2 Low	
Sidelink UE 3	Sidelink Transmissions		PSDCH	
	Resource pool used for transmissions		<i>discRxPool(1)</i>	
	RB allocation		PRB pairs $\{2i..2i+1\}$ , where $i$ is chosen randomly uniformly from $[0,11]$ in each discovery period.	
	Time offset (NOTE 4)	$\mu$ s	3511	
	Frequency offset (NOTE 5)	Hz	+300	
	Propagation Channel		EPA5	
Antenna configuration		1x2 Low		
NOTE 1: $P_B = 0$ .				
NOTE 2: OCNG is used to fully allocate the available resource blocks to virtual UEs.				
NOTE 3: Applicable to both DL channel and ProSe Direct Discovery Subframes on UL.				
NOTE 4: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE.				
NOTE 5: Frequency offset of Sidelink UE with respect to Cell 1 uplink frequency.				

**Table 11.4.1-2: Minimum performance**

Test num.	Band-width	Sidelink UE	Reference channel	Reference value	
				BLER of PSDCH (%) <sup>NOTE 1</sup>	SNR (dB)
1	5 MHz	2	D.1 FDD	30	4.6
		3	D.1 FDD	30	4.6

NOTE 1: The BLER is measured after 5 D2D Discovery periods (1600 frames) of lead time during which the test UE detects and synchronizes to Sidelink UE 1 SLSS.

The normative reference for this requirement is TS 36.101 [2] clause 11.4.1.

#### 11.4.1.4 Test Description

##### 11.4.1.4.1 Initial Conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range for Cell1, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 11.4.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure TBD.
2. The parameter settings for the cell are set up according to Table 11.4.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 2A-RF according to TS 36.508 [7] clause 5.2A.1A. Message contents exceptions are defined in clause 11.4.1.4.3.
6. SS continues with the generic procedures described in TS 36.508 [7] clause 4.5.3A.3 and 4.5.4.3 and ensures the UE is in State 4 according to TS 36.508 [7] clause 4.5.4 and the UE test loop Mode D is activated.

##### 11.4.1.4.2 Test Procedure

TBD

##### 11.4.1.4.3 Message Contents

TBD

##### 11.4.1.5 Test Requirement

For the parameters specified in Table 11.4.1.3-1 and SNR in Table 11.4.1.5-1, the BLER obtained in step TBD shall be below the test limit in Annex TBD.

Table 11.4.1-2: Minimum performance

Test num.	Band-width	Sidelink UE	Reference channel	Reference value	
				BLER of PSDCH (%) <sup>NOTE 1</sup>	SNR (dB)
1	5 MHz	2	D.1 FDD	30	4.6+TT
		3	D.1 FDD	30	4.6+TT

NOTE 1: The BLER is measured after 5 D2D Discovery periods (1600 frames) of lead time during which the test UE detects and synchronizes to Sidelink UE 1 SLSS.

## 11.5 Maximum Sidelink processes test

The purpose of this test is to verify the maximum number of Sidelink processes supported by the UE as reported using UE capability signalling (discSupportedProc).

The UE is required to meet only the test for the maximum channel bandwidth over the ProSe operating bands supported by the UE.

### 11.5.1 FDD maximum Sidelink processes test (ProSe Direct Discovery)

**Editor's note:** This test case is not complete. Following aspects are either missing or not yet determined:

- ProSe UE authentication is not handled in the test case and is still under investigation.
- Test time is FFS.
- Test system uncertainties and test tolerances is TBD
- Connection Diagram is FFS
- UL and DL RMC for cell1 is TBD

#### 11.5.1.1 Test Purpose

This test verifies the UE's ability to support maximum number of Sidelink processes by verifying the percentage of the information bit throughput for a specified PSDCH Reference Measurement Channel (RMC) not falling below a specified value.

#### 11.5.1.2 Test Applicability

This test case applies to all types of E-UTRA FDD UE release 12 and forward which support ProSe Direct Discovery.

#### 11.5.1.3 Minimum Conformance Requirements

The test parameters are specified in Table 11.5.1.3-1. Multiple discovery resource pools are interleaved. Each Sidelink UE transmits in one of the resource pools with 3 retransmissions. The minimum requirements are specified in Table 11.5.1.3-2.

Table 11.5.1.3-1: Test Parameters

Parameter		Unit	Test 1-7	
Discovery resource pool configuration			As specified in Table A.7.1.1-3 (Configuration #3-FDD) with parameters $BW_{\text{Channel}}$ , $N_{\text{Pools}}$ = Number of configured resource pools (as specified in Table 11.5.1.3-2), and $N = \text{discSupportedProc}$	
DRX configuration			As specified in Table 11.1.2-1	
Active cell(s)			Cell 1 (Serving cell)	
Cell 1	Cyclic prefix		Normal	
	Cell ID		0	
	Downlink power allocation	$\rho_A$	dB	0
		$\rho_B$	dB	0 (NOTE 1)
		$\sigma$	dB	0
	OCNG Pattern <sup>NOTE 2</sup>		OP.1 FDD	
	Propagation channel		Static propagation condition No external noise sources are applied	
	Antenna configuration		1x2	
RSRP	dBm/15kHz	-85		
Active Sidelink UE(s)			Sidelink UE $i$ , $i = 0, \dots, \text{discSupportedProc}-1$	
Sidelink UE $i$	Sidelink Transmissions		PSDCH (D.1 FDD)	
	Resource pool index (NOTE 3)		$\left\lfloor \frac{i}{N_{\text{MAX\_SF}}} \right\rfloor$	
	PSDCH RB allocation (NOTE 3)		PRB pairs $\{2*(i \% N_{\text{MAX\_SF}}), 2*(i \% N_{\text{MAX\_SF}})+1\}$	
	Time offset (NOTE 4)	$\mu\text{s}$	0	
	Frequency offset (NOTE 4)	Hz	0	
	Propagation Channel		Static propagation condition No external noise sources are applied	
	Antenna configuration		1x2 Low	
NOTE 1: $P_B = 0$ .				
NOTE 2: OCNG is used to fully allocate the available resource blocks to virtual UEs.				
NOTE 3: $N_{\text{MAX\_SF}}$ represents the maximum number of Sidelink UEs transmitting in one subframe. $N_{\text{MAX\_SF}} = 12$ (5 MHz), 25 (10MHz), 37 (15MHz), 50 (10MHz).				
NOTE 4: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE.				
NOTE 5: Frequency offset of Sidelink UE with respect to Cell 1 uplink frequency.				

Table 11.5.1.3-2: Minimum performance

Test num.	Bandwidth	discSupportedProc	Number of configured resource pools	$\hat{E}_s$ at antenna port (dBm/15kHz)	Reference value for Sidelink UE $i=0\dots\text{discSupportedProc}-1$
					Fraction of maximum throughput (%)
1	5 MHz	50	5	-85	95
2	10 MHz	50	2	-85	95
3	15 MHz	50	2	-85	95
4	20 MHz	50	1	-85	95
5	10 MHz	400	16	-85	95
6	15 MHz	400	11	-85	95
7	20 MHz	400	8	-85	95

The normative reference for this requirement is TS 36.101 [2] clause 11.5.1.

## 11.5.1.4 Test Description

### 11.5.1.4.1 Initial Conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range for Cell1, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: Select the test numbers in Table 11.5.1.3-2 corresponding to the max channel bandwidth among the UE supported ProSe operating bands as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure TBD without faders or AWGN source.
2. The parameter settings for the cell are set up according to Table 11.5.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 2A-RF according to TS 36.508 [7] clause 5.2A.1A. Message contents exceptions are defined in clause 11.5.1.4.3.
6. SS continues with the generic procedures described in TS 36.508 [7] clause 4.5.3A.3 and 4.5.4.3 and ensures the UE is in State 4 according to TS 36.508 [7] clause 4.5.4 and the UE test loop Mode D is activated.

### 11.5.1.4.2 Test Procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table TBD. The SS sends downlink MAC padding bits on the DL RMC.
2. SS sends uplink scheduling information via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table TBD. When the UE has no payload data to send, it transmits uplink MAC padding bits on the UL RMC.
3. Set the parameters of bandwidth, propagation condition, antenna configuration and the SNR for cell1 according to Table 11.5.1.3-1.
4. SS transmits PSDCH on each active Sidelink UE as per with SL RMC according to Table 11.5.1.3-1. Set the Sidelink signal level, configured resource pools, bandwidth, antenna configuration according to Table 11.5.1.3-1 and Table 11.5.1.3-2.
5. SS shall transmit an RRCConnectionReconfiguration message to configure DRX. Message contents exceptions are defined in clause 11.5.1.4.3.
6. The UE shall transmit RRCConnectionReconfigurationComplete message.
7. Initialise the variables  $P_{tot}$  and  $P_{ok}$  as 0.
8. SS shall send SL Discovery Packets (MAC padding bits) on the SL RMC for each of the active sidelink for the test time [FFS]. SS stores the number of the transmitted Discovery Packets per sidelink UE in the current test iteration in the variable  $P_{tot}$ .
9. SS shall send (on the available PDSCH) a "UE TEST LOOP PROSE MODE D SIDELINK DIRECT DISCOVERY PACKET COUNTER REQUEST" message and wait for the UE to respond (on the available PUSCH) with a "UE TEST LOOP PROSE MODE D SIDELINK DIRECT DISCOVERY PACKET COUNTER RESPONSE" reporting the received Sidelink direct discovery packet counter value.
10. SS calculates the variable  $P_{ok}$  as (current counter value - counter value at last test iteration).

11. SS shall compute the fraction of maximum throughput as  $100\% * (P_{ok} / P_{tot})$ .

12. Repeat steps 1 to 11 for each subtest as applicable.

#### 11.5.1.4.3 Message Contents

Message contents are according to TS 36.508 [7] clauses TBD with following exceptions:

#### 11.5.1.5 Test Requirement

The fraction of the maximum throughput obtained per active sidelink UE shall meet or exceed the specified value in Table 11.5.1.5-1 for each test number as applicable.

Table 11.5.1.5-1: Test Requirements

Test num.	Bandwidth	discSupportedProc	Number of configured resource pools	$\hat{E}_s$ at antenna port (dBm/15kHz)	Reference value for Sidelink UE $i=0\dots\text{discSupportedProc}-1$
					Fraction of maximum throughput (%)
1	5 MHz	50	5	-85	[95+TT]
2	10 MHz	50	2	-85	[95+TT]
3	15 MHz	50	2	-85	[95+TT]
4	20 MHz	50	1	-85	[95+TT]
5	10 MHz	400	16	-85	[95+TT]
6	15 MHz	400	11	-85	[95+TT]
7	20 MHz	400	8	-85	[95+TT]

## 11.5.2 TDD maximum Sidelink processes test (ProSe Direct Discovery)

Editor's note: This test case is not complete. Following aspects are either missing or not yet determined:

- ProSe UE authentication is not handled in the test case and is still under investigation.
- Test time is FFS.
- Test system uncertainties and test tolerances is TBD
- Connection Diagram is FFS
- UL and DL RMC for cell1 is TBD

### 11.5.2.1 Test Purpose

This test verifies the UE's ability to support maximum number of Sidelink processes by verifying the percentage of the information bit throughput for a specified PSDCH Reference Measurement Channel (RMC) not falling below a specified value.

### 11.5.2.2 Test Applicability

This test case applies to all types of E-UTRA TDD UE release 12 and forward which support ProSe Direct Discovery.

### 11.5.2.3 Minimum Conformance Requirements

The test parameters are specified in Table 11.5.2.3-1. Multiple discovery resource pools are interleaved. Each Sidelink UE transmits in one of the resource pools with 3 retransmissions. The minimum requirements are specified in Table 11.5.1.3-2.

Table 11.5.2.3-1: Test Parameters

Parameter		Unit	Test 1-7	
Discovery resource pool configuration			As specified in Table A.7.1.2-2 (Configuration #2-TDD) with parameters $BW_{\text{Channel}}$ , $N_{\text{Pools}}$ = Number of configured resource pools (as specified in Table 11.5.2-2), and $N = \text{discSupportedProc}$	
DRX configuration			As specified in Table 11.1.2-1	
Active cell(s)			Cell 1 (Serving cell)	
Cell 1	Cyclic prefix		Normal	
	Uplink downlink configuration (NOTE 3)		0	
	Special subframe configuration (NOTE 4)		4	
	Cell ID		0	
	Downlink power allocation	$\rho_A$	dB	0
		$\rho_B$	dB	0 (NOTE 1)
		$\sigma$	dB	0
	OCNG Pattern <sup>NOTE 2</sup>		OP.1 TDD	
	Propagation channel		Static propagation condition No external noise sources are applied	
	Antenna configuration		1x2	
RSRP	dBm/15kHz	-85		
Active Sidelink UE(s)			Sidelink UE $i$ , $i = 0, \dots, \text{discSupportedProc}-1$	
Sidelink UE $i$	Sidelink Transmissions		PSDCH (D.1 TDD)	
	PSDCH Resource pool (NOTE 5)		$\left\lfloor \frac{i}{N_{\text{MAX\_SF}}} \right\rfloor$	
	PSDCH RB allocation (NOTE 5)		PRB pairs $\{2*(i \% N_{\text{MAX\_SF}}), 2*(i \% N_{\text{MAX\_SF}})+1\}$	
	Time offset (NOTE 6)	$\mu\text{s}$	0	
	Frequency offset (NOTE 7)	Hz	0	
	Propagation Channel		Static propagation condition No external noise sources are applied	
	Antenna configuration		1x2 Low	
NOTE 1: $P_B = 0$ .				
NOTE 2: OCNG is used to fully allocate the available resource blocks to virtual UEs.				
NOTE 3: As specified in Table 4.2-2 in TS 36.211 [8].				
NOTE 4: As specified in Table 4.2-1 in TS 36.211 [8].				
NOTE 5: $N_{\text{MAX\_SF}}$ represents the maximum number of Sidelink UEs transmitting in one subframe. $N_{\text{MAX\_SF}} = 12$ (5 MHz), 25 (10MHz), 37 (15MHz), 50 (10MHz).				
NOTE 6: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE.				
NOTE 7: Frequency offset of Sidelink UE with respect to Cell 1 uplink frequency.				

Table 11.5.2.3-2: Minimum performance

Test num.	Bandwidth	discSupportedProc	Number of configured resource pools	$\hat{E}_s$ at antenna port (dBm/15kHz)	Reference value
					Fraction of maximum throughput (%) for Sidelink UE $i=0\dots\text{discSupportedProc}-1$
1	5 MHz	50	5	-85	95
2	10 MHz	50	2	-85	95
3	15 MHz	50	2	-85	95
4	20 MHz	50	1	-85	95
5	10 MHz	400	16	-85	95
6	15 MHz	400	11	-85	95
7	20 MHz	400	8	-85	95

## 11.5.2.4 Test Description

### 11.5.2.4.1 Initial Conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state.

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range for Cell1, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: Select the test numbers in Table 11.5.1.3-2 corresponding to the max channel bandwidth among the UE supported ProSe operating bands as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure TBD without faders or AWGN source.
2. The parameter settings for the cell are set up according to Table 11.5.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 2A-RF according to TS 36.508 [7] clause 5.2A.1A. Message contents exceptions are defined in clause 11.5.1.4.3.
6. SS continues with the generic procedures described in TS 36.508 [7] clause 4.5.3A.3 and 4.5.4.3 and ensures the UE is in State 4 according to TS 36.508 [7] clause 4.5.4 and the UE test loop Mode D is activated.

### 11.5.2.4.2 Test Procedure

1. SS transmits PDSCH via PDCCH DCI format 1A for C\_RNTI to transmit the DL RMC according to Table TBD. The SS sends downlink MAC padding bits on the DL RMC.
2. SS sends uplink scheduling information via PDCCH DCI format 0 for C\_RNTI to schedule the UL RMC according to Table TBD. When the UE has no payload data to send, it transmits uplink MAC padding bits on the UL RMC.
3. Set the parameters of bandwidth, propagation condition, antenna configuration and the SNR for cell1 according to Table 11.5.1.3-1.
4. SS transmits PSDCH on each active Sidelink UE as per with SL RMC according to Table 11.5.1.3-1. Set the Sidelink signal level, configured resource pools, bandwidth, antenna configuration according to Table 11.5.1.3-1 and Table 11.5.1.3-2.

5. SS shall transmit an RRCConnectionReconfiguration message to configure DRX. Message contents exceptions are defined in clause 11.5.1.4.3.
6. The UE shall transmit RRCConnectionReconfigurationComplete message.
7. Initialise the variables  $P_{tot}$  and  $P_{ok}$  as 0.
8. SS shall send SL Discovery Packets (MAC padding bits) on the SL RMC for each of the active sidelink for the test time [FFS]. SS stores the number of the transmitted Discovery Packets per sidelink UE in the current test iteration in the variable  $P_{tot}$ .
9. SS shall send (on the available PDSCH) a “UE TEST LOOP PROSE MODE D SIDELINK DIRECT DISCOVERY PACKET COUNTER REQUEST” message and wait for the UE to respond (on the available PUSCH) with a “UE TEST LOOP PROSE MODE D SIDELINK DIRECT DISCOVERY PACKET COUNTER RESPONSE” reporting the received Sidelink direct discovery packet counter value.
10. SS calculates the variable  $P_{ok}$  as (current counter value - counter value at last test iteration).
11. SS shall compute the fraction of maximum throughput as  $100\% * (P_{ok} / P_{tot})$ .
12. Repeat steps 1 to 11 for each subtest as applicable.

#### 11.5.2.4.3 Message Contents

Message contents are according to TS 36.508 [7] clauses TBD with following exceptions:

**Table 11.5.2.4.3-1: ACTIVATE TEST MODE: TDD PSDCH Single Link Performance for ProSe Direct Discovery**

Derivation Path: 36.508, Table 4.7A-1, condition UE TEST LOOP MODE D

**Table 11.5.2.4.3-2: CLOSE UE TEST LOOP: TDD PSDCH Single Link Performance for ProSe Direct Discovery**

sf2560	0		
}			
shortDRX	Not present		
}			
}			
timeAlignmentTimerDedicated	Sf500		
}			

### 11.5.2.5 Test Requirement

The fraction of the maximum throughput obtained per active sidelink UE shall meet or exceed the specified value in Table 11.5.2.5-1 for each test number as applicable.

**Table 11.5.2.5-1: Test Requirements**

Test num.	Bandwidth	discSupportedProc	Number of configured resource pools	$\hat{E}_s$ at antenna port (dBm/15kHz)	Reference value
					Fraction of maximum throughput (%) for Sidelink UE $i=0\dots\text{discSupportedProc}-1$
1	5 MHz	50	5	-85	[95+TT]
2	10 MHz	50	2	-85	[95+TT]
3	15 MHz	50	2	-85	[95+TT]
4	20 MHz	50	1	-85	[95+TT]
5	10 MHz	400	16	-85	[95+TT]
6	15 MHz	400	11	-85	[95+TT]
7	20 MHz	400	8	-85	[95+TT]

## 12 Performance requirement (ProSe Direct Communication)

This clause contains test method to measure the performance requirements for the Sidelink physical channels specified for ProSe Direct Communication in TS 36.211 [4].

### 12.1 General

#### 12.1.1 Applicability of requirements

The requirements in this clause are applicable to UEs that support ProSe Direct Communication. Test cases defined for 5MHz channel bandwidth are applicable to UEs that support ProSe Direct Communication on only Band 31.

#### 12.1.2 Reference DRX configuration

**Table 12.1.2-1: Reference DRX configuration**

Parameter	Value	Comments
onDurationTimer	psf1	
drx-InactivityTimer	psf1	
drx-RetransmissionTimer	psf1	
longDRX-CycleStartOffset	sf2560, 0	
shortDRX	disabled	
NOTE 1: For further information see clause 6.3.2 in TS 36.331.		

## 12.2 Demodulation of PSSCH

This clause contains test method to measure the PSSCH demodulation performance with a single active PSSCH link.

### 12.2.1 FDD PSSCH Single Link Performance for ProSe Direct communication

**Editor's note: This test case is not complete. Following aspects are either missing or not yet determined:**

- ProSe UE authentication is not handled in the test case and is still under investigation.
- Test time is FFS.
- Test system uncertainties and test tolerances is TBD
- Connection Diagram is FFS
- Test procedure is TBD
- Message contents are TBD
- UL and DL RMC for cell1 is TBD

#### 12.2.1.1 Test Purpose

This test verifies the PSSCH demodulation performance with a single active PSSCH link with a given SNR for which the average BLER remains below a given reference value under different channel conditions.

#### 12.2.1.2 Test Applicability

This test case applies to all types of E-UTRA FDD UE release 12 and forward which support ProSe Direct Communication.

#### 12.2.1.3 Minimum Conformance Requirements

The minimum requirements are specified in Table 12.2.1.3-2 with the test parameters specified in Table 12.2.1.3-1. The receiver UE under test is associated with Cell 1.

Table 12.2.1.3-1: Test Parameters

Parameter		Unit	Test 1
Communication resource pool configuration			As specified in Table A.7.2.1-1 (Configuration #1-FDD)
DRX configuration			As specified in Table 12.1.2-1
$N_{oc}$ at antenna port (NOTE 1)		dBm/15 kHz	-98
Active cell(s)			None
Sidelink UE 1	Sidelink Transmissions		SLSS + PSBCH
	networkControlledSyncTx		ON
	slssid		30
	inCoverage (in MIB-SL)		TRUE
	syncOffsetIndicator		Set same as syncOffsetIndicator1 in Configuration #1-FDD
	Propagation channel		EPA5
	Antenna configuration		1x2 Low
	$\widehat{E}_s$ at antenna port	dBm/15 kHz	-85
Sidelink UE 2	Sidelink Transmissions		PSCCH + PSSCH
	PSCCH RMC		5MHz: CC.3 FDD 10 MHz: CC.4 FDD
	PSCCH subframe allocation		As defined by TS 36.213 with $n_{PSCCH}$ chosen randomly (uniformly) in $[0, \lfloor M_{RB}^{PSCCH\_RP} / 2 \rfloor L_{PSCCH} - 1]$ every sc-period
	PSCCH RB allocation		
	$\widehat{E}_s$ of PSCCH at antenna port	dBm/15 kHz	-85
	PSSCH RMC		As specified in Table 12.2.1-2
	PSSCH subframe allocation		As per time repetition pattern specified in PSCCH
	PSSCH RB allocation		First transmission: Chosen randomly (uniformly) among the allowed RBs as per TS36.213 HARQ retransmission: As per frequency hopping indicated in PSCCH and specified in TS36.213
	Time offset (NOTE 2)	$\mu$ s	+1
	Frequency offset (NOTE 3)	Hz	+200
	Propagation Channel		EVA70
	Antenna configuration		1x2 Low
NOTE 1: Applicable to both DL channel and ProSe Direct Communication Subframes on UL.			
NOTE 2: Time offset of Sidelink UE 2 receive signal timing with respect to Sidelink UE 1 receive signal timing at the tested UE.			
NOTE 3: Frequency offset of Sidelink UE 2 with respect to Sidelink UE 1 transmit frequency.			

Table 11.2.1.3-2: Minimum performance

Test num.	Sidelink UE	Band-width	PSSCH Reference channel	Reference value	
				Fraction of maximum throughput (%) (NOTE 1)	SNR (dB) of PSSCH
1	2	10 MHz	CD.1 FDD	70	-3.4
		5 MHz		70	-3.3
NOTE 1: The throughput is measured after 40 radio frames of lead time during which the test UE detects and synchronizes to Sidelink UE 1					

The normative reference for this requirement is TS 36.101 [2] clause 12.2.1

## 12.2.1.4 Test Description

### 12.2.1.4.1 Initial Conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range for Cell1, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 12.2.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure TBD.
2. The parameter settings for the cell are set up according to Table 12.2.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 4 according to TS 36.508 [7] clause 4.5.4 and UE test loop Mode E is activated on a EUTRA cell. Message contents are defined in clause 12.2.1.4.3.

### 12.2.1.4.2 Test Procedure

TBD

### 12.2.1.4.3 Message Contents

TBD

### 12.2.1.5 Test Requirement

For the parameters specified in Table 12.2.1.3-1 and SNR in Table 12.2.1.5-1, the BLER obtained in step TBD shall be below the test limit in Annex TBD.

**Table 12.2.1.5-1: Test Requirements**

Test num.	Sidelink UE	Band-width	PSSCH Reference channel	Reference value	
				Fraction of maximum throughput (%) (NOTE 1)	SNR (dB) of PSSCH
1	2	10 MHz	CD.1 FDD	70	-3.4+TT
		5 MHz		70	-3.3+TT
NOTE 1: The throughput is measured after 40 radio frames of lead time during which the test UE detects and synchronizes to Sidelink UE 1.					

## 12.3 Demodulation of PSCCH (single link performance)

FFS

## 12.4 Demodulation of PSBCH (single link performance)

FFS

## 12.5 Power imbalance performance with two links

The purpose of this test is to check the demodulation performance when receiving PSSCH transmissions from two Sidelink UEs with power imbalance in one subframe.

### 12.5.1 FDD Power imbalance performance with two links

Editor's note: This test case is not complete. Following aspects are either missing or not yet determined:

- ProSe UE authentication is not handled in the test case and is still under investigation.
- Test time is FFS.
- Test system uncertainties and test tolerances is TBD
- Connection Diagram is FFS
- Test procedure is TBD
- Message contents are TBD

#### 12.5.1.1 Test Purpose

This test verifies the PSSCH demodulation performance from two Sidelink UEs with power imbalance in one subframe

#### 12.5.1.2 Test Applicability

This test case applies to all types of E-UTRA FDD UE release 12 and forward which support ProSe Direct Communication.

#### 12.5.1.3 Minimum Conformance Requirements

The minimum requirements are specified in Table 12.5.1.3-2 with the test parameters specified in Table 12.5.1.3-1. The receiver UE under test is associated with Cell 1.

Table 12.5.1.3-1: Test Parameters

Parameter			Unit	Test 1
Communication resource pool configuration				As specified in Table A.7.2.1-2 (Configuration #2-FDD)
DRX configuration				As specified in Table 12.1.2-1
$N_{oc}$ at antenna port (Note 3)			dBm/15kHz	-98
Active cell(s)				Cell 1 (Serving cell)
Cell 1	Cyclic prefix			Normal
	Cell ID			0
	Downlink power allocation	$\rho_A$	dB	0
		$\rho_B$	dB	0 (NOTE 1)
		$\sigma$	dB	0
	OCNG Pattern (Note 2)			OP.1 FDD
	Propagation channel			AWGN
	Antenna configuration			1x2
RSRP		dBm/15kHz	-92	
Active Sidelink UE(s)				Sidelink UE 1, Sidelink UE 2
Sidelink UE 1	Sidelink Transmissions			PSCCH + PSSCH
	PSCCH RMC			5 MHz: CC.1 FDD 10 MHz: CC.2 FDD
	PSCCH subframe allocation			$n_{PSCCH} = 0$ (as defined in TS 36.213)
	PSCCH RB allocation			
	$\widehat{E}_s$ of PSCCH at antenna port		dBm/15kHz	-85
	PSSCH RMC			As specified in Table 12.5.1-2
	PSSCH subframe allocation			As per time repetition pattern specified in PSCCH
	PSSCH RB allocation			PRB pairs {4, 5}
	Time offset (NOTE 4)		$\mu$ s	0
	Frequency offset (NOTE 5)		Hz	0
	Propagation Channel			AWGN
Antenna configuration			1x2 Low	
Sidelink UE 2	Sidelink Transmissions			PSCCH + PSSCH
	PSCCH RMC			5 MHz: CC.1 FDD 10 MHz: CC.2 FDD
	PSCCH subframe allocation			$n_{PSCCH} = 2$ (as defined in TS 36.213)
	PSCCH RB allocation			
	$\widehat{E}_s$ of PSCCH at antenna port		dBm/15kHz	-85
	PSSCH RMC			As specified in Table 12.5.1-2
	PSSCH subframe allocation			As per time repetition pattern specified in PSCCH
	PSSCH RB allocation			PRB pairs {6, 7}
	Time offset (NOTE 4)		$\mu$ s	0
	Frequency offset (NOTE 5)		Hz	0
	Propagation Channel			AWGN
Antenna configuration			1x2 Low	
NOTE 1: $P_B = 0$ .				
NOTE 2: OCNG is used to fully allocate the available resource blocks to virtual UEs.				
NOTE 3: Applicable to both DL channel and ProSe Direct Communication Subframes on UL.				
NOTE 4: The power of PSCCH is set high to ensure reliable reception of PSCCH.				
NOTE 4: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE.				
NOTE 5: Frequency offset of Sidelink UE with respect to Cell 1 uplink frequency.				

**Table 12.5.1.3-2: Minimum performance**

Test num.	Band-width	Sidelink UE	PSSCH Reference channel	Reference value	
				Fraction of maximum throughput (%)	SNR (dB) of PSSCH
1	5 / 10 MHz	1	CD.5 FDD	(NOTE 1)	24.35
		2	CD.5 FDD	70	2.4
NOTE 1: There is no throughput requirement for Sidelink UE 1.					

The normative reference for this requirement is TS 36.101 [2] clause 12.5.1

## 12.5.1.4 Test Description

### 12.5.1.4.1 Initial Conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range for Cell1, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 12.5.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure TBD.
2. The parameter settings for the cell are set up according to Table 12.5.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.
5. Ensure the UE is in State 3A-RF according to TS 36.508 [7] clause 5.2A.2. Message contents are defined in clause 12.5.1.4.3.

### 12.5.1.4.2 Test Procedure

TBD

### 12.5.1.4.3 Message Contents

TBD

## 12.5.1.5 Test Requirement

For the parameters specified in Table 12.5.1.3-1 and SNR in Table 12.5.1.5-1, the BLER obtained in step TBD shall be below the test limit in Annex TBD.

**Table 12.5.1.5-1: Test Requirements**

Test num.	Band-width	Sidelink UE	PSSCH Reference channel	Reference value	
				Fraction of maximum throughput (%)	SNR (dB) of PSSCH
1	5 / 10 MHz	1	CD.5 FDD	(NOTE 1)	24.35+TT
		2	CD.5 FDD	70	2.4+TT
NOTE 1: There is no throughput requirement for Sidelink UE 1.					

## 12.6 Multiple timing reference test

FFS

## 12.7 Maximum Sidelink processes test

The purpose of this test is to verify the maximum number of Sidelink processes and the maximum number of bits per TTI supported by the UE.

### 12.7.1 FDD Maximum Sidelink Processes for ProSe Direct communication

**Editor's note: This test case is not complete. Following aspects are either missing or not yet determined:**

- ProSe UE authentication is not handled in the test case and is still under investigation.
- Test time is FFS.
- Test system uncertainties and test tolerances is TBD
- Connection Diagram is FFS
- Test procedure is TBD
- Message contents are TBD
- UL and DL RMC for cell1 is TBD

#### 12.7.1.1 Test Purpose

This test verifies the PSSCH demodulation performance with a single active PSSCH link with a given SNR for which the average BLER remains below a given reference value under different channel conditions.

#### 12.7.1.2 Test Applicability

This test case applies to all types of E-UTRA FDD UE release 12 and forward which support ProSe Direct Communication.

#### 12.7.1.3 Minimum Conformance Requirements

The minimum requirements are specified in Table 12.7.1.3-2 with the test parameters specified in Table 12.7.1.3-1. The receiver UE under test is associated with Cell 1.

**Table 12.7.1.3-1: Test Parameters**

Parameter		Unit	Test 1	
Communication resource pool configuration			As specified in Table A.7.2.1-4 (Configuration #4-FDD)	
DRX configuration			As specified in Table 12.1.2-1	
Active cell(s)			Cell 1 (Serving cell)	
Cell 1	Cyclic prefix		Normal	
	Cell ID		0	
	Downlink power allocation	$\rho_A$	dB	0
		$\rho_B$	dB	0 (NOTE 1)
		$\sigma$	dB	0
	OCNG Pattern (Note 2)			OP.1 FDD
	Propagation channel			Static propagation condition No external noise sources are applied
	Antenna configuration			1x2
RSRP		dBm/15kHz	-85	

Active Sidelink UE(s)		Sidelink UE $i$ , $0 \leq i \leq 15$	
Sidelink UE $i$ , $0 \leq i \leq 15$	Sidelink Transmissions	PSCCH + PSSCH	
	Resource pool	$commRxPool(\lfloor \frac{i}{8} \rfloor)$	
	PSCCH RMC	5MHz: CC.1 FDD with $I_{TRP}=i\%8$ (NOTE 3) 10 MHz: CC.2 FDD with $I_{TRP}=i\%8$ (NOTE 3)	
	PSCCH subframe allocation	As defined by TS 36.213 with $n_{PSCCH} = i$	
	PSCCH RB allocation		
	PSSCH RMC	As specified in Table 12.7.1-2	
	PSSCH subframe allocation	As per time repetition pattern specified in PSCCH	
	PSSCH RB allocation	Fully allocated	
	Time offset (NOTE 4)	$\mu\text{s}$	0
	Frequency offset (NOTE 5)	Hz	0
	Propagation Channel		Static propagation condition No external noise sources are applied
	Antenna configuration		1x2 Low

NOTE 1:  $P_B = 0$ .

NOTE 2: OCNG is used to fully allocate the available resource blocks to virtual UEs.

NOTE 3: For  $N_{TRP} = 8$  (FDD) and  $trpt-Subset = 001$ ,  $I_{TRP} = 0$  corresponds to a time repetition pattern of (1,0,0,0,0,0,0,0),  $I_{TRP} = 1$  corresponds to a time repetition pattern of (0,1,0,0,0,0,0,0), etc.

NOTE 4: Time offset of Sidelink UE receive signal with respect to Cell 1 downlink timing at the tested UE.

NOTE 5: Frequency offset of Sidelink UE with respect to Cell 1 uplink frequency.

Table 12.7.1.3-2: Minimum performance

Test num.	Bandwidth	PSCCH Reference channel	$\hat{E}_s$ at antenna port (dBm/15kHz)	Reference value for Sidelink UE $i=0..15$
				Fraction of maximum throughput (%)
1	10 MHz	CD.7 FDD	-85	95
	5 MHz	CD.6 FDD	-85	95

The normative reference for this requirement is TS 36.101 [2] clause 12.7.1

## 12.7.1.4 Test Description

### 12.7.1.4.1 Initial Conditions

Initial conditions are a set of test configurations the UE needs to be tested in and the steps for the SS to take with the UE to reach the correct measurement state

Configurations of PDSCH and PDCCH before measurement are specified in Annex C.2.

Test Environment: Normal, as defined in TS 36.508 [7] clause 4.1.

Frequencies to be tested: Mid Range for Cell1, as defined in TS 36.508 [7] clause 4.3.1.1.

Channel Bandwidths to be tested: As specified per test number in Table 11.2.1.3-2 as defined in TS 36.508 [7] clause 4.3.1.1

1. Connect the SS, the faders and AWGN noise source to the UE antenna connectors as shown in TS 36.508 [7] Annex A, Figure TBD.
2. The parameter settings for the cell are set up according to Table 12.7.1.3-1.
3. Downlink signals are initially set up according to Annex C.0, C.1 and C.3.2, and uplink signals according to Annex H.1 and H.3.2.
4. Propagation conditions are set according to Annex B.0.

5. Ensure the UE is in State 4 according to TS 36.508 [7] clause 4.5.4 and UE test loop Mode E is activated on a EUTRA cell. Message contents are defined in clause 11.2.1.4.3.

#### 12.7.1.4.2 Test Procedure

TBD

#### 12.7.1.4.3 Message Contents

TBD

#### 12.7.1.5 Test Requirement

For the parameters specified in Table 12.7.1.3-1 and SNR in Table 12.7.1.5-1, the BLER obtained in step TBD shall be below the test limit in Annex TBD.

**Table 12.7.1.5-1: Test Requirements**

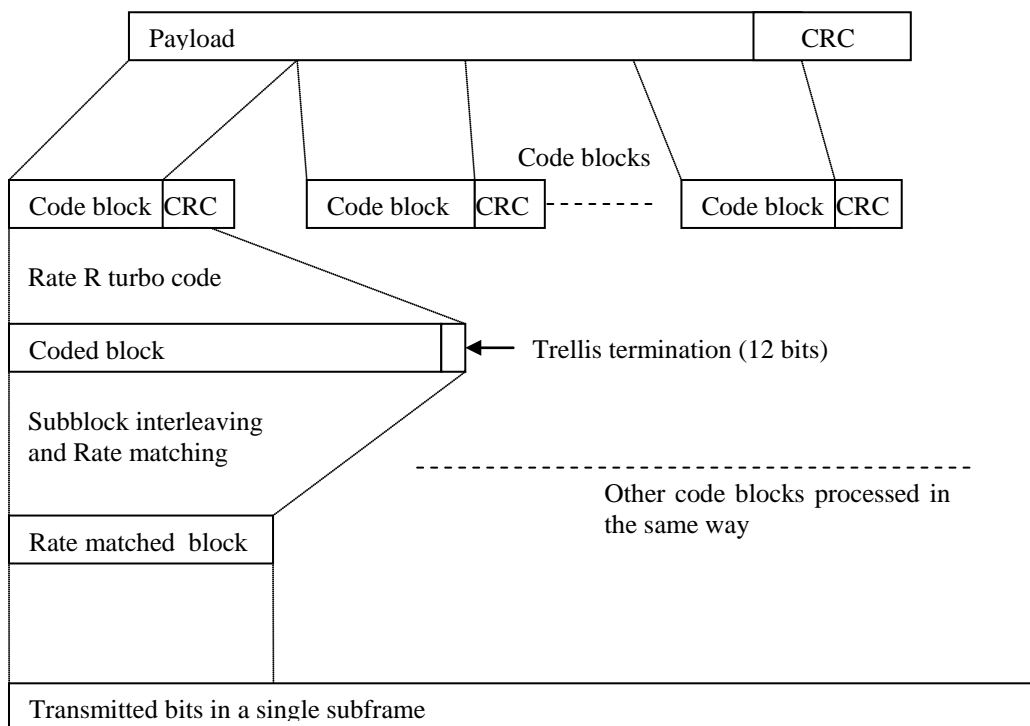

Test num.	Bandwidth	PSCCH Reference channel	$\hat{E}_s$ at antenna port (dBm/15kHz)	Reference value for Sidelink UE i=0...15
				Fraction of maximum throughput (%)
1	10 MHz	CD.7 FDD	-85+TT	95
	5 MHz	CD.6 FDD	-85+TT	95

# Annex A (normative): Measurement Channels

## A.1 General

A schematic overview of the encoding process for the reference measurement channels is provided in Figure A-1.

**Figure A-1: Schematic overview of the encoding process**

The throughput values defined in the measurement channels specified in Annex A, are calculated and are valid per data stream (codeword). For multi-stream (more than one codeword) transmissions, the throughput referenced in the minimum requirements is the sum of throughputs of all data streams (codewords).

The UE category entry in the definition of the reference measurement channels in Annex A is only informative and reveals the UE categories, which can support the corresponding measurement channel. Whether the measurement channel is used for testing a certain UE category or not is specified in the individual test cases.

Rate matching process in Figure A-1 is dependent on the parameter “Total number of Soft Channel bits” which has been defined for each UE category in TS 36.306 [15] clause 4.1. The SS shall use the Soft Channel bits size according to the UE category.

## A.2 UL reference measurement channels

### A.2.1 General

#### A.2.1.1 Applicability and common parameters

The following sections define the UL signal applicable to the Transmitter Characteristics (clause 6) and for the Receiver Characteristics (clause 7) where the UL signal is relevant.

The Reference channels in this section assume transmission of PUSCH and Demodulation Reference signal only. The following conditions apply:

- 1 HARQ transmission
- Cyclic Prefix normal
- PUSCH hopping off
- Link adaptation off
- Demodulation Reference signal as per TS 36.211 [8] clause 5.5.2.1.2.

Where ACK/NACK is transmitted, it is assumed to be multiplexed on PUSCH as per TS 36.212 [9] subclause 5.2.2.6.

- ACK/NACK 1 bit
- ACK/NACK mapping adjacent to Demodulation Reference symbol
- ACK/NACK resources punctured into data
- Max number of resources for ACK/NACK: 4 SC-FDMA symbols per subframe
- No CQI transmitted, no RI transmitted

#### A.2.1.2 Determination of payload size

The algorithm for determining the payload size  $A$  is as follows; given a desired coding rate  $R$  and radio block allocation  $N_{RB}$ :

1. Calculate the number of channel bits  $N_{ch}$  that can be transmitted during the first transmission of a given sub-frame.
2. Find  $A$  such that the resulting coding rate is as close to  $R$  as possible, that is,

$$\min \left| R - (A + 24 * (N_{CB} + 1)) / N_{ch} \right|, \text{ where } N_{CB} = \begin{cases} 0, & \text{if } C = 1 \\ C, & \text{if } C > 1 \end{cases}$$

subject to

- a)  $A$  is a valid TB size according to clause 7.1.7 of TS 36.213 [10] assuming an allocation of  $N_{RB}$  resource blocks.
  - b)  $C$  is the number of Code Blocks calculated according to section 5.1.2 of TS 36.212 [9].
  - c) For RMC-s, which at the nominal target coding rate do not cover all the possible UE categories for the given modulation, reduce the target coding rate gradually (within the same modulation), until the maximal possible number of UE categories is covered.
3. If there is more than one  $A$  that minimises the equation above, then the larger value is chosen per default and the chosen code rate should not exceed 0.93.

### A.2.1.3 Overview of UL reference measurement channels

In Table A.2.1.3-1 are listed the UL reference measurement channels specified in annexes A.2.2 and A.2.3 of this release of TS 36.521-1. This table is informative and serves only to a better overview. The reference for the concrete reference measurement channels and corresponding implementation's parameters as to be used for testing are annexes A.2.2 and A.2.3 as appropriate.

**Table A.2.1.3-1: Overview of UL reference measurement channels**

## A.2.2 Reference measurement channels for FDD

### A.2.2.1 Full RB allocation

#### A.2.2.1.1 QPSK

**Table A.2.2.1.1-1: Reference Channels for QPSK with full RB allocation**

Parameter	Unit	Value					
		1.4	3	5	10	15	20
Channel bandwidth	<b>MHz</b>	1.4	3	5	10	15	20
Allocated resource blocks		6	15	25	50	75	100
DFT-OFDM Symbols per Sub-Frame		12	12	12	12	12	12
Modulation		QPSK	QPSK	QPSK	QPSK	QPSK	QPSK
Target Coding rate		1/3	1/3	1/3	1/3	1/5	1/6
Payload size	Bits	600	1544	2216	5160	4392	4584
Transport block CRC	Bits	24	24	24	24	24	24
Number of code blocks per Sub-Frame (Note 1)		1	1	1	1	1	1
Total number of bits per Sub-Frame (Note 1)	Bits	1728	4320	7200	14400	21600	28800
Total symbols per Sub-Frame		864	2160	3600	7200	10800	14400
UE Category		≥ 1	≥ 1	≥ 1	≥ 1	≥ 1	≥ 1
Note 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)							

**Table A.2.2.1.1-1a: Reference Channels for QPSK with full/maximum RB allocation for UE category 0**

Parameter	Unit	Value					
		1.4	3	5	10	15	20
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks		6	15	25	[36]	[36]	[36]
DFT-OFDM Symbols per Sub-Frame		12	12	12	12	12	12
Modulation		QPSK	QPSK	QPSK	QPSK	QPSK	QPSK
Target Coding rate		1/3	1/5	1/8	[1/10]	[1/10]	[1/10]
Payload size	Bits	600	872	904	[1000]	[1000]	[1000]
Transport block CRC	Bits	24	24	24	24	24	24
Number of code blocks per Sub-Frame		1	1	1	1	1	1
Total number of bits per Sub-Frame	Bits	1728	4320	7200	[1036 8]	[1036 8]	[1036 8]
Total symbols per Sub-Frame		864	2160	3600	[5184]	[5184]	[5184]
UE Category		0	0	0	0	0	0
NOTE 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).							
NOTE 2: For HD-FDD UE, the uplink subframes are scheduled at the 4th, 5th, 6th, 12th, 13th, 14th, 20th, 21st, 22nd, 28th, 29th, 30th, 36th, 37th, and 38th subframes every 40ms. Information bit payload is available if uplink subframe is scheduled.							

**Table A.2.2.1-1b: Reference Channels for QPSK with full/maximum RB allocation for UE category M1**

Parameter	Unit	Value					
		1.4	3	5	10	15	20
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks		6	6	6	6	6	6
DFT-OFDM Symbols per Sub-Frame		12	12	12	12	12	12
Modulation		QPSK	QPSK	QPSK	QPSK	QPSK	QPSK
Target Coding rate		1/3	1/3	1/3	1/3	1/3	1/3

Transport block CRC	Bits	24	24	24	24	24	24
Number of code blocks per Sub-Frame		1	1	1	1	1	1
Total number of bits per Sub-Frame	Bits	2880	2880	2880	2880	2880	2880
Total symbols per Sub-Frame		720	720	720	720	720	720
UE Category		M1	M1	M1	M1	M1	M1
NOTE 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)							
NOTE 2: For HD-FDD UE, the uplink subframes are scheduled at the 4th, 5th, 6th, 12th, 13th, 14th, 20th, 21st, 22nd, 28th, 29th, 30th, 36th, 37th, and 38th subframes every 40ms. Information bit payload is available if uplink subframe is scheduled.							

### A.2.2.1.3 64-QAM

**Table A.2.2.1.3-1: Reference Channels for 64-QAM with full RB allocation**

Parameter	Unit	Value					
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks		6	15	25	50	75	100
DFT-OFDM Symbols per Sub-Frame		12	12	12	12	12	12
Modulation		64QAM	64QAM	64QAM	64QAM	64QAM	64QAM
Target Coding rate		3/4	3/4	3/4	3/4	3/4	3/4
Payload size	Bits	3752	9528	15840	31704	46888	63776
Transport block CRC	Bits	24	24	24	24	24	24
Number of code blocks per Sub-Frame (Note 1)		1	2	3	6	8	11
Total number of bits per Sub-Frame	Bits	5184	12960	21600	43200	64800	86400
Total symbols per Sub-Frame		864	2160	3600	7200	10800	14400
UE Category (Note 2)		5,8	5,8	5,8	5,8	5,8	5,8
UE UL Category (Note 2)		5, 8, 13, 14	5, 8, 13, 14	5, 8, 13, 14	5, 8, 13, 14	5, 8, 13, 14	5, 8, 13, 14
Note 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)							
Note2: If UE does not report UE UL category, then the applicability of reference channel is determined by UE category. If UE reports UE UL category, then the applicability of reference channel is determined by UE UL category.							

### A.2.2.2 Partial RB allocation

For each channel bandwidth, various partial RB allocations are specified. The number of allocated RBs is chosen according to values specified in the Tx and Rx requirements. The single allocated RB case is included.

The allocated RBs are contiguous and start from one end of the channel bandwidth. A single allocated RB is at one end of the channel bandwidth.

## A.2.2.2.1 QPSK

Table A.2.2.2.1-1: Reference Channels for QPSK with partial RB allocation

Parameter	Ch BW	Allocated RBs	DFT-OFDM Symbols per Sub-Frame	Mod'n	Target Coding rate	Payload size	Transport block CRC	Number of code blocks per Sub-Frame (Note 1)	Total number of bits per Sub-Frame	Total symbols per Sub-Frame	UE Category
Unit	MHz					Bits	Bits		Bits		
	1.4 - 20	1	12	QPSK	1/3	72	24	1	288	144	≥ 1
	1.4 - 20	2	12	QPSK	1/3	176	24	1	576	288	≥ 1

												14
	20	96	12	64QAM	3/4	61664	24	11	82944	13824	5,8	5, 8, 13, 14
Note 1:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)											
Note 2 :	If UE does not report UE UL category, then the applicability of reference channel is determined by UE category. If UE reports UE UL category, then the applicability of reference channel is determined by UE UL category.											

### A.2.2.3 Reference measurement channels for sustained downlink data rate provided by lower layers

**Table A.2.2.3-1: Uplink Reference Channels for sustained data-rate test (FDD)**

Parameter	Unit	Value					
		R.1-1 FDD	R.1-2 FDD	R.1-3 FDD	R.1-3A FDD	R.1-4 FDD	R.1-4B FDD
Reference Channel							
Channel Bandwidth	MHz	10	10	20	10	20	15
Allocated Resource Blocks		40 (Note 2)	40 (Note 2)	90 (Note 3)	40(Note 2)	90 (Note 3)	60 (Note 4)
Allocated Sub-Frames per Radio-Frame		10	10	10	10	10	10
DFT-OFDM Symbols per Sub-Frame		12	12	12	12	12	12
Modulation		QPSK	QPSK	QPSK	QPSK	QPSK	QPSK
Coding Rate		0.31	0.31	0.31	0.31	0.31	0.31
Information Bit Payload per Sub-Frame	Bits	3496	3496	7992	3496	7992	5352
Number of Code Blocks per Sub-Frame (Note 1)		1	1	2	1	2	2
Modulation Symbols per Sub-Frame		5760	5760	12960	5760	12960	5760
Binary Channel Bits per Sub-Frame		11520	11520	25920	11520	25920	17260
Max Throughput over 1 Radio-Frame	Mbps	3.496	3.496	7.992	3.496	7.992	5.352
UE Category		≥ 1	≥ 1	≥ 2	≥ 1	≥ 2	≥ 1
Note 1:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)						
Note 2:	RB-s 5-44 allocated with PUSCH.						
Note 3:	RB-s 5-94 allocated with PUSCH.						
Note 4:	RB-s 7-66 allocated with PUSCH.						

### A.2.3 Reference measurement channels for TDD

For TDD the measurement channel is based on DL/UL configuration ratio of 2DL:2UL.

## A.2.3.1 Full RB allocation

## A.2.3.1.1 QPSK

Table A.2.3.1.1-1: Reference Channels for QPSK with full RB allocation

Parameter	Unit	Value					
		1.4	3	5	10	15	20
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks		6	15	25	50	75	100
Uplink-Downlink Configuration (Note 2)		1	1	1	1	1	1
DFT-OFDM Symbols per Sub-Frame		12	12	12	12	12	12
Modulation		QPSK	QPSK	QPSK	QPSK	QPSK	QPSK
Target Coding rate		1/3	1/3	1/3	1/3	1/5	1/6
Payload size							
For Sub-Frame 2,3,7,8	Bits	600	1544	2216	5160	4392	4584
Transport block CRC	Bits	24	24	24	24	24	24
Number of code blocks per Sub-Frame (Note 1)		1	1	1	1	1	1
Total number of bits per Sub-Frame							
For Sub-Frame 2,3,7,8	Bits	1728	4320	7200	14400	21600	28800
Total symbols per Sub-Frame							
For Sub-Frame 2,3,7,8		864	2160	3600	7200	10800	14400
UE Category		≥ 1	≥ 1	≥ 1	≥ 1	≥ 1	≥ 1
Note 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)							
Note 2: As per Table 4.2-2 in TS 36.211 [8]							

Table A.2.3.1.1-1a: Reference Channels for QPSK with full/maximum RB allocation for UE UL category 0

Parameter	Unit	Value					
		1.4	3	5	10	15	20
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks		6	15	25	[36]	[36]	[36]
Uplink-Downlink Configuration (Note 2)		1	1	1	1	1	1
DFT-OFDM Symbols per Sub-Frame		12	12	12	12	12	12
Modulation		QPSK	QPSK	QPSK	QPSK	QPSK	QPSK
Target Coding rate		1/3	1/5	1/8	[1/10]	[1/10]	[1/10]
Payload size							
For Sub-Frame 2,3,7,8	Bits	600	872	904	[1000]	[1000]	[1000]
Transport block CRC	Bits	24	24	24	24	24	24
Number of code blocks per Sub-Frame (Note 1)							
For Sub-Frame 2,3,7,8		1	1	1	1	1	1
Total number of bits per Sub-Frame							
For Sub-Frame 2,3,7,8	Bits	1728	4320	7200	[10368]	[10368]	[10368]
Total symbols per Sub-Frame							
For Sub-Frame 2,3,7,8		864	2160	3600	[5184]	[5184]	[5184]
UE Category		0	0	0	0	0	0
NOTE 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)							
NOTE 2: As per Table 4.2-2 in TS 36.211 [8]							

**Table A.2.3.1.1-1b: Reference Channels for QPSK with full/maximum RB allocation for UE UL category M1**

Parameter	Unit	Value					
		1.4	3	5	10	15	20
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks		6	6	6	6	6	6
Uplink-Downlink Configuration (Note 2)		1	1	1	1	1	1
DFT-OFDM Symbols per Sub-Frame		12	12	12	12	12	12
Modulation		QPSK	QPSK	QPSK	QPSK	QPSK	QPSK
Target Coding rate		1/3	1/3	1/3	1/3	1/3	1/3
Payload size							
For Sub-Frame 2,3,7,8	Bits	600	600	600	600	600	600
Transport block CRC	Bits	24	24	24	24	24	24
Number of code blocks per Sub-Frame (Note 1)							
For Sub-Frame 2,3,7,8		1	1	1	1	1	1
Total number of bits per Sub-Frame							
For Sub-Frame 2,3,7,8	Bits	1728	1728	1728	1728	1728	1728
Total symbols per Sub-Frame							
For Sub-Frame 2,3,7,8		864	864	864	864	864	864
UE Category		M1	M1	M1	M1	M1	M1
NOTE 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)							
NOTE 2: As per Table 4.2-2 in TS 36.211							

## A.2.3.1.2 16-QAM

**Table A.2.3.1.2-1: Reference Channels for 16-QAM with full RB allocation**

Parameter	Unit	Value					
		1.4	3	5	10	15	20
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks		6	15	25	50	75	100
Uplink-Downlink Configuration (Note 2)		1	1	1	1	1	1
DFT-OFDM Symbols per Sub-Frame		12	12	12	12	12	12
Modulation		16QAM	16QAM	16QAM	16QAM	16QAM	16QAM
Target Coding rate		3/4	1/2	1/3	3/4	1/2	1/3
Payload size							
For Sub-Frame 2,3,7,8	Bits	2600	4264	4968	21384	21384	19848
Transport block CRC	Bits	24	24	24	24	24	24
Number of code blocks - C		1	1	1	4	4	4
Total number of bits per Sub-Frame							
For Sub-Frame 2,3,7,8	Bits	3456	8640	14400	28800	43200	57600
Total symbols per Sub-Frame							
For Sub-Frame 2,3,7,8		864	2160	3600	7200	10800	14400
UE Category		≥ 1	≥ 1	≥ 1	≥ 2	≥ 2	≥ 2
Note 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)							
Note 2: As per Table 4.2-2 in TS 36.211 [8]							

**Table A.2.3.1.2-1a: Reference Channels for 16-QAM with maximum RB allocation for UE UL category 0**

Parameter	Unit	Value					
		1.4	3	5	10	15	20
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks		5	5	5	5	5	5
Uplink-Downlink Configuration (Note 2)		1	1	1	1	1	1
DFT-OFDM Symbols per Sub-Frame		12	12	12	12	12	12
Modulation		16QAM	16QAM	16QAM	16QAM	16QAM	16QAM
Target Coding rate		1/3	1/3	1/3	1/3	1/3	1/3
Payload size							
For Sub-Frame 2,3,7,8	Bits	872	872	872	872	872	872
Transport block CRC	Bits	24	24	24	24	24	24
Number of code blocks per Sub-Frame (Note 1)							
For Sub-Frame 2,3,7,8		1	1	1	1	1	1
Total number of bits per Sub-Frame							
For Sub-Frame 2,3,7,8	Bits	2880	2880	2880	2880	2880	2880
Total symbols per Sub-Frame							
For Sub-Frame 2,3,7,8		720	720	720	720	720	720
UE Category		0	0	0	0	0	0
NOTE 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)							
NOTE 2: As per Table 4.2-2 in TS 36.211 [8]							

**Table A.2.3.1.2-1b: Reference Channels for 16-QAM with maximum RB allocation for UE UL category M1**

Parameter	Unit	Value					
		1.4	3	5	10	15	20
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks		5	5	5	5	5	5
Uplink-Downlink Configuration (Note 2)		1	1	1	1	1	1
DFT-OFDM Symbols per Sub-Frame		12	12	12	12	12	12
Modulation		16QAM	16QAM	16QAM	16QAM	16QAM	16QAM
Target Coding rate		1/3	1/3	1/3	1/3	1/3	1/3
Payload size							
For Sub-Frame 2,3,7,8	Bits	872	872	872	872	872	872
Transport block CRC	Bits	24	24	24	24	24	24
Number of code blocks per Sub-Frame (Note 1)							
For Sub-Frame 2,3,7,8		1	1	1	1	1	1
Total number of bits per Sub-Frame							
For Sub-Frame 2,3,7,8	Bits	2880	2880	2880	2880	2880	2880
Total symbols per Sub-Frame							
For Sub-Frame 2,3,7,8		720	720	720	720	720	720
UE Category		M1	M1	M1	M1	M1	M1
NOTE 1: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)							
NOTE 2: As per Table 4.2-2 in TS 36.211[4]							

## A.2.3.1.3 64-QAM

Table A.2.3.1.3-1 Reference Channels for 64-QAM with full RB allocation

Parameter	Unit	Value					
		1.4	3	5	10	15	20
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks		6	15	25	50	75	100
Uplink-Downlink Configuration (Note 2)		1	1	1	1	1	1
DFT-OFDM Symbols per Sub-Frame		12	12	12	12	12	12
Modulation		64QAM	64QAM	64QAM	64QAM	64QAM	64QAM
Target Coding rate		3/4	3/4	3/4	3/4	3/4	3/4
Payload size							
For Sub-Frame 2,3,7,8	Bits	3752	9528	15840	31704	46888	63776
Transport block CRC	Bits	24	24	24	24	24	24
Number of code blocks per Sub-Frame (Note 1)							
For Sub-Frame 2,3,7,8		1	2	3	6	8	11
Total number of bits per Sub-Frame							
For Sub-Frame 2,3,7,8	Bits	5184	12960	21600	43200	64800	86400
Total symbols per Sub-Frame							
For Sub-Frame 2,3,7,8		864	2160	3600	7200	10800	14400
UE Category (Note 3)		5,8	5,8	5,8	5,8	5,8	5,8
UE UL Category (Note 3)		5, 8, 13, 14	5, 8, 13, 14	5, 8, 13, 14	5, 8, 13, 14	5, 8, 13, 14	5, 8, 13, 14
Note 1:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)						
Note 2:	As per Table 4.2-2 in TS 36.211 [4]						
Note 3:	If UE does not report UE UL category, then the applicability of reference channel is determined by UE category. If UE reports UE UL category, then the applicability of reference channel is determined by UE UL category.						

## A.2.3.2 Partial RB allocation

For each channel bandwidth, various partial RB allocations are specified. The number of allocated RBs is chosen according to values specified in the Tx and Rx requirements. The single allocated RB case is included.

The allocated RBs are contiguous and start from one end of the channel bandwidth. A single allocated RB is at one end of the channel bandwidth.

## A.2.3.2.1 QPSK

Table A.2.3.2.1-1: Reference Channels for QPSK with partial RB allocation

Parameter	Ch BW	Allocated RBs	UDL Configuration (Note 2)	DFT-OFDM Symbols per Sub-Frame	Mod'n	Target Coding rate	Payload size for Sub-Frame 2, 3, 7, 8	Transport block CRC	Number of code blocks per Sub-Frame (Note 1)	Total number of bits per Sub-Frame for Sub-Frame 2, 3, 7, 8	Total symbols per Sub-Frame for Sub-Frame 2, 3, 7, 8	UE Category
Unit	MHz						Bits	Bits		Bits		
	1.4-20	1	1	12	QPSK	1/3	72	24	1	288	144	≥ 1
	1.4-20	2	1	12	QPSK	1/3	176	24	1	576	288	≥ 1

Note 1:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)											
Note 2:	As per Table 4.2-2 in TS 36.211 [4].											
Note 3:	If UE does not report UE UL category, then the applicability of reference channel is determined by UE category. If UE reports UE UL category, then the applicability of reference channel is determined by UE UL category.											

### A.2.3.3 Reference measurement channels for sustained downlink data rate provided by lower layers

**Table A.2.3.3-1: Uplink Reference Channels for sustained data-rate test (TDD)**

Parameter	Unit	Value					
		R.1-1 TDD	R.1-2 TDD	R.1-3 TDD	R.1-3B TDD	R.1-4 TDD	R.1-5 TDD
Reference Channel							
Channel Bandwidth	MHz	10	10	20	15	20	10
Uplink-Downlink Configuration (Note 2)		5	5	5	1	1	1
Allocated Resource Blocks		40 (Note 3)	40 (Note 3)	90 (Note 5)	60 (Note 4)	90 (Note 5)	40 (Note 3)
Allocated Sub-Frames per Radio-Frame		1	1	1	1	1	1
DFT-OFDM Symbols per Sub-Frame		12	12	12	12	12	12
Modulation		QPSK	QPSK	QPSK	QPSK	QPSK	QPSK
Coding Rate							
For Sub-Frame 2		0.43	0.61	0.49	0.42	0.49	0.61
For Sub-Frame 3,7,8		n/a	n/a	n/a	0.42	0.49	0.61
Information Bit Payload per Sub-Frame	Bits						
For Sub-Frame 2		4968	6968	12576	7224	12576	6968
For Sub-Frame 3,7,8		0	0	0	7224	12576	6968
Number of Code Blocks per Sub-Frame (Note 1)							
For Sub-Frame 2		1	2	3	2	3	2
For Sub-Frame 3,7,8		0	0	0	2	3	2
Modulation Symbols per Sub-Frame							
For Sub-Frame 2		5760	5760	12960	8640	10240	5760
For Sub-Frame 3,7,8		0	0	0	8640	10240	5760
Binary Channel Bits per Sub-Frame							
For Sub-Frame 2		11520	11520	25920	17280	25920	11520
For Sub-Frame 3,7,8		n/a	n/a	n/a	17280	25920	11520
Max Throughput over 1 Radio-Frame	Mbps	0.4968	0.6968	1.2576	2.8896	5.0304	2.7872
UE Category		≥ 1	≥ 2	≥ 2	≥ 2	≥ 2	≥ 2
Note 1:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)						
Note 2:	As per Table 4.2-2 in TS 36.211 [8]						
Note 3:	RB-s 5-44 allocated with PUSCH.						
Note 4:	RB-s 7-66 allocated with PUSCH.						
Note 5:	RB-s 5-94 allocated with PUSCH.						

## A.3 DL reference measurement channels

### A.3.1 General

The number of available channel bits varies across the sub-frames due to PBCH and PSS/SSS overhead. The payload size per sub-frame is varied in order to keep the code rate constant throughout a frame.

No user data is scheduled on subframes #5 in order to facilitate the transmission of system information blocks (SIB).

The algorithm for determining the payload size  $A$  is as follows; given a desired coding rate  $R$  and radio block allocation  $N_{RB}$

1. Calculate the number of channel bits  $N_{ch}$  that can be transmitted during the first transmission of a given sub-frame.
2. Find  $A$  such that the resulting coding rate is as close to  $R$  as possible, that is,

$$\min |R - (A + 24 * (N_{CB} + 1)) / N_{ch}|, \text{ where } N_{CB} = \begin{cases} 0, & \text{if } C = 1 \\ C, & \text{if } C > 1 \end{cases},$$

subject to

- a)  $A$  is a valid TB size (according to TS 36.213 [10] clause 7.1.7) assuming an allocation of  $N_{RB}$  resource blocks
- b)  $C$  is the number of Code Blocks calculated according to section 5.1.2 of TS 36.212 [9].
3. If there is more than one  $A$  that minimizes the equation above, then the larger value is chosen per default and the chosen code rate should not exceed 0.93.
4. For TDD, the measurement channel is based on DL/UL configuration ratio of 2DL+DwPTS (12 OFDM symbol); 2UL.

### A.3.1.1 Overview of DL reference measurement channels

In Table A.3.1.1-1 are listed the DL reference measurement channels specified in annexes A.3.2 to A.3.10 of this release of TS 36.521-1. This table is informative and serves only to a better overview. The reference for the concrete reference measurement channels and corresponding implementation's parameters as to be used for testing are annexes A.3.2 to A.3.10 as appropriate.

Table A.3.1.1-1: Overview of DL reference measurement channels

## A.3.2 Reference measurement channel for receiver characteristics

Tables A.3.2-1 and A.3.2-2 are applicable for measurements on the Receiver Characteristics (clause 7) with the exception of sub-clause 7.4 (Maximum input level).

Tables A.3.2-3, A.3.2-3a, A.3.2-3b, A.3.2-4, A.3.2-4a and A.3.2-4b are applicable for sub-clause 7.4 (Maximum input level).

Tables A.3.2-1 and A.3.2-2 also apply for the modulated interferer used in Clauses 7.5, 7.6 and 7.8 with test specific bandwidths.

Table A.3.2-1: Fixed Reference Channel for Receiver Requirements (FDD)

Parameter	Unit	Value					
		1.4	3	5	10	15	20
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks		6	15	25	50	75	100
Subcarriers per resource block		12	12	12	12	12	12
Allocated subframes per Radio Frame		9	9	9	9	9	9
Modulation		QPSK	QPSK	QPSK	QPSK	QPSK	QPSK
Target Coding Rate		1/3	1/3	1/3	1/3	1/3	1/3
Number of HARQ Processes	Processes	8	8	8	8	8	8
Maximum number of HARQ transmissions		1	1	1	1	1	1
Information Bit Payload per Sub-Frame							
For Sub-Frames 1,2,3,4,6,7,8,9	Bits	408	1320	2216	4392	6712	8760
For Sub-Frame 5	Bits	n/a	n/a	n/a	n/a	n/a	n/a
For Sub-Frame 0	Bits	152	872	1800	4392	6712	8760
Transport block CRC	Bits	24	24	24	24	24	24
Number of Code Blocks per Sub-Frame (Note 3)							
For Sub-Frames 1,2,3,4,6,7,8,9	Bits	1	1	1	1	2	2
For Sub-Frame 5	Bits	n/a	n/a	n/a	n/a	n/a	n/a
For Sub-Frame 0	Bits	1	1	1	1	2	2
Binary Channel Bits Per Sub-Frame							
For Sub-Frames 1,2,3,4,6,7,8,9	Bits	1368	3780	6300	13800	20700	27600
For Sub-Frame 5	Bits	n/a	n/a	n/a	n/a	n/a	n/a
For Sub-Frame 0	Bits	528	2940	5460	12960	19860	26760
Max. Throughput averaged over 1 frame	kbps	341.6	1143. 2	1952. 8	3952. 8	6040. 8	7884
UE Category		≥ 1	≥ 1	≥ 1	≥ 1	≥ 1	≥ 1
Note 1:	2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10MHz channel BW. 3 symbols allocated to PDCCH for 5 MHz and 3 MHz. 4 symbols allocated to PDCCH for 1.4 MHz						
Note 2:	Reference signal, Synchronization signals and PBCH allocated as per TS 36.211 [8]						
Note 3:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)						

**Table A.3.2-1a: Fixed Reference Channel for Receiver Requirements for UE Category 0 (FDD)**

Parameter	Unit	Value					
		1.4	3	5	10	15	20
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks		6	14	14	14	14	14
Subcarriers per resource block		12	12	12	12	12	12
Allocated subframes per Radio Frame		9	9	9	9	9	9
Modulation		QPSK	QPSK	QPSK	QPSK	QPSK	QPSK
Target Coding Rate		1/3	1/3	1/3	1/3	1/3	1/3
Number of HARQ Processes	Processes	[8]	[8]	[8]	[8]	[8]	[8]
Maximum number of HARQ transmissions		1	1	1	1	1	1
Information Bit Payload per Sub-Frame							
For Sub-Frames 1,2,3,4,6,7,8,9	Bits	408	1000	1000	1000	1000	1000
For Sub-Frame 5	Bits	N/A	N/A	N/A	N/A	N/A	N/A
For Sub-Frame 0 (Note 3)	Bits	152	840	840	904	904	904
Transport block CRC	Bits	24	24	24	24	24	24
Number of Code Blocks per Sub-Frame							
For Sub-Frames 1,2,3,4,6,7,8,9	Bits	1	1	1	1	1	1
For Sub-Frame 5	Bits	N/A	N/A	N/A	N/A	N/A	N/A
For Sub-Frame 0	Bits	1	1	1	1	1	1
Binary Channel Bits Per Sub-Frame							
For Sub-Frames 1,2,3,4,6,7,8,9	Bits	1368	3528	3528	3864	3864	3864
For Sub-Frame 5	Bits	N/A	N/A	N/A	N/A	N/A	N/A
For Sub-Frame 0 (Note 3)	Bits	528	2688	2688	3024	3024	3024
Max. Throughput averaged over 1 frame	kbps	341.6	884	884	890.4	890.4	890.4
UE DL Category		0	0	0	0	0	0
Note 1:	2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10MHz channel BW. 3 symbols allocated to PDCCH for 5 MHz and 3 MHz. 4 symbols allocated to PDCCH for 1.4 MHz.						
Note 2:	Reference signal, Synchronization signals and PBCH allocated as per TS 36.211 [8].						
Note 3:	For Sub-Frame 0, it is assumed the 6PRBs are allocated in the centre of the channel where some REs of the same PRBs are occupied by PBCH and synchronization signals.						
Note 4:	For HD-FDD UE, the downlink subframes are scheduled at the 0th, 1st, 2nd, 8th, 9th, 10th, 16th, 17th, 18th, 24th, 25th, 26th, 32nd, 33rd, 34th subframes every 40ms. Information bit payload is available if downlink subframe is scheduled.						

**Table A.3.2-1b: Fixed Reference Channel for Receiver Requirements (FDD) for UE Category M1**

Parameter	Unit	Value					
		1.4	3	5	10	15	20
Channel bandwidth	MHz	4	4	4	4	4	4
Allocated resource blocks		12	12	12	12	12	12
Subcarriers per resource block		9	9	9	9	9	9
Allocated subframes per Radio Frame		QPSK	QPSK	QPSK	QPSK	QPSK	QPSK
Modulation		1/3	1/3	1/3	1/3	1/3	1/3
Target Coding Rate		[8]	[8]	[8]	[8]	[8]	[8]
Number of HARQ Processes	Processes	1	1	1	1	1	1
Maximum number of HARQ transmissions							
Information Bit Payload per Sub-Frame							
For Sub-Frames 1,2,3,4,6,7,8,9	Bits	256	256	256	328	328	328
For Sub-Frame 5	Bits	N/A	N/A	N/A	N/A	N/A	N/A
For Sub-Frame 0 (Note 3)	Bits	256	256	256	328	328	328
Transport block CRC	Bits	24	24	24	24	24	24
Number of Code Blocks per Sub-Frame							
For Sub-Frames 1,2,3,4,6,7,8,9	Bits	1	1	1	1	1	1
For Sub-Frame 5	Bits	N/A	N/A	N/A	N/A	N/A	N/A
For Sub-Frame 0	Bits	1	1	1	1	1	1
Binary Channel Bits Per Sub-Frame							
For Sub-Frames 1,2,3,4,6,7,8,9	Bits	912	1008	1008	1104	1104	1104
For Sub-Frame 5	Bits	N/A	N/A	N/A	N/A	N/A	N/A
For Sub-Frame 0 (Note 3)	Bits	912	1008	1008	1104	1104	1104
Max. Throughput averaged over 1 frame	kbps	230.4	230.4	230.4	295.2	295.2	295.2
UE DL Category		M1	M1	M1	M1	M1	M1
Note 1:	2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10MHz channel BW. 3 symbols allocated to PDCCH for 5 MHz and 3 MHz. 4 symbols allocated to PDCCH for 1.4 MHz						
Note 2:	Reference signal, Synchronization signals and PBCH allocated as per TS 36.211.						
Note 3:	For Sub-Frame 0, the scheduled narrowband avoids the centre of the channel where some REs of the same PRBs are occupied by PBCH and synchronization signals.						
Note 4:	For HD-FDD UE, PDSCH are scheduled at the [2th, 10th, 18th, 26th, and 34th] subframes every [40]ms. Information bit payload is available if downlink subframe is scheduled. The corresponding M-PDCCH is scheduled at the [0th, 8th, 16th, 24th, and 32th] subframes every [40]ms.						
Note 5:	2 resource blocks allocated to M-PDCCH						

**Table A.3.2-1c: Fixed Reference Channel for Receiver Requirements (HD-FDD) without repetition – for CAT-NB1**

## A.3.2A Downlink Reference measurement channel for TX characteristics

Tables A.3.2A-1 and A.3.2A-2 describes the reference measurement channels to be used on the downlink during Transmitter Characteristics (clause 6) for FDD and TDD respectively. The number of allocated resource blocks have been defined (partial allocation) to allow the transmission of PBCH, PSS/SSS and system information mapped on PDSCH.

**Table A.3.2A-1: Fixed DL PDSCH Dedicated Reference Channel for TX Requirements (FDD)**

Parameter	Unit	Value					
		1.4	3	5	10	15	20
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks		3	4	8	16	25	30
Subcarriers per resource block		12	12	12	12	12	12
Allocated subframes per Radio Frame		10	10	10	10	10	10
Modulation		QPSK	QPSK	QPSK	QPSK	QPSK	QPSK
Target Coding Rate		(Note 4)	1/3	1/3	1/3	1/3	1/3
Number of HARQ Processes	Processes	8	8	8	8	8	8
Maximum number of HARQ transmissions		1	1	1	1	1	1
Information Bit Payload							
For Sub-Frames 0, 1, 2, 3, 4, 5, 6, 7, 8, 9	Bits	88	328	680	1384	2216	2664
Transport block CRC	Bits	24	24	24	24	24	24
Number of Code Blocks per Sub-Frame		1	1	1	1	1	1
Code block CRC size	Bits	0	0	0	0	0	0
Binary Channel Bits Per Sub-Frame							
For Sub-Frames 1, 2, 3, 4, 6, 7, 8, 9	Bits	684	1008	2016	4416	6900	8280
For Sub-Frames 5		540	1008	2016	4416	6900	8280
For Sub-Frames 0		264	1008	2016	4416	6900	8280
Max. Throughput averaged over 1 frame	kbps	88	328	680	1384	2216	2664
UE-Category		≥ 1	≥ 1	≥ 1	≥ 1	≥ 1	≥ 1
Note 1:	2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10MHz channel BW. 3 symbols allocated to PDCCH for 5 MHz and 3 MHz. 4 symbols allocated to PDCCH for 1.4 MHz						
Note 2:	Reference signal, Synchronization signals and PBCH allocated as per TS 36.211 [8]						
Note 3:	The PDSCH shall be assigned to the UE under test with a set of allocated localized virtual resource blocks starting from one end of the channel.						
Note 4:	To ensure constant transport block size in 1.4MHz, the code rate for subframes varies approx. within {1/8-1/3}						

**Table A.3.2A-2: Fixed DL PDSCH Dedicated Reference Channel for TX Requirements (TDD)**

Parameter	Unit	Value					
		1.4	3	5	10	15	20

Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4]

Note 3: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise not)

Note 4: Given per component carrier per codeword.

**Table A.3.3.2.1-3: Fixed Reference Channel two antenna ports for UE category 0**

Parameter	Unit	Value	
Reference channel		R.62 FDD	R.63 FDD
Channel bandwidth	MHz	10	10
Allocated resource blocks (Note 4)		3	1
Allocated DL subframes per 4 Radio Frames (Note 3)		15	15
Modulation		16QAM	64QAM
Target Coding Rate		1/2	1/2
Information Bit Payload			
For Sub-Frames 0,1,2,3,4,5,6,7,8,9	Bits	744	408
Number of Code Blocks			
For Sub-Frames 0,1,2,3,4,5,6,7,8,9	Code blocks	1	1
Binary Channel Bits			
For Sub-Frames 0,1,2,3,4,5,6,7,8,9	Bits	1584	792
Max. Throughput averaged over 4 frames	Mbps	0.279	0.153
UE DL Category		0	0
Note 1:	2 symbols allocated to PDCCH.		
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8].		
Note 3:	The downlink subframes are scheduled at the 0th, 1st, 2nd, 8th, 9th, 10th, 16th, 17th, 18th, 24th, 25th, 26th, 32nd, 33rd, 34th subframes every 40ms. Information bit payload is available if downlink subframe is scheduled.		
Note 4:	Allocated PRB positions start from {9, 10, ..., 9+N-1}, where N is the number of allocated resource blocks.		

**Table A.3.3.2.1-4: Fixed Reference Channel two antenna ports for UE category M1**

Parameter	Unit	Values
Reference channel		R.79 FDD
Channel bandwidth	MHz	10
Allocated resource blocks (Note 4)		3
Allocated DL subframes per 4 Radio Frames (Note 3)		3
Modulation		16QAM
Target Coding Rate		1/2
Information Bit Payload		
For Sub-Frames 0,1,2,3,4,5,6,7,8,9	Bits	744
Number of Code Blocks		
For Sub-Frames 0,1,2,3,4,5,6,7,8,9	Code blocks	1
Binary Channel Bits		
For Sub-Frames 0,1,2,3,4,5,6,7,8,9	Bits	1584
For Sub-Frames 0,1,5,6,7,8,9	Bits	N/A
Max. Throughput averaged over 4 frames	Mbps	0.223
UE DL Category		M1, ≥ 0
Note 1:	2 symbols allocated to PDCCH.	
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].	
Note 3:	The downlink subframes are scheduled at the 0th, 1st, 2nd, 8th, 9th, 10th, 16th, 17th, 18th, 24th, 25th, 26th, 32nd, 33rd, 34th subframes every 40ms. Information bit payload is available if downlink subframe is scheduled (starting from 0th subframe). The 3rd-7th, 11th-15th, 19th-23rd, 27th-31st, 35th-36th subframes every 40ms are set as invalid subframe.	
Note 4:	Allocated PRB positions for PDSCH are {3, 4, 5} within the assigned narrowband. Allocated PRB positions for MPDCCH are {0, 1} within the assigned narrowband.	

## A.3.3.2.2 Four antenna ports

Note 1:	2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz; 4 symbols allocated to PDCCH for 1.4 MHz.											
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8].											
Note 3:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).											
Note 4:	Given per component carrier per codeword.											

## A.3.3.3 Reference Measurement Channel for UE-Specific Reference Symbols

## A.3.3.3.0 Two antenna ports (no CSI-RS)

The reference measurement channels in Table A.3.3.3.0-1 apply with two CRS antenna ports and without CSI-RS.

Table A.3.3.3.0-1: Fixed Reference Channel without CSI-RS

Parameter	Unit	Value	
Reference channel		R.70 FDD	R.71 FDD
Channel bandwidth	MHz	10	10
Allocated resource blocks		50	50
Allocated subframes per Radio Frame		10	10
Modulation		QPSK	16QAM
Target Coding Rate		0.65	0.6
Information Bit Payload			
For Sub-Frames 1,2,3,4,6,7,8,9	Bits	6968	12960
For Sub-Frame 5	Bits	N/A	N/A
For Sub-Frame 0	Bits	N/A	N/A
Number of Code Blocks per Sub-Frame (Note 4)			
For Sub-Frames 1,2,3,4,6,7,8,9		2	3
For Sub-Frame 5		N/A	N/A
For Sub-Frame 0		N/A	N/A
Binary Channel Bits Per Sub-Frame			
For Sub-Frames 1,2,3,4,6,7,8,9	Bits	10800	21600
For Sub-Frame 5	Bits	N/A	N/A
For Sub-Frame 0	Bits	N/A	N/A
Max. Throughput averaged over 1 frame	Mbps	5.5744	10.368
UE Category		$\geq 1$	$\geq 2$
Note 1:	3 symbols allocated to PDCCH.		
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8].		
Note 3:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).		

### A.3.3.3.1 Two antenna port (CSI-RS)

The reference measurement channels in Table A.3.3.3.1-1 apply for verifying demodulation performance for UE-specific reference symbols with two cell-specific antenna ports and two CSI-RS antenna ports.

**Table A.3.3.3.1-1: Fixed Reference Channel for CDM-multiplexed DM RS with two CSI-RS antenna ports**

Parameter	Unit	Value
Reference channel		R.51 FDD
Channel bandwidth	MHz	10
Allocated resource blocks		50 (Note 3)
Allocated subframes per Radio Frame		9
Modulation		16QAM
Target Coding Rate		1/2
Information Bit Payload		
For Sub-Frames 1,4,6,9	Bits	11448
For Sub-Frames 2,3,7,8	Bits	11448
For Sub-Frame 5	Bits	n/a
For Sub-Frame 0	Bits	9528
Number of Code Blocks (Note 4)		
For Sub-Frames 1,4,6,9	Code blocks	2
For Sub-Frames 2,3,7,8	Code blocks	2
For Sub-Frame 5	Bits	n/a
For Sub-Frame 0	Bits	2
Binary Channel Bits		
For Sub-Frames 1,4,6,9	Bits	24000
For Sub-Frames 2,7		23600
For Sub-Frames 3,8		23200
For Sub-Frame 5	Bits	n/a
For Sub-Frame 0	Bits	19680
Max. Throughput averaged over 1 frame	Mbps	10.1112
UE Category		≥ 2
Note 1:	2 symbols allocated to PDCCH.	
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8].	
Note 3:	50 resource blocks are allocated in sub-frames 1, 2, 3, 4, 6, 7, 8, 9 and 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in sub-frame 0.	
Note 4:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).	

The reference measurement channels in Table A3.3.3.1-2 apply for verifying demodulation performance for UE-specific reference symbols with two cell specific antenna ports and two CSI-RS antenna ports with ZP CSI-RS and NZP CSI-RS in same subframe.

**Table A.3.3.3.1-2: Fixed Reference Channel for CDM-multiplexed DM RS with two CSI-RS antenna ports with ZP CSI-RS and NZP CSI-RS**

Parameter	Unit	Value		
		R.52 FDD	R.53 FDD	R.54 FDD
Reference channel		R.52 FDD	R.53 FDD	R.54 FDD
Channel bandwidth	MHz	10	10	10
Allocated resource blocks		50 (Note 3)	50 (Note 3)	50 (Note 3)
Allocated subframes per Radio Frame		9	9	9
Modulation		64QAM	64QAM	16QAM
Target Coding Rate		1/2	1/2	1/2
Information Bit Payload				
For Sub-Frames 1,3,4,6,8,9	Bits	18336	18336	11448
For Sub-Frames 2,7	Bits	16416	16416	11448
For Sub-Frame 5	Bits	n/a	n/a	n/a
For Sub-Frame 0	Bits	14688	14688	9528
Number of Code Blocks (Note 4)				
For Sub-Frames 1,3,4,6,8,9	Code blocks	3	3	2
For Sub-Frames 2, 7	Code blocks	3	3	2
For Sub-Frame 5	Bits	n/a	n/a	n/a
For Sub-Frame 0	Bits	3	3	2
Binary Channel Bits				
For Sub-Frames 1,3,4,6,8,9	Bits	36000	36000	24000
For Sub-Frames 2,7		34200	33600	22800
For Sub-Frame 5	Bits	n/a	n/a	n/a
For Sub-Frame 0	Bits	29520	29520	19680
Max. Throughput averaged over 1 frame	Mbps	15.7536	15.7536	10.1112
Note 1:	2 symbols allocated to PDCCH.			
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8].			
Note 3:	50 resource blocks are allocated in sub-frames 1, 2, 3, 4, 6, 7, 8, 9 and 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in sub-frame 0.			
Note 4:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).			

### A.3.3.3.2 Four antenna ports (CSI-RS)

The reference measurement channels in Table A.3.3.3.2-1 apply for verifying demodulation performance for UE-specific reference symbols with two cell-specific antenna ports and four CSI-RS antenna ports.

**Table A.3.3.3.2-1: Fixed Reference Channel for CDM-multiplexed DM RS with four CSI-RS antenna ports**

Reference channel		R.43 FDD	R.50 FDD	R.48 FDD	R.66 FDD
Channel bandwidth	MHz	10	10	10	10
Allocated resource blocks		50 (Note 3)	50 (Note 3)	50 (Note 3)	50 (Note 3)
Allocated subframes per Radio Frame		9	9	9	9
Modulation		QPSK	64QAM	QPSK	256QAM
Target Coding Rate		1/3	1/2		0.77
Information Bit Payload					
For Sub-Frames 1,4,6,9	Bits	3624	18336	6200	36696
For Sub-Frames 2,3,7,8	Bits	3624	16416	6200	35160
For Sub-Frame 5	Bits	N/A	N/A	N/A	N/A
For Sub-Frame 0	Bits	2984	14688	4968	30576
Number of Code Blocks (Note 4)					
For Sub-Frames 1,4,6,9	Code blocks	1	3	2	6
For Sub-Frames 2,3,7,8	Code blocks	1	3	2	6
For Sub-Frame 5	Bits	N/A	N/A	N/A	N/A
For Sub-Frame 0	Bits	1	3	1	5
Binary Channel Bits					
For Sub-Frames 1,4,6,9	Bits	12000	36000	12000	48000
For Sub-Frames 2,7		11600	34800	11600	46400
For Sub-Frames 3,8		11600	34800	12000	46400
For Sub-Frame 5	Bits	N/A	N/A	N/A	N/A
For Sub-Frame 0	Bits	9840	29520	9840	39360
Max. Throughput averaged over 1 frame	Mbps	3.1976	15.3696	5.4568	31.800
UE Category		≥ 1	≥ 2	≥ 1	11-12
UE DL Category		≥ 6	≥ 6	≥ 6	≥ 11
Note 1:	2 symbols allocated to PDCCH.				
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].				
Note 3:	For R.31-1 and R.34-1, 50 resource blocks are allocated in sub-frames 1, 2, 3, 4, 6, 7, 8, 9 and 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in sub-frame 0.				
Note 4:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).				

The reference measurement channels in Table A.3.3.3.2-2 apply for verifying FDD PMI accuracy measurement with two CRS antenna ports and four CSI-RS antenna ports.

Table A.3.3.3.2-2: Fixed Reference Channel for four antenna ports (CSI-RS)

Parameter	Unit	Value			
		R.44 FDD	R.45 FDD	R.45-1 FDD	R.60 FDD
Reference channel					
Channel bandwidth	MHz	10	10	10	10
Allocated resource blocks		50 <sup>3</sup>	50 <sup>3</sup>	39	50 <sup>3</sup>
Allocated subframes per Radio Frame		10	10	10	10
Modulation		QPSK	16QAM	16QAM	QPSK
Target Coding Rate		1/3	1/2	1/2	1/2
Information Bit Payload					
For Sub-Frames (Non CSI-RS subframe)	Bits	3624	11448	8760	6200
For Sub-Frames (CSI-RS subframe)	Bits	3624	11448	8760	6200
For Sub-Frames (ZeroPowerCSI-RS subframe)	Bits	n/a	n/a	n/a	N/A
For Sub-Frame 5	Bits	n/a	n/a	n/a	N/A
For Sub-Frame 0	Bits	2984	9528	8760	N/A
Number of Code Blocks per Sub-Frame (Note 4)					
For Sub-Frames (Non CSI-RS subframe)		1	2	2	2
For Sub-Frames (CSI-RS subframe)		1	2	2	2
For Sub-Frames (ZeroPowerCSI-RS subframe)	Bits	n/a	n/a	n/a	N/A
For Sub-Frame 5		n/a	n/a	n/a	N/A
For Sub-Frame 0		1	2	2	N/A
Binary Channel Bits Per Sub-Frame					
For Sub-Frames (Non CSI-RS subframe)	Bits	12000	24000	18720	12000
For Sub-Frames (CSI-RS subframe)	Bits	11600	23200	18096	11600
For Sub-Frames (ZeroPowerCSI-RS subframe)	Bits	n/a	n/a	n/a	N/A
For Sub-Frame 5	Bits	n/a	n/a	n/a	N/A
For Sub-Frame 0	Bits	9840	19680	18720	N/A
Max. Throughput averaged over 1 frame	Mbps	3.1976	10.1112	7.884	4.96
UE Category		≥ 1	≥ 2	≥ 1	≥ 1
Note 1:	2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz; 4 symbols allocated to PDCCH for 1.4 MHz.				
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8].				
Note 3:	For R.44, R.45 and R.60, 50 resource blocks are allocated in sub-frames 1, 2, 3, 4, 6, 7, 8, 9 and 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in sub-frame 0. For R.45-1, 39 resource blocks are allocated in all subframes (RB0-RB20 and RB30-RB47).				
Note 4:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).				

**Table A.3.3.3.2-3: Fixed Reference Channel for CDM-multiplexed DM RS with four CSI-RS antenna ports**

Parameter	Unit	Value
Reference channel		R.64 FDD
Channel bandwidth	MHz	10
Allocated resource blocks (Note 4)		6
Allocated subframes per 4 Radio Frames		15
Modulation		QPSK
Target Coding Rate		1/3
Information Bit Payload		
For Sub-Frames 0,1,4,5,6,9 (Note 3)	Bits	504
For Sub-Frames 2,3,7,8 (Note 3)	Bits	504
Number of Code Blocks		
For Sub-Frames 0,1,4,5,6,9	Code blocks	1
For Sub-Frames 2,3,7,8	Code blocks	1
Binary Channel Bits		
For Sub-Frames 0,1,4,5,6,9	Bits	1440
For Sub-Frames 2,3,7,8	Bits	1392
Max. Throughput averaged over 4 frames	Mbps	0.189
UE DL Category		0
Note 1:	2 symbols allocated to PDCCH.	
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8].	
Note 3:	The downlink subframes are scheduled at the 0th, 1st, 2nd, 8th, 9th, 10th, 16th, 17th, 18th, 24th, 25th, 26th, 32nd, 33rd, 34th subframes every 40ms. Information bit payload is available if downlink subframe is scheduled.	
Note 4:	Allocated PRB positions start from {9, 10, ..., 9+N-1}, where N is the number of allocated resource blocks.	

The reference measurement channels in Table A.3.3.3.2-4 apply with two CRS antenna ports and four CSI-RS antenna ports.

**Table A.3.3.3.2-4: Fixed Reference Channel for four antenna ports (CSI-RS)**

Parameter	Unit	Value
Reference channel		R.69 FDD
Channel bandwidth	MHz	10
Allocated resource blocks		50
Allocated subframes per Radio Frame		10
Modulation		QPSK
Target Coding Rate		
For Sub-Frames 2,3,4,6,7,8,9		0.74
For Sub-Frame 1		0.8
Information Bit Payload		
For Sub-Frames 2,3,4,6,7,8,9	Bits	7992
For Sub-Frame 1	Bits	7992
For Sub-Frame 5	Bits	N/A
For Sub-Frame 0	Bits	N/A
Number of Code Blocks per Sub-Frame (Note 4)		
For Sub-Frames 2,3,4,6,7,8,9		2
For Sub-Frame 1		2
For Sub-Frame 5		N/A
For Sub-Frame 0		N/A
Binary Channel Bits Per Sub-Frame		
For Sub-Frames 2,3,4,6,7,8,9	Bits	10800
For Sub-Frame 1	Bits	10000
2 For Sub-Frame 5	Bits	N/A
For Sub-Frame 0	Bits	N/A
Max. Throughput averaged over 1 frame	Mbps	6.3936
UE Category		≥ 1
Note 1: 3 symbols allocated to PDCCH. Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8]. Note 3: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).		

## A.3.4 Reference measurement channel for PDSCH performance requirements (TDD)

### A.3.4.1 Single-antenna transmission (Common Reference Symbols)

**Table A.3.4.1-1: Fixed Reference Channel QPSK R=1/3**

Parameter	Unit	Value						
		R.4 TDD	R.42 TDD	R.2A TDD	R.2 TDD	R.42-1 TDD	R.42-2 TDD	R.42-3 TDD
Reference channel								
Channel bandwidth	MHz	1.4	20	10	10	3	5	15
Allocated resource blocks (Note 6)		6	100	50	50	15	25	75
Uplink-Downlink Configuration (Note 4)		1	1	2	1	1	1	1
Allocated subframes per Radio Frame (D+S)		3	3+2	5+2	3+2	3+2	3+2	3+2
Modulation		QPSK	QPSK	QPSK	QPSK	QPSK	QPSK	QPSK
Target Coding Rate		1/3	1/3	1/3	1/3	1/3	1/3	1/3
Information Bit Payload (Note 6)								
For Sub-Frames 4,9	Bits	408	8760	4392	4392	1320	2216	6712
For Sub-Frames 1,6	Bits	N/A	7736	3240	3240	1128	1864	5992
For Sub-Frames 3,8	Bits	N/A	N/A	4392	N/A	N/A	N/A	N/A
For Sub-Frame 5	Bits	N/A	N/A	N/A	N/A	N/A	N/A	N/A
For Sub-Frame 0	Bits	208	8760	4392	4392	1064	1800	6712
Number of Code Blocks (Notes 5 and 6)								
For Sub-Frames 4,9		1	2	1	1	1	1	2
For Sub-Frames 1,6		N/A	2	1	1	1	1	1
For Sub-Frames 3,8		N/A	N/A	1	N/A	N/A	N/A	N/A
For Sub-Frame 5		N/A	N/A	N/A	N/A	N/A	N/A	N/A
For Sub-Frame 0		1	2	1	1	1	1	2
Binary Channel Bits (Note 6)								
For Sub-Frames 4,9	Bits	1368	27600	13800	13800	3780	6300	20700
For Sub-Frames 1,6	Bits	N/A	22656	11256	11256	3276	5556	16956
For Sub-Frames 3,8		N/A	N/A	13800	N/A	N/A	N/A	N/A
For Sub-Frame 5	Bits	N/A	N/A	N/A	N/A	N/A	N/A	N/A
For Sub-Frame 0	Bits	672	26904	13104	13104	3084	5604	20004
Max. Throughput averaged over 1 frame (Note 6)	Mbps	0.102	4.175	2.844	1.966	0.596	0.996	3.212
UE Category		≥ 1	≥ 1	≥ 1	≥ 1	≥ 1	≥ 1	≥ 1
Note 1:	2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz; 4 symbols allocated to PDCCH for 1.4 MHz. For subframe 1&6, only 2 OFDM symbols are allocated to PDCCH.							
Note 2:	For BW=1.4 MHz, the information bit payloads of special subframes are set to zero (no scheduling) to avoid problems with insufficient PDCCH performance at the test point.							
Note 3:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8].							
Note 4:	As per Table 4.2-2 in TS 36.211 [8].							
Note 5:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).							
Note 6:	Given per component carrier per codeword.							

Table A.3.4.1-2: Fixed Reference Channel 16QAM R=1/2

Parameter	Unit	Value					
				R.3-1 TDD	R.3 TDD		
Reference channel							
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks				25	50		
Uplink-Downlink Configuration (Note 3)				1	1		
Allocated subframes per Radio Frame (D+S)				3+2	3+2		
Modulation				16QAM	16QAM		
Target Coding Rate				1/2	1/2		
Information Bit Payload

For Sub-Frame 5	Bits	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
For Sub-Frame 0	Bits	624	1217 6	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Max. Throughput averaged over 1 frame (Note 6)	Mbps	0.10 2	1.96 6	4.49 8	0.309	0.149	9.36 8	6.83 5	0.238	1.245	2.179	4.728	6.984
UE Category		≥ 1	≥ 1	≥ 2	≥ 1	≥ 1	≥ 2	≥ 2	≥ 1	≥ 1	≥ 1	≥ 2	≥ 2
Note 1:	2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz; 4 symbols allocated to PDCCH for 1.4 MHz. For subframe 1&6, only 2 OFDM symbols are allocated to PDCCH.												
Note 2:	For BW=1.4 MHz, the information bit payloads of special subframes are set to zero (no scheduling) to avoid problems with insufficient PDCCH performance at the test point.												
Note 3:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8].												
Note 4:	As per Table 4.2-2 in TS 36.211 [8].												
Note 5:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).												
Note 6:	Given per component carrier per codeword.												

### A.3.4.3 Reference Measurement Channels for UE-Specific Reference Symbols

#### A.3.4.3.1 Single antenna port (Cell Specific)

The reference measurement channels in Table A.3.4.3.1-1 apply for verifying demodulation performance for UE-specific reference symbols with one cell-specific antenna port.

**Table A.3.4.3.1-1: Fixed Reference Channel for DRS**

Parameter	Unit	Value					
		R.25 TDD	R.26 TDD	R.26-1 TDD	R.27 TDD	R.27-1 TDD	R.28 TDD
Reference channel							
Channel bandwidth	MHz	10	10	5	10	10	10
Allocated resource blocks		50 <sup>4</sup>	50 <sup>4</sup>	25 <sup>4</sup>	50 <sup>4</sup>	18 <sup>6</sup>	1
Uplink-Downlink Configuration (Note 3)		1	1	1	1	1	1
Allocated subframes per Radio Frame (D+S)		3+2	3+2	3+2	3+2	3+2	3+2
Modulation		QPSK	16QAM	16QAM	64QAM	64QAM	16QAM
Target Coding Rate		1/3	1/2	1/2	3/4	3/4	1/2
Information Bit Payload							
For Sub-Frames 4,9	Bits	4392	12960	5736	28336	10296	224
For Sub-Frames 1,6	Bits	3240	9528	4584	22920	8248	176
For Sub-Frame 5	Bits	n/a	n/a	n/a	n/a	n/a	n/a
For Sub-Frame 0	Bits	2984	9528	3880	22152	10296	224
Number of Code Blocks per Sub-Frame (see Note 5)							
For Sub-Frames 4,9		1	3	1	5	2	1
For Sub-Frames 1,6		1	2	1	4	2	1
For Sub-Frame 5		n/a	n/a	n/a	n/a	n/a	n/a
For Sub-Frame 0		1	2	1	4	2	1
Binary Channel Bits Per Sub-Frame							
For Sub-Frames 4,9	Bits	12600	25200	11400	37800	13608	504
For Sub-Frames 1,6	Bits	10356	20712	10212	31068	11340	420
For Sub-Frame 5	Bits	n/a	n/a	n/a	n/a	n/a	n/a
For Sub-Frame 0	Bits	10332	20664	7752	30996	13608	504
Max. Throughput averaged over 1 frame	Mbps	1.825	5.450	2.452	12.466	4.738	0.102
UE Category		≥ 1	≥ 2	≥ 1	≥ 2	≥ 1	≥ 1
Note 1:	2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz; 4 symbols allocated to PDCCH for 1.4 MHz. For subframe 1&6, only 2 OFDM symbols are allocated to PDCCH.						
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8].						
Note 3:	as per Table 4.2-2 in TS 36.211 [8].						
Note 4:	For R.25, R.26 and R.27, 50 resource blocks are allocated in sub-frames 1, 4, 6, 9 and 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in sub-frame 0. For R.26-1, 25 resource blocks are allocated in sub-frames 1, 4, 6, 9 and 17 resource blocks (RB0–RB7 and RB16–RB24) are allocated in sub-frame 0.						
Note 5:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).						
Note 6:	Localized allocation started from RB #0 is applied.						

#### A.3.4.3.2 Two antenna ports (Cell Specific)

The reference measurement channels in Table A.3.4.3.2-1 apply for verifying demodulation performance for CDM-multiplexed UE specific reference symbols with two cell-specific antenna ports.

Table A.3.4.3.2-1: Fixed Reference Channel for CDM-multiplexed DM RS

Parameter	Unit	Value					
		R.31 TDD	R.32 TDD	R.32-1 TDD	R.33 TDD	R.33-1 TDD	R.34 TDD
Reference channel							
Channel bandwidth	MHz	10	10	5	10	10	10
Allocated resource blocks		50 <sup>4</sup>	50 <sup>4</sup>	25 <sup>4</sup>	50 <sup>4</sup>	18 <sup>6</sup>	50 <sup>4</sup>
Uplink-Downlink Configuration (Note 3)		1	1	1	1	1	1
Allocated subframes per Radio Frame (D+S)		3+2	3+2	3+2	3+2	3+2	3+2
Modulation		QPSK	16QAM	16QAM	64QAM	64QAM	64QAM
Target Coding Rate		1/3	1/2	1/2	3/4	3/4	1/2
Information Bit Payload							
For Sub-Frames 4,9	Bits	3624	11448	5736	27376	9528	18336
For Sub-Frames 1,6		2664	7736	3112	16992	7480	11832
For Sub-Frame 5	Bits	n/a	n/a	n/a	n/a	n/a	n/a
For Sub-Frame 0	Bits	2984	9528	3496	22152	9528	14688
Number of Code Blocks per Sub-Frame (Note 5)							
For Sub-Frames 4,9		1	2	1	5	2	3
For Sub-Frames 1,6		1	2	1	3	2	2
For Sub-Frame 5		n/a	n/a	n/a	n/a	n/a	n/a
For Sub-Frame 0		1	2	1	4	2	3
Binary Channel Bits Per Sub-Frame							
For Sub-Frames 4,9	Bits	12000	24000	10800	36000	12960	36000
For Sub-Frames 1,6		7872	15744	6528	23616	10368	23616
For Sub-Frame 5	Bits	n/a	n/a	n/a	n/a	n/a	n/a
For Sub-Frame 0	Bits	9840	19680	7344	29520	12960	29520
Max. Throughput averaged over 1 frame	Mbps	1.556	4.79	2.119	11.089	4.354	7.502
UE Category		≥ 1	≥ 2	≥ 1	≥ 2	≥ 1	≥ 2
Note 1:	2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz; 4 symbols allocated to PDCCH for 1.4 MHz. For subframe 1&6, only 2 OFDM symbols are allocated to PDCCH.						
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8].						
Note 3:	as per Table 4.2-2 in TS 36.211 [8].						
Note 4:	For R.31, R.32, R.33 and R.34, 50 resource blocks are allocated in sub-frames 4, 9 and 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in sub-frame 0 and the DwPTS portion of sub-frames 1, 6. For R.32-1, 25 resource blocks are allocated in sub-frames 4, 9 and 17 resource blocks (RB0–RB7 and RB16–RB24) are allocated in sub-frame 0 and the DwPTS portion of sub-frames 1, 6.						
Note 5:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).						
Note 6:	Localized allocation started from RB#0 is applied.						

The reference measurement channels in Table A.3.4.3.2-2 apply with two CRS antenna ports.

**Table A.3.4.3.2-2: Fixed Reference Channel for CDM-multiplexed DM RS**

Parameter	Unit	Value	
		R.70 TDD	R.71 TDD
Reference channel		R.70 TDD	R.71 TDD
Channel bandwidth	MHz	10	10
Allocated resource blocks		50 (Note 4)	50 (Note 4)
Uplink-Downlink Configuration (Note 3)		1	1
Allocated subframes per Radio Frame (D+S)		2+2	2+2
Modulation		QPSK	16QAM
Target Coding Rate			
For Sub-Frames 4,9		0.65	0.6
For Sub-Frames 1,6		0.54	0.5
Information Bit Payload			
For Sub-Frames 4,9	Bits	6968	12960
For Sub-Frames 1,6	Bits	4264	7736
For Sub-Frame 5	Bits	N/A	N/A
For Sub-Frame 0	Bits	N/A	N/A
Number of Code Blocks per Sub-Frame (Note 5)			
For Sub-Frames 4,9		2	3
For Sub-Frames 1,6		1	2
For Sub-Frame 5		N/A	N/A
For Sub-Frame 0		N/A	N/A
Binary Channel Bits Per Sub-Frame			
For Sub-Frames 4,9	Bits	10800	21600
For Sub-Frames 1,6	Bits	7872	15744
For Sub-Frame 5	Bits	N/A	N/A
For Sub-Frame 0	Bits	N/A	N/A
Max. Throughput averaged over 1 frame	Mbps	2.2464	4.1392
UE Category		≥ 1	≥ 2
Note 1:	3 symbols allocated to PDCCH in normal subframes and 2 symbols allocated to PDCCH in special subframes.		
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8].		
Note 3:	As per Table 4.2-2 in TS 36.211 [8].		
Note 4:	For R.63, and R.64, 50 resource blocks are allocated in sub-frames 4,9 and 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in the DwPTS portion of sub-frames 1,6.		
Note 5:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).		

### A.3.4.3.3 Two antenna ports (CSI-RS)

The reference measurement channels in Table A.3.4.3.3-1 apply for verifying demodulation performance for CDM-multiplexed UE specific reference symbols with two cell-specific antenna ports and two CSI-RS antenna ports.

**Table A.3.4.3.3-1: Fixed Reference Channel for CDM-multiplexed DM RS with two CSI-RS antenna ports**

Parameter	Unit	Value
Reference channel		R.51 TDD
Channel bandwidth	MHz	10
Allocated resource blocks		50 (Note 5)
Uplink-Downlink Configuration (Note 3)		1
Allocated subframes per Radio Frame (D+S)		3+2
Modulation		16QAM
Target Coding Rate		1/2
Information Bit Payload		
For Sub-Frames 4,9 (non CSI-RS subframe)	Bits	11448
For Sub-Frame 4,9	Bits	11448
For Sub-Frames 1,6	Bits	7736
For Sub-Frame 5	Bits	n/a
For Sub-Frame 0	Bits	9528
Number of Code Blocks (Note 4)		
For Sub-Frames 4, 9 (non CSI-RS subframe)	Code blocks	2
For Sub-Frames 4,9	Code blocks	2
For Sub-Frames 1,6	Code blocks	2
For Sub-Frame 5		n/a
For Sub-Frame 0	Code blocks	2
Binary Channel Bits		
For Sub-Frames 4, 9 (non CSI-RS subframe)	Bits	24000
For Sub-Frames 4,9		22800
For Sub-Frames 1,6		15744
For Sub-Frame 5	Bits	n/a
For Sub-Frame 0	Bits	19680
Max. Throughput averaged over 1 frame	Mbps	4.7896
UE Category		$\geq 2$
Note 1:	2 symbols allocated to PDCCH.	
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8].	
Note 3:	as per Table 4.2-2 in TS 36.211 [8].	
Note 4:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).	
Note 5:	50 resource blocks are allocated in sub-frames 4, 9 and 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in sub-frame 0 and the DwPTS portion of sub-frames 1, 6.	

The reference measurement channels in Table A3.4.3.3-2 apply for verifying demodulation performance for UE-specific reference symbols with two cell specific antenna ports and two CSI-RS antenna ports with ZP CSI-RS and NZP CSI-RS in same subframe.

**Table A.3.4.3.3-2: Fixed Reference Channel for CDM-multiplexed DM RS with two CSI-RS antenna ports with ZP CSI-RS and NZP CSI-RS**

Parameter	Unit	Value		
		R.52 TDD	R.53 TDD	R.54 TDD
Reference channel		R.52 TDD	R.53 TDD	R.54 TDD
Channel bandwidth	MHz	10	10	10
Allocated resource blocks		50 (Note 5)	50 (Note 5)	50 (Note 5)
Uplink-Downlink Configuration (Note 3)		1	1	1
Allocated subframes per Radio Frame (D+S)		3+2	3+2	3+2
Modulation		64QAM	64QAM	16QAM
Target Coding Rate		1/2	1/2	1/2
Information Bit Payload				
For Sub-Frame 4,9	Bits	16416	16416	11448
For Sub-Frames 1,6	Bits	11832	11832	7736
For Sub-Frame 5	Bits	n/a	n/a	n/a
For Sub-Frame 0	Bits	14688	14688	9528
Number of Code Blocks (Note 4)				
For Sub-Frames 4,9	Code blocks	3	3	2
For Sub-Frames 1,6	Code blocks	2	2	2
For Sub-Frame 5		n/a	n/a	n/a
For Sub-Frame 0	Code blocks	3	3	2
Binary Channel Bits				
For Sub-Frames 4,9		34200	33600	22800
For Sub-Frames 1,6		23616	23616	15744
For Sub-Frame 5	Bits	n/a	n/a	n/a
For Sub-Frame 0	Bits	29520	29520	19680
Max. Throughput averaged over 1 frame	Mbps	7.1184	7.1184	4.7896
UE Category		≥ 2	≥ 2	≥ 2
Note 1: 2 symbols allocated to PDCCH. Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8]. Note 3: as per Table 4.2-2 in TS 36.211 [8]. Note 4: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit). Note 5: 50 resource blocks are allocated in sub-frames 4, 9 and 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in sub-frame 0 and the DwPTS portion of sub-frames 1, 6.				

#### A.3.4.3.4 Four antenna ports (CSI-RS)

The reference measurement channels in Table A.3.4.3.4-1 apply for verifying demodulation performance for CDM-multiplexed UE specific reference symbols with two cell-specific antenna ports and four CSI-RS antenna ports.

**Table A.3.4.3.4-1: Fixed Reference Channel for CDM-multiplexed DM RS with four CSI-RS antenna ports**

Parameter	Unit	Value		
		R.44 TDD	R.48 TDD	R.66 TDD
Reference channel		R.44 TDD	R.48 TDD	R.66 TDD
Channel bandwidth	MHz	10	10	20
Allocated resource blocks		50 (Note 4)	50 (Note 4)	100
Uplink-Downlink Configuration (Note 3)		1	1	1
Allocated subframes per Radio Frame (D+S)		3+2	3+2	3+2
Modulation		64QAM	QPSK	256QAM
Target Coding Rate		$\frac{1}{2}$		
Information Bit Payload				
For Sub-Frames 4,9 (non CSI-RS subframe)	Bits	18336	N/A	N/A
For Sub-Frames 4,9 (CSI-RS subframe)	Bits	16416	6200	71112
For Sub-Frames 1,6		11832	4264	48936
For Sub-Frame 5	Bits	N/A	N/A	N/A
For Sub-Frame 0	Bits	14688	4968	66592
Number of Code Blocks per Sub-Frame (Note 5)				
For Sub-Frames 4,9 (non CSI-RS subframe)		3	2	N/A
For Sub-Frames 4,9 (CSI-RS subframe)		3	2	12
For Sub-Frames 1,6		2	1	8
For Sub-Frame 5		N/A	N/A	N/A
For Sub-Frame 0		3	1	11
Binary Channel Bits Per Sub-Frame				
For Sub-Frames 4,9 (non CSI-RS subframe)	Bits	36000	12000	N/A
For Sub-Frames 4,9 (CSI-RS subframe)	Bits	33600	11600	89600
For Sub-Frames 1,6		23616	7872	67584
For Sub-Frame 5	Bits	N/A	N/A	N/A
For Sub-Frame 0	Bits	29520	9840	84480
Max. Throughput averaged over 1 frame	Mbps	7.1184	2.5896	30.669
UE Category		$\geq 2$	$\geq 1$	11-12
UE DL Category		$\geq 6$	$\geq 6$	$\geq 11$
Note 1:	2 symbols allocated to PDCCH.			
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].			
Note 3:	as per Table 4.2-2 in TS 36.211 [4].			
Note 4:	For R.44 and R.48, 50 resource blocks are allocated in sub-frames 4,9 and 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in sub-frame 0 and the DwPTS portion of sub-frames 1,6. For R.66, 100 resource blocks are allocated in sub-frames 4, 9 and 88 resources blocks (RB0–RB43 and RB56–RB99) are allocated in sub-frame 0 and the DwPTS portion of sub-frames 1,6.			
Note 5:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).			

The reference measurement channels in Table A.3.4.3.4-2 apply for verifying TDD PMI accuracy measurement with two CRS antenna ports and four CSI-RS antenna ports.

Table A.3.4.3.4-2: Fixed Reference Channel for four antenna ports (CSI-RS)

Parameter	Unit	Value		
		R.60 TDD	R.61 TDD	R.61-1 TDD
Reference channel		R.60 TDD	R.61 TDD	R.61-1 TDD
Channel bandwidth	MHz	10	10	10
Allocated resource blocks		50 <sup>4</sup>	50 <sup>4</sup>	39 <sup>5</sup>
Uplink-Downlink Configuration (Note 3)		1	1	1
Allocated subframes per Radio Frame (D+S)		4+2	4+2	4+2
Allocated subframes per Radio Frame		10	10	10
Modulation		QPSK	16QAM	16QAM
Target Coding Rate		1/2	1/2	1/2
Information Bit Payload				
For Sub-Frames 4 and 9 (Non CSI-RS subframe)	Bits	N/A	N/A	N/A
For Sub-Frames 4 and 9 (CSI-RS subframe)	Bits	6200	11448	8760
For Sub-Frames 1,6	Bits	N/A	7736	7480
For Sub-Frame 5	Bits	N/A	N/A	N/A
For Sub-Frame 0	Bits	N/A	9528	8760
Number of Code Blocks per Sub-Frame (Note 6)				
For Sub-Frames 4 and 9 (Non CSI-RS subframe)		N/A	N/A	N/A
For Sub-Frames 4 and 9 (CSI-RS subframe)		2	2	2
For Sub-Frames 1,6		N/A	2	2
For Sub-Frame 5		N/A	N/A	N/A
For Sub-Frame 0		N/A	2	2
Binary Channel Bits Per Sub-Frame				
For Sub-Frames 4 and 9 (Non CSI-RS subframe)	Bits	N/A	N/A	N/A
For Sub-Frames 4 and 9 (CSI-RS subframe)	Bits	11600	23200	18096
For Sub-Frames 1,6	Bits	N/A	15744	14976
For Sub-Frame 5	Bits	N/A	N/A	N/A
For Sub-Frame 0	Bits	N/A	19680	18720
Max. Throughput averaged over 1 frame	Mbps	1.24	4.7896	4.1240
UE Category		≥ 1	≥ 2	≥ 1
Note 1:	2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz; 4 symbols allocated to PDCCH for 1.4 MHz. For subframe 1&6, only 2 OFDM symbols are allocated to PDCCH.			
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].			
Note 3:	As per Table 4.2-2 in TS 36.211 [4].			
Note 4:	For R. 60 and R.61, 50 resource blocks are allocated in sub-frames 4,9 and 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in sub-frame 0 and the DwPTS portion of sub-frames 1,6.			
Note 5:	For R. 61-1, 39 resource blocks (RB0–RB20 and RB30–RB47) are allocated in sub-frame 0, 1, 4, 6 and 9.			
Note 6:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).			
Note 7:	Localized allocation started from RB #0 is applied.			

The reference measurement channels in Table A.3.4.3.4-3 apply for verifying demodulation performance for CDM-multiplexed UE specific reference symbols with two cell-specific antenna ports and four CSI-RS antenna ports.

**Table A.3.4.3.4-3: Fixed Reference Channel for CDM-multiplexed DM RS with four CSI-RS antenna ports**

Parameter	Unit	Value
Reference channel		R.64 TDD
Channel bandwidth	MHz	10
Allocated resource blocks (Note 4)		6
Uplink-Downlink Configuration (Note 3)		1
Allocated subframes per Radio Frame (D+S)		4+2
Modulation		QPSK
Target Coding Rate		1/3
Information Bit Payload		
For Sub-Frames 4,9 (non CSI-RS subframe)	Bits	504
For Sub-Frames 4,9 (CSI-RS subframe)	Bits	504
For Sub-Frames 1,6		256
For Sub-Frames 0,5	Bits	504
Number of Code Blocks per Sub-Frame		
For Sub-Frames 4,9 (non CSI-RS subframe)	Code blocks	1
For Sub-Frames 4,9 (CSI-RS subframe)	Code blocks	1
For Sub-Frames 1,6	Code blocks	1
For Sub-Frames 0,5	Code blocks	1
Binary Channel Bits Per Sub-Frame		
For Sub-Frames 4,9 (non CSI-RS subframe)	Bits	1440
For Sub-Frames 4,9 (CSI-RS subframe)	Bits	1352
For Sub-Frames 1,6		1152
For Sub-Frames 0,5	Bits	1440
Max. Throughput averaged over 1 frame	Mbps	0.2528
UE DL Category		0
Note 1:	2 symbols allocated to PDCCH.	
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8].	
Note 3:	as per Table 4.2-2 in TS 36.211 [8].	
Note 4:	Allocated PRB positions start from {9, 10, ..., 9+N-1}, where N is the number of allocated resource blocks.	

The reference measurement channels in Table A.3.4.3.4-4 apply for verifying demodulation performance for CDM-multiplexed UE specific reference symbols with two cell-specific antenna ports and four CSI-RS antenna ports.

**Table A.3.4.3.4-4: Fixed Reference Channel for CDM-multiplexed DM RS with four CSI-RS antenna ports**

Parameter	Unit	Value
Reference channel		R.69
Channel bandwidth	MHz	10
Allocated resource blocks		50 (Note 4)
Uplink-Downlink Configuration (Note 3)		1
Allocated subframes per Radio Frame (D+S)		2+2
Modulation		QPSK
Target Coding Rate		
For Sub-Frame 4(CSI-RS subframe)		0.8
For Sub-Frame 9 (non CSI-RS subframe)		0.74
For Sub-Frames 1,6		0.61
Information Bit Payload		
For Sub-Frame 4(CSI-RS subframe)	Bits	7992
For Sub-Frame 9 (non CSI-RS subframe)	Bits	7992
For Sub-Frames 1,6	Bits	4776
For Sub-Frame 5	Bits	N/A
For Sub-Frame 0	Bits	N/A
Number of Code Blocks per Sub-Frame (Note 5)		
For Sub-Frame 4(CSI-RS subframe)		2
For Sub-Frame 9 (non CSI-RS subframe)		2
For Sub-Frames 1,6		1
For Sub-Frame 5		N/A
For Sub-Frame 0		N/A
Binary Channel Bits Per Sub-Frame		
For Sub-Frame 4(CSI-RS subframe)	Bits	10000
For Sub-Frame 9 (non CSI-RS subframe)	Bits	10800
For Sub-Frames 1,6	Bits	7872
For Sub-Frame 5	Bits	N/A
For Sub-Frame 0	Bits	N/A
Max. Throughput averaged over 1 frame	Mbps	2.5536
UE Category		≥ 1
Note 1: 3 symbols allocated to PDCCH. Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8]. Note 3: As per Table 4.2-2 in TS 36.211 [8]. Note 4: 50 resource blocks are allocated in sub-frames 4,9 and 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in the DwPTS portion of sub-frames 1,6. Note 5: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).		

#### A.3.4.3.5 Eight antenna ports (CSI-RS)

The reference measurement channels in Table A.3.4.3.5-1 apply for verifying demodulation performance for CDM-multiplexed UE specific reference symbols with two cell-specific antenna ports and eight CSI-RS antenna ports.

**Table A.3.4.3.5-1: Fixed Reference Channel for CDM-multiplexed DM RS with eight CSI-RS antenna ports**

Parameter	Unit	Value
Reference channel		R.50 TDD
Channel bandwidth	MHz	10
Allocated resource blocks		50 (Note 4)
Uplink-Downlink Configuration (Note 3)		1
Allocated subframes per Radio Frame (D+S)		3+2
Modulation		QPSK
Target Coding Rate		1/3
Information Bit Payload		
For Sub-Frames 4,9 (non CSI-RS subframe)	Bits	3624
For Sub-Frames 4,9 (CSI-RS subframe)	Bits	3624
For Sub-Frames 1,6		2664
For Sub-Frame 5	Bits	n/a
For Sub-Frame 0	Bits	2984
Number of Code Blocks per Sub-Frame (Note 5)		
For Sub-Frames 4,9 (non CSI-RS subframe)		1
For Sub-Frames 4,9 (CSI-RS subframe)		1
For Sub-Frames 1,6		1
For Sub-Frame 5		n/a
For Sub-Frame 0		1
Binary Channel Bits Per Sub-Frame		
For Sub-Frames 4,9 (non CSI-RS subframe)	Bits	12000
For Sub-Frames 4,9 (CSI-RS subframe)	Bits	10400
For Sub-Frames 1,6		7872
For Sub-Frame 5	Bits	n/a
For Sub-Frame 0	Bits	9840
Max. Throughput averaged over 1 frame	Mbps	1.556
UE Category		$\geq 1$
Note 1: 2 symbols allocated to PDCCH. Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8]. Note 3: as per Table 4.2-2 in TS 36.211 [8]. Note 4: 50 resource blocks are allocated in sub-frames 4, 9 and 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in sub-frame 0 and the DwPTS portion of sub-frames 1, 6. Note 5: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).		

The reference measurement channels in Table A.3.4.3.5-2 apply for verifying TDD PMI accuracy measurement with two CRS antenna ports and eight CSI-RS antenna ports.

Table A.3.4.3.5-2: Fixed Reference Channel for eight antenna ports (CSI-RS)

Parameter	Unit	Value	
		R.45 TDD	R.45-1 TDD
Reference channel			
Channel bandwidth	MHz	10	10
Allocated resource blocks		50 <sup>4</sup>	39
Uplink-Downlink Configuration (Note 3)		1	1
Allocated subframes per Radio Frame (D+S)		4+2	4+2
Allocated subframes per Radio Frame		10	10
Modulation		16QAM	16QAM
Target Coding Rate		1/2	1/2
Information Bit Payload			
For Sub-Frames 4 and 9 (Non CSI-RS subframe)	Bits	n/a	n/a
For Sub-Frames 4 and 9 (CSI-RS subframe)	Bits	11448	8760
For Sub-Frames 1,6	Bits	7736	7480
For Sub-Frame 5	Bits	n/a	n/a
For Sub-Frame 0	Bits	9528	8760
Number of Code Blocks per Sub-Frame (Note 5)			
For Sub-Frames 4 and 9 (Non CSI-RS subframe)		n/a	n/a
For Sub-Frames 4 and 9 (CSI-RS subframe)		2	2
For Sub-Frames 1,6		2	2
For Sub-Frame 5		n/a	n/a
For Sub-Frame 0		2	2
Binary Channel Bits Per Sub-Frame			
For Sub-Frames 4 and 9 (Non CSI-RS subframe)	Bits	n/a	n/a
For Sub-Frames 4 and 9 (CSI-RS subframe)	Bits	22400	17472
For Sub-Frames 1,6	Bits	15744	14976
For Sub-Frame 5	Bits	n/a	n/a
For Sub-Frame 0	Bits	19680	18720
Max. Throughput averaged over 1 frame	Mbps	4.7896	4.1240
UE Category		≥ 2	≥ 1
Note 1:	2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10 MHz channel BW; 3 symbols allocated to PDCCH for 5 MHz and 3 MHz; 4 symbols allocated to PDCCH for 1.4 MHz. For subframe 1&6, only 2 OFDM symbols are allocated to PDCCH.		
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8].		
Note 3:	As per Table 4.2-2 in TS 36.211 [8].		
Note 4:	For R.45, 50 resource blocks are allocated in sub-frames 4, 9 and 41 resource blocks (RB0-RB20 and RB30-RB49) are allocated in sub-frame 0 and the DwPTS portion of sub-frames 1, 6. For R.45-1, 39 resource blocks are allocated in sub-frames 0,4,9 and the DwPTS portion of sub-frames 1,6 (RB0-RB20 and RB30-RB47).		
Note 5:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).		
Note 6:	Localized allocation started from RB #0 is applied.		

## A.3.5 Reference measurement channels for PDCCH/PCFICH performance requirements

### A.3.5.1 FDD

**Table A.3.5.1-1: Reference Channel FDD**

Parameter	Unit	Value				
		R.15 FDD	R.15-1 FDD	R.15-2 FDD	R.16 FDD	R.17 FDD
Reference channel						
Number of transmitter antennas		1	2	2	2	4
Channel bandwidth	MHz	10	10	10	1.4	10
Number of OFDM symbols for PDCCH	symbols	2	3	2	2	2
Aggregation level	CCE	8	8	8	2	4
DCI Format		Format 1	Format 1	Format 1	Format 2	Format 2
Cell ID		0	0	0	0	0
Payload (without CRC)	Bits	31	31	31	31	46

**Table A.3.5.1-1A: Reference Channel FDD**

Parameter	Unit	Value	
		R.16_1 FDD	R.17_1 FDD
Reference channel			
Number of transmitter antennas		2	4
Channel bandwidth	MHz	10	5
Number of OFDM symbols for PDCCH	symbols	2	2
Aggregation level	CCE	4	2
DCI Format		Format 2	Format 2
Cell ID		0	0
Payload (without CRC)	Bits	43	42

**Table A.3.5.1-2: Additional PDSCH Reference Channel FDD**

Parameter	Unit	Value				
		1	2	2	4	4
Number of transmitter antennas		1	2	2	4	4
Channel bandwidth	MHz	10	1.4	10	10	5
Allocated Resource Blocks		50	6	50	50	25
Modulation		QPSK	QPSK	QPSK	QPSK	QPSK
Target Coding Rate		1/3	1/3	1/3	1/3	1/3
Information Bit Payload						
For Sub-Frames 1,2,3,4,6,7,8,9	Bits	4392	504	4392	4392	2216
For Sub-Frame 5		n/a	n/a	n/a	n/a	n/a
For Sub-Frame 0	Bits	4392	256	4392	3624	1800
Number of Code Blocks per Sub-Frame						
For Sub-Frames 1,2,3,4,6,7,8,9		1	1	1	1	1
For Sub-Frame 5		n/a	n/a	n/a	n/a	n/a
For Sub-Frame 0		1	1	1	1	1
Binary Channel Bits Per Sub-Frame						
For Sub-Frames 1,2,3,4,6,7,8,9	Bits	13800	1584	13200	12800	6400
For Sub-Frame 5	Bits	n/a	n/a	n/a	n/a	n/a
For Sub-Frame 0		12960	768	12384	12032	5632
Max. Throughput averaged over 1 frame	Mbps	3.953	0.429	3.953	3.876	1.953
UE Category		≥ 1	≥ 1	≥ 1	≥ 1	≥ 1

Note 1: 2 symbols allocated to PDCCH for all BW.

**Table A.3.5.1-2A: Additional PDSCH Reference Channel FDD**

Parameter	Unit	Value
Number of transmitter antennas		2
Channel bandwidth	MHz	10
Allocated Resource Blocks		50
Modulation		QPSK
Target Coding Rate		1/3
Information Bit Payload		
For Sub-Frames 1,2,3,4,6,7,8,9	Bits	3624
For Sub-Frame 5		n/a
For Sub-Frame 0	Bits	3624
Number of Code Blocks per Sub-Frame		
For Sub-Frames 1,2,3,4,6,7,8,9		1
For Sub-Frame 5		n/a
For Sub-Frame 0		1
Binary Channel Bits Per Sub-Frame		
For Sub-Frames 1,2,3,4,6,7,8,9	Bits	12000
For Sub-Frame 5	Bits	n/a
For Sub-Frame 0		11184
Max. Throughput averaged over 1 frame	Mbps	3.262
UE Category		≥ 1
Note 1: 3 symbols allocated to PDCCH for all BW.		

## A.3.5.2 TDD

**Table A.3.5.2-1: Reference Channel TDD**

Parameter	Unit	Value				
		R.15 TDD	R.15-1 TDD	R.15-2 TDD	R.16 TDD	R.17 TDD
Reference channel						
Number of transmitter antennas		1	2	2	2	4
Channel bandwidth	MHz	10	10	10	1.4	10
Number of OFDM symbols for PDCCH	symbols	2	3	2	2	2
Aggregation level	CCE	8	8	8	2	4
DCI Format		Format 1	Format 1	Format 1	Format 2	Format 2
Cell ID		0	0	0	0	0
Payload (without CRC)	Bits	34	34	34	34	49

**Table A.3.5.2-1A: Reference Channel TDD**

Parameter	Unit	Value	
Reference channel		R.16_1 TDD	R.17_1 TDD
Number of transmitter antennas		2	4
Channel bandwidth	MHz	10	5
Number of OFDM symbols for PDCCH	symbols	2	2
Aggregation level	CCE	4	2
DCI Format		Format 2	Format 2
Cell ID		0	0
Payload (without CRC)	Bits	46	45

Table A.3.5.2-2: Additional PDSCH Reference Channel TDD

Parameter	Unit	Value				
		1	2	4	5	6
Number of transmitter antennas		1	2	4	4	4
Channel bandwidth	MHz	10	1.4	10	10	5
Uplink-Downlink Configuration (Note 2)		0	0	0	0	0
Allocated Resource Blocks		50	6	50	50	25
Modulation		QPSK	QPSK	QPSK	QPSK	QPSK
Target Coding Rate		1/3	1/3	1/3	1/3	1/3
Information Bit Payload						
For Sub-Frame 1,6	Bits	3240	328	3240	3240	1544
For Sub-Frame 5	Bits	n/a	n/a	n/a	n/a	n/a
For Sub-Frame 0	Bits	4392	256	4392	4392	1800
Number of Code Blocks per Sub-Frame						
For Sub-Frame 1,6		1	1	1	1	1
For Sub-Frame 5	Bits	n/a	n/a	n/a	n/a	n/a
For Sub-Frame 0		1	1	1	1	1
Binary Channel Bits Per Sub-Frame						
For Sub-Frame 1,6	Bits	11256	1152	10656	10256	5056
For Sub-Frame 5	Bits	n/a	n/a	n/a	n/a	n/a
For Sub-Frame 0	Bits	13104	936	12528	12176	5776
Max. Throughput averaged over 1 frame	Mbps	1.087	0.091	1.087	1.164	0.489
UE Category		≥ 1	≥ 1	≥ 1	≥ 1	≥ 1
Note 1: 2 symbols allocated to PDCCH for all BW.						
Note 2: As per Table 4.2-2 in TS 36.211 [8].						

Table A.3.5.2-2A: Additional PDSCH Reference Channel TDD

Parameter	Unit	Value	
		1	2
Number of transmitter antennas		2	2
Channel bandwidth	MHz	10 (Note 1)	10 (Note 2)
Uplink-Downlink Configuration (Note 3)		1	1
Special subframe configuration		4	4
Allocated Resource Blocks		50	50
Modulation		QPSK	QPSK
Target Coding Rate		1/3	1/3
Information Bit Payload			
For Sub-Frame 4,9	Bits	4392	3624
For Sub-Frame 1,6	Bits	3240	3240
For Sub-Frame 5	Bits	n/a	n/a
For Sub-Frame 0	Bits	4392	3624
Number of Code Blocks per Sub-Frame			
For Sub-Frame 4,9		1	1
For Sub-Frame 1,6		1	1
For Sub-Frame 5		n/a	n/a
For Sub-Frame 0		1	1
Binary Channel Bits Per Sub-Frame			
For Sub-Frame 4,9	Bits	13200	12000
For Sub-Frame 1,6	Bits	10656	10656
For Sub-Frame 5	Bits	n/a	n/a
For Sub-Frame 0	Bits	12528	11328
Max. Throughput averaged over 1 frame	Mbps	1.9656	1.7352
UE Category		≥ 1	≥ 1
Note 1: 2 symbols allocated to PDCCH.			
Note 2: 3 symbols allocated to PDCCH.			
Note 3: As per Table 4.2-2 in TS 36.211 [8].			

## A.3.6 Reference measurement channels for PHICH performance requirements

**Table A.3.6-1: Reference Channel FDD/TDD**

Parameter	Unit	Value				
		R.18	R.19	R.19-1	R.20	R.24
Reference channel		R.18	R.19	R.19-1	R.20	R.24
Number of transmitter antennas		1	2	2	4	1
Channel bandwidth	MHz	10	1.4	5	10	10
User roles (Note 1)		[W I1 I2]	[W I1 I2]	W I1 I2	[W I1 I2]	[W I1]
Resource allocation (Note 2)		[(0,0) (0,1) (0,4)]	[(0,0) (0,1) (0,4)]	(0,0) (0,1) (0,4)	[(0,0) (0,1) (0,4)]	[(0,0) (0,1)]
Power offsets (Note 3)	dB	[-4 0 -3]	[-4 0 -3]	-4 0 -3	[-4 0 -3]	[+3 0]
Payload (Note 4)		[A R R]	[A R R]	A R R	[A R R]	[A R]
Note 1: W=wanted user, I1=interfering user 1, I2=interfering user 2. Note 2: The resource allocation per user is given as (N_group_PHICH, N_seq_PHICH). Note 3: The power offsets (per user) represent the difference of the power of BPSK modulated symbol per PHICH relative to the first interfering user. Note 4: A=fixed ACK, R=random ACK/NACK.						

**Table A.3.6-1A: Reference Channel FDD/TDD**

Parameter	Unit	Value	
		R.19_1	R.20_1
Reference channel		R.19_1	R.20_1
Number of transmitter antennas		2	4
Channel bandwidth	MHz	10	5
User roles (Note 1)		[W I1 I2]	[W I1 I2]
Resource allocation (Note 2)		[(0,0) (0,1) (0,4)]	[(0,0) (0,1) (0,4)]
Power offsets (Note 3)	dB	[-4 0 -3]	[-4 0 -3]
Payload (Note 4)		[A R R]	[A R R]
Note 1: W=wanted user, I1=interfering user 1, I2=interfering user 2. Note 2: The resource allocation per user is given as (N_group_PHICH, N_seq_PHICH). Note 3: The power offsets (per user) represent the difference of the power of BPSK modulated symbol per PHICH relative to the first interfering user. Note 4: A=fixed ACK, R=random ACK/NACK.			

## A.3.7 [FFS]

## A.3.8 Reference measurement channels for MBMS performance requirements

## A.3.8.1 FDD

Table A.3.8.1-1: Fixed Reference Channel QPSK R=1/3

Parameter	PMCH						
	Unit	Value					
Reference channel		R.40 FDD			R.37 FDD		
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks		6			50		
Allocated subframes per Radio Frame (Note 1)		6			6		
Modulation		QPSK			QPSK		
Target Coding Rate		1/3			1/3		
Information Bit Payload (Note 2)							
For Sub-Frames 1,2,3,6,7,8	Bits	408			3624		
For Sub-Frames 0,4,5,9	Bits	n/a			n/a		
Number of Code Blocks per Subframe (Note 3)		1			1		
Binary Channel Bits Per Subframe							
For Sub-Frames 1,2,3,6,7,8	Bits	1224			10200		
For Sub-Frames 0,4,5,9	Bits	n/a			n/a		
MBMS UE Category		≥ 1			≥ 1		
Note 1: For FDD mode, up to 6 subframes (#1/2/3/6/7/8) are available for MBMS, in line with TS 36.331. Note 2: 2 OFDM symbols are reserved for PDCCH; and reference signal allocated as per TS 36.211. Note 3: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).							

Table A.3.8.1-2: Fixed Reference Channel 16QAM R=1/2

Parameter	PMCH						
	Unit	Value					
Reference channel					R.38 FDD		
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks					50		
Allocated subframes per Radio Frame (Note 1)					6		
Modulation					16QAM		
Target Coding Rate					1/2		
Information Bit Payload (Note 2)							
For Sub-Frames 1,2,3,6,7,8	Bits				9912		
For Sub-Frames 0,4,5,9	Bits				n/a		
Number of Code Blocks per Subframe (Note 3)					2		
Binary Channel Bits Per Subframe							
For Sub-Frames 1,2,3,6,7,8	Bits				20400		
For Sub-Frames 0,4,5,9	Bits				n/a		
MBMS UE Category					≥ 1		
Note 1: For FDD mode, up to 6 subframes (#1/2/3/6/7/8) are available for MBMS, in line with TS 36.331. Note 2: 2 OFDM symbols are reserved for PDCCH; and reference signal allocated as per TS 36.211. Note 3: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).							

Table A.3.8.1-3: Fixed Reference Channel 64QAM R=2/3

Parameter	PMCH						
	Unit	Value					
Reference channel				R.39-1 FDD	R.39 FDD		
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks				25	50		
Allocated subframes per Radio Frame(Note1)				6	6		
Modulation				64QAM	64QAM		
Target Coding Rate				2/3	2/3		
Information Bit Payload (Note 2)							
For Sub-Frames 1,2,3,6,7,8	Bits			9912	19848		
For Sub-Frames 0,4,5,9	Bits			n/a	n/a		
Number of Code Blocks per Sub-Frame (Note 3)				2	4		
Binary Channel Bits Per Subframe							
For Sub-Frames 1,2,3,6,7,8	Bits			15300	30600		
For Sub-Frames 0,4,5,9	Bits			n/a	n/a		
MBMS UE Category				≥ 1	≥ 2		
Note 1: For FDD mode, up to 6 subframes (#1/2/3/6/7/8) are available for MBMS, in line with TS 36.331. Note 2: 2 OFDM symbols are reserved for PDCCH; and reference signal allocated as per TS 36.211. Note 3: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).							

## A.3.8.2 TDD

Table A.3.8.2-1: Fixed Reference Channel QPSK R=1/3

Parameter	PMCH						
	Unit	Value					
Reference channel		R.40 TDD			R.37 TDD		
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks		6			50		
Uplink-Downlink Configuration(Note 1)		5			5		
Allocated subframes per Radio Frame		5			5		
Modulation		QPSK			QPSK		
Target Coding Rate		1/3			1/3		
Information Bit Payload (Note 2)							
For Sub-Frames 3,4,7,8,9	Bits	408			3624		
For Sub-Frames 0,1,2,5,6	Bits	n/a			n/a		
Number of Code Blocks per Subframe (Note 3)		1			1		
Binary Channel Bits Per Subframe							
For Sub-Frames 3,4,7,8,9	Bits	1224			10200		
For Sub-Frames 0,1,2,5,6	Bits	n/a			n/a		
MBMS UE Category		≥ 1			≥ 1		
Note 1: For TDD mode, in line with TS 36.331, Uplink-Downlink Configuration 5 is proposed, up to 5 subframes (#3/4/7/8/9) are available for MBMS. Note 2: 2 OFDM symbols are reserved for PDCCH; reference signal allocated as per TS 36.211. Note 3: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).							

**Table A.3.8.2-2: Fixed Reference Channel 16QAM R=1/2**

Parameter	PMCH

Number of layers		2	2	2	2	2	
Max. Throughput averaged over 1 frame (Note 5)	Mbps	34.859	26.459	17.425	[53.125]	[40.374]	
UE Categories		11-12	11-12	11-12	11-12	11-12	
UE DL Categories		≥ 11	≥ 11	≥ 11	≥ 11	≥ 11	

Note 1: 1 symbol allocated to PDCCH for all tests.

Note 2: Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [4].

Note 3: As per Table 4.2-2 in TS 36.211 [4].

Note 4: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).

Note 5: Given per component carrier per codeword.

Note 6: Resource blocks  $n_{PRB} = 4..99$  are allocated for the user data in sub-frame 5, and resource blocks  $n_{PRB} = 0..99$  in other

	downlink sub-frames.
Note 7:	Resource blocks $n_{PRB} = 4..74$ are allocated for the user data in sub-frame 5, and resource blocks $n_{PRB} = 0..74$ in other downlink sub-frames.
Note 8:	Resource blocks $n_{PRB} = 3..49$ are allocated for the user data in sub-frame 5, and resource blocks $n_{PRB} = 0..49$ in the available downlink sub-frames according to uplink downlink configurations used.

### A.3.9.3 FDD (EPDCCH scheduling)

**Table A.3.9.3-1: Fixed Reference Channel for sustained data-rate test with EPDCCH scheduling (FDD)**

Parameter	Unit	Value

UE Category		≥ 1	≥ 2	≥ 2	≥ 2	≥ 3
Note 1:	1 symbol allocated to PDCCH for all tests.					
Note 2:	Reference signal, synchronization signals and PBCH allocated as per TS 36.211 [8].					
Note 3:	As per Table 4.2-2 in TS 36.211 [8].					
Note 4:	If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).					
Note 5:	Resource blocks $n_{PRB} = 0..2$ are allocated for SIB transmissions in sub-frame 5 for all bandwidths.					
Note 6:	Resource blocks $n_{PRB} = 6..14,30..49$ are allocated for the user data in all subframes.					
Note 7:	Resource blocks $n_{PRB} = 3..49$ are allocated for the user data in sub-frame 5, and resource blocks $n_{PRB} = 0..49$ in sub-frames 0,3,4,6,7,8,9.					
Note 8:	Resource blocks $n_{PRB} = 4..99$ are allocated for the user data in sub-frame 5, and resource blocks $n_{PRB} = 0..99$ in sub-frames 0,3,4,6,7,8,9.					
Note 9:	Resource blocks $n_{PRB} = 4..71$ are allocated for the user data in all sub-frames					
Note10:	Given per component carrier per codeword.					

## A.3.10 Reference Measurement Channels for EPDCCH performance requirements

### A.3.10.1 FDD

Table A.3.10.1-1: Reference Channel FDD

Parameter	Unit	Value					
		R.55 FDD	R.56 FDD	R.57 FDD	R.58 FDD	R.59 FDD	
Reference channel							
Number of transmitter antennas		2	2	2	2	2	
Channel bandwidth	MHz	10	10	10	10	10	
Number of OFDM symbols for PDCCH	symbols	2	2	1	1	1	
Aggregation level	ECCE	4	16	2	8	2	
DCI Format		2A	2A	2C	2C	2D	

## A.3.10.2 TDD

**Table A.3.10.2-1: Reference Channel TDD**

Parameter	Unit	Value					
		R.55 TDD	R.56 TDD	R.57 TDD	R.58 TDD	R.59 TDD	
Reference channel							
Number of transmitter antennas		2	2	2	2	2	
Channel bandwidth	MHz	10	10	10	10	10	
Number of OFDM symbols for PDCCH	symbols	2	2	1	1	1	
Aggregation level	CCE	4	16	2	8	2	
DCI Format		2A	2A	2C	2C	2D	

## A.3.11 Reference Measurement Channels for MPDCCH performance requirements

### A.3.11.1 FDD and half-duplex FDD

**Table A.3.11.1-1: Reference Channel FDD and half-duplex FDD**

Parameter	Unit	Value
Reference channel		R.[xx] FDD
Number of transmitter antennas		2
Channel bandwidth	MHz	10
OFDM starting symbol (startSymbolLC)	symbols	2
Aggregation level	ECCE	16
DCI Format		6-1A

### A.3.11.2 TDD

**Table A.3.11.2-1: Reference Channel TDD**

Parameter	Unit	Value
Reference channel		R.[xx] TDD
Number of transmitter antennas		2
Channel bandwidth	MHz	10
OFDM starting symbol (startSymbolLC)	symbols	2
Aggregation level	ECCE	16
DCI Format		6-1A

---

## A.4 CQI reference measurement channels

This section defines the DL signal applicable to the reporting of channel quality information (Clause 9.2, 9.3 and 9.5).

In Table A.4-1 are specified the reference channels. Table A.4-13 specifies the mapping of CQI index to modulation coding scheme, which complies with the CQI definition specified in Section 7.2.3 of [10].

Table A.4-0: Void

Table A.4-1: CSI reference measurement channels

- Note 1: 3 symbols allocated to PDCCH.
- Note 2: For FDD only subframes 1, 2, 3, 4, 6, 7, 8 and 9 are allocated to avoid PBCH and synchronization signal overhead.
- Note 3: TDD UL-DL configuration as specified in the individual tests.
- Note 4: For TDD when UL-DL configuration 1 is used only subframes 4 and 9 are allocated to avoid PBCH and synchronization signal overhead.
- Note 5: For TDD when UL-DL configuration 2 is used only subframes 3, 4, 8, and 9 are allocated to avoid PBCH and synchronization signal overhead.
- Note 6: Centred within the Transmission Bandwidth Configuration (Figure 5.4.2-1).
- Note 7: Only subframes 2, 3, 4, 7, 8 and 9 are allocated to avoid PBCH and synchronization signal overhead.
- Note 8: Allocate PDSCH on 5th and 6th PRBs within a subband.
- Note 9: The number of HARQ processes is 10 for TDD UL/DL configuration 2 and 7 for TDD UL/DL configuration 1.
- Note 10: The downlink subframes are scheduled at the 1st, 2nd, 8th, 9th, 16th, 17th, 18th, 24th, 26th, 32nd, 33rd, 34th subframes every 40ms. Information bit payload is available if downlink subframe is scheduled.(starting from 0th subframe).
- Note 11: 41 resource blocks (RB0–RB20 and RB30–RB49) are allocated in subframe 0 and 5 in RC.19 TDD.
- Note 12: Allocate PDSCH on 3th, 4th and 6th PRBs within a narrowband. Allocate MPDCCH on the 0th and 1st PRBs within a narrowband.
- Note 13: The downlink subframes are scheduled at the 0th, 1st, 2nd, 8th, 9th, 10th, 16th, 17th, 18th, 24th, 25th, 26th, 32nd, 33rd, 34th subframes every 40ms. Information bit payload is available if downlink subframe is scheduled (starting from 0th subframe). The 3rd-7th, 11th-15th, 19th-23rd, 27th-31st, 35th-36th subframes every 40ms are set as invalid subframe.

## A.4.1 Additional CSI reference measurement channels

This section defines additional reference measurement channels for CSI testing, required to run the test properly according to the test parameters.

**Table A.4.1-1: Uplink reference channels for transmitting CSI reports on PUSCH, when being in a PUCCH reporting mode (FDD)**

Parameter	Unit	Value			
Channel bandwidth	MHz	10			
Allocated resource blocks		6			
DFT-OFDM Symbols per Sub-Frame		12			
Modulation		QPSK			
Target Coding rate		1/3			
Allocated Sub-Frames		Note 1			
Payload size	Bits	600			
Transport block CRC	Bits	24			
Number of code blocks per Sub-Frame (Note 2)		1			
Total number of bits per Sub-Frame	Bits	1728			
Total symbols per Sub-Frame		864			
UE Category		$\geq 1$			
Note 1: All subframes, if not other specified. In case of allocation of only certain subframes, as specified in the test case, the remaining subframes are not allocated with data. All the allocation details specified in the reference channel are valid only for the allocated subframes. Note 2: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)					

**Table A.4.1-2: Uplink reference channels for transmitting CSI reports on PUSCH, when being in a PUCCH reporting mode (TDD)**

Parameter	Unit	Value			
Channel bandwidth	MHz	10	10		
Allocated resource blocks		6	6		
Uplink-Downlink Configuration (Note 1)		1	2		
DFT-OFDM Symbols per Sub-Frame		12	12		
Modulation		QPSK	QPSK		
Target Coding rate		1/3	1/3		
Allocated Sub-Frames		Note 2	Note 2		
Payload size	Bits	600	600		
Transport block CRC	Bits	24	24		
Number of code blocks per Sub-Frame (Note 3)		1	1		
Total number of bits per Sub-Frame	Bits	1728	1728		
Total symbols per Sub-Frame		864	864		
UE Category		$\geq 1$	$\geq 1$		
Note 1: As per Table 4.2-2 in TS 36.211 [4]. Note 2: All uplink subframes, if not other specified. In case of allocation of only certain uplink subframes, as specified in the test case, the remaining uplink subframes are not allocated with data. All the allocation details specified in the reference channel are valid only for the allocated uplink subframes. Note 3: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).					

## A.5 OFDMA Channel Noise Generator (OCNG)

### A.5.1 OCNG Patterns for FDD

The following OCNG patterns are used for modelling allocations to virtual UEs (which are not under test). The OCNG pattern for each sub frame specifies the allocations that shall be filled with OCNG, and furthermore, the relative power level of each such allocation.

In each test case the OCNG is expressed by parameters OCNG\_RA and OCNG\_RB which together with a relative power level ( $\gamma$ ) specifies the PDSCH EPRE-to-RS EPRE ratios in OFDM symbols with and without reference symbols, respectively. The relative power, which is used for modelling boosting per virtual UE allocation, is expressed by:

$$\gamma_i = PDSCH_i\_RA / OCNG\_RA = PDSCH_i\_RB / OCNG\_RB,$$

where  $\gamma_i$  denotes the relative power level of the  $i$ :th virtual UE. The parameter settings of OCNG\_RA, OCNG\_RB, and the set of relative power levels  $\gamma$  are chosen such that when also taking allocations to the UE under test into account, as given by a PDSCH reference channel, a transmitted power spectral density that is constant on an OFDM symbol basis is targeted.

Moreover the OCNG pattern is accompanied by a PCFICH/PDCCH/PHICH reference channel which specifies the control region. For any aggregation and PHICH allocation, the PDCCH and any unused PHICH groups are padded with resource element groups with a power level given respectively by PDCCH\_RA/RB and PHICH\_RA/RB as specified in the test case such that a total power spectral density in the control region that is constant on an OFDM symbol basis is targeted.

### A.5.1.1 OCNG FDD pattern 1: One sided dynamic OCNG FDD pattern

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the DL sub-frames, when the unallocated area is continuous in frequency domain (one sided).

**Table A.5.1.1-1: OP.1 FDD: One sided dynamic OCNG FDD Pattern**

Relative power level $\gamma_{PRB}$ [dB]			PDSCH Data
Subframe			
0	5	1 – 4, 6 – 9	
Allocation			
First unallocated PRB – Last unallocated PRB	First unallocated PRB – Last unallocated PRB	First unallocated PRB – Last unallocated PRB	
0	0	0	Note 1
<p>Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PDSCH.</p> <p>Note 2: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 2. The parameter <math>\gamma_{PRB}</math> applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.</p>			

### A.5.1.2 OCNG FDD pattern 2: Two sided dynamic OCNG FDD pattern

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the DL sub-frames, when the unallocated area is discontinuous in frequency domain (divided in two parts by the allocated area – two sided), starts with PRB 0 and ends with PRB  $N_{RB} - 1$ .

**Table A.5.1.2-1: OP.2 FDD: Two sided dynamic OCNG FDD Pattern**

Relative power level $\gamma_{PRB}$ [dB]			PDSCH Data
Subframe			
0	5	1 – 4, 6 – 9	
Allocation			
0 – (First allocated PRB-1) and (Last allocated PRB+1) – ( $N_{RB} - 1$ )	0 – (First allocated PRB-1) and (Last allocated PRB+1) – ( $N_{RB} - 1$ )	0 – (First allocated PRB-1) and (Last allocated PRB+1) – ( $N_{RB} - 1$ )	
0	0	0	Note 1
<p>Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PDSCH.</p> <p>Note 2: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 2. The parameter <math>\gamma_{PRB}</math> applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.</p>			

**A.5.1.3 OCNG FDD pattern 3: 49 RB OCNG allocation with MBSFN in 10 MHz**

**Table A.5.1.3-1: OP.3 FDD: OCNG FDD Pattern 3**

Allocation $n_{PRB}$	Relative power level $\gamma_{PRB}$ [dB]				PDSCH Data	PMCH Data
	Subframe					
	0	5	4, 9	1 – 3, 6 – 8		
1 – 49	0	0 (Allocation: all empty PRB-s)	0	N/A	Note 1	N/A
0 – 49	N/A	N/A	N/A	0	N/A	Note 2
<p>Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PDSCH.</p> <p>Note 2: Each physical resource block (PRB) is assigned to MBSFN transmission. The data in each PRB shall be uncorrelated with data in other PRBs over the period of any measurement. The MBSFN data shall be QPSK modulated. PMCH subframes shall contain cell-specific Reference Signals only in the first symbol of the first time slot. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PMCH.</p> <p>Note 3: If two or more transmit antennas are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas according to transmission mode 2. The transmit power shall be equally split between all the transmit antennas used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.</p>						
N/A: Not Applicable						

### A.5.1.4 OCNG FDD pattern 4: One sided dynamic OCNG FDD pattern for MBMS transmission

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the DL sub-frames, when the unallocated area is continuous in frequency domain (one sided) and MBMS performance is tested.

**Table A.5.1.4-1: OP.4 FDD: One sided dynamic OCNG FDD Pattern for MBMS transmission**

Allocation $n_{PRB}$	Relative power level $\gamma_{PRB}$ [dB]			PDSCH Data	PMCH Data
	Subframe				
	0, 4, 9	5	1 – 3, 6 – 8		
First unallocated PRB – Last unallocated PRB	0	0 (Allocation: all empty PRB-s)	N/A	Note 1	N/A
First unallocated PRB – Last unallocated PRB	N/A	N/A	N/A	N/A	Note 2
<p>Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PDSCH.</p> <p>Note 2: Each physical resource block (PRB) is assigned to MBSFN transmission. The data in each PRB shall be uncorrelated with data in other PRBs over the period of any measurement. The MBSFN data shall be QPSK modulated. PMCH subframes shall contain cell-specific Reference Signals only in the first symbol of the first time slot. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PMCH.</p> <p>Note 3: If two or more transmit antennas are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas according to transmission mode 2. The transmit power shall be equally split between all the transmit antennas used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.</p> <p>N/A: Not Applicable</p>					

### A.5.1.5 OCNG FDD pattern 5: One sided dynamic 16QAM modulated OCNG FDD pattern

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of DL sub-frames, when the unallocated area is continuous in the frequency domain (one sided).

**Table A.5.1.5-1: OP.5 FDD: One sided dynamic 16QAM modulated OCNG FDD Pattern**

Relative power level $\gamma_{PRB}$ [dB]			PDSCH Data
Subframe			
0	5	1 – 4, 6 – 9	
Allocation			
First unallocated PRB – Last unallocated PRB	First unallocated PRB – Last unallocated PRB	First unallocated PRB – Last unallocated PRB	
0	0	0	Note 1
<p>Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is 16QAM modulated. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PDSCH.</p> <p>Note 2: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 3 (Large Delay CDD). The parameter <math>\gamma_{PRB}</math> applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.</p>			

### A.5.1.6 OCNG FDD pattern 6: dynamic OCNG FDD pattern when user data is in 2 non-contiguous blocks

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the DL sub-frames, when the unallocated area is discontinuous in frequency domain (divided in two parts by the first allocated block). The second allocated block ends with PRB  $N_{RB} - 1$ .

**Table A.5.1.6-1: OP.6 FDD: OCNG FDD Pattern when user data is in 2 non-contiguous blocks**

Relative power level $\gamma_{PRB}$ [dB]			PDSCH Data
Subframe			
0	5	1 – 4, 6 – 9	
Allocation			
0 – (First allocated PRB of first block -1) and (Last allocated PRB of first block +1) – (First allocated PRB of second block -1)	0 – (First allocated PRB of first block -1) and (Last allocated PRB of first block +1) – (First allocated PRB of second block -1)	0 – (First allocated PRB of first block -1) and (Last allocated PRB of first block +1) – (First allocated PRB of second block -1)	
0	0	0	Note 1
<p>Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PDSCH.</p> <p>Note 2: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 2. The parameter <math>\gamma_{PRB}</math> applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.</p>			

### A.5.1.7 OCNG FDD pattern 7: dynamic OCNG FDD pattern when user data is in multiple non-contiguous blocks

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data, EPDCCH or system information) of the DL sub-frames, when the unallocated area is discontinuous in frequency domain (divided in multiple parts by the  $M$  allocated blocks for data transmission). The  $m$ -th allocated block starts with PRB  $N_{Start,m}$  and ends with PRB  $N_{End,m} - 1$ , where  $m = 1, \dots, M$ . The system bandwidth starts with PRB 0 and ends with  $N_{RB} - 1$ .

**Table A.5.1.7-1: OP.7 FDD: OCNG FDD Pattern when user data is in multiple non-contiguous blocks**

Relative power level $\gamma_{PRB}$ [dB]			PDSCH Data
Subframe			
0	5	1 – 4, 6 – 9	
Allocation			
0 – (PRB $N_{Start,1} - 1$ ) ... (PRB $N_{End,(m-1)} - 1$ ) – (PRB $N_{Start,m} - 1$ ) ... (PRB $N_{End,M} - 1$ ) – (PRB $N_{RB} - 1$ )	0 – (PRB $N_{Start,1} - 1$ ) ... (PRB $N_{End,(m-1)} - 1$ ) – (PRB $N_{Start,m} - 1$ ) ... (PRB $N_{End,M} - 1$ ) – (PRB $N_{RB} - 1$ )	0 – (PRB $N_{Start,1} - 1$ ) ... (PRB $N_{End,(m-1)} - 1$ ) – (PRB $N_{Start,m} - 1$ ) ... (PRB $N_{End,M} - 1$ ) – (PRB $N_{RB} - 1$ )	
0	0	0	Note 1
Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.			
Note 2: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 2. The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213 [10].			

### A.5.1.8 OCNG FDD pattern 8: One sided dynamic OCNG FDD pattern for TM10 transmission

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the DL sub-frames, when the unallocated area is continuous in frequency domain (one sided).

Table A.5.1.8-1: OP.8 FDD: One sided dynamic OCNG FDD Pattern

Relative power level $\gamma_{PRB}$ [dB]			PDSCH Data
Subframe			
0	5	1 – 4, 6 – 9	
Allocation			
First unallocated PRB – Last unallocated PRB	First unallocated PRB – Last unallocated PRB	First unallocated PRB – Last unallocated PRB	
0	0	0	Note 1,2,3
Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is 16QAM modulated. The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.			
Note 2: The OCNG shall be transmitted to the virtual users by all the transmit antennas according to transmission mode10. The transmit power is equal between all the transmit antennas used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213 [10].			
Note 3: The detailed test set-up for TM10 transmission i.e. PMI configuration is specified to each test case.			

## A.5.2 OCNG Patterns for TDD

The following OCNG patterns are used for modelling allocations to virtual UEs (which are not under test). The OCNG pattern for each sub frame specifies the allocations that shall be filled with OCNG, and furthermore, the relative power level of each such allocation.

In each test case the OCNG is expressed by parameters OCNG\_RA and OCNG\_RB which together with a relative power level ( $\gamma$ ) specifies the PDSCH EPRE-to-RS EPRE ratios in OFDM symbols with and without reference symbols, respectively. The relative power, which is used for modelling boosting per virtual UE allocation, is expressed by:

$$\gamma_i = PDSCH_i\_RA / OCNG\_RA = PDSCH_i\_RB / OCNG\_RB,$$

where  $\gamma_i$  denotes the relative power level of the  $i$ :th virtual UE. The parameter settings of OCNG\_RA, OCNG\_RB, and the set of relative power levels  $\gamma$  are chosen such that when also taking allocations to the UE under test into account, as given by a PDSCH reference channel, a transmitted power spectral density that is constant on an OFDM symbol basis is targeted.

Moreover the OCNG pattern is accompanied by a PCFICH/PDCCH/PHICH reference channel which specifies the control region. For any aggregation and PHICH allocation, the PDCCH and any unused PHICH groups are padded with resource element groups with a power level given respectively by PDCCH\_RA/RB and PHICH\_RA/RB as specified in the test case such that a total power spectral density in the control region that is constant on an OFDM symbol basis is targeted.

### A.5.2.1 OCNG TDD pattern 1: One sided dynamic OCNG TDD pattern

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the subframes available for DL transmission (depending on TDD UL/DL configuration), when the unallocated area is continuous in frequency domain (one sided).

Table A.5.2.1-1: OP.1 TDD: One sided dynamic OCNG TDD Pattern

Relative power level $\gamma_{PRB}$ [dB]				PDSCH Data
Subframe (only if available for DL)				
0	5	3, 4, 7, 8, 9 and 6 (as normal subframe) <sup>Note 2</sup>	1 and 6 (as special subframe) <sup>Note 2</sup>	
Allocation				
First unallocated PRB –	First unallocated PRB –	First unallocated PRB –	First unallocated PRB –	
Last unallocated PRB	Last unallocated PRB	Last unallocated PRB	Last unallocated PRB	
0	0	0	0	<b>Note 1</b>
<p>Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PDSCH.</p> <p>Note 2: Subframes available for DL transmission depends on the Uplink-Downlink configuration in Table 4.2-2 in 3GPP TS 36.211.</p> <p>Note 3: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 2. The parameter <math>\gamma_{PRB}</math> applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.</p>				

### A.5.2.2 OCNG TDD pattern 2: Two sided dynamic OCNG TDD pattern

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the subframes available for DL transmission (depending on TDD UL/DL configuration), when the unallocated area is discontinuous in frequency domain (divided in two parts by the allocated area – two sided), starts with PRB 0 and ends with PRB  $N_{RB} - 1$ .

Table A.5.2.2-1: OP.2 TDD: Two sided dynamic OCNG TDD Pattern

Relative power level $\gamma_{PRB}$ [dB]				PDSCH Data
Subframe (only if available for DL)				
0	5	3, 4, 6, 7, 8, 9 (6 as normal subframe) <sup>Note 2</sup>	1, 6 (6 as special subframe) <sup>Note 2</sup>	
Allocation				
0 – (First allocated PRB-1) and (Last allocated PRB+1) – ( $N_{RB} - 1$ )	0 – (First allocated PRB-1) and (Last allocated PRB+1) – ( $N_{RB} - 1$ )	0 – (First allocated PRB-1) and (Last allocated PRB+1) – ( $N_{RB} - 1$ )	0 – (First allocated PRB-1) and (Last allocated PRB+1) – ( $N_{RB} - 1$ )	
0	0	0	0	Note 1
<p>Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PDSCH.</p> <p>Note 2: Subframes available for DL transmission depends on the Uplink-Downlink configuration in Table 4.2-2 in 3GPP TS 36.211.</p> <p>Note 3: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 2. The parameter <math>\gamma_{PRB}</math> applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.</p>				

### A.5.2.3 OCNG TDD pattern 3: 49 RB OCNG allocation with MBSFN in 10 MHz

Table A.5.2.3-1: OP.3 TDD: OCNG TDD Pattern 3 for 5ms downlink-to-uplink switch-point periodicity

Allocation $n_{PRB}$	Relative power level $\gamma_{PRB}$ [dB]				PDSCH Data	PMCH Data
	Subframe					
	0	5	4, 9 <sup>Note 2</sup>	1, 6		
1 – 49	0	0 (Allocation: all empty PRB-s)	N/A	0	Note 1	N/A
0 – 49	N/A	N/A	0	N/A	N/A	Note 3
<p>Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PDSCH.</p> <p>Note 2: Subframes available for DL transmission depends on the Uplink-Downlink configuration in Table 4.2-2 in 3GPP TS 36.211.</p> <p>Note 3: Each physical resource block (PRB) is assigned to MBSFN transmission. The data in each PRB shall be uncorrelated with data in other PRBs over the period of any measurement. The MBSFN data shall be QPSK modulated. PMCH symbols shall not contain cell-specific Reference Signals</p> <p>Note 4: If two or more transmit antennas are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas according to transmission mode 2. The transmit power shall be equally split between all the transmit antennas used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.</p>						
N/A: Not Applicable						

### A.5.2.4 OCNG TDD pattern 4: One sided dynamic OCNG TDD pattern for MBMS transmission

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the DL sub-frames, when the unallocated area is continuous in frequency domain (one sided) and MBMS performance is tested.

**Table A.5.2.4-1: OP.4 TDD: One sided dynamic OCNG TDD Pattern for MBMS transmission**

Allocation $n_{PRB}$	Relative power level $\gamma_{PRB}$ [dB]				PDSCH Data	PMCH Data
	Subframe (only for DL)					
	0 and 6 (as normal subframe)	1 (as special subframe)	5	3, 4, 7 – 9		
First unallocated PRB – Last unallocated PRB	0	0 (Allocation: all empty PRB-s of DwPTS)	0 (Allocation: all empty PRB-s)	N/A	Note 1	N/A
First unallocated PRB – Last unallocated PRB	N/A	N/A	N/A	N/A	N/A	Note2
<p>Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PDSCH.</p> <p>Note 2: Each physical resource block (PRB) is assigned to MBSFN transmission. The data in each PRB shall be uncorrelated with data in other PRBs over the period of any measurement. The MBSFN data shall be QPSK modulated. PMCH symbols shall not contain cell-specific Reference Signals.</p> <p>Note 3: If two or more transmit antennas are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas according to transmission mode 2. The transmit power shall be equally split between all the transmit antennas used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.</p>						
N/A Not Applicable						

### A.5.2.5 OCNG TDD pattern 5: One sided dynamic 16QAM modulated OCNG TDD pattern

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the sub-frames available for DL transmission (depending on TDD UL/DL configuration), when the unallocated area is continuous in frequency domain (one sided).

Table A.5.2.5-1: OP.5 TDD: One sided dynamic 16QAM modulated OCNG TDD Pattern

Relative power level $\gamma_{PRB}$ [dB]				PDSCH Data
Subframe (only if available for DL)				
0	5	3, 4, 7, 8, 9 and 6 (as normal subframe) <small>Note 2</small>	1 and 6 (as special subframe) <small>Note 2</small>	
Allocation				
First unallocated PRB –	First unallocated PRB –	First unallocated PRB –	First unallocated PRB –	
Last unallocated PRB	Last unallocated PRB	Last unallocated PRB	Last unallocated PRB	
0	0	0	0	Note 1
<p>Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is 16QAM modulated. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PDSCH.</p> <p>Note 2: Subframes available for DL transmission depends on the Uplink-Downlink configuration in Table 4.2-2 in 3GPP TS 36.211</p> <p>Note 3: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 3 (Large Delay CDD). The parameter <math>\gamma_{PRB}</math> applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.</p>				

### A.5.2.6 OCNG TDD pattern 6: dynamic OCNG TDD pattern when user data is in 2 non-contiguous blocks

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the subframes available for DL transmission (depending on TDD UL/DL configuration), when the unallocated area is discontinuous in frequency domain (divided in two parts by the first allocated block). The second allocated block ends with PRB  $N_{RB} - 1$ .

Table A.5.2.6-1: OP.6 TDD: OCNG TDD Pattern when user data is in 2 non-contiguous blocks

Relative power level $\gamma_{PRB}$ [dB]				PDSCH Data
Subframe (only if available for DL)				
0	5	3, 4, 6, 7, 8, 9 (6 as normal subframe) <small>Note 2</small>	1,6 (6 as special subframe) <small>Note 2</small>	
Allocation				
0 – (First allocated PRB of first block -1) and (Last allocated PRB of first block +1) – (First allocated PRB of second block -1)	0 – (First allocated PRB of first block -1) and (Last allocated PRB of first block +1) – (First allocated PRB of second block -1)	0 – (First allocated PRB of first block -1) and (Last allocated PRB of first block +1) – (First allocated PRB of second block -1)	0 – (First allocated PRB of first block -1) and (Last allocated PRB of first block +1) – (First allocated PRB of second block -1)	
0	0	0	0	
<p>Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PDSCH.</p> <p>Note 2: Subframes available for DL transmission depends on the Uplink-Downlink configuration in Table 4.2-2 in 3GPP TS 36.211</p> <p>Note 3: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 2. The parameter <math>\gamma_{PRB}</math> applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.</p>				

### A.5.2.7 OCNG TDD pattern 7: dynamic OCNG TDD pattern when user data is in multiple non-contiguous blocks

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data, EPDCCH or system information) of the DL sub-frames, when the unallocated area is discontinuous in frequency domain (divided in multiple parts by the  $M$  allocated blocks for data transmission). The  $m$ -th allocated block starts with RPB  $N_{Start,m}$  and ends with PRB  $N_{End,m} - 1$ , where  $m = 1, \dots, M$ . The system bandwidth starts with RPB 0 and ends with  $N_{RB} - 1$ .

**Table A.5.2.7-1: OP.7 TDD: OCNG TDD Pattern when user data is in multiple non-contiguous blocks**

Relative power level $\gamma_{PRB}$ [dB]				PDSCH Data
Subframe (only if available for DL)				
0	5	3, 4, 6, 7, 8, 9 (6 as normal subframe) Note 2	1,6 (6 as special subframe) Note 2	
Allocation				
0 – (PRB $N_{Start,1} - 1$ ) ... (PRB $N_{End,(m-1)} -$ (PRB $N_{Start,m} - 1$ ) ... (PRB $N_{End,M} -$ (PRB $N_{RB} - 1$ )	0 – (PRB $N_{Start,1} - 1$ ) ... (PRB $N_{End,(m-1)} -$ (PRB $N_{Start,m} - 1$ ) ... (PRB $N_{End,M} -$ (PRB $N_{RB} - 1$ )	0 – (PRB $N_{Start,1} - 1$ ) ... (PRB $N_{End,(m-1)} -$ (PRB $N_{Start,m} - 1$ ) ... (PRB $N_{End,M} -$ (PRB $N_{RB} - 1$ )	0 – (PRB $N_{Start,1} - 1$ ) ... (PRB $N_{End,(m-1)} -$ (PRB $N_{Start,m} - 1$ ) ... (PRB $N_{End,M} -$ (PRB $N_{RB} - 1$ )	
0	0	0	0	Note 1
<p>Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PDSCH.</p> <p>Note 2: Subframes available for DL transmission depends on the Uplink-Downlink configuration in Table 4.2-2 in 3GPP TS 36.211 [8].</p> <p>Note 3: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS according to transmission mode 2. The parameter <math>\gamma_{PRB}</math> applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213 [10].</p>				

### A.5.2.8 OCNG TDD pattern 8: One sided dynamic OCNG TDD pattern for TM10 transmission

This OCNG Pattern fills with OCNG all empty PRB-s (PRB-s with no allocation of data or system information) of the DL sub-frames, when the unallocated area is continuous in frequency domain (one sided).

Table A.5.2.8-1: OP.8 TDD: One sided dynamic OCNG TDD Pattern

Relative power level $\gamma_{PRB}$ [dB]			PDSCH Data
Subframe			
0	5	1 – 4, 6 – 9	
Allocation			
First unallocated PRB – Last unallocated PRB	First unallocated PRB – Last unallocated PRB	First unallocated PRB – Last unallocated PRB	
0	0	0	Note 1,2,3
Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is 16QAM modulated. The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.			
Note 2: The OCNG shall be transmitted to the virtual users by all the transmit antennas according to transmission mode10. The transmit power is equal between all the transmit antennas used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213 [10].			
Note 3: The detailed test set-up for TM10 transmission i.e. PMI configuration is specified to each test case.			

## A.6 Sidelink reference measurement channels

### A.6.1 General

The algorithm for determining the payload size  $A$  is as follows; given a desired coding rate  $R$  and radio block allocation  $N_{RB}$

1. Calculate the number of channel bits  $N_{ch}$  that can be transmitted during the first transmission of a given sub-frame.
2. Find  $A$  such that the resulting coding rate is as close to  $R$  as possible, that is,

$$\min |R - (A + 24 * (N_{CB} + 1)) / N_{ch}|, \text{ where } N_{CB} = \begin{cases} 0, & \text{if } C = 1 \\ C, & \text{if } C > 1 \end{cases}$$

subject to

- a)  $A$  is a valid TB size according to section 7.1.7 of TS 36.213 [10] assuming an allocation of  $N_{RB}$  resource blocks.
  - b)  $C$  is the number of Code Blocks calculated according to section 5.1.2 of TS 36.212 [9].
3. If there is more than one  $A$  that minimizes the equation above, then the larger value is chosen per default and the chosen code rate should not exceed 0.93.

### A.6.2 Reference measurement channel for receiver characteristics

For ProSe Direct Discovery, Table A.6.2-1 is applicable for measurements on the Receiver Characteristics (clause 7) including the requirements of subclause 7.4D (Maximum input level).

For ProSe Direct Communication, Table A.6.2-2 is applicable for measurements on the Receiver Characteristics (clause 7) with the exception of subclause 7.4D (Maximum input level). Tables A.6.2-3, A.6.2-4, are applicable for subclause 7.4D (Maximum input level).

**Table A.6.2-1: Fixed Reference measurement channel for ProSe Direct Discovery receiver requirements and maximum input level**

Parameter	Unit	Value					
		1.4	3	5	10	15	20
Channel bandwidth	MHz						
Allocated resource blocks				2	2	2	2
Subcarriers per resource block				12	12	12	12
Allocated subframes per Discovery period				1	1	1	1
DFT-OFDM Symbols per subframe (see note)				11	11	11	11
Modulation				QPSK	QPSK	QPSK	QPSK
Transport Block Size				232	232	232	232
Transport block CRC	Bits			24	24	24	24
Maximum number of HARQ transmissions				1	1	1	1
Binary Channel Bits (see note)	Bits			528	528	528	528
Max. Throughput averaged over 1 Discovery period of 320ms	kbps			0.725	0.725	0.725	0.725
UE Category				≥ 1	≥ 1	≥ 1	≥ 1
NOTE1: PSDCH transmissions are rate-matched for 12 DFT-OFDM symbols per subframe, and the last symbol shall be punctured as per TS 36.211.							
NOTE2: Throughput is 232 bits per Discovery period. The discovery period is configured as 320ms in the test.							

**Table A.6.2-2: Fixed Reference measurement channel for ProSe Direct Communication receiver requirements**

Parameter	Unit	Value					
		1.4	3	5	10	15	20
Channel bandwidth	MHz						
Allocated resource blocks				25	50		
Subcarriers per resource block				12	12		
Packets per SA period				1	1

Transport block CRC	Bits			24	24		
Maximum number of HARQ transmissions				4	4		
Binary Channel Bits	Bits			14400	13824		
Max. Throughput averaged over 1 SA period of 40ms	kbps			247.8	257.4		
NOTE 1: For PSSCH transmission, the last symbol shall be punctured as per TS 36.211.							
NOTE 2: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).							
NOTE 3: Throughput (in kbps) will depend on SA period configuration							

### A.6.3 Reference measurement channels for PSDCH performance requirements

**Table A.6.3-1: Fixed Reference measurement channel for PSDCH performance requirement**

Parameter	Unit	Value					
		D.1 FDD / D.1 TDD					
Reference channel							
Channel bandwidth	MHz	1.4	3	5	10	15	20
Allocated resource blocks				2	2	2	2
Subcarriers per resource block				12	12	12	12
DFT-OFDM Symbols per subframe (see note)				11	11	11	11
Modulation				QPSK	QPSK	QPSK	QPSK
Transport Block Size				232	232	232	232
Transport block CRC	Bits			24	24	24	24
Binary Channel Bits (see note)	Bits			528	528	528	528
Max. Throughput averaged over 1 Discovery period of 320ms	kbps			0.725	0.725	0.725	0.725
UE Category				≥ 1	≥ 1	≥ 1	≥ 1
NOTE1: PSDCH transmissions are rate-matched for 12 DFT-OFDM symbols per subframe, and the last symbol shall be punctured as per TS 36.211.							

## A.6.4 Reference measurement channels for PSCCH performance requirements

**Table A.6.4-1: Fixed reference measurement channel for PSCCH performance requirement**

Parameter		Unit	Value					
			CC.1 FDD	CC.2 FDD	CC.3 FDD	CC.4 FDD	CC.5 FDD	CC.6 FDD
Reference channel								
Channel bandwidth		MHz	5	10	5	10	5	10
Allocated resource blocks			1	1	1	1	1	1
Subcarriers per resource block			12	12	12	12	12	12
DFT-OFDM Symbols per subframe (see NOTE 1)			11	11	11	11	11	11
Modulation			QPSK	QPSK	QPSK	QPSK	QPSK	QPSK
Transport Block Size		Bits	41	43	41	43	41	43
Information bits	Frequency hopping flag		0	0	1	1	1	1
	RB assignment		Set as per PSSCH RB allocation specific in the test					
	Hopping bits		N/A	N/A	1 Type 2 Hopping	(1,1) Type 2 Hopping	0 Type 1 Hopping	(1,0) Type 1 Hopping
	Time resource pattern ( $I_{TRP}$ )		8 (unless specified otherwise in the test) (NOTE 3)					
	Modulation and coding scheme		Set as the PSSCH MCS specified in the test					
	Timing advance indication		0 (unless specified otherwise in the test)					
	Group destination ID		As set by higher layers					
Transport block CRC		Bits	16	16	16	16	16	16
Maximum number of HARQ transmissions			2	2	2	2	2	2
Binary Channel Bits (see NOTE 1,2)		Bits	264	264	264	264	264	264
Max. Throughput averaged over one sc-period (bits/sc-period)			41	43	41	43	41	43
NOTE 1: PSCCH transmissions are rate-matched for 12 DFT-OFDM symbols per subframe, and the last symbol shall be punctured as per TS 36.211.								
NOTE 2: Binary channel bits per HARQ transmission.								
NOTE 3: For $N_{TRP} = 8$ (FDD) and $trpt-Subset = 010$ , $I_{TRP} = 8$ corresponds to a time repetition pattern of (1,1,0,0,0,0,0,0) as per TS 36.213.								

## A.6.5 Reference measurement channels for PSSCH performance requirements

**Table A.6.5-1: Fixed reference measurement channel for PSSCH performance requirement**

Parameter	Unit	Value				
		CD.1 FDD	CD.2 FDD	CD.3 FDD	CD.4 FDD	CD.5 FDD
Reference channel						
Channel bandwidth	MHz	5 / 10	5 / 10	5	10	5 / 10
Allocated resource blocks		10	10	25	50	2
Subcarriers per resource block		12	12	12	12	12
DFT-OFDM Symbols per subframe (see NOTE 1)		11	11	11	11	11
Modulation		QPSK	16QAM	16QAM	16QAM	QPSK
Transport Block Size		872	2536	6546	12960	328
Transport block CRC	Bits	24	24	24	24	24
Maximum number of HARQ transmissions		4	4	4	4	4
Binary Channel Bits (see NOTE 1,2)	Bits	2640	5280	13200	26400	528
Max. Throughput averaged over one sc-period (bits/sc-period)		872	2536	6546	12960	328
NOTE 1: PSSCH transmissions are rate-matched for 12 DFT-OFDM symbols per subframe, and the last symbol shall be punctured as per TS 36.211.						
NOTE 2: Binary channel bits per HARQ transmission.						
NOTE 3: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).						

**Table A.6.5-2: Fixed reference measurement channel for PSSCH for maximum Sidelink processes test**

Parameter	Unit	Value	
		CD.6 FDD	CD.7 FDD
Reference channel			
Channel bandwidth	MHz	5	10
Allocated resource blocks		25	50
Subcarriers per resource block		12	12
DFT-OFDM Symbols per subframe (see NOTE 1)		11	11
Modulation		16QAM	16QAM
Transport Block Size		15840	25456
Transport block CRC	Bits	24	24
Maximum number of HARQ transmissions		4	4
Binary Channel Bits (see NOTE 1,2)	Bits	13200	26400
Max. Throughput averaged over one sc-period (bits/sc-period)		15840	25456
NOTE 1: PSSCH transmissions are rate-matched for 12 DFT-OFDM symbols per subframe, and the last symbol shall be punctured as per TS 36.211.			
NOTE 2: Binary channel bits per HARQ transmission.			
NOTE 3: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit).			

## A.6.6 Reference measurement channels for PSBCH performance requirements

**Table A.6.6-1: Fixed reference measurement channel for PSBCH performance requirement**

Parameter	Unit	Value
Reference channel		CP.1 FDD
Channel bandwidth	MHz	5 / 10
Allocated resource blocks		6
Subcarriers per resource block		12
DFT-OFDM Symbols per subframe (see NOTE 1)		7
Modulation		QPSK
Transport Block Size		40
Transport block CRC	Bits	16
Maximum number of HARQ transmissions		1
Binary Channel Bits (see NOTE 1,2)	Bits	1008
Max. Throughput averaged over 40ms	kbps	1
NOTE 1: PSBCH transmissions are rate-matched for 8 DFT-OFDM symbols per subframe, and the last symbol shall be punctured as per TS 36.211.		

## A.7 Sidelink reference resource pool configurations

### A.7.1 Reference resource pool configurations for ProSe Direct Discovery demodulation tests

#### A.7.1.1 FDD

## Annex B (normative): Propagation Conditions

The propagation conditions and channel models for various environments are specified. For each environment a propagation model is used to evaluate the propagation pathloss due to the distance. Channel models are formed by combining delay profiles with a Doppler spectrum, with the addition of correlation properties in the case of a multi-antenna scenario.

---

### B.0 No interference

The downlink connection between the System Simulator and the UE is without Additive White Gaussian Noise, and has no fading or multipath effects.

---

### B.1 Static propagation condition

The downlink connection between the System Simulator and the UE is an Additive White Gaussian Noise (AWGN) environment (unless otherwise stated) with no fading or multipath effects.

For 1 port transmission to UE Receiver with 2Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{pmatrix} 1 \\ 1 \end{pmatrix}.$$

For 2 port transmission to UE Receiver with 2Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{pmatrix} 1 & j \\ 1 & -j \end{pmatrix}$$

For 4 port transmission to UE Receiver with 2Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{bmatrix} 1 & 1 & j & j \\ 1 & 1 & -j & -j \end{bmatrix}$$

For 8 port transmission to UE Receiver with 2Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{bmatrix} 1 & 1 & 1 & 1 & j & j & j & j \\ 1 & 1 & 1 & 1 & -j & -j & -j & -j \end{bmatrix}$$

For 1 port transmission to UE Receiver with 4Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}.$$

For 2 port transmission to UE Receiver with 4Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{bmatrix} 1 & j \\ 1 & -j \\ 1 & j \\ 1 & -j \end{bmatrix}.$$

For 4 port transmission to UE Receiver with 4Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{bmatrix} 1 & 1 & j & j \\ 1 & 1 & -j & -j \\ 1 & -1 & j & -j \\ 1 & -1 & -j & j \end{bmatrix}.$$

For 8 port transmission to UE Receiver with 4Rx the channel matrix is defined in the frequency domain by

$$\mathbf{H} = \begin{bmatrix} 1 & 1 & 1 & 1 & j & j & j & j \\ 1 & 1 & 1 & 1 & -j & -j & -j & -j \\ 1 & 1 & -1 & -1 & j & j & -j & -j \\ 1 & 1 & -1 & -1 & -j & -j & j & j \end{bmatrix}$$

### B.1.1 Definition of Additive White Gaussian Noise (AWGN) Interferer

Note that the AWGN interferer can be used in static propagation conditions, or in conjunction with multi-path fading.

The acceptable uncertainties of the AWGN interferer are defined in Annex F.

---

## B.2 Multi-path fading Propagation Conditions

The multipath propagation conditions consist of several parts:

- A delay profile in the form of a "tapped delay-line", characterized by a number of taps at fixed positions on a sampling grid. The profile can be further characterized by the r.m.s. delay spread and the maximum delay spanned by the taps.
- A combination of channel model parameters that include the Delay profile and the Doppler spectrum that is characterized by a classical spectrum shape and a maximum Doppler frequency
- A set of correlation matrices defining the correlation between the UE and eNodeB antennas in case of multi-antenna systems.

### B.2.1 Delay profiles

The delay profiles are selected to be representative of low, medium and high delay spread environments. The resulting model parameters are defined in Table B.2.1-1 and the tapped delay line models are defined in Tables B.2.1-2, B.2.1-3 and B.2.1-4.

**Table B.2.1-1: Delay profiles for E-UTRA channel models**

Model	Number of channel taps	Delay spread (r.m.s.)	Maximum excess tap delay (span)
Extended Pedestrian A (EPA)	7	45 ns	410 ns
Extended Vehicular A model (EVA)	9	357 ns	2510 ns
Extended Typical Urban model (ETU)	9	991 ns	5000 ns

**Table B.2.1-2: Extended Pedestrian A model (EPA)**

Excess tap delay [ns]	Relative power [dB]
0	0.0
30	-1.0
70	-2.0
90	-3.0
110	-8.0
190	-17.2
410	-20.8

**Table B.2.1-3: Extended Vehicular A model (EVA)**

Excess tap delay [ns]	Relative power [dB]
0	0.0
30	-1.5
150	-1.4
310	-3.6
370	-0.6
710	-9.1
1090	-7.0
1730	-12.0
2510	-16.9

**Table B.2.1-4: Extended Typical Urban model (ETU)**

Excess tap delay [ns]	Relative power [dB]
0	-1.0
50	-1.0
120	-1.0
200	0.0
230	0.0
500	0.0
1600	-3.0
2300	-5.0
5000	-7.0

## B.2.2 Combinations of channel model parameters

Table B.2.2-1 shows propagation conditions that are used for the performance measurements in multi-path fading environment for low, medium and high Doppler frequencies.

**Table B.2.2-1: Channel model parameters**

Model	Maximum Doppler frequency
EPA 5Hz	5 Hz
EVA 5Hz	5 Hz
EVA 70Hz	70 Hz
EVA 200Hz	200 Hz
ETU 30Hz	30 Hz
ETU 70Hz	70 Hz
ETU 300Hz	300 Hz

## B.2.3 MIMO Channel Correlation Matrices

The MIMO channel correlation matrices defined in B.2.3 apply for the antenna configuration using uniform linear arrays at both eNodeB and UE.

### B.2.3.1 Definition of MIMO Correlation Matrices

Table B.2.3.1-1 defines the correlation matrix for the eNodeB

**Table B.2.3.1-1: eNodeB correlation matrix**

	One antenna	Two antennas	Four antennas
eNode B Correlation	$R_{eNB} = 1$	$R_{eNB} = \begin{pmatrix} 1 & \alpha \\ \alpha^* & \mathbf{1} \end{pmatrix}$	$R_{eNB} = \begin{pmatrix} 1 & \alpha^{1/9} & \alpha^{4/9} & \alpha \\ \alpha^{1/9*} & 1 & \alpha^{1/9} & \alpha^{4/9} \\ \alpha^{4/9*} & \alpha^{1/9*} & 1 & \alpha^{1/9} \\ \alpha^* & \alpha^{4/9*} & \alpha^{1/9*} & 1 \end{pmatrix}$

Table B.2.3.1-2 defines the correlation matrix for the UE:

**Table B.2.3.1-2: UE correlation matrix**

	One antenna	Two antennas	Four antennas
UE Correlation	$R_{UE} = 1$	$R_{UE} = \begin{pmatrix} 1 & \beta \\ \beta^* & \mathbf{1} \end{pmatrix}$	$R_{UE} = \begin{pmatrix} 1 & \beta^{1/9} & \beta^{4/9} & \beta \\ \beta^{1/9*} & 1 & \beta^{1/9} & \beta^{4/9} \\ \beta^{4/9*} & \beta^{1/9*} & 1 & \beta^{1/9} \\ \beta^* & \beta^{4/9*} & \beta^{1/9*} & 1 \end{pmatrix}$

Table B.2.3.1-3 defines the channel spatial correlation matrix  $R_{spat}$ . The parameters,  $\alpha$  and  $\beta$  in Table B.2.3.1-3 defines the spatial correlation between the antennas at the eNodeB and UE.

**Table B.2.3.1-3:  $R_{spat}$  correlation matrices**

1x2 case	$R_{spat} = R_{UE} = \begin{bmatrix} 1 & \beta \\ \beta^* & 1 \end{bmatrix}$
2x1 case	$R_{spat} = R_{eNB} = \begin{bmatrix} 1 & \alpha \\ \alpha^* & 1 \end{bmatrix}$
2x2 case	$R_{spat} = R_{eNB} \otimes R_{UE} = \begin{bmatrix} 1 & \alpha \\ \alpha^* & 1 \end{bmatrix} \otimes \begin{bmatrix} 1 & \beta \\ \beta^* & 1 \end{bmatrix} = \begin{bmatrix} 1 & \beta & \alpha & \alpha\beta \\ \beta^* & 1 & \alpha\beta^* & \alpha \\ \alpha^* & \alpha^*\beta & 1 & \beta \\ \alpha^*\beta^* & \alpha^*\beta^* & \beta^* & 1 \end{bmatrix}$
4x2 case	$R_{spat} = R_{eNB} \otimes R_{UE} = \begin{bmatrix} 1 & \alpha^{1/9} & \alpha^{4/9} & \alpha \\ \alpha^{1/9*} & 1 & \alpha^{1/9} & \alpha^{4/9} \\ \alpha^{4/9} & \alpha^{1/9*} & 1 & \alpha^{1/9} \\ \alpha^* & \alpha^{4/9*} & \alpha^{1/9*} & 1 \end{bmatrix} \otimes \begin{bmatrix} 1 & \beta \\ \beta^* & 1 \end{bmatrix}$
4x4 case	$R_{spat} = R_{eNB} \otimes R_{UE} = \begin{bmatrix} 1 & \alpha^{1/9} & \alpha^{4/9} & \alpha \\ \alpha^{1/9*} & 1 & \alpha^{1/9} & \alpha^{4/9} \\ \alpha^{4/9} & \alpha^{1/9*} & 1 & \alpha^{1/9} \\ \alpha^* & \alpha^{4/9*} & \alpha^{1/9*} & 1 \end{bmatrix} \otimes \begin{bmatrix} 1 & \beta^{1/9} & \beta^{4/9} & \beta \\ \beta^{1/9*} & 1 & \beta^{1/9} & \beta^{4/9} \\ \beta^{4/9} & \beta^{1/9*} & 1 & \beta^{1/9} \\ \beta^* & \beta^{4/9*} & \beta^{1/9*} & 1 \end{bmatrix}$

For cases with more antennas at either eNodeB or UE or both, the channel spatial correlation matrix can still be expressed as the Kronecker product of  $R_{eNB}$  and  $R_{UE}$  according to  $R_{spat} = R_{eNB} \otimes R_{UE}$ .

### B.2.3.2 MIMO Correlation Matrices at High, Medium and Low Level

The  $\alpha$  and  $\beta$  for different correlation types are given in Table B.2.3.2-1.

**Table B.2.3.2-1**

Low correlation		Medium Correlation		High Correlation	
$\alpha$	$\beta$	$\alpha$	$\beta$	$\alpha$	$\beta$
0	0	0.3	0.9	0.9	0.9

The correlation matrices for high, medium and low correlation are defined in Table B.2.3.2-2, B.2.3.2-3 and B.2.3.2-4, as below.

The values in the Table B.2.3.2-2 table have been adjusted for the 4x2 and 4x4 high correlation cases to insure the correlation matrix is positive semi-definite after round-off to 4 digit precision. This is done using the equation:

$$\mathbf{R}_{high} = [\mathbf{R}_{spatial} + a\mathbf{I}_n] / (1 + a)$$

Where the value “a” is a scaling factor such that the smallest value is used to obtain a positive semi-definite result. For the 4x2 high correlation case, a=0.00010. For the 4x4 high correlation case, a=0.00012.

The same method is used to adjust the 4x4 medium correlation matrix in Table B.2.3.2-3 to insure the correlation matrix is positive semi-definite after round-off to 4 digit precision with a = 0.00012.

**Table B.2.3.2-2: MIMO correlation matrices for high correlation**

**Table B.2.3.2-4: MIMO correlation matrices for low correlation**

1x2 case	$R_{low} = \mathbf{I}_2$
2x1 case	$R_{low} = \mathbf{I}_2$
2x2 case	$R_{low} = \mathbf{I}_4$
4x2 case	$R_{low} = \mathbf{I}_8$
4x4 case	$R_{low} = \mathbf{I}_{16}$

In Table B.2.3.2-4,  $\mathbf{I}_d$  is the  $d \times d$  identity matrix.

### B.2.3A MIMO Channel Correlation Matrices using cross polarized antennas

The MIMO channel correlation matrices defined in B.2.3A apply for the antenna configuration using cross polarized (XP/X-pol) antennas at both eNodeB and UE. The cross-polarized antenna elements with +/-45 degrees polarization slant angles are deployed at eNB and cross-polarized elements with +90/0 degrees polarization slant angles are deployed at UE.

For the cross-polarized antennas, the N antennas are labelled such that antennas for one polarization are listed from 1 to N/2 and antennas for the other polarization are listed from N/2+1 to N, where N is the number of transmit or receive antennas.

### B.2.3A.1 Definition of MIMO Correlation Matrices using cross polarized antennas

For the channel spatial correlation matrix, the following is used:

$$R_{spat} = P(R_{eNB} \otimes \Gamma \otimes R_{UE})P^T$$

Where

- $R_{UE}$  is the spatial correlation matrix at the UE with same polarization,
- $R_{eNB}$  is the spatial correlation matrix at the eNB with same polarization,
- $\Gamma$  is a polarization correlation matrix, and
- $(\bullet)^T$  denotes transpose.

The matrix  $\Gamma$  is defined as

$$\Gamma = \begin{bmatrix} 1 & 0 & -\gamma & 0 \\ 0 & 1 & 0 & \gamma \\ -\gamma & 0 & 1 & 0 \\ 0 & \gamma & 0 & 1 \end{bmatrix}$$

A permutation matrix  $P$  element is defined as:

$$P(a,b) = \begin{cases} 1 & \text{for } a = (j-1)Nr + i \text{ and } b = 2(j-1)Nr + i, \quad i = 1, \dots, Nr, j = 1, \dots, Nt/2 \\ 1 & \text{for } a = (j-1)Nr + i \text{ and } b = 2(j - Nt/2)Nr - Nr + i, \quad i = 1, \dots, Nr, j = Nt/2 + 1, \dots, Nt \\ 0 & \text{otherwise} \end{cases}$$

Where  $N_t$  and  $N_r$  is the number of transmitter and receiver respectively. This is used to map the spatial correlation coefficients in accordance with the antenna element labelling system described in B.2.3A.

### B.2.3A.2 Spatial Correlation Matrices using cross polarized antennas at eNB and UE sides

#### B.2.3A.2.1 Spatial Correlation Matrices at eNB side

For 2-antenna transmitter using one pair of cross-polarized antenna elements,  $R_{eNB} = 1$ .

For 4-antenna transmitter using two pairs of cross-polarized antenna elements,  $R_{eNB} = \begin{pmatrix} 1 & \alpha \\ \alpha^* & 1 \end{pmatrix}$ .

For 8-antenna transmitter using four pairs of cross-polarized antenna elements,  $R_{eNB} = \begin{pmatrix} 1 & \alpha^{1/9} & \alpha^{4/9} & \alpha \\ \alpha^{1/9*} & 1 & \alpha^{1/9} & \alpha^{4/9} \\ \alpha^{4/9*} & \alpha^{1/9*} & 1 & \alpha^{1/9} \\ \alpha^* & \alpha^{4/9*} & \alpha^{1/9*} & 1 \end{pmatrix}$ .

#### B.2.3A.2.2 Spatial Correlation Matrices at UE side

For 2-antenna transmitter using one pair of cross-polarized antenna elements,  $R_{UE} = 1$ .

For 4-antenna transmitter using two pairs of cross-polarized antenna elements,  $R_{UE} = \begin{pmatrix} 1 & \beta \\ \beta^* & \mathbf{1} \end{pmatrix}$ .

**B.2.3A.3 MIMO Correlation Matrices using cross polarized antennas**

The values for parameters  $\alpha$ ,  $\beta$  and  $\gamma$  for low correlation and high spatial correlation are given in Table B.2.3A.3-1.

**Table B.2.3A.3-1**

High spatial correlation		
$\alpha$	$\beta$	$\gamma$
0.9	0.9	0.3

Note 1: Value of  $\alpha$  applies when more than one pair of cross-polarized antenna elements at eNB side.  
 Note 2: Value of  $\beta$  applies when more than one pair of cross-polarized antenna elements at UE side.

The correlation matrices for high spatial and low correlation are defined in Table B.2.3A.3-2 as below.

The values in Table B.2.3A.3-2 have been adjusted to insure the correlation matrix is positive semi-definite after round-off to 4 digit precision. This is done using the equation:

$$R_{high} = [R_{spat} + aI_n]/(1+a)$$

Where the value "a" is a scaling factor such that the smallest value is used to obtain a positive semi-definite result. For the 8x2 high spatial correlation case, a=0.00010.

**Table B.2.3A.3-2: MIMO correlation matrices for high spatial correlation**

### B.2.3A.4 Beam steering approach

Given the channel spatial correlation matrix in B.2.3A.1, the corresponding random channel matrix  $\mathbf{H}$  can be calculated. The signal model for the  $k$ -th subframe is denoted as:

$$y = \mathbf{H} \mathbf{D}_{\theta_k} \mathbf{W} x + n$$

Where

- $\mathbf{H}$  is the  $N_r \times N_t$  channel matrix per subcarrier.
- $\mathbf{D}_{\theta_k}$  is the steering matrix,

$$\text{For 8 transmission antennas, } \mathbf{D}_{\theta_k} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \otimes \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & e^{j\theta_k} & 0 & 0 \\ 0 & 0 & e^{j2\theta_k} & 0 \\ 0 & 0 & 0 & e^{j3\theta_k} \end{bmatrix};$$

$$\text{For 4 transmission antennas, } \mathbf{D}_{\theta_k} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \otimes \begin{bmatrix} 1 & 0 \\ 0 & e^{j\theta_k} \end{bmatrix}.$$

- $\theta_k$  controls the phase variation, and the phase for  $k$ -th subframe is denoted by  $\theta_k = \theta_0 + \Delta\theta \cdot k$ , where  $\theta_0$  is the random start value with the uniform distribution, i.e.  $\theta_0 \in [0, 2\pi]$ ,  $\Delta\theta$  is the step of phase variation, which is defined in Table B.2.3A.4-1, and  $k$  is the linear increment of 1 for every subframe throughout the simulation,
- $\mathbf{W}$  is the precoding matrix for  $N_t$  transmission antennas,
- $y$  is the received signal,  $x$  is the transmitted signal, and  $n$  is AWGN.

**Table B.2.3A.4-1: The step of phase variation**

Variation Step	Value (rad/subframe)
$\Delta\theta$	$1.2566 \times 10^{-3}$

## B.2.4 Propagation conditions for CQI tests

[For Channel Quality Indication (CQI) tests, the following additional multi-path profile is used:

$$h(t, \tau) = \delta(\tau) + a \exp(-i2\pi f_D t) \delta(\tau - \tau_d)$$

in continuous time  $(t, \tau)$  representation, with  $\tau_d$  the delay,  $a$  a constant and  $f_D$  the Doppler frequency.]

## B.2.5 FFS

## B.2.6 MBSFN Propagation Channel Profile

Table B.2.6-1 shows propagation conditions that are used for the MBSFN performance requirements in multi-path fading environment in an extended delay spread environment.

**Table B.2.6-1: Propagation Conditions for Multi-Path Fading Environments for MBSFN Performance Requirements in an extended delay spread environment**

Extended Delay Spread	
Maximum Doppler frequency [5Hz]	
Relative Delay [ns]	Relative Mean Power [dB]
0	0
30	-1.5
150	-1.4
310	-3.6
370	-0.6
1090	-7.0
12490	-10
12520	-11.5
12640	-11.4
12800	-13.6
12860	-10.6
13580	-17.0
27490	-20
27520	-21.5
27640	-21.4
27800	-23.6
27860	-20.6
28580	-27.0

### B.3 High speed train scenario

The high speed train condition for the test of the baseband performance is a non fading propagation channel with one tap. Doppler shift is given by

$$f_s(t) = f_d \cos \theta(t) \quad (\text{B.3.1})$$

where  $f_s(t)$  is the Doppler shift and  $f_d$  is the maximum Doppler frequency. The cosine of angle  $\theta(t)$  is given by

$$\cos \theta(t) = \frac{D_s/2 - vt}{\sqrt{D_{\min}^2 + (D_s/2 - vt)^2}}, \quad 0 \leq t \leq D_s/v \quad (\text{B.3.2})$$

$$\cos \theta(t) = \frac{-1.5D_s + vt}{\sqrt{D_{\min}^2 + (-1.5D_s + vt)^2}}, \quad D_s/v < t \leq 2D_s/v \quad (\text{B.3.3})$$

$$\cos \theta(t) = \cos \theta(t \bmod (2D_s/v)), \quad t > 2D_s/v \quad (\text{B.3.4})$$

where  $D_s/2$  is the initial distance of the train from eNodeB, and  $D_{\min}$  is eNodeB Railway track distance, both in meters;  $v$  is the velocity of the train in m/s,  $t$  is time in seconds.

Doppler shift and cosine angle are given by equation B.3.1 and B.3.2-B.3.4 respectively, where the required input parameters listed in table B.3-1 and the resulting Doppler shift is shown in Figure B.3-1 are applied for all frequency bands.

**Table B.3-1: High speed train scenario**

Parameter	Value
$D_s$	300 m
$D_{\min}$	2 m
$v$	300 km/h
$f_d$	750 Hz

NOTE 1: Parameters for HST conditions in table B.3-1 including  $f_d$  and Doppler shift trajectories presented on figure B.3-1 were derived from Band7 and are applied for performance verification in all frequency bands.

**Figure B.3-1: Doppler shift trajectory**

For 1x2 antenna configuration, the same  $h(t,\tau)$  is used to describe the channel between every pair of Tx and Rx.

For 2x2 antenna configuration, the same  $h(t,\tau)$  is used to describe the channel between every pair of Tx and Rx with phase shift according to  $\mathbf{H} = \begin{pmatrix} 1 & j \\ 1 & -j \end{pmatrix}$ .

## B.4 Beamforming Model

### B.4.1 Single-layer random beamforming (Antenna port 5, 7 or 8)

Single-layer transmission on antenna port 5 or on antenna port 7 or 8 without a simultaneous transmission on the other antenna port, is defined by using a precoder vector  $W(i)$  of size  $2 \times 1$  randomly selected with the number of layers

$\nu = 1$  from Table 6.3.4.2.3-1 in TS 36.211 [8] as beamforming weights. This precoder takes as an input the signal  $y^{(p)}(i)$ ,  $i = 0, 1, \dots, M_{\text{symb}}^{\text{ap}} - 1$ , for antenna port  $p \in \{5, 7, 8\}$ , with  $M_{\text{symb}}^{\text{ap}}$  the number of modulation symbols including the user-specific reference symbols (DRS), and generates a block of signals  $y_{\text{bf}}(i) = [y_{\text{bf}}(i) \ \tilde{y}_{\text{bf}}(i)]^T$  the elements of which are to be mapped onto the same physical RE but transmitted on different antenna elements:

$$\begin{bmatrix} y_{\text{bf}}(i) \\ \tilde{y}_{\text{bf}}(i) \end{bmatrix} = W(i)y^{(p)}(i)$$

Single-layer transmission on antenna port 7 or 8 with a simultaneous transmission on the other antenna port, is defined by using a pair of precoder vectors  $W_1(i)$  and  $W_2(i)$  each of size  $2 \times 1$ , which are not identical and randomly selected with the number of layers  $\nu = 1$  from Table 6.3.4.2.3-1 in TS 36.211 [8], as beamforming weights, and normalizing the transmit power as follows:

$$\begin{bmatrix} y_{\text{bf}}(i) \\ \tilde{y}_{\text{bf}}(i) \end{bmatrix} = \frac{1}{\sqrt{2}} (W_1(i)y^{(7)}(i) + W_2(i)y^{(8)}(i))$$

The precoder update granularity is specific to a test case.

The CSI reference symbols  $a_{k,l}^{(p)}$  satisfying  $p \bmod 2 = 1$ ,  $p \in \{15, 16, \dots, 22\}$ , are transmitted on the same physical antenna element as the modulation symbols  $y_{\text{bf}}(i)$ . The CSI reference symbols  $a_{k,l}^{(p)}$  satisfying  $p \bmod 2 = 0$ ,  $p \in \{15, 16, \dots, 22\}$ , are transmitted on the same physical antenna element as the modulation symbols  $\tilde{y}_{\text{bf}}(i)$ .

## B.4.2 Dual-layer random beamforming (antenna ports 7 and 8)

Dual-layer transmission on antenna ports 7 and 8 is defined by using a precoder matrix  $W(i)$  of size  $2 \times 2$  randomly selected with the number of layers  $\nu = 2$  from Table 6.3.4.2.3-1 in TS 36.211 [8] as beamforming weights. This precoder takes as an input a block of signals for antenna ports 7 and 8,  $y(i) = [y^{(7)}(i) \ y^{(8)}(i)]^T$ ,  $i = 0, 1, \dots, M_{\text{symb}}^{\text{ap}} - 1$ , with  $M_{\text{symb}}^{\text{ap}}$  being the number of modulation symbols per antenna port including the user-specific reference symbols, and generates a block of signals  $y_{\text{bf}}(i) = [y_{\text{bf}}(i) \ \tilde{y}_{\text{bf}}(i)]^T$  the elements of which are to be mapped onto the same physical RE but transmitted on different antenna elements:

$$\begin{bmatrix} y_{\text{bf}}(i) \\ \tilde{y}_{\text{bf}}(i) \end{bmatrix} = W(i) \begin{bmatrix} y^{(7)}(i) \\ y^{(8)}(i) \end{bmatrix},$$

The precoder update granularity is specific to a test case.

The CSI reference symbols  $a_{k,l}^{(p)}$  satisfying  $p \bmod 2 = 1$ ,  $p \in \{15, 16, \dots, 22\}$ , are transmitted on the same physical antenna element as the modulation symbols  $y_{\text{bf}}(i)$ . The CSI reference symbols  $a_{k,l}^{(p)}$  satisfying  $p \bmod 2 = 0$ ,  $p \in \{15, 16, \dots, 22\}$ , are transmitted on the same physical antenna element as the modulation symbols  $\tilde{y}_{\text{bf}}(i)$ .

## B.4.3 Generic beamforming model (antenna ports 7-14)

The transmission on antenna port(s)  $p = 7, 8, \dots, \nu + 6$  is defined by using a precoder matrix  $W(i)$  of size  $N_{\text{CSI}} \times \nu$ , where  $N_{\text{CSI}}$  is the number of CSI reference signals configured per test and  $\nu$  is the number of spatial layers. This precoder takes as an input a block of signals for antenna port(s)  $p = 7, 8, \dots, \nu + 6$ ,  $y^{(p)}(i) = [y^{(7)}(i) \ y^{(8)}(i) \ \dots \ y^{(6+\nu)}(i)]$ ,  $i = 0, 1, \dots, M_{\text{symb}}^{\text{ap}} - 1$ , with  $M_{\text{symb}}^{\text{ap}}$  being the number of modulation symbols per antenna port including the user-specific reference symbols (DM-RS), and generates a block of signals

$y_{bf}^{(q)}(i) = [y_{bf}^{(0)}(i) \ y_{bf}^{(1)}(i) \ \dots \ y_{bf}^{(N_{CSI}-1)}(i)]^T$  the elements of which are to be mapped onto the same time-frequency index pair  $(k, l)$  but transmitted on different physical antenna elements:

$$\begin{bmatrix} y_{bf}^{(0)}(i) \\ y_{bf}^{(1)}(i) \\ \vdots \\ y_{bf}^{(N_{CSI}-1)}(i) \end{bmatrix} = W(i) \begin{bmatrix} y^{(7)}(i) \\ y^{(8)}(i) \\ \vdots \\ y^{(6+\nu)}(i) \end{bmatrix}$$

The precoder matrix  $W(i)$  is specific to a test case.

The physical antenna elements are identified by indices  $j = 0, 1, \dots, N_{ANT} - 1$ , where  $N_{ANT} = N_{CSI}$  is the number of physical antenna elements configured per test.

Modulation symbols  $y_{bf}^{(q)}(i)$  with (i.e. beamformed PDSCH and DM-RS) are mapped to the physical antenna index.

Modulation symbols with  $p \in \{0, 1, \dots, P - 1\}$  (i.e. PBCH, PDCCH, PHICH, PCFICH) are mapped to the physical antenna index  $j = p$ , where  $P$  is the number of cell-specific reference signals configured per test.

Modulation symbols  $a_{k,l}^{(p)}$  with  $p \in \{0, 1, \dots, P - 1\}$  (i.e. CRS) are mapped to the physical antenna index  $j = p$ , where  $P$  is the number of cell-specific reference signals configured per test.

Modulation symbols  $a_{k,l}^{(p)}$  with  $p \in \{15, 16, \dots, 14 + N_{CSI}\}$  (i.e. CSI-RS) are mapped to the physical antenna index  $j = p - 15$ , where  $N_{CSI}$  is the number of CSI reference signals configured per test.

#### B.4.4 Random beamforming for EPDCCH distributed transmission (Antenna port 107 and 109)

EPDCCH distributed transmission on antenna port 107 and antenna port 109 is defined by using a pair of precoder vectors  $W_1(i)$  and  $W_2(i)$  each of size  $2 \times 1$ , which are not identical and randomly selected per EPDCCH PRB pair with the number of layers  $\nu = 1$  from Table 6.3.4.2.3-1 in [8], as beamforming weights. This precoder takes as an input the signal  $y^{(p)}(i)$ ,  $i = 0, 1, \dots, M_{\text{symp}}^{\text{ap}} - 1$ , for antenna port  $p \in \{107, 109\}$ , with  $M_{\text{symp}}^{\text{ap}}$  the number of modulation symbols including the user-specific reference symbols (DMRS), and generates a block of signals  $y_{bf}(i) = [y_{bf}(i) \ \tilde{y}_{bf}(i)]^T$ . When EPDCCH is associated with port 107, the transmitted block of signals is denoted as

$$\begin{bmatrix} y_{bf}(i) \\ \tilde{y}_{bf}(i) \end{bmatrix} = W_1(i) y^{(107)}(i).$$

When EPDCCH is associated with port 109, the transmitted block of signals is denoted as

$$\begin{bmatrix} y_{bf}(i) \\ \tilde{y}_{bf}(i) \end{bmatrix} = W_2(i) y^{(109)}(i).$$

#### B.4.5 Random beamforming for EPDCCH localized transmission (Antenna port 107, 108, 109 or 110)

EPDCCH localized transmission on antenna port 107, 108, 109 or 110 is defined by using a precoder vector  $w(i)$  of size  $2 \times 1$  randomly selected with the number of layers  $\nu = 1$  from Table 6.3.4.2.3-1 in [8] as beamforming weights.

This precoder takes as an input the signal  $y^{(p)}(i)$ ,  $i = 0, 1, \dots, M_{\text{symp}}^{\text{ap}} - 1$ , for antenna port  $p \in \{107, 108, 109, 110\}$ , with

$M_{\text{symb}}^{\text{ap}}$  the number of modulation symbols including the user-specific reference symbols (DMRS), and generates a block of signals  $y_{bf}(i) = [y_{bf}(i) \ \tilde{y}_{bf}(i)]^T$  the elements of which are to be mapped onto the same physical RE but transmitted on different antenna elements:

$$\begin{bmatrix} y_{bf}(i) \\ \tilde{y}_{bf}(i) \end{bmatrix} = W(i)y^{(p)}(i).$$

## B.5 Interference models for enhanced performance requirements Type-A

This clause provides a description for the modelling of interfering cell transmissions for enhanced performance requirements Type-A including: definition of dominant interferer proportion, transmission mode 3, 4 and 9 type of interference modelling.

### B.5.1 Dominant interferer proportion

Each interfering cell involved in enhanced performance requirements Type-A is characterized by its associated dominant interferer proportion (DIP) value:

$$DIP_i = \frac{\hat{I}_{or(i+1)}}{N_{oc}'}$$

where is  $\hat{I}_{or(i+1)}$  is the average received power spectral density from the  $i$ -th strongest interfering cell involved in the requirement scenario ( $\hat{I}_{or(1)}$  is assumed to be the power spectral density associated with the serving cell) and

$N_{oc}' = \sum_{j=2}^N \hat{I}_{or(j)} + N_{oc}$  where  $N_{oc}$  is the average power spectral density of a white noise source consistent with the

definition provided in subclause 3.2 and  $N$  is the total number of cells involved in a given requirement scenario.

### B.5.2 Transmission mode 3 interference model

This subclause provides transmission mode 3 interference modelling for each explicitly modelled interfering cell in the requirement scenario. In each subframe, each interfering cell shall transmit randomly modulated data over the entire PDSCH region and the full transmission bandwidth. Transmitted physical channels shall include PSS, SSS and PBCH.

For each subframe and each CQI subband as defined in subclause 7.2 of [10], a transmission rank shall be randomly determined independently from other CQI subbands as well as other interfering cells. Probabilities of occurrence of each possible transmission rank are as specified in the requirement scenario.

For rank-1 transmission over a subband, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to 16QAM randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [8].

For rank-2 transmission over a subband, precoding for spatial multiplexing with large delay CDD over two layers for the number of antenna ports in the requirement scenario shall be applied to 16QAM randomly modulated layer symbols, as specified in subclause 6.3.4.2.2 of [8].

For unallocated REs in the control region, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [8]. The EPRE ratio for these REs shall be as defined for PDCCH in Annex C.3.2.

### B.5.3 Transmission mode 4 interference model

This subclause provides transmission mode 4 interference modelling for each explicitly modelled interfering cell in the requirement scenario. In each subframe, each interfering cell shall transmit randomly modulated data over the entire PDSCH region and the full transmission bandwidth. Transmitted physical channels shall include PSS, SSS and PBCH.

For each subframe and each CQI subband as defined in subclause 7.2 of [10], a transmission rank shall be randomly determined independently from other CQI subbands as well as other interfering cells. Probabilities of occurrence of each possible transmission rank are as specified in the requirement scenario.

For each subframe and CQI subband, a precoding matrix for the number of layers  $\nu$  associated to the selected rank shall be selected randomly from Table 6.3.4.2.3-1 of [8]. Note that codebook index 0 shall be excluded from random precoder selection when the number of layers is  $\nu = 2$ .

Precoding for spatial multiplexing with cell-specific reference signals for the number of antenna ports in the requirement scenario shall be applied to 16QAM randomly modulated layer symbols, as specified in subclause 6.3.4.2.1 of [8] with the selected precoding matrices for each subframe and each CQI subband.

For unallocated REs in the control region, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [8]. The EPRE ratio for these REs shall be as defined for PDCCH in Annex C.3.2.

### B.5.4 Transmission mode 9 interference model

This subclause provides transmission mode 9 interference modelling for each explicitly modelled interfering cell in the requirement scenario. In each subframe, each interfering cell shall transmit randomly modulated data over the entire PDSCH region and the full transmission bandwidth. Transmitted physical channels shall include PSS, SSS and PBCH.

For each subframe and each CQI subband as defined in subclause 7.2 of [10], a transmission rank shall be randomly determined independently from other CQI subbands as well as other interfering cells. Probabilities of occurrence of each possible transmission rank are as specified in the requirement scenario.

For each subframe and each CQI subband, a precoding matrix for the number of layers  $\nu$  associated to the selected rank shall be selected randomly from Table 6.3.4.2.3-2 of [8].

The generic beamforming model in subclause B.4.3 shall be applied assuming cell-specific reference signals and CSI reference signals as specified in the requirement scenario. Random precoding with selected rank and precoding matrices for each subframe and each CQI subband shall be applied to 16QAM randomly modulated layer symbols including the user-specific reference symbols over antenna port 7 when the rank is one and antenna ports 7, 8 when the rank is two.

For unallocated REs in the control region, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [8]. The EPRE ratio for these REs shall be as defined for PDCCH in Annex C.3.2.

---

## B.6 Interference models for enhanced performance requirements Type-B

This clause provides a description for the modelling of interfering cell transmissions for enhanced performance requirements Type-B including: transmission mode 2, 3, 4 and 9 type of interference modelling and a definition of the random interference model.

### B.6.1 Transmission mode 2 interference model

This subclause provides transmission mode 2 interference modelling for each explicitly modelled interfering cell in the requirement scenario. In each subframe, each interfering cell shall transmit randomly modulated data over the PDSCH region as specified in subclause B.6.6. Transmitted physical channels shall include PSS, SSS and PBCH.

The MCS shall be randomly determined with probabilities of occurrence of each possible MCS as specified in subclause B.6.6.

Precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to the randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [8].

For unallocated REs in the control region, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [8]. The EPRE ratio for these REs shall be as defined for PDCCH in Annex C.3.2.

## B.6.2 Transmission mode 3 interference model

This subclause provides transmission mode 3 interference modelling for each explicitly modelled interfering cell in the requirement scenario. In each subframe, each interfering cell shall transmit randomly modulated data over the PDSCH region as specified in subclause B.6.6. Transmitted physical channels shall include PSS, SSS and PBCH.

The transmission rank shall be randomly determined for each user defined in section B.6.6 with probabilities of occurrence of each possible transmission rank as specified in subclause B.6.6.

The MCS shall be randomly determined with probabilities of occurrence of each possible MCS as specified in subclause B.6.6.

For rank-1 transmission, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to the randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [8].

For rank-2 transmission, precoding for spatial multiplexing with large delay CDD over two layers for the number of antenna ports in the requirement scenario shall be applied to the randomly modulated layer symbols, as specified in subclause 6.3.4.2.2 of [8].

For unallocated REs in the control region, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [8]. The EPRE ratio for these REs shall be as defined for PDCCH in Annex C.3.2.

## B.6.3 Transmission mode 4 interference model

This subclause provides transmission mode 4 interference modelling for each explicitly modelled interfering cell in the requirement scenario. In each subframe, each interfering cell shall transmit randomly modulated data over the PDSCH region as specified in subclause B.6.6. Transmitted physical channels shall include PSS, SSS and PBCH.

The transmission rank shall be randomly determined with probabilities of occurrence of each possible transmission rank as specified in subclause B.6.6.

The MCS shall be randomly determined with probabilities of occurrence of each possible MCS as specified in subclause B.6.6.

For each TTI, for each user defined in B.6.6, a single precoding matrix for the number of layers  $\nu$  associated to the selected rank shall be selected randomly from Table 6.3.4.2.3-1 of [8]. Note that codebook index 0 shall be excluded from random precoder selection when the number of layers is  $\nu = 2$ .

Precoding for spatial multiplexing with cell-specific reference signals for the number of antenna ports in the requirement scenario shall be applied to randomly modulated layer symbols, as specified in subclause 6.3.4.2.1 of [8] with the selected precoding matrices as specified in subclause B.6.6.

For unallocated REs in the control region, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [8]. The EPRE ratio for these REs shall be as defined for PDCCH in Annex C.3.2.

## B.6.4 Transmission mode 9 interference model

This subclause provides transmission mode 9 interference modelling for each explicitly modelled interfering cell in the requirement scenario. In each subframe, each interfering cell shall transmit randomly modulated data over the PDSCH region as specified in subclause B.6.6. Transmitted physical channels shall include PSS, SSS and PBCH.

The transmission rank shall be randomly determined with probabilities of occurrence of each possible transmission rank as specified in subclause B.6.6.

The MCS shall be randomly determined with probabilities of occurrence of each possible MCS as specified in subclause B.6.6.

For each TTI, for each user defined in B.6.6, a single precoding matrix for the number of layers  $\nu$  associated to the selected rank shall be selected randomly from Table 6.3.4.2.3-1 of [8]. Note that codebook index 0 shall be excluded from random precoder selection when the number of layers is  $\nu = 2$ .

The generic beamforming model in subclause B.4.3 shall be applied assuming cell-specific reference signals and CSI reference signals as specified in the requirement scenario. Random precoding with selected rank and precoding matrices for each subframe shall be applied to randomly modulated layer symbols including the user-specific reference symbols over antenna port 7 when the rank is one and antenna ports 7, 8 when the rank is two.

For each TTI, for each user defined in B.6.6, the scrambling ID value nSCID is randomly assigned from the set of {0,1}.

For unallocated REs in the control region, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [8]. The EPRE ratio for these REs shall be as defined for PDCCH in Annex C.3.2.

## B.6.5 CRS interference model

This subclause provides for the CRS interference modelling for each explicitly modelled interfering cell in the requirement scenario. In each subframe there is no PDSCH transmitted. Transmitted physical channels shall include PSS, SSS and PBCH.

For unallocated REs in the control region, precoding for transmit diversity for the number of antenna ports in the requirement scenario shall be applied to QPSK randomly modulated layer symbols, as specified in subclause 6.3.4.3 of [8]. The EPRE ratio for these REs shall be as defined for PDCCH in Annex C.3.2.

## B.6.6 Random interference model

This subclause presents the interference model which defines the resource allocation, MCS and rank for the two interference cells. The model includes approximately 10% DTX on these interference cells. Table B.6.6-1 shows the resource allocation for four users in two different configurations for each of the two interferers. Table B.6.6-2 shows the resource allocation to be used for special subframes with TM9 interference. Table B.6.6-3 shows the probabilities for the MCS and rank for these users.

**Table B.6.6-1: Resource allocation for the random interference model**

Resource allocation configurations Indexes	User Index	Resource allocation for random interference model				Probability
		Resource allocation type	Bitmap for resource allocation (Note 1)			
			1st field bitmap	2nd field bitmap	3rd field bitmap	
Configuration 1	User 0	1	00	0	10101000101010	50%
	User 1	1	00	0	01010101010101	
	User 2	0	01001001001001001			
	User 3	0	00100100100100100			
Configuration 2	User 0	1	00	0	10101010101010	50%
	User 1	1	00	1	01010100010101	
	User 2	0	01001001001001001			
	User 3	0	00100100100100100			

NOTE 1: The 1<sup>st</sup>, 2<sup>nd</sup>, and 3<sup>rd</sup> field bitmaps are only valid for resource allocation type 1 which was defined in [10].  
 NOTE 2: The resource allocation model is used for both 1<sup>st</sup> and 2<sup>nd</sup> interfering cells and the resource allocation is independent for each interfering cell.

**Table B.6.6-2: Resource allocation for the random interference model for TM9 special subframes**

Resource allocation configurations Indexes	User Index	Resource allocation for random interference model				Probability
		Resource allocation type	Bitmap for resource allocation (Note 1)			
			1st field bitmap	2nd field bitmap	3rd field bitmap	
Configuration 1	User 0	1	00	0	10101000101010	50%
	User 1	1	00	0	01010101000001	
	User 2	0	01001000001001001			
	User 3	0	00100100000100100			
Configuration 2	User 0	1	00	0	10101000101010	50%
	User 1	1	00	1	01010000010101	
	User 2	0	01001000001001001			
	User 3	0	00100100000100100			

NOTE 1: The 1<sup>st</sup>, 2<sup>nd</sup>, and 3<sup>rd</sup> field bitmaps are only valid for resource allocation type 1 which was defined in [10].  
 NOTE 2: The resource allocation model is used for both 1<sup>st</sup> and 2<sup>nd</sup> interfering cells and the resource allocation is independent for each interfering cell.

**Table B.6.6-3: MCS and rank configuration for the random interference model**

MCS probability			Rank probability	
MCS5	MCS14	MCS25	Rank 1	Rank 2
50%	25%	25%	80%	20%

NOTE 1: The MCS and rank should follow the probability indicated in the table randomly per UE per TTI.  
 NOTE 2: The probabilities for MCS and rank configuration are used for both 1<sup>st</sup> and 2<sup>nd</sup> interfering cells. The MCS and rank configurations are independent for each interfering cell.

## Annex C (normative): Downlink Physical Channels

This annex specifies the downlink physical channels that are needed for setting a connection and channels that are needed during a connection.

### C.0 Downlink signal levels

The downlink power settings in Table C.0-1 or Table C.0-2 are used unless otherwise specified in a test case.

If the UE has two Rx antennas, the downlink signal is applied to each one. Both UE Rx antennas shall be connected.

If the UE has one Rx antenna, the downlink signal is applied to it.

**Table C.0-1: Default Downlink power levels for E-UTRA**

	Unit	Channel bandwidth					
		1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
Number of RBs		6	15	25	50	75	100
Channel BW Power	dBm	-66	-62	-60	-57	-55	-54
RS EPRE	dBm/15kHz	-85	-85	-85	-85	-85	-85
Note 1: The channel bandwidth powers and RB allocations are informative, based on -85dBm/15kHz RS_EPRES, then scaled according to the number of RBs and rounded to the nearest integer dBm value. Full RE allocation with no boost or deboost is assumed in this calculation, but allocation may vary during setup.							
Note 2: The power level is specified at each UE Rx antenna.							

**Table C.0-2: Default Downlink power levels for NB-IoT**

	Unit	
Subcarriers		12
Channel BW Power	dBm	-74
NRS EPRE	dBm/15kHz	-85
Note 1: The channel bandwidth power is informative, based on -85dBm/15kHz NRS_EPRES, then scaled according to the number of subcarriers and rounded to the nearest integer dBm value. Full RE allocation with no boost or deboost is assumed in this calculation, but allocation may vary during setup.		
Note 2: The power level is specified at the UE Rx antenna		

The default signal level uncertainty is +/-3dB at each test port, for any level specified. If the uncertainty value is critical for the test purpose, a tighter uncertainty is specified for the related test case in Annex F.

### C.1 General

Table C.1-1 describes the mapping of downlink physical channels and signals to physical resources for E-UTRA FDD.

Table C.1-2 describes the mapping of downlink physical channels and signals to physical resources for E-UTRA TDD.

Table C.1-3 describes the mapping of downlink physical channels and signals to physical resources for NB-IoT.

**Table C.1-1: Mapping of downlink physical channels and signals to physical resources for E-UTRA FDD**

Physical channel	Time Domain Location	Frequency Domain Location	Note
RS	Symbols 0, 4 of each subframe for antenna port 0 & 1 Symbol 1 of each subframe for antenna port 2 & 3	Downlink system bandwidth dependent	Mapping rule is specified in TS 36.211 6.10.1.2 - CELL_ID = 0
PBCH	Symbols 0 to 3 of slot 1 of subframe 0 of each radio frame	Occupies 72 subcarriers centred on the DC subcarrier	Mapping rule is specified in TS 36.211 Section 6.6.4 (Note 2)
PSS	Symbol 6 of slot 0 and 10 of each radio frame	Occupies 62 subcarriers centred on the DC subcarrier. Additional 10 subcarriers (5 on each side) adjacent to the centred 62 subcarriers are reserved.	Mapping rule is specified in TS 36.211 Section 6.11.1.2
SSS	Symbol 5 of slots 0 and 10 of each radio frame	Occupies 62 subcarriers centred on the DC subcarrier. Additional 10 subcarriers (5 on each side) adjacent to the centred 62 subcarriers are reserved.	Mapping rule is specified in TS 36.211 Section 6.11.2.2
PCFICH	Symbol 0 of each subframe	Downlink system bandwidth dependent. Maps into 4 REGs uniformly spread in the frequency domain over the whole system bandwidth.	Mapping rule is specified in TS 36.211 Section 6.7.4 (Note 1) - CELL_ID = 0
PHICH	Symbol 0 of each subframe	Downlink system bandwidth dependent. Each PHICH group maps into 3 REGs in the frequency domain on the REGs not assigned to PCFICH over the whole system bandwidth	Mapping rule is specified in TS 36.211 Section 6.9.3 (Note 1) - CELL_ID = 0 - Ng = 1 - Normal PHICH duration - Number of PHICH groups = 1(BW=1.4MHz)/2(BW=3MHz)/4(BW=5MHz)/7(BW=10MHz)/10(BW=15MHz)/13(BW=20MHz)  Not required for UE category M1 testing
PDCCH	Symbols 0, 1, 2, 3 of each subframe for 1.4 MHz  Symbols 0, 1, 2, of each subframe for 3 and 5 MHz  Symbols 0, 1 of each subframe for 10, 15 and 20 MHz	The remaining REGs not allocated to both PCFICH and PHICH are used for PDCCH	Mapping rule is specified in TS 36.211 Section 6.8.5 (Note 1)
MPDCCH	Same as PDSCH	For Subframe 0, subcarriers corresponding to resource elements not allocated to RS, PSS, SSS and PBCH (core set and repetitions) and reserved for PBCH antenna ports 3 and 4 on the 72 central subcarriers.  For Subframe 5, subcarriers corresponding to resource elements not allocated to RS, PSS and SSS.  For Subframe 9, subcarriers corresponding to resource elements not allocated to RS, PSS, SSS and PBCH (repetitions).  For other subframes, subcarriers corresponding to resource elements not allocated to RS.	Mapping rule is specified in TS 36.211 Section 6.8B.5 (Note 1)  Only required for UE category M1 testing
PDSCH	All remaining OFDM symbols of	For Subframe 0,	Note that there are reserved

	each subframe not allocated to PDCCH	REs not allocated to RS, PSS, SSS and PBCH, is allocated to PDSCH  For Subframe 5, REs not allocated to RS, PSS and SSS, is allocated to PDSCH  For other subframes, REs not allocated to RS, is allocated to PDSCH	REs that are not used for transmission of any physical channels (Note 3 ) & (Note 4) which need to be taken into account when allocating REs to PDSCH
<p>Note 1: In case a single cell-specific RS is configured, cell-specific RS shall be assume to be present on antenna ports 0 and 1 for the purpose of mapping a symbol-quadruplet to a REG (resource-element group). (See TS 36.211 Section 6.2.4).</p> <p>Note 2: PBCH is mapped into RE assuming RS from 4 antennas are used at the eNB transmitter, irrespective of the actual number of Tx antenna. Resource elements assumed to be reserved for RS but not used for transmission of RS shall not be used for transmission of any physical channel. (See TS 36.211 Section 6.6.4).</p> <p>Note 3: In slot 0 and slot 10 of each radio frame, there are reserved REs for PSS and SSS that are not used for transmission of any physical channels. (See TS 36.211 Section 6.11.1.2 &amp; 6.11.2.2).</p> <p>Note 4: REs used for RS transmission on any of the antenna ports in a slot shall not be used for any transmission on any other antenna port in the same slot and set to zero. (See TS 36.211 Section 6.10.1.2).</p>			

**Table C.1-2: Mapping of downlink physical channels and signals to physical resources for E-UTRA TDD**

Physical channel	Time Domain Location	Frequency Domain Location	Note
RS	Symbols 0, 4 of each subframe for antenna port 0 & 1 Symbol 1 of each subframe for antenna port 2 & 3	Downlink system bandwidth dependent.	Mapping rule is specified in TS 36.211[8] 6.10.1.2 - CELL_ID = 0
PBCH	Symbols 0 to 3 of slot 1 of subframe 0 of each radio frame	Occupies 72 subcarriers centred on the DC subcarrier	Mapping rule is specified in TS 36.211[8] Section 6.6.4 (Note 3)
PSS	Symbol 2 of slot 2 and 12 of each radio frame	Occupies 62 subcarriers centred on the DC subcarrier. Additional 10 subcarriers (5 on each side) adjacent to the centred 62 subcarriers are reserved.	Mapping rule is specified in TS 36.211[8] Section 6.11.1.2
SSS	Symbol 6 of slots 1 and 11 of each radio frame	Occupies 62 subcarriers centred on the DC subcarrier. Additional 10 subcarriers (5 on each side) adjacent to the centred 62 subcarriers are reserved.	Mapping rule is specified in TS 36.211[8] Section 6.11.2.2
PCFICH	Symbol 0 of each subframe and special subframe	Downlink system bandwidth dependent. Maps into 4 REGs uniformly spread in the frequency domain over the whole system bandwidth	Mapping rule is specified in TS 36.211[8] Section 6.7.4 (Note 2) - CELL_ID = 0
PHICH	Symbol 0 of each subframe and special subframe	Downlink system bandwidth dependent. Each PHICH group maps into 3 REGs in the frequency domain on the REGs not assigned to PCFICH over the whole system bandwidth	Mapping rule is specified in TS 36.211[8] Section 6.9.3 (Note 2) - CELL_ID = 0 - Ng = 1 - Normal PHICH duration - Number of PHICH groups = 1(BW=1.4MHz)/2(BW=3MHz)/4(BW=5MHz)/7(BW=10MHz)/10(BW=15MHz)/13(BW=20MHz)  Not required for UE category M1 testing
PDCCH	For normal subframes(0,4,5,9) Symbols 0, 1, 2, 3 of each subframe for 1.4 MHz Symbols 0, 1, 2, of each subframe for 3 and 5 MHz Symbols 0, 1 of each subframe for 10, 15 and 20 MHz  For special subframe (1&6) Symbols 0, 1 of each subframe for all BWs	The remaining REGs not allocated to both PCFICH and PHICH are used for PDCCH	Mapping rule is specified in TS 36.211[8] Section 6.8.5 (Note 2)
MPDCC H	Same as PDSCH	For Subframe 0, subcarriers corresponding to resource elements not allocated to RS, SSS and PBCH (core set and repetitions) and reserved for PBCH antenna ports 3 and 4 on the 72 central subcarriers.  For Subframe 5, subcarriers corresponding to resource elements not allocated to RS, SSS and PBCH (repetitions).  For Subframe 1 and 6, resource elements not allocated to RS, PSS, GP and UpPTS.  For other subframes, subcarriers corresponding to resource elements not allocated to RS.	Mapping rule is specified in TS 36.211[8] Section 6.8B.5 (Note 2)  Only required for UE category M1 testing

PDSCH	<p>,All remaining OFDM symbols of each subframe not allocated to PDCCH with the following exception:</p> <p>For 1.4MHz,no data shall be scheduled on special subframes (1&amp;6) to avoid problems with insufficient PDCCH performance</p>	<p>For Subframe 0, REs not allocated to RS, SSS and PBCH, is allocated to PDSCH</p> <p>For Subframe 5, REs not allocated to RS and SSS, is allocated to PDSCH</p> <p>For Subframe 1 and 6, REs not allocated to RS, PSS, GP and UpPTS is allocated to PDSCH</p> <p>For other downlink subframes, REs not allocated to RS is allocated to PDSCH</p>	<p>Note that there are reserved REs that are not used for transmission of any physical channels (Note 4 ) &amp; (Note 5) which need to be taken into account when allocating REs to PDSCH</p>
<p>Note 1: The mapping is based on the default TDD configuration for subframe assignment and special subframe patterns (see 36.508 [7]subclause 4.6.3)</p> <p>Note 2: In case a single cell-specific RS is configured, cell-specific RS shall be assume to be present on antenna ports 0 and 1 for the purpose of mapping a symbol-quadruplet to a REG (resource-element group). (See TS 36.211[8] Section 6.2.4).</p> <p>Note 3: PBCH is mapped into RE assuming RS from 4 antennas are used at the eNB transmitter, irrespective of the actual number of Tx antenna. Resource elements assumed to be reserved for RS but not used for transmission of RS shall not be used for transmission of any physical channel. (See TS 36.211[8] Section 6.6.4).</p> <p>Note 4: In slot 1,2,11 and 12 of each radio frame, there are reserved REs for PSS and SSS that are not used for transmission of any physical channels. (See TS 36.211[8] Section 6.11.1.2 &amp; 6.11.2.2).</p> <p>Note 5: REs used for RS transmission on any of the antenna ports in a slot shall not be used for any transmission on any other antenna port in the same slot and set to zero. (See TS 36.211[8] Section 6.10.1.2).</p>			

**Table C.1-3: Mapping of downlink physical channels and signals to physical resources for NB-IoT**

Physical channel	Time Domain Location	Frequency Domain Location	Note
NPBCH	NPBCH is transmitted in subframe 0 in every radio frame. NPBCH consists of 8 independently decodable blocks of 80 ms duration. The time interval where MIB remains unchanged is 640 ms. NPBCH does not use the first 3 symbols in a subframe in in-band operation. For stand-alone and guard-band, the first 3 symbols (of the subframe transmitting NPBCH) contain no NPBCH.	Occupies any of the 12 subcarriers not reserved for transmission of reference signals	Mapping rule is specified in TS 36.211 [8] sub clause 10.2.4.4
NPSS	NPSS is transmitted in subframe 5. NPSS uses the last 11 OFDM symbols of subframes in which NB-PSS occurs for normal CP. NB-IoT PSS/SSS do not use: <ul style="list-style-type: none"> <li>- the LTE PDCCH control region</li> <li>- REs used by LTE CRS</li> </ul> NSSS periodicity is 10ms.	NPSS is mapped to sub-carriers #0-10 of the NB-IoT carrier	Mapping rule is specified in TS 36.211 [8] sub clause 10.2.7.1.2
NSSS	NSSS is transmitted in subframe 9. NSSS uses the last 11 OFDM symbols of subframes in which NB-SSS occurs for normal CP. NB-IoT PSS/SSS do not use: <ul style="list-style-type: none"> <li>- the LTE PDCCH control region</li> <li>- REs used by LTE CRS</li> </ul> NSSS periodicity is 20ms.	The number of subcarriers for NSSS is 12	Mapping rule is specified in TS 36.211 [8] sub clause 10.2.7.2.2
NPDCCH	NPDCCH on a given NB-IoT carrier are not mapped to the subframes containing NPSS/NSSS/PBCH on that carrier. NPDCCH are not be mapped onto resources elements used for NRS. NPDCCH are not overlapped with PBCH, PSS, SSS, or CRS. One or two NPDCCHs can be transmitted in a subframe. In in-band, first 3 OFDM symbols are not used for NPDCCH. In stand-alone and guard-band, all OFDM symbols are available for NPDCCH. NPDCCH and NPDSCH are multiplexed only based on TDM at subframe level: <ul style="list-style-type: none"> <li>- It means that only cross subframe scheduling is supported</li> <li>- The start of an NPDCCH search space is <math>\geq 4</math>ms after the end of the last NPDCCH search space</li> </ul>	NPDCCH is transmitted on an aggregation of one or two consecutive narrowband control channel elements (NCCEs), where a narrowband control channel element corresponds to 6 consecutive subcarriers in a subframe where NCCE 0 occupies subcarriers 0 through 5 and NCCE 1 occupies subcarriers 6 through 11	Mapping rule is specified in TS36.211 [8] sub clause 10.2.5.5
NPDSCH	The start of NB-PDSCH transmission is $\geq 4$ ms later than the end of its associated DL	Occupies any of the 12 subcarriers not reserved for transmission of reference signals	Mapping rule is specified in TS 36.211 [8] sub clause 10.2.3.4

	<p>assignment.  NPDSCH on a given NB-IoT carrier are not mapped to the subframes containing NPSS/NSSS/PBCH on that carrier.  NPDSCH resource elements should be different from the ones used for NRS.  NPDSCH resource elements should be different from the ones used for CRS.</p>		
NRS	<p>Narrowband reference signals are transmitted in all NB-IoT downlink subframes in a cell supporting NPDSCH transmission.  NRS is not transmitted in subframes that are not NB-IoT downlink subframes, except if these subframes contain NPBCH or NPDSCH carrying SystemInformationBlockType1-NB where NRS shall be transmitted  Narrowband reference signals are transmitted in subframes #0 and #4 and in subframes #9 not containing NSSS [when no NB-IoT downlink subframes configuration has not been established].  The narrowband reference signals shall not be mapped to subframes containing NPSS or NSSS.  NRS are transmitted on one or two antenna ports 0 to 1 (Figure 10.2.6.2-1 in TS 36.211 [8]).</p>	2 subcarriers per antenna port in any OFDM symbol where NRS is transmitted	

---

## C.2 Set-up

Table C.2-1 describes the downlink Physical Channels that are required for E-UTRA connection set up.

**Table C.2-1: Downlink Physical Channels required for E-UTRA connection set-up**

Physical Channel	EPRE Ratio	Note
<b>PBCH</b>	PBCH_RA = 0 dB	
	PBCH_RB = 0 dB	
<b>PSS</b>	PSS_RA = 0 dB	
<b>SSS</b>	SSS_RA = 0 dB	
<b>PCFICH</b>	PCFICH_RB = 0 dB	
<b>PDCCH</b>	PDCCH_RA = 0 dB	
	PDCCH_RB = 0 dB	
<b>MPDCCH</b>	MPDCCH_RA = 0 dB	Only required for UE category M1 testing
	MPDCCH_RB = 0 dB	
<b>PDSCH</b>	PDSCH_RA = 0 dB	
	PDSCH_RB = 0 dB	
<b>PHICH</b>	PHICH_RA = 0 dB	Note 2 Not required for UE category M1 testing
	PHICH_RB = 0 dB	
Note 1: No boosting is applied.		
Note 2: PHICH group power, i.e. the total power of all active PHICH sequences within a PHICH group.		

Table C.2-2 describes the configuration of PDSCH and PDCCH before measurement for E-UTRA FDD and Table C.2-3 for E-UTRA TDD.

Table C.2-4 describes the configuration of PDSCH and MPDCCH before measurement for FDD and Table C.2-5 for TDD.

**Table C.2-2: PDSCH and PDCCH configuration for E-UTRA FDD**

Parameter	Unit	Value	Comments
Allocated resource blocks		6	
MCS Index		-	TB Size with transmitting message in 1TTI
Number of HARQ processes	Processes	8	
Maximum number of HARQ transmission		5	
Aggregation level	CCE	2	Note 4
DCI Format for PDSCH		Format 1A	
DCI Format for PUSCH		Format 0	
Note 1: 2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10 MHz channel BW. 3 symbols allocated to PDCCH for 5 MHz and 3 MHz. 4 symbols allocated to PDCCH for 1.4 MHz.			
Note 2: Reference signal, Synchronization signals and PBCH allocated as per TS 36.211 [8].			
Note 3: The PDSCH shall be occupied 6 resource blocks centred on the DC subcarrier.			
Note 4: For PDCCH using SI-RNTI, Aggregation level: a) Tables C.3.0-3, C.3.1-3, and C.3.2-3 for RF tests b) Table A.2.1-1 of 36.521-3 for RRM tests.			

**Table C.2-3: PDSCH and PDCCH configuration for E-UTRA TDD**

Parameter	Unit	Value	Comments
Allocated resource blocks		6	
MCS Index		0	TB Size with transmitting message in 1TTI
Number of HARQ processes (Note 1)	Processes	7	
Maximum number of HARQ transmission		4	
Aggregation level	CCE	2	Note 5
DCI Format for PDSCH		Format 1A	
DCI Format for PUSCH		Format 0	
Note 1:	Number of HARQ processes shall be determined by UL/DL configuration, for configuration other than 1, the process number shall be set per TS 36.213 [10] Table 8-1.		
Note 2:	For normal downlink subframes, 2 symbols allocated to PDCCH for 20 MHz, 15 MHz and 10 MHz channel BW. 3 symbols allocated to PDCCH for 5 MHz and 3 MHz. 4 symbols allocated to PDCCH for 1.4 MHz. For special subframe (1&6), only 2 OFDM symbols are allocated to PDCCH for all BWs.		
Note 3:	Reference signal, Synchronization signals and PBCH allocated as per TS 36.211 [8].		
Note 4:	The PDSCH shall be occupied 6 resource blocks centred on the DC subcarrier.		
Note 5:	For PDCCH using SI-RNTI, Aggregation level: a) Tables C.3.0-3, C.3.1-3, and C.3.2-3 for RF tests b) Table A.2.2-1 of 36.521-3 for RRM tests

## C.3 Connection

The following clauses describes the downlink Physical Channels that are transmitted during a connection i.e., when measurements are done.

## C.3.0 Measurement of Transmitter Characteristics

Table C.3.0-1 is applicable for measurements on the Transmitter Characteristics (clause 6).

**Table C.3.0-1: Downlink Physical Channels transmitted during a connection (FDD and TDD)**

Physical Channel	EPRE Ratio	Note
PBCH	PBCH_RA = 0 dB	
	PBCH_RB = 0 dB	
PSS	PSS_RA = 0 dB	
SSS	SSS_RA = 0 dB	
PCFICH	PCFICH_RB = 0 dB	
PDCCH	PDCCH_RA = 0 dB	
	PDCCH_RB = 0 dB	
MPDCCH	MPDCCH_RA = 0 dB	Only required for UE category M1 testing
	MPDCCH_RB = 0 dB	
PDSCH	PDSCH_RA = 0 dB	
	PDSCH_RB = 0 dB	
PHICH	PHICH_RB = 0 dB	Note 1, Note 2 Not required for UE category M1 testing
Note 1: PHICH group power, i.e. the total power of all active PHICH sequences within a PHICH group. Note 2: For CA tests with 1 UL, no PHICH resources are assigned to the DUT in the SCell. Note 3: Unused PDCCH or MPDCCH resources and PHICH groups are padded with resource element groups with power level given respectively by PDCCH_RA/RB or MPDCCH_RA/RB and PHICH_RB, such that a total power spectral density in the control region that is constant on an OFDM symbol basis is targeted.		

NOTE 1: No boosting is applied.

**Table C.3.0-2: Power allocation for OFDM symbols and reference signals**

Parameter	Unit	Value	Note
Transmitted power spectral density $I_{or}$	dBm/15 kHz	Test specific	1. $I_{or}$ shall be kept constant throughout all OFDM symbols
Cell-specific reference signal power ratio $E_{RS} / I_{or}$		0 dB	

**Table C.3.0-3: PDCCH Aggregation Level (in CCE-s)**

Bandwidth	DCI for DL (SI-RNTI)	DCI for DL (C-RNTI)	DCI for UL (C-RNTI)	Notes
1.4 MHz	4	1	1	Note 1
3 MHz	4	4	4	Note 1
5 MHz	4	4	4	Note 1
10 MHz	8	8	8	Note 1
15 MHz	8	8	8	Note 1
20 MHz	8	8	8	Note 1
Note 1: No DL data allocated on TDD special subframes				

**Table C.3.0-3a: MPDCCH Aggregation Level (in ECCE-s)**

FFS

## C.3.1 Measurement of Receiver Characteristics

Table C.3.1-1 or Table C.3.1-5 is applicable for measurements on the Receiver Characteristics (clause 7).

**Table C.3.1-1: Downlink Physical Channels transmitted during a connection (E-UTRA FDD and TDD)**

Physical Channel	EPRE Ratio	Note
PBCH	PBCH_RA = 0 dB	
	PBCH_RB = 0 dB

	PDSCH_RB	dB	N/A	Note 1
OCNG	OCNG_RA	dB	$\rho_A$	Note 1
	OCNG_RB	dB	$\rho_B$	Note 1

Note 1:  $-\infty$  dB is allocated for this channel in this test.

### C.3.4 Power Allocation for Measurement of Performance Requirements when Quasi Co-location Type B: same Cell ID

For the performance requirements related to quasi-collocation type B behaviour when transmission points share the same Cell ID, the power allocation for the physical channels of the serving cell is listed in table C.3.4-1 and the power allocation for the physical channels of the cell transmitting PDSCH is listed in table C.3-4-2

**Table C.3.4-1: Downlink physical channels transmitted in the serving cell (TP1)**

Physical Channel	EPRE Ratio
PBCH	PBCH_RA = $\rho_A + \sigma$
	PBCH_RB = $\rho_B + \sigma$
PSS	PSS_RA = 0 (Note 2)
SSS	SSS_RA = 0 (Note 2)
PDSCH	PDSCH_RA = $\rho_A$
	PDSCH_RB = $\rho_B$
PCFICH	PCFICH_RB = $\rho_B + \sigma$
PDCCH	PDCCH_RA = $\rho_A + \sigma$
	PDCCH_RB = $\rho_B + \sigma$

NOTE 1:  $\rho_A = \rho_B = 0$  dB means no RS boosting.

NOTE 2: Assuming PSS and SSS transmitted on a single antenna port.

NOTE 3:  $\rho_A, \rho_B$  and  $\sigma$  are test specific.

**Table C.3.4-2: Downlink physical channels for the transmission point transmitting PDSCH (TP2)**

Physical Channel	Value
PDSCH	Test Specific

### C.3.5 Simplified CA testing method

For CA tests which require more than 16 independent faders, if a test system cannot support a throughput measurement with fading on all carriers simultaneously, the simplified CA testing method shall be used.

In the simplified CA testing method, the resulting propagation channel(s) shall be generated by considering a number of independent faders needed for one carrier and connecting them to the signal of randomly chosen carrier(s). The maximum number of channel faders on the test will be less than or equal to 16. The remaining carrier(s) shall be connected without a channel fader but with AWGN. The throughput is then collected only for the carrier(s) connected to channel faders.

In the simplified CA testing method, the test shall be repeated by choosing carrier(s) excluding already chosen carrier(s) until all the carrier(s) are tested under fading conditions. All the collected throughputs from each carrier shall be compared against the reference value of the requirements.

All supported carriers shall be configured and activated during the test.

---

## Annex D (normative): Characteristics of the Interfering Signal

### D.1 General

Some RF performance requirements for the E-UTRA UE receiver are defined with interfering signals present in addition to the wanted signal. When the wanted channel band width is wider than or equal to 5MHz, a modulated 5MHz full band width E-UTRA down link signal, and in some cases an additional CW signal, are used. For wanted channel band widths below 5MHz, the band width of the modulated interferer should be equal to the channel band width of the wanted signal.

---

### D.2 Interference signals

Table D.2-1 describes the modulated interferer for different channel band width options.

**Table D.2-1: Description of modulated E-UTRA interferer**

	Channel bandwidth					
	1.4 MHz	3 MHz	5 MHz	10 MHz	15 MHz	20 MHz
RB	6	15	25	25	25	25
BW <sub>Interferer</sub>	1.4 MHz	3 MHz	5 MHz	5 MHz	5 MHz	5 MHz

Table D.2-2 describes the GSM interferer.

**Table D.2-2: Description of GSM interferer**

BW <sub>Interferer</sub>	200kHz
Modulation	GMSK

---

## Annex E (normative): Global In-Channel TX-Test

Note: Clauses E.2.2 to E.5.9.3 are descriptions, which assume no power ramping adjacent to the measurement period. *Power ramping adjacent to the measurement period requires exclusion periods, described in clause E.7*

---

### E.1 General

The global in-channel TX test enables the measurement of all relevant parameters that describe the in-channel quality of the output signal of the TX under test in a single measurement process.

The parameters describing the in-channel quality of a transmitter, however, are not necessarily independent. The algorithm chosen for description inside this annex places particular emphasis on the exclusion of all interdependencies among the parameters.

---

### E.2 Signals and results

#### E.2.1 Basic principle

The process is based on the comparison of the actual **output signal of the TX under test**, received by an ideal receiver, with a **reference signal**, that is generated by the measuring equipment and represents an ideal error free received signal. All signals are represented as equivalent (generally complex) baseband signals.

The description below uses numbers as examples. These numbers are taken from frame structure 1 with normal CP length and 20 MHz bandwidth. The application of the text below, however, is not restricted to this frame structure and bandwidth.

#### E.2.2 Output signal of the TX under test

The output signal of the TX under test is acquired by the measuring equipment and stored for further processing. It is sampled at a sampling rate of 30.72 Msps. In the time domain it comprises at least 10 uplink subframes. The measurement period is derived by concatenating the correct number of individual uplink slots until the correct measurement period is reached. The output signal is named  $z(v)$ . Each slot is modelled as a signal with the following parameters: demodulated data content, carrier frequency, amplitude and phase for each subcarrier, timing, carrier leakage.

NOTE 1: TDD

For frame structure type 2, subframes with special fields (UpPTS) do not undergo any evaluation. Since the uplink subframes are not continuous, the 20 slots should be extracted from more than 1 continuous radio frame:

Figure E.2.2-1 is an example for uplink-downlink configuration 1 (DSUUDDSUUD) as specified in TS 36.211 [8] Table 4.2-2, assuming all uplink subframes are active.

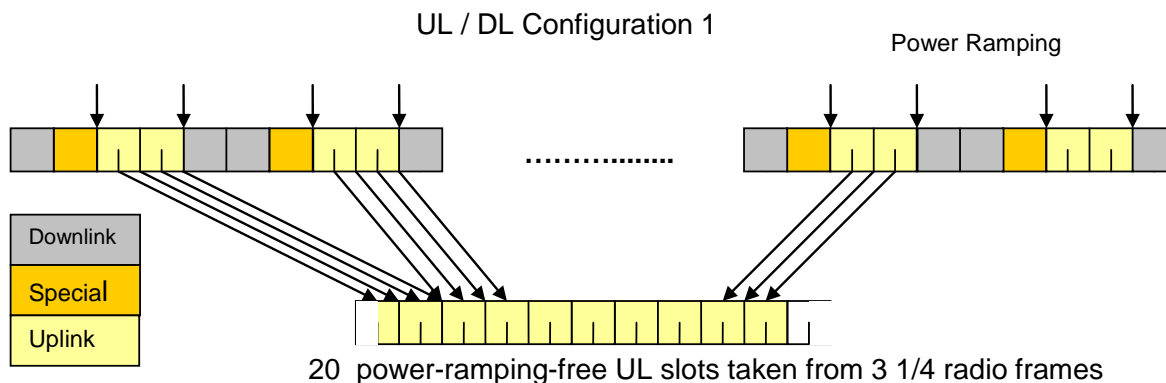

Figure E.2.2-1: Example of uplink – downlink configuration 1

## E.2.3 Reference signal

Two types of reference signal are defined:

The reference signal  $i_1(v)$  is constructed by the measuring equipment according to the relevant TX specifications, using the following parameters: demodulated data content, nominal carrier frequency, nominal amplitude and phase for each subcarrier, nominal timing, no carrier leakage. It is represented as a sequence of samples at a sampling rate of 30.72 Msps in the time domain.

The reference signal  $i_2(v)$  is constructed by the measuring equipment according to the relevant TX specifications, using the following parameters: restricted data content: nominal reference symbols, (all modulation symbols for user data symbols are set to 0V), nominal carrier frequency, nominal amplitude and phase for each applicable subcarrier, nominal timing, no carrier leakage. It is represented as a sequence of samples at a sampling rate of 30.72 Msps in the time domain.

NOTE: The PUCCH is off during the time under test.

## E.2.4 Measurement results

The measurement results, achieved by the global in channel TX test are the following:

- Carrier Frequency error
- EVM (Error Vector Magnitude)
- Carrier leakage
- Unwanted emissions, falling into non allocated resource blocks.
- EVM equalizer spectrum flatness

## E.2.5 Measurement points

The unwanted emission falling into non-allocated RB(s) is calculated directly after the FFT as described below. In contrast to this, the EVM for the allocated RB(s) is calculated after the IDFT. The samples after the TX-RX chain equalizer are used to calculate EVM equalizer spectrum flatness. Carrier frequency error and carrier leakage is calculated in the block “RF correction”.

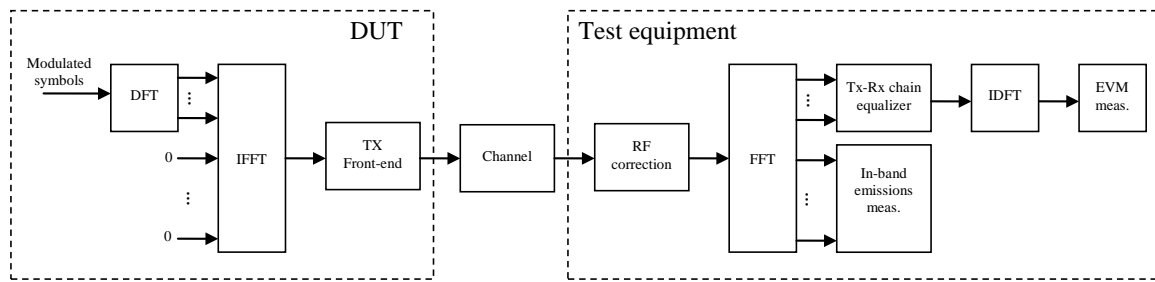

Figure E.2.5-1: EVM measurement points

## E.3 Signal processing

### E.3.1 Pre FFT minimization process

Before applying the pre-FFT minimization process,  $z(v)$  and  $i(v)$  are portioned into 20 pieces, comprising one slot each. Each slot is processed separately. Sample timing, Carrier frequency and carrier leakage in  $z(v)$  are jointly varied in order to minimise the difference between  $z(v)$  and  $i(v)$ . Best fit (minimum difference) is achieved when the RMS difference value between  $z(v)$  and  $i(v)$  is an absolute minimum.

The carrier frequency variation and the IQ variation are the measurement results: Carrier Frequency Error and Carrier leakage.

From the acquired samples 20 carrier frequencies and 20 carrier leakages can be derived.

NOTE 1: The minimisation process, to derive carrier leakage and RF error can be supported by Post FFT operations. However the minimisation process defined in the pre FFT domain comprises all acquired samples (i.e. it does not exclude the samples in between the FFT widths and it does not exclude the bandwidth outside the transmission bandwidth configuration)

NOTE 2: The algorithm would allow to derive Carrier Frequency error and Sample Frequency error of the TX under test separately. However there are no requirements for Sample Frequency error. Hence the algorithm models the RF and the sample frequency commonly (not independently). It returns one error and does not distinguish between both.

After this process the samples  $z(v)$  are called  $z^0(v)$ .

### E.3.2 Timing of the FFT window

The FFT window length is 2048 samples per OFDM symbol. 7 FFTs (14336 samples) cover less than the acquired number of samples (15360 samples) The position in time for FFT must be determined.

In an ideal signal, the FFT may start at any instant within the cyclic prefix without causing an error. The TX filter, however, reduces the window. The EVM requirements shall be met within a window  $W < CP$ . There are three different instants for FFT:

Centre of the reduced window, called  $\Delta\tilde{c}$ ,  $\Delta\tilde{c} - W/2$  and  $\Delta\tilde{c} + W/2$ .

The timing of the measured signal is determined in the pre FFT domain as follows, using  $z^0(v)$  and  $i_2(v)$  :

1. The measured signal is delay spread by the TX filter. Hence the distinct borders between the OFDM symbols and between Data and CP are also spread and the timing is not obvious.
2. In the Reference Signal  $i_2(v)$  the timing is known.
3. Correlation between (1.) and (2.) will result in a correlation peak. The meaning of the correlation peak is approx. the “impulse response” of the TX filter. The meaning of “impulse response” assumes that the autocorrelation of

the reference signal  $i_2(v)$  is a Dirac peak and that the correlation between the reference signal  $i_2(v)$  and the data in the measured signal is 0. The correlation peak, (the highest, or in case of more than one, the earliest) indicates the timing in the measured signal.

From the acquired samples 20 timings can be derived.

For all calculations, except EVM, the number of samples in  $z^0(v)$  is reduced to 7 blocks of samples, comprising 2048 samples (FFT width) and starting with  $\Delta\tilde{c}$  in each OFDM symbol including the demodulation reference signal.

For the EVM calculation the output signal under test is reduced to 14 blocks of samples, comprising 2048 samples (FFT width) and starting with  $\Delta\tilde{c} -W/2$  and  $\Delta\tilde{c} +W/2$  in each OFDM symbol including the demodulation reference signal.

The number of samples, used for FFT is reduced compared to  $z^0(v)$ . This subset of samples is called  $z'(v)$ .

The timing of the centre  $\Delta\tilde{c}$  with respect to the different CP length in a slot is as follows: (Frame structure 1, normal CP length)

$\Delta\tilde{c}$  is on  $T_{f=72}$  within the CP of length 144 (in OFDM symbol 1 to 6)

$\Delta\tilde{c}$  is on  $T_{f=88}$  (=160-72) within the CP of length 160 (in OFDM symbol 0)

### E.3.3 Post FFT equalisation

Perform 7 FFTs on  $z'(v)$ , one for each OFDM symbol in a slot using the timing  $\Delta\tilde{c}$ , including the demodulation reference symbol. The result is an array of samples, 7 in the time axis  $t$  times 2048 in the frequency axis  $f$ . The samples represent the DFT coded data symbols (in OFDM-symbol 0,1,2,4,5 and 6 in each slot) and demodulation reference symbols (OFDM symbol 3 in each slot) in the allocated RBs and inband emissions in the non allocated RBs within the transmission BW.

Only the allocated resource blocks in the frequency domain are used for equalisation.

The nominal demodulation reference symbols and nominal DFT coded data symbols are used to equalize the measured data symbols. (Location for equalization see Figure E.2.5-1)

NOTE: The nomenclature inside this note is local and not valid outside.

The nominal DFT coded data symbols are created by a demodulation process. The location to gain the demodulated data symbols is "EVM" in Figure E.2.5-1. A demodulation process as follows is recommended:

1. Equalize the measured DFT coded data symbols using the reference symbols for equalisation. Result: Equalized DFT coded data symbols
2. iDFT transform the equalized DFT coded data symbols: Result: Equalized data symbols
3. Decide for the nearest constellation point: Result: Nominal data symbols
4. DFT transform the nominal data symbols: Result: Nominal DFT coded data symbols

At this stage we have an array of Measured DFT coded data-Symbols and reference-Symbols ( $MS(f,t)$ )

versus an array of Nominal DFT coded data-Symbols and reference Symbols ( $NS(f,t)$ )

(complex, the arrays comprise 6 DFT coded data symbols and 1 demodulation reference symbol in the time axis and the number of allocated subcarriers in the frequency axis.)

$MS(f,t)$  and  $NS(f,t)$  are processed with a least square (LS) estimator, to derive one equalizer coefficient per time slot and per allocated subcarrier.  $EC(f)$

$$EC(f) = \frac{\sum_{t=0}^6 NS(f,t)^* NS(f,t)}{\sum_{t=0}^6 NS(f,t)^* MS(f,t)}$$

With \* denoting complex conjugation.

EC(f) are used to equalize the DFT-coded data symbols. The measured DFT-coded data and the references symbols are equalized by:

$$Z'(f,t) = MS(f,t) \cdot EC(f)$$

With · denoting multiplication.

Z'(f,t), restricted to the data symbol (excluding t=3) is used to calculate EVM, as described in E.4.1.

EC(f) is used in E.4.4 to calculate EVM equalizer spectral flatness.

NOTE: although an exclusion period for EVM may be applicable in E.7, the post FFT minimisation process is done over 7 symbols (6 DFT-coded data symbols and 1 reference symbol).

The samples of the non allocated resource blocks within the transmission bandwidth configuration in the post FFT domain are called Y(f,t) (f covering the non allocated subcarriers within the transmission bandwidth configuration, t covering the OFDM symbols during 1 slot).

## E.4 Derivation of the results

### E.4.1 EVM

For EVM create two sets of Z'(f,t), according to the timing "  $\Delta\tilde{c} = -W/2$  and  $\Delta\tilde{c} = +W/2$ " using the equalizer coefficients from E.3.3.

Perform the iDFTs on Z'(f,t). The IDFT-decoding preserves the meaning of t but transforms the variable f (representing the allocated sub carriers) into an another variable g, covering the same count and representing the demodulated symbols. The samples in the post IDFT domain are called iZ'(g, t). The equivalent ideal samples are called iI(g,t). Those samples of Z'(f,t), carrying the reference symbols (=symbol 3) are not iDFT processed.

The EVM is the difference between the ideal waveform and the measured and equalized waveform for the allocated RB(s)

$$EVM = \sqrt{\frac{\sum_{t \in T} \sum_{g \in G} |iZ'(g, t) - iI(g, t)|^2}{|G| \cdot |T| \cdot P_0}},$$

where

t covers the count of demodulated symbols with the considered modulation scheme being active within the measurement period, (i.e. symbol 0,1,2,4,5 and 6 in each slot,  $\rightarrow |T|=6$ )

g covers the count of demodulated symbols with the considered modulation scheme being active within the allocated bandwidth. ( $|G|=12 * L_{CRBs}$  (with  $L_{CRBs}$  : number of allocated resource blocks)).

$iZ'(g, t)$  are the samples of the signal evaluated for the EVM.

$iI(g, t)$  is the ideal signal reconstructed by the measurement equipment, and

$P_0$  is the average power of the ideal signal. For normalized modulation symbols  $P_0$  is equal to 1.

From the acquired samples 40 EVM value can be derived, 20 values for the timing  $\Delta\tilde{c} = -W/2$  and 20 values for the timing  $\Delta\tilde{c} = +W/2$

## E.4.2 Averaged EVM

EVM is averaged over all basic EVM measurements.

The averaging comprises 20 UL slots (for frame structure 2: excluding special fields(UpPTS))

$$\overline{EVM} = \sqrt{\frac{1}{20} \sum_{i=1}^{20} EVM_i^2}$$

The averaging is done separately for timing!  $\Delta\tilde{c} -W/2$  and  $\Delta\tilde{c} +W/2$  leading to  $\overline{EVM}_l$  and  $\overline{EVM}_h$

$EVM_{\text{final}} = \max(\overline{EVM}_l, \overline{EVM}_h)$  is compared against the test requirements.

## E.4.3 In-band emissions measurement

The in-band emissions are a measure of the interference falling into the non-allocated resources blocks.

Explanatory Note:

The inband emission measurement is only meaningful with allocated RBs next to non allocated RB. The allocated RBs are necessary but not under test. The non allocated RBs are under test. The RB allocation for this test is as follows: The allocated RBs are at one end of the channel BW, leaving the other end unallocated. The number of allocated RBs is smaller than half of the number of RBs, available in the channel BW. This means that the vicinity of the carrier in the centre is unallocated.

There are 3 types of inband emissions:

1. General
2. IQ image
3. Carrier leakage

*Carrier leakage* are inband emissions next to the carrier.

*IQ image* are inband emissions symmetrically (with respect to the carrier) on the other side of the allocated RBs.

*General* are applied to all unallocated RBs.

For each evaluated RB, the minimum requirement is calculated as the higher of  $P_{RB} - 30$  dB and the power sum of all limit values (General, IQ Image or Carrier leakage) that apply.

In specific the following combinations:

- Power (General)
- Power (General + Carrier leakage)
- Power (General + IQ Image)

1 and 2 is expressed in terms of power in one non allocated RB under test, normalized to the average power of an allocated RB (unit dB).

3 is expressed in terms of power in one non allocated RB, normalized to the power of all allocated RBs. (unit dBc).

This is the reason for two formulas *Emissions relative*.

Create one set of  $Y(t,f)$  per slot according to the timing “  $\Delta\tilde{c}$  ”

For the non-allocated RBs below the in-band emissions are calculated as follows

$$Emissions_{absolute}(\Delta_{RB}) = \begin{cases} \frac{1}{|T_s|} \sum_{t \in T_s} \sum_{c_l + (12 \cdot \Delta_{RB} + 1) \cdot \Delta f}^{c_l + (12 \cdot \Delta_{RB} + 11) \cdot \Delta f} |Y(t, f)|^2, \Delta_{RB} < 0 \\ \frac{1}{|T_s|} \sum_{t \in T_s} \sum_{c_h + (12 \cdot \Delta_{RB} - 11) \cdot \Delta f}^{\min(f_{\max}, (c_h + 12 \cdot \Delta_{RB} \cdot \Delta f))} |Y(t, f)|^2, \Delta_{RB} > 0 \end{cases}$$

where

the upper formula represents the in band emissions below the allocated frequency block and the lower one the in band emissions above the allocated frequency block.

$T_s$  is a set of  $|T_s|$  SC-FDMA symbols with the considered modulation scheme being active within the measurement period,

$\Delta_{RB}$  is the starting frequency offset between the allocated RB and the measured non-allocated RB (e.g.  $\Delta_{RB} = 1$  for the first upper or  $\Delta_{RB} = -1$  for the first lower adjacent RB),

$f_{\min}$  and  $f_{\max}$  are the lower and upper edge of the UL transmission BW configuration,

$c_l$  and  $c_h$  are the lower and upper edge of the allocated BW,

$\Delta f$  is 15kHz, and

$Y(t, f)$  is the frequency domain signal evaluated for in-band emissions as defined in the subsection E.3.3

The allocated RB power per RB and the total allocated RB power are given by:

$$P_{RB} = \frac{1}{|T_s| \cdot L_{CRBs}} \sum_{t \in T_s} \sum_{c_1}^{c_1 + (12 \cdot L_{CRBs} - 1) \cdot \Delta f} |MS(t, f)|^2 \text{ [dBm/180 kHz]}$$

$$P_{All-RBs} = \frac{1}{|T_s|} \sum_{t \in T_s} \sum_{c_1}^{c_1 + (12 \cdot L_{CRBs} - 1) \cdot \Delta f} |MS(t, f)|^2 \text{ [dBm]}$$

The relative in-band emissions, applicable for General and IQ image, are given by:

$$Emissions_{relative}(\Delta_{RB}) = 10 \cdot \log_{10} \left( \frac{Emissions_{absolute}(\Delta_{RB})}{\frac{1}{|T_s| \cdot L_{CRBs}} \sum_{t \in T_s} \sum_{c_1}^{c_1 + (12 \cdot L_{CRBs} - 1) \cdot \Delta f} |MS(t, f)|^2} \right) \text{ [dB]}$$

$$= Emissions_{absolute}(\Delta_{RB}) \text{ [dBm/180 kHz]} - P_{RB} \text{ [dBm/180 kHz]}$$

where

$L_{CRBs}$  is the number of allocated resource blocks,

and

$MS(t, f)$  is the frequency domain samples for the allocated bandwidth, as defined in the subsection E.3.3.

The relative in-band emissions, applicable for carrier leakage, is given by:

$$\begin{aligned}
Emissions_{relative} &= 10 \cdot \log_{10} \left( \frac{Emissions_{absolute}(RB_{nextDC})}{\frac{1}{|T_s|} \sum_{t \in T_s} \sum_{c_1}^{c_1 + (12 \cdot L_{CRBS} - 1) \cdot \Delta f} |MS(t, f)|^2} \right) [\text{dBc}] \\
&= Emissions_{absolute}(RB_{nextDC}) [\text{dBm}/180 \text{ kHz}] - P_{All-RBs} [\text{dBm}]
\end{aligned}$$

where RBnextDC means: Resource Block next to the carrier.

This is one RB, namely the central one in case of an odd number of RBs in the channel BW.

This is one pair of RBs, namely the immediately adjacent RBs to the carrier in case of an even number of RBs in the channel BW.

Although an exclusion period may be applicable in the time domain, when evaluating EVM (clause E.7), the inband emissions measurement interval is defined over one complete slot in the time domain.

From the acquired samples 20 functions for general in band emissions and IQ image inband emissions can be derived. 20 values or 20 pairs of carrier leakage inband emissions can be derived. They are compared against different limits.

## E.4.4 EVM equalizer spectrum flatness

For EVM equalizer spectrum flatness use EC(f) as defined in E.3.3. Note, EC(f) represents equalizer coefficient

$$f \in F, \quad f \text{ is the allocated subcarriers within the transmission bandwidth } (|F|=12 \cdot L_{CRBS})$$

From the acquired samples 20 functions EC(f) can be derived.

EC(f) is broken down to 2 functions:

$$EC_1(f), f \in \text{Range } 1$$

$$EC_2(f), f \in \text{Range } 2$$

Where Range 1 and Range 2 are as defined in Table 6.5.2.4.5-1 for normal condition and Table 6.5.2.4.5-2 for extreme condition

The following peak to peak ripple is calculated:

$$RP_1 = 20 \cdot \log \left( \frac{\max(|EC_1(f)|)}{\min(|EC_1(f)|)} \right), \text{ which denote the maximum ripple in Range 1}$$

$$RP_2 = 20 \cdot \log \left( \frac{\max(|EC_2(f)|)}{\min(|EC_2(f)|)} \right), \text{ which denote the maximum ripple in Range 2}$$

$RP_{12} = 20 \cdot \log \left( \frac{\max(|EC_1(f)|)}{\min(|EC_2(f)|)} \right)$ , which denote the maximum ripple between the upper side of Range 1 and lower side of Range 2

$RP_{21} = 20 \cdot \log \left( \frac{\max(|EC_2(f)|)}{\min(|EC_1(f)|)} \right)$ , which denote the maximum ripple between the upper side of Range 2 and lower side of Range 1

## E.4.5 Frequency error and Carrier leakage

See E.3.1.

### E.4.6 EVM of Demodulation reference symbols (EVM<sub>DMRS</sub>)

For the purpose of EVM<sub>DMRS</sub>, the steps E.2.2 to E.4.2 are repeated 6 times, constituting 6 EVM<sub>DMRS</sub> sub-periods. The only purpose of the repetition is to cover the longer gross measurement period of EVM<sub>DMRS</sub> (120 time slots) and to derive the FFT window timing per sub-period.

The bigger of the EVM results in one 20 TS period corresponding to the timing  $\Delta\tilde{c} - W/2$  or  $\Delta\tilde{c} + W/2$  is compared against the limit. (Clause E.4.2) This timing is re-used for EVM<sub>DMRS</sub> in the equivalent EVM<sub>DMRS</sub> sub-period.

For EVM the demodulation reference symbols are excluded, while the data symbols are used. For EVM<sub>DMRS</sub> the data symbols are excluded, while the demodulation references symbols are used. This is illustrated in figure E.4.6-1

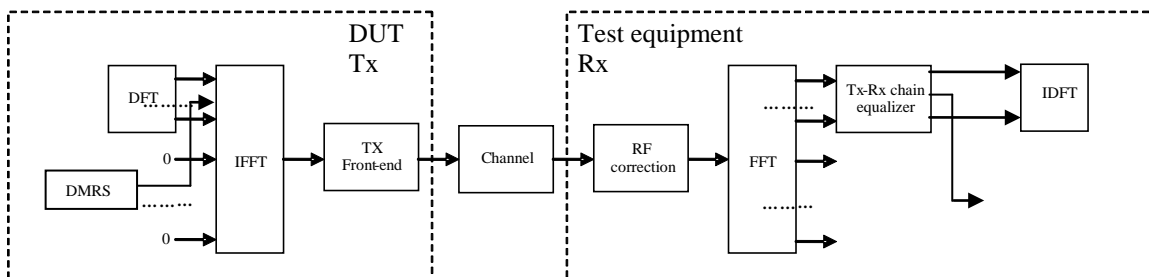

Figure E.4.6-1: EVM<sub>DMRS</sub> measurement points

Re-use the following formula from E.3.3:

$$Z'(f,t) = MS(f,t) \cdot EC(f)$$

To calculate EVM<sub>DMRS</sub>, the data symbol (t=0,1,2,4,5,6) in Z'(f,t) are excluded and only the reference symbol (t=3) is used.

The EVM<sub>DMRS</sub> is the difference between the ideal waveform and the measured and equalized waveform for the allocated RB(s)

$$EVM_{DMRS} = \sqrt{\frac{\sum_{t \in T} \sum_{f \in F} |Z'(f,t) - I(f,t)|^2}{|T| \cdot P_0 \cdot |F|}}$$

where

t covers the count of demodulation reference symbols (i.e. only symbol 3 in each slot, so count =1)

f covers the count of demodulation reference symbols within the allocated bandwidth. (|F|=12\* L<sub>CRBs</sub> (with L<sub>CRBs</sub> : number of allocated resource blocks)).

Z'(f,t) are the samples of the signal evaluated for the EVM<sub>DMRS</sub>

I(f,t) is the ideal signal reconstructed by the measurement equipment, and

P<sub>0</sub> is the average power of the ideal signal. For normalized modulation symbols P<sub>0</sub> is equal to 1.

20 such results are generated per measurement sub-period.

#### E.4.6.1 1<sup>st</sup> average for EVM<sub>DMRS</sub>

EVM<sub>DMRS</sub> is averaged over all basic EVM<sub>DMRS</sub> measurements in one sub-period

The averaging comprises 20 UL slots (for frame structure 2: excluding special fields(UpPTS))

$$1stEVM_{DMRS} = \sqrt{\frac{1}{20} \sum_{i=1}^{20} EVM_{DMRS_i}^2}$$

The timing is taken from the EVM for the data. 6 of those results are achieved from the samples. In general the timing is not the same for each result.

#### E.4.6.2 Final average for EVM<sub>DMRS</sub>

$$finalEVM_{DMRS} = \sqrt{\frac{1}{6} \sum_{i=1}^6 1stEVM_{DMRS_i}^2}$$

---

## E.5 EVM and inband emissions for PUCCH

For the purpose of worst case testing, the PUCCH shall be located on the edges of the Transmission Bandwidth Configuration (6,15,25,50,75,100 RBs).

The EVM for PUCCH (EVM<sub>PUCCH</sub>) is averaged over 20 slots. At least 20 TSs shall be transmitted by the UE without power change. SRS multiplexing shall be avoided during this period. The following transition periods are applicable: One OFDM symbol on each side of the slot border (instant of band edge alternation).

The description below is generic in the sense that all 6 PUCCH formats are covered. Although the number of OFDM symbols in one slot is 6 or 7 (depending on the cyclic prefix length), the text below uses 7 without excluding 6.

### E.5.1 Basic principle

The basis principle is the same as described in E.2.1

### E.5.2 Output signal of the TX under test

The output signal of the TX under test is processed same as described in E.2.2

### E.5.3 Reference signal

The reference signal is defined same as in E.2.3. Same as in E.2.3,  $i_1(v)$  is the ideal reference for EVM<sub>PUCCH</sub> and  $i_2(v)$  is used to estimate the FFT window timing.

Note PUSCH is off during the PUCCH measurement period.

### E.5.4 Measurement results

The measurement results are:

- EVM<sub>PUCCH</sub>
- Inband emissions with the sub-results: General in-band emission, IQ image (according to: 36.101. Annex F.4, Clause starting with: "At this stage the ....")

### E.5.5 Measurement points

The measurement points are illustrated in the figure below:

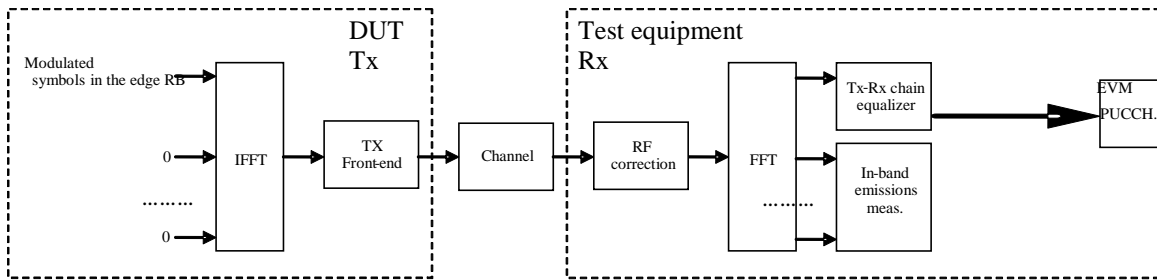

Figure E.5.5-1

## E.5.6 Pre FFT minimization process

The pre FFT minimisation process is the same as describes in clause E.3.1.

NOTE: although an exclusion period for  $EVM_{PUCCH}$  is applicable in E.5.9.1, the pre FFT minimisation process is done over the complete slot.

RF error, and carrier leakage are necessary for best fit of the measured signal towards the ideal signal in the pre FFT domain. However they are not used to compare them against the limits.

## E.5.7 Timing of the FFT window

Timing of the FFT window is estimated with the same method as described in E.3.2.

## E.5.8 Post FFT equalisation

The post FFT equalisation is described separately without reference to E.3.3:

Perform 7 FFTs on  $z'(v)$ , one for each OFDM symbol in a slot using the timing  $\Delta\tilde{c}$ , including the demodulation reference symbol. The result is an array of samples, 7 in the time axis  $t$  times 2048 in the frequency axis  $f$ . The samples represent the OFDM symbols (data and reference symbols) in the allocated RBs and inband emissions in the non allocated RBs within the transmission BW.

Only the allocated resource blocks in the frequency domain are used for equalisation.

The nominal reference symbols and **nominal** OFDM data symbols are used to equalize the measured data symbols.

Note: (The nomenclature inside this note is local and not valid outside)

The nominal OFDM data symbols are created by a demodulation process. A demodulation process as follows is recommended:

1. Equalize the measured OFDM data symbols using the reference symbols for equalisation. Result: Equalized OFDM data symbols
2. Decide for the nearest constellation point, however not independent for each subcarrier in the RB. 12 constellation points are decided dependent, using the applicable CAZAC sequence. Result: Nominal OFDM data symbols

At this stage we have an array of Measured data-Symbols and reference-Symbols ( $MS(f,t)$ )

versus an array of Nominal data-Symbols and reference Symbols ( $NS(f,t)$ )

The arrays comprise in sum 7 data and reference symbols, depending on the PUCCH format, in the time axis and the number of allocated sub-carriers in the frequency axis.

$MS(f,t)$  and  $NS(f,t)$  are processed with a least square (LS) estimator, to derive one equalizer coefficient per time slot and per allocated subcarrier.  $EC(f)$

$$EC(f) = \frac{\sum_{t=0}^6 NS(f,t)^* NS(f,t)}{\sum_{t=0}^6 MS(f,t)^* NS(f,t)}$$

With \* denoting complex conjugation.

EC(f) are used to equalize the OFDM data together with the demodulation reference symbols by:

$$Z'(f,t) = MS(f,t) \cdot EC(f)$$

With · denoting multiplication.

Z'(f,t) is used to calculate EVM<sub>PUCCH</sub>, as described in E.5.9.1

NOTE: although an exclusion period for EVM<sub>PUCCH</sub> is applicable in E.5.9.1, the post FFT minimisation process is done over 7 OFDM symbols.

The samples of the non allocated resource blocks within the transmission bandwidth configuration in the post FFT domain are called Y(f,t) (f covering the non allocated subcarriers within the transmission bandwidth configuration, t covering the OFDM symbols during 1 slot).

## E.5.9 Derivation of the results

### E.5.9.1 EVM<sub>PUCCH</sub>

For EVM<sub>PUCCH</sub> create two sets of Z'(f,t), according to the timing "Δc̃ -W/2 and Δc̃ +W/2" using the equalizer coefficients from E.5.8

The EVM<sub>PUCCH</sub> is the difference between the ideal waveform and the measured and equalized waveform for the allocated RB(s)

$$EVM_{PUCCH} = \sqrt{\frac{\sum_{t \in T} \sum_{f \in F} |Z'(f,t) - I(f,t)|^2}{|T| \cdot P_0 \cdot |F|}},$$

where

the OFDM symbols next to slot borders (instant of band edge alternation) are excluded:

t covers less than the count of demodulated symbols in the slot (|T|= 5)

f covers the count of subcarriers within the allocated bandwidth. (|F|=12)

Z'(f,t) are the samples of the signal evaluated for the EVM<sub>PUCCH</sub>

I(f,t) is the ideal signal reconstructed by the measurement equipment, and

P<sub>0</sub> is the average power of the ideal signal. For normalized modulation symbols P<sub>0</sub> is equal to 1.

From the acquired samples 40 EVM<sub>PUCCH</sub> value can be derived, 20 values for the timing Δc̃ -W/2 and 20 values for the timing Δc̃ +W/2

### E.5.9.2 Averaged EVM<sub>PUCCH</sub>

EVM<sub>PUCCH</sub> is averaged over all basic EVM<sub>PUCCH</sub> measurements

The averaging comprises 20 UL slots (for frame structure 2: excluding special fields(UpPTS))

$$\overline{EVM}_{PUCCH} = \sqrt{\frac{1}{20} \sum_{i=1}^{20} EVM_{PUCCH_i}^2}$$

The averaging is done separately for timing!  $\Delta\tilde{c} - W/2$  and  $\Delta\tilde{c} + W/2$  leading to  $\overline{EVM}_{PUCCH,low}$  and  $\overline{EVM}_{PUCCH,high}$

$EVM_{PUCCH,final} = \max(\overline{EVM}_{PUCCH,low}, \overline{EVM}_{PUCCH,high})$  is compared against the test requirements.

### E.5.9.3 In-band emissions measurement

The in-band emissions are a measure of the interference falling into the non-allocated resources blocks

Create one set of  $Y(t,f)$  per slot according to the timing “ $\Delta\tilde{c}$ ”

For the non-allocated RBs the in-band emissions are calculated as follows

$$Emissions_{absolute}(\Delta_{RB}) = \begin{cases} \frac{1}{|T_s|} \sum_{t \in T_s} \sum_{c_l + (12 \cdot \Delta_{RB} + 11) \cdot \Delta f}^{c_l + (12 \cdot \Delta_{RB} + 11) \cdot \Delta f} |Y(t, f)|^2, \Delta_{RB} < 0 \\ \frac{1}{|T_s|} \sum_{t \in T_s} \sum_{c_h + (12 \cdot \Delta_{RB} - 11) \cdot \Delta f}^{\min(f_{max}, (c_h + 12 \cdot \Delta_{RB} \cdot \Delta f))} |Y(t, f)|^2, \Delta_{RB} > 0 \end{cases},$$

where

the upper formula represents the inband emissions below the allocated frequency block and the lower one the inband emissions above the allocated frequency block.

$T_s$  is a set of  $|T_s|$  OFDM symbols in the measurement period,

$\Delta_{RB}$  is the starting frequency offset between the allocated RB and the measured non-allocated RB (e.g.  $\Delta_{RB} = 1$  for the first upper or  $\Delta_{RB} = -1$  for the first lower adjacent RB),

$f_{min}$  and  $f_{max}$  are the lower and upper edge of the UL system BW,

$c_l$  and  $c_h$  are the lower and upper edge of the allocated BW,

$\Delta f$  is 15kHz, and

$Y(t, f)$  is the frequency domain signal evaluated for in-band emissions as defined in the subsection E.5.8

The relative in-band emissions are, given by

$$Emissions_{relative}(\Delta_{RB}) = 10 * \log_{10} \frac{Emissions_{absolute}(\Delta_{RB})}{\frac{1}{|T_s|} \cdot L_{CRBs} \sum_{t \in T_s} \sum_{c_1}^{c_1 + (12 \cdot L_{CRBs} - 1) \cdot \Delta f} |MS(t, f)|^2} [dB]$$

where

$L_{CRBs}$  is the number of allocated RBs, which is always 1 in case of PUCCH

and  $MS(t, f)$  is the frequency domain samples for the allocated bandwidth, as defined in the subsection E.5.8

Although an exclusion period for EVM is applicable in E.5.9.1, the inband emissions measurement interval is defined over one complete slot in the time domain.

From the acquired samples 20 functions for inband emissions can be derived.

Since the PUCCH allocation is always on the upper or lower band-edge, the opposite to the allocated one represents the IQ image, and the remaining inner RBs represent the general inband emissions. They are compared against different limits.

---

## E.6 EVM for PRACH

The description below is generic in the sense that all 5 PRACH formats are covered. The numbers, used in the text below are taken from PRACH format#0 without excluding the other formats. The sampling rate for the PUSCH, 30.72 Msps in the time domain, is re-used for the PRACH. The carrier spacing of the PUSCH is 12 (format 0 to 3) and 2 (format 4) times of the PRACH. This results in an oversampling factor of 12 (format 0 to 3) and 2 (format 4), when acquiring the time samples for the PRACH. The pre-FFT algorithms (clauses E.6.6 and E.6.7) use all time samples, although oversampled. For the FFT the time samples are decimated by the factor of 12 (format 0 to 3) and 2 (format 4), resulting in the same FFT size as for the other transmit modulation tests (2048). Decimation requires a decision, which samples are used and which ones are rejected. The algorithm in E.6.6, Timing of the FFT window, can also be used to decide about the used samples.

### E.6.1 Basic principle

The basic principle is the same as described in E.2.1

### E.6.2 Output signal of the TX under test

The output signal of the TX under test is processed same as described in E.2.2

The measurement period is different:

- 2 PRACH preambles are recorded for format 0 and 1,
- 1 PRACH preamble is recorded for format 2 and 3, each containing 1 CP and 2 preamble sequences
- 10 RPRACH preambles are recorded for format 4.

### E.6.3 Reference signal

The test description in 6.5.2.1.4.1A is based on non contention based access:

- PRACH configuration index (responsible for Preamble format, System frame number and subframe number)
- Preamble ID
- Preamble power

signalled to the UE, defines the reference signal unambiguously, such that no demodulation process is necessary to gain the reference signal.

The reference signal  $i(v)$  is constructed by the measuring equipment according to the relevant TX specifications, using the following parameters: the applicable Zadoff Chu sequence, nominal carrier frequency, nominal amplitude and phase for each subcarrier, nominal timing, no carrier leakage. It is represented as a sequence of samples at a sampling rate of 30.72 Msps in the time domain.

### E.6.4 Measurement results

The measurement result is:

- EVMPRACH

## E.6.5 Measurement points

The measurement points are illustrated in the figure below:

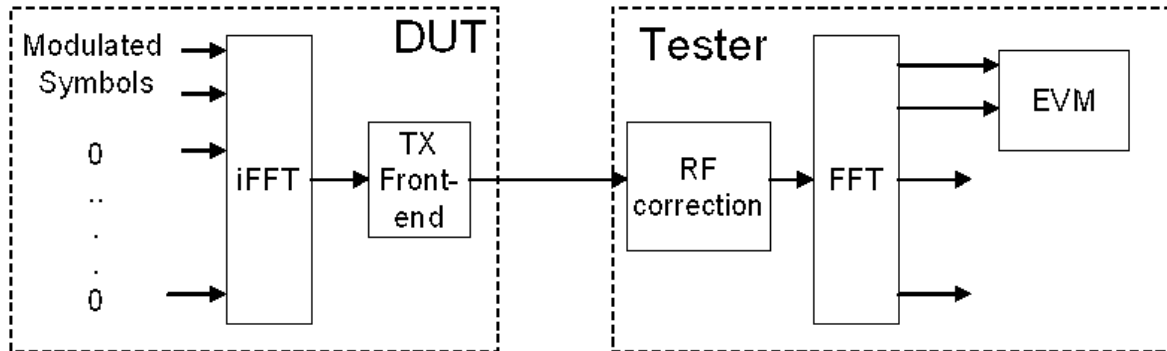

Figure E.6.5-1

## E.6.6 Pre FFT minimization process

The pre-FFT minimization process is applied to each PRACH preamble separately. The time period for the pre-FFT minimisation process includes the complete CP and Zadoff-Chu sequence (in other words, the power transition period is per definition outside of this time period) Sample timing, Carrier frequency and carrier leakage in  $z(v)$  are jointly varied in order to minimise the difference between  $z(v)$  and  $i(v)$ . Best fit (minimum difference) is achieved when the RMS difference value between  $z(v)$  and  $i(v)$  is an absolute minimum.

After this process the samples  $z(v)$  are called  $z^0(v)$ .

RF error, and carrier leakage are necessary for best fit of the measured signal towards the ideal signal in the pre-FFT domain. However they are not used to compare them against the limits.

## E.6.7 Timing of the FFT window

The FFT window length is 24576 samples for preamble format 0, however in the measurement period is at least 27744 samples are taken. The position in time for FFT must be determined.

In an ideal signal, the FFT may start at any instant within the cyclic prefix without causing an error. The TX filter, however, reduces the window. The EVM requirements shall be met within a window  $W < CP$ .

The reference instant for the FFT start is the centre of the reduced window, called  $\Delta\tilde{c}$ ,

EVM is measured at the following two instants:  $\Delta\tilde{c} - W/2$  and  $\Delta\tilde{c} + W/2$ .

The timing of the measured signal  $z^0(v)$  with respect to the ideal signal  $i(v)$  is determined in the pre-FFT domain as follows:

Correlation between  $z^0(v)$  and  $i(v)$  will result in a correlation peak. The meaning of the correlation peak is approx. the “impulse response” of the TX filter. The correlation peak, (the highest, or in case of more than one, the earliest) indicates the timing in the measured signal with respect to the ideal signal.

$W$  is different for different preamble formats and shown in Table E.6.7-1.

Table E.6.7-1EVM window length for PRACH

Preamble format	Cyclic prefix length <sup>1</sup> $N_{cp}$	Nominal FFT size <sup>2</sup>	EVM window length $W$ in FFT samples	Ratio of $W$ to CP <sup>3</sup>
0	3168	24576	3072	96.7%
1	21024	24576	20928	99.5%
2	6240	49152	6144	98.5%
3	21024	49152	20928	99.5%
4	448	4096	432	96.4%
Note 1: The unit is number of samples, sampling rate of 30.72MHz is assumed				
Note 2: Decimation of time samples by 12(format 0 to 3) and factor 2 (format 4) is assumed, leading to a uniform FFT size of 2048 for all formats.				
Note 3: These percentages are informative				

The number of samples, used for FFT is reduced compared to  $z^0(v)$ . This subset of samples is called  $z'(v)$ .

The sample frequency 30.72 MHz is oversampled with respect to the PRACH-subcarrier spacing of 1.25kHz (format 0 to 3) and 7.5kHz (format 4). EVM is based on 2048 samples per PRACH preamble and requires decimation of the time samples by the factor of 12 (format 0 to 3) and factor 2 (format 4). The final number of samples per PRACH preamble, used for FFT is reduced compared to  $z'(v)$  by the factor of 12 (format 0 to 3) and factor 2 (format 4). This subset of samples is called  $z''(v)$ .

## E.6.8 Post FFT equalisation

Equalisation is not applicable for the PRACH.

## E.6.9 Derivation of the results

### E.6.9.1 $EVM_{PRACH}$

Perform FFT on  $z''(v)$  and  $i(v)$  using the FFT timing  $\Delta\tilde{c} - W/2$  and  $\Delta\tilde{c} + W/2$ .

For format 2 and 3 the first and the repeated preamble sequence are FFT-converted separately. using the standard FFT length of 2048

The  $EVM_{PRACH}$  is the difference between the ideal waveform and the measured and equalized waveform for the allocated RB(s).

$$EVM_{PRACH} = \sqrt{\frac{\sum_{f \in F} |Z'(f) - I(f)|^2}{N_{ZC} \cdot P_0}},$$

where

$f$  covers the count of demodulated symbols within the allocated bandwidth.

$Z'(f)$  are the samples of the signal evaluated for the  $EVM_{PRACH}$

$I(f)$  is the ideal signal reconstructed by the measurement equipment, and

$P_0$  is the average power of the ideal signal. For normalized modulation symbols  $P_0$  is equal to 1.

$N_{ZC}$  is random access preamble sequence length.

From the acquired samples 4  $EVM_{PRACH}$  value can be derived, 2 values for the timing  $\Delta\tilde{c} - W/2$  and 2 values for the timing  $\Delta\tilde{c} + W/2$  (4 and 2 applies for format 0,1,2,3. 20 and 10 applies for format 4).

### E.6.9.2 Averaged $EVM_{PRACH}$

The PRACH EVM,  $EVM_{PRACH}$ , is averaged over two preamble sequence measurements for preamble formats 0, 1, 2, 3, and it is averaged over 10 preamble sequence measurements for preamble format 4.

$$\overline{EVM}_{PRACH} = \sqrt{\frac{1}{2} \sum_{i=1}^2 EVM_{PRACH_i}^2} \quad \text{for preamble formats 0,1,2,3}$$

$$\overline{EVM}_{PRACH} = \sqrt{\frac{1}{10} \sum_{i=1}^{10} EVM_{PRACH_i}^2} \quad \text{for preamble format 4}$$

The averaging is done separately for timing;  $\Delta\tilde{c} - W/2$  and  $\Delta\tilde{c} + W/2$  leading to  $\overline{EVM}_{PRACH}$  and  $\overline{EVM}_{PRACH}$ .

$EVM_{PRACH}$  is compared against the test requirements.

## E.7 EVM with exclusion period

### E.7.1 General

EVM with exclusion periods is defined in clause 6.5.2.1.1, third paragraph. For PUCCH entire symbols are excluded, if applicable. For PUSCH fractions of symbols are excluded, if applicable. The exclusion period for PUSCH is defined at the air interface, leading to exclusion periods in the EVM domain. The necessary mapping is described in this clause.

### E.7.2 The model

The exclusion period in the time domain has corresponding periods in the quasi time domains (Table E.7.2). The mapping of corresponding periods needs only scaling and cyclic shifting.

The algorithm below uses a sampling frequency 30.72 MHz and FFT-width 2048 for all bandwidths. Bandwidth-adapted sampling frequencies and FFT-widths are not excluded. Only normal cyclic prefix is mentioned in the model without excluding the extended CP.

**Table. E.7.2: Model for mapping exclusion period in the time domain**

Operation	TX			Channel	EVM meter					
		D F T			i F F T		F F T		iD F T	
Meaning	Modulation symbols		Precoded symbols		BB samples	BB samples		Precoded symbols		demodulated symbols
No of samples	allocated Sub Carriers		allocated subcarriers + unallocated subcarriers = 2048		allocated subcarriers + unallocated subcarriers + CP samples	2048, position depending on EVM window		allocated subcarriers		allocated subcarriers
Domain	Quasi time domain		Frequency domain		Time domain	Time domain		Frequency domain		Quasi time domain
text below		1	2	3	4	7	7	8	9	11

1. A sequence of complex valued modulation symbols are Transform-Precoded (DFT) according to 36.211 clause 5.3.3. The size of this transformation is the number of allocated subcarriers.
2. The outcome of (1) is supplemented by 0 for the non allocated subcarriers. In sum 2048 subcarriers.
3. The baseband time signal (without CP) is then calculated by a iFFT according to 36.211 clause 5.6
4. (3) is then supplemented by a cyclic prefix (144 or 160 samples) leading to 2192 or 2208 samples. (144 CP samples = 144 tail samples from the data field)
5. (4) is transmitted over the channel and sampled by the EVM meter.
6. In case of an exclusion period those samples of (5) are marked, where the exclusion applies. The exclusion period is an unbroken leading or lagging exclusion period next to a subframe or timeslot boarder.
7. Depending on early or late EVM-window a subset of 2048 samples (out of 2192 or 2208 samples) are the input for the subsequent FFT. These samples may or may not comprise marked samples. The result are 2048 frequency domain samples.
8. The non allocated subcarriers are removed from the 2048 samples.
9. (8) is then iDFT transformed. The result are demodulated complex valued symbols in the same domain as (1)
10. Step 7, 8 and 9 are modified by an equalizer algorithm.  
For the purpose of this clause, the equalizer partly re-does step 4 (CP insertion):  
The equalizer algorithm cuts that subset of CP samples, covered by the FFT, from the head and copies it to the tail of the data field.
11. The result of (10) is: complex valued symbols in the same sequence as in (1) They are compared with (1) symbol by symbol for EVM. Due to exclusion in the time domain (6) we have marked corresponding symbols, which are disregarded for EVM.
12. From step 1 to 4 the number of samples is expanded. A subset of expanded samples is marked as excluded. From step 6 to step 9 the number of samples is compressed, leading to a non integer number of samples, marked as excluded. The number of marked samples in this domain is rounded up at the expense of the EVM samples

### E.7.3 Illustration

The figures below illustrate the cyclic shift due to the equalizer and scaling.

Figure E.7.3-1: leading exclusion period (when number of RBs=1)

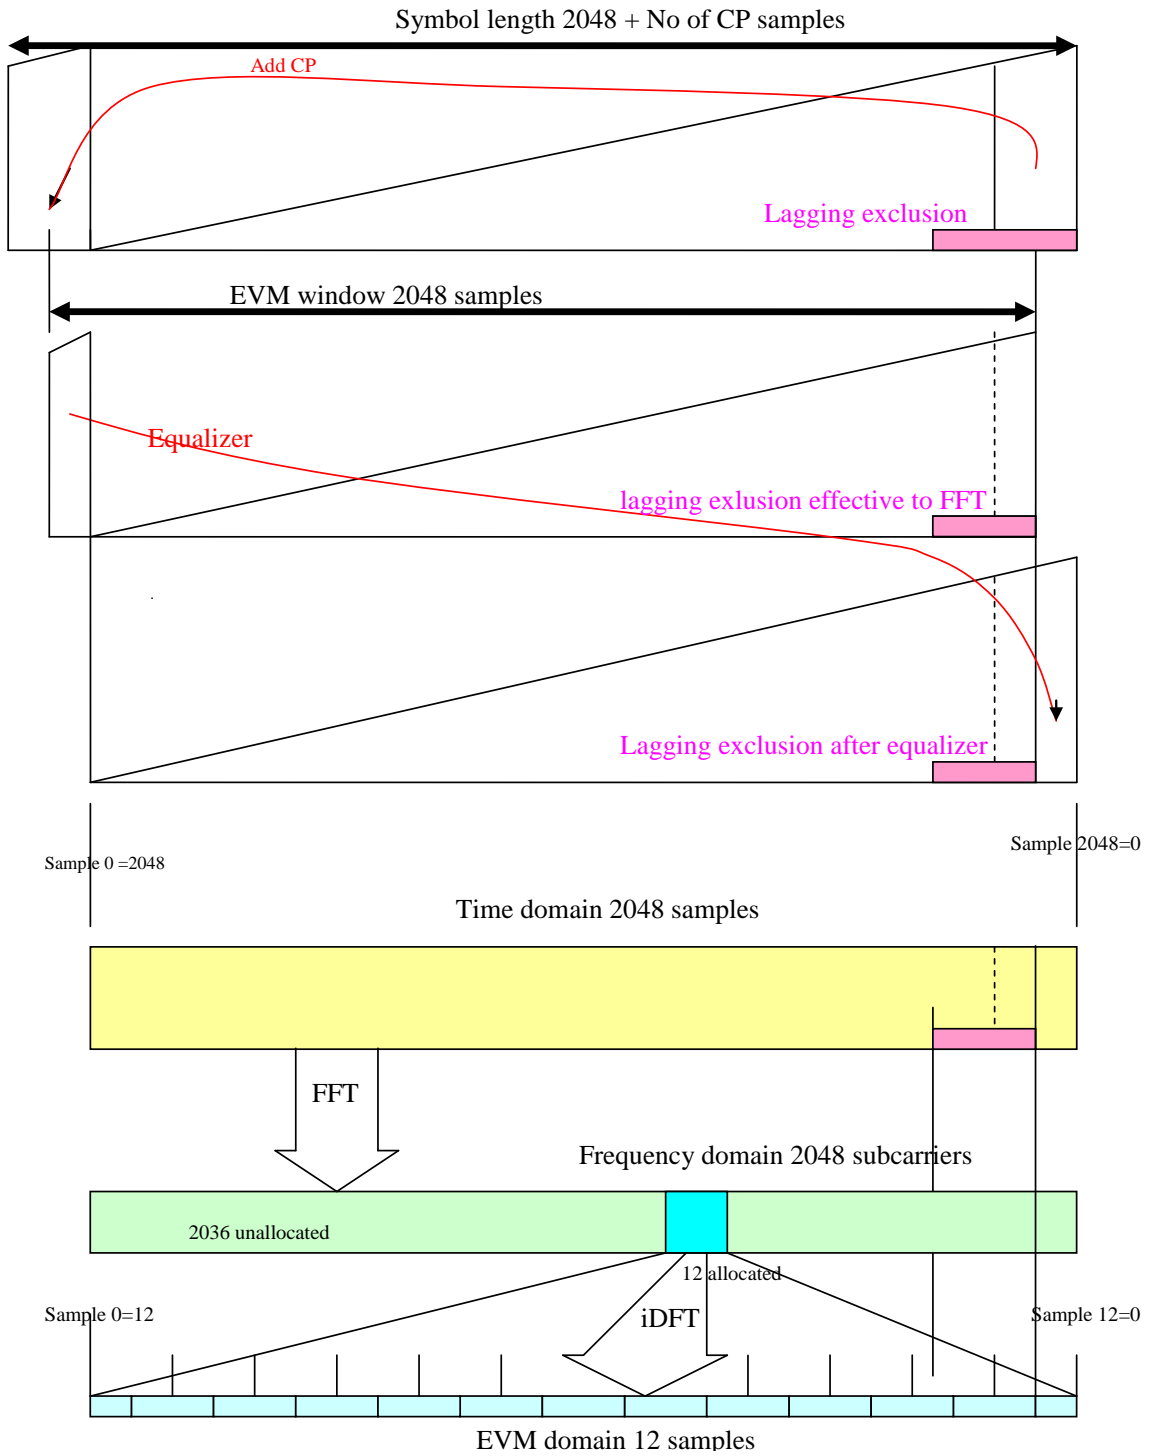

Figure E.7.3-2: lagging exclusion period (when number of RBs=1)

## Legend to figure E.7.3-1

The figure contains 6 related subfigures.

The upper 3 triangles illustrate the cyclic shift due to EVM windowing and equalizer.

The lower 3 boxes illustrate the mapping from the time domain, where the exclusion period is defined, into the EVM domain, where EVM samples are actually excluded.

### Cyclic shift

The leading exclusion period covers the entire CP and a part of the data field. The EVM window masks a part of the exclusion period. For the purpose of this annex, the equalizer re-arranges the time domain samples into the original order, splitting the exclusion period into two parts.

### Mapping

The split exclusion period (after cyclic shift) is copied from above. The frequency domain is derived by Fast Fourier Transformation from the time domain and represent the frequency domain with 2048 subcarriers, 12 of them are allocated, the rest is unallocated. The 12 allocated subcarriers are iDFT transformed into the EVM domain comprising 12 samples. Note that all 3 domains are displayed cyclically: the leftmost sample is identical to the rightmost sample.

The two transformations map the time domain into the EVM domain, carrying out a compression of samples 12/2048. In spite of the compression, there is a correspondence of ranges in the time domain and in the EVM domain. One sample in the EVM domain comprises a range, which is influenced from (and only from) the equivalent samples in the time domain vertically above. Note that this correspondence holds irrespective of the position of the 12 allocated samples in the frequency domain.

#### Example leading exclusion (figure E.7.3-1)

Sample No in the EVM domain	Influence(exclusion) from the time domain	EVM exclusion
12=0	full	excluded
1	partly	excluded
2 to 11	none	counted

#### Example lagging exclusion example (figure E.7.3-2)

Sample No in the EVM domain	Influence(exclusion) from the time domain	EVM exclusion
12=0	none	counted
1 to 9	none	counted
10	partly	excluded
11	full	excluded

## E.7.4 Formula

The exclusion period is defined in  $\mu\text{s}$  at the air interface.

Convert the  $\mu\text{s}$ 's into No of samples in the time domain.

No of exclusion samples (before EVM windowing and equalizer) is calculated from:

No of exclusion sample =  $\text{ceil}(30.72 * \text{Exclusion } \mu\text{s})$

then, EVM windowing and equalizer is applied by 2048 samples based cyclic shift process.

(the upper 3 triangles illustrate in fig. E.7.3-1 and -2.)

Determine the indices **k**, to be excluded in the time domain, according to fig. E.7.3-1 and -2

(after application of EVM windowing and equaliser, original sample order,

$\mathbf{k}$  = subset from the set (0 to 2047) )

The indices  $\mathbf{l}$  in the EVM domain, to be excluded, are:

$$\mathbf{l} = [ \text{round} (\mathbf{k} * 12 * L_{\text{CRBs}} / 2048) ] \bmod (12 * L_{\text{CRBs}})$$

with  $L_{\text{CRBs}}$  number of allocated resource blocks

---

## Annex F (normative): Measurement uncertainties and Test Tolerances

### F.1 Acceptable uncertainty of Test System (normative)

The maximum acceptable uncertainty of the Test System is specified below for each test, where appropriate. The Test System shall enable the stimulus signals in the test case to be adjusted to within the specified range, and the equipment under test to be measured with an uncertainty not exceeding the specified values. All ranges and uncertainties are absolute values, and are valid for a confidence level of 95 %, unless otherwise stated.

A confidence level of 95 % is the measurement uncertainty tolerance interval for a specific measurement that contains 95 % of the performance of a population of test equipment.

For RF tests it should be noted that the uncertainties in clause F.1 apply to the Test System operating into a nominal 50 ohm load and do not include system effects due to mismatch between the DUT and the Test System.

The downlink signal uncertainties apply at each receiver antenna connector.

#### F.1.1 Measurement of test environments

The measurement accuracy of the UE test environments defined in TS 36.508 subclause 4.1, Test environments shall be.

- Pressure  $\pm 5$  kPa.
- Temperature  $\pm 2$  degrees.
- Relative Humidity  $\pm 5$  %.
- DC Voltage  $\pm 1,0$  %.
- AC Voltage  $\pm 1,5$  %.
- Vibration 10 %.
- Vibration frequency 0,1 Hz.

The above values shall apply unless the test environment is otherwise controlled and the specification for the control of the test environment specifies the uncertainty for the parameter.

## F.1.2 Measurement of transmitter

**Table F.1.2-1: Maximum Test System Uncertainty for transmitter tests**

Subclause	Maximum Test System Uncertainty	Derivation of Test System Uncertainty
6.2.2 UE Maximum Output Power	$\pm 0.7$ dB, $f \leq 3.0$ GHz $\pm 1.0$ dB, $3.0$ GHz $< f \leq 4.2$ GHz	
6.2.2_1 Maximum Output Power for HPUE	$\pm 0.7$ dB, $f \leq 3.0$ GHz	
6.2.2A.1 UE Maximum Output Power for CA (intra-band contiguous DL CA and UL CA)	Same as 6.2.2 for sum of powers of all CCs	
6.2.2A.2 UE Maximum Output Power for CA (inter-band DL CA and UL CA)	Same as 6.2.2 for sum of powers of all CCs	
6.2.2B UE Maximum Output Power for UL-MIMO	Same as 6.2.2 for each antenna	
6.2.2E UE Maximum Output Power for UE category 0	Same as 6.2.2	
6.2.2EA UE Maximum Output Power for UE category M1	Same as 6.2.2	
6.2.2F UE Maximum Output Power for UE category NB1	Same as 6.2.2_1	
6.2.3 Maximum Power Reduction	$\pm 0.7$ dB, $f \leq 3.0$ GHz $\pm 1.0$ dB, $3.0$ GHz $< f \leq 4.2$ GHz	
6.2.3_1 Maximum Power Reduction (MPR) for HPUE	$\pm 0.7$ dB, $f \leq 3.0$ GHz	
6.2.3A.1 Maximum Power Reduction (MPR) for CA (intra-band contiguous DL CA and UL CA)	Same as 6.2.3 for sum of powers of all CCs	
6.2.3A.1_1 Maximum Power Reduction (MPR) for CA (intra-band contiguous DL CA and UL CA) for UL 64QAM	Same as 6.2.3 for sum of powers of all CCs	
6.2.3A.2 Maximum Power Reduction (MPR) for CA (inter-band DL CA and UL CA)	Same as 6.2.3 for sum of powers of all CCs	
6.2.3A.2_1 Maximum Power Reduction (MPR) for CA (inter-band DL CA and UL CA) for UL 64QAM	Same as 6.2.3 for sum of powers of all CCs	
6.2.3A.3 Maximum Power Reduction (MPR) for CA (intra-band non-contiguous DL CA and UL CA)	Same as 6.2.3 for sum of powers of all CCs	
6.2.3A.3_1 Maximum Power Reduction (MPR) for CA (intra-band non-contiguous DL CA and UL CA) for UL 64QAM	Same as 6.2.3 for sum of powers of all CCs	
6.2.3B Maximum Power Reduction (MPR) for UL-MIMO	Same as 6.2.3 for each antenna	
6.2.3_2 Maximum Power Reduction (MPR) for Multi-Cluster PUSCH	Same as 6.2.3	
6.2.3E Maximum Power Reduction for UE category 0	Same as 6.2.3	
6.2.3EA Maximum Power Reduction for UE category M1	Same as 6.2.3	

6.2.3_3 Maximum Power Reduction (MPR) for UL 64QAM	Same as 6.2.3	
6.2.3_4 Maximum Power Reduction (MPR) for Multi-Cluster PUSCH with UL 64QAM	Same as 6.2.3	
6.2.4 UE Maximum Output Power with additional requirements	$\pm 0.7$ dB, $f \leq 3.0$ GHz $\pm 1.0$ dB, $3.0$ GHz $< f \leq 4.2$ GHz	
6.2.4_1 Additional Maximum Power Reduction (A-MPR) for HPUE	$\pm 0.7$ dB, $f \leq 3.0$ GHz	
6.2.4_2 Additional Maximum Power Reduction (A-MPR) for UL 64QAM	Same as 6.2.4	
6.2.4_3 Additional Maximum Power Reduction (A-MPR) with PUSCH frequency hopping	Same as 6.2.4	
6.2.4A.1 Additional Maximum Power Reduction (A-MPR) for CA (intra-band contiguous DL CA and UL CA)	Same as 6.2.4 for sum of powers of all CCs	
6.2.4A.1_1 Additional Maximum Power Reduction (A-MPR) for CA (intra-band contiguous DL CA and UL CA) for UL 64QAM	Same as 6.2.4 for sum of powers of all CCs	
6.2.4A.2 Additional Maximum Power Reduction (A-MPR) for CA (inter-band DL CA and UL CA)	Same as 6.2.4 for sum of powers of all CCs	
6.2.4A.2_1 Additional Maximum Power Reduction (A-MPR) for CA (inter-band DL CA and UL CA) for UL 64QAM	Same as 6.2.4 for sum of powers of all CCs	
6.2.4B Additional Maximum Power Reduction (A-MPR) for UL-MIMO	Same as 6.2.4 for each antenna	
6.2.4E Additional Maximum Power Reduction (A-MPR) for UE category 0	Same as 6.2.4	
6.2.4EA Additional Maximum Power Reduction (A-MPR) for UE category M1	$\pm 0.7$ dB	
6.2.5 Configured UE transmitted Output Power	$\pm 0.7$ dB, $f \leq 3.0$ GHz $\pm 1.0$ dB, $3.0$ GHz $< f \leq 4.2$ GHz	
6.2.5_1 Configured UE transmitted Output Power for HPUE	$\pm 0.7$ dB, $f \leq 3.0$ GHz	
6.2.5A.1 Configured UE transmitted Output Power for CA (intra-band contiguous DL CA and UL CA)	Same as 6.2.5 for sum of powers of all CCs	
6.2.5A.3 Configured UE transmitted Output Power for CA (inter-band DL CA and UL CA)	Same as 6.2.5 for sum of powers of all CCs	
6.2.5A.4 Configured UE transmitted Output Power for CA (intra-band non-contiguous DL CA and UL CA)	Same as 6.2.5 for sum of powers of all CCs	

6.2.5B Configured UE transmitted output power for UL-MIMO	Same as 6.2.5 for each antenna	
6.2.5E Configured Transmitted Power for UE category 0	Same as 6.2.5	
6.2.5EA Configured UE transmitted Power for UE category M1	Same as 6.2.5	
6.2.5F Configured UE transmitted Output Power for UE category NB1	$\pm 0.7$ dB, $f \leq 3.0$ GHz	
6.3.2 Minimum Output Power	$\pm 1.0$ dB, $f \leq 3.0$ GHz $\pm 1.3$ dB, $3.0$ GHz $< f \leq 4.2$ GHz	
6.3.2A.1 Minimum Output Power for CA (intra-band contiguous DL CA and UL CA)	Same as 6.3.2 for each CC	
6.3.2B Minimum Output Power for UL-MIMO	Same as 6.3.2 for each antenna	
6.3.2E Minimum Output Power for UE category 0	Same as 6.3.2	
6.3.2EA Minimum Output Power for UE category M1	Same as 6.3.2	
6.3.2F Minimum Output Power for UE category NB1	$\pm 1.0$ dB, $f \leq 3.0$ GHz	
6.3.3 Transmission ON/OFF Power	Transmission OFF Power: $\pm 1.5$ dB, $f \leq 3.0$ GHz $\pm 1.8$ dB, $3.0$ GHz $< f \leq 4.2$ GHz	
6.3.3A.1 UE Transmit OFF power for CA (intra-band contiguous DL CA and UL CA)	Same as 6.3.3 for each CC	
6.3.3A.2 UE Transmit OFF power for CA (inter-band DL CA and UL CA)	Same as 6.3.3A.1	
6.3.3A.3 UE Transmit OFF power for CA (intra-band non-contiguous DL CA and UL CA)	Same as 6.3.3 for each CC	
6.3.3B UE Transmit OFF power for UL-MIMO	Same as 6.3.3 for each antenna	
6.3.3E UE Transmit OFF Power for UE category 0	Same as 6.3.3	
6.3.3EA UE Transmit OFF power for UE category M1	Same as 6.3.3	
6.3.4.1 General ON/OFF time mask	Transmission ON/OFF Power: $\pm 1.5$ dB, $f \leq 3.0$ GHz $\pm 1.8$ dB, $3.0$ GHz $< f \leq 4.2$ GHz	
6.3.4.2 PRACH and SRS time mask	Transmission ON/OFF Power: $\pm 1.5$ dB, $f \leq 3.0$ GHz $\pm 1.8$ dB, $3.0$ GHz $< f \leq 4.2$ GHz	
6.3.4A.1.2 General ON/OFF time mask for CA (inter-band DL CA and UL CA)	Same as 6.3.4A.1.1	
6.3.4A.1.1 General ON/OFF time mask for CA (intra-band contiguous DL CA and UL CA)	Same as 6.3.4.1 for each CC	
6.3.4A.1.3 General ON/OFF time mask for CA (intra-band non-contiguous DL CA and UL CA)	Same as 6.3.4.1 for each CC	
6.3.4B.1 General ON/OFF time mask for UL-MIMO	Same as 6.3.4.1 for each antenna	
6.3.4E.1 General ON/OFF time mask for UE category 0	Same as 6.3.4.1	
6.3.4E.2 PRACH and SRS time mask for UE category 0	Same as 6.3.4.2	

6.3.4EA.1 General ON/OFF time mask for UE category M1	Same as 6.3.4.1	
6.3.4EA.2 PRACH and SRS ON/OFF time mask for UE category M1	Same as 6.3.4.2	
6.3.5.1 Power Control Absolute power tolerance	$\pm 1.0$ dB, $f \leq 3.0$ GHz $\pm 1.4$ dB, $3.0$ GHz $< f \leq 4.2$ GHz	Overall system uncertainty comprises two quantities: 1. Downlink signal level uncertainty 2. Uplink level measurement uncertainty Items 1 and 2 are assumed to be uncorrelated so can be root sum squared. Test System uncertainty = [SQRT (DL level uncert <sup>2</sup> + UL measurement uncert <sup>2</sup> )] $f \leq 3.0$ GHz DL signal level uncert $\pm 0.7$ dB UL meas't uncert $\pm 0.7$ dB  $3.0$ GHz $< f \leq 4.2$ GHz DL signal level uncert $\pm 1.0$ dB UL meas't uncert $\pm 1.0$ dB
6.3.5.2 Power Control Relative power tolerance	$\pm 0.7$ dB	
6.3.5.3 Aggregate power control tolerance	$\pm 0.7$ dB	
6.3.5_1.1 Power Control Absolute power tolerance for HPUE	$\pm 1.0$ dB, $f \leq 3.0$ GHz	
6.3.5_1.2 Power Control Relative power tolerance for HPUE	$\pm 0.7$ dB	
6.3.5_1.3 Aggregate power control tolerance for HPUE	$\pm 0.7$ dB	
6.3.5A.1.1 Power Control Absolute power tolerance for CA (intra-band contiguous DL CA and UL CA)	Same as 6.3.5.1 for each CC	
6.3.5A.1.2 Power Control Absolute power tolerance for CA (inter-band DL CA and UL CA)	Same as 6.3.5.1 for each CC	
6.3.5A.1.3 Power Control Absolute power tolerance for CA (intra-band non-contiguous DL CA and UL CA)	Same as 6.3.5.1 for each CC	
6.3.5A.2.1 Power Control Relative power tolerance for CA (intra-band contiguous DL CA and UL CA)	Absolute power $\pm 1$ dB, $f \leq 4.2$ GHz Relative power $\pm 0.7$ dB Both requirements apply for each CC	Absolute power is used to check when power is near lower and upper limits of the range. Relative power is used to check step sizes.
6.3.5A.3.1 Aggregate power control tolerance for CA (intra-band contiguous DL CA and UL CA)	Same as 6.3.5.3 for each CC	
6.3.5A.3.2 Aggregate power control tolerance for CA (inter-band DL CA and UL CA)	Same as 6.3.5.3 for each CC	

6.3.5A.3.3 Aggregate power control tolerance for CA (intra-band non-contiguous DL CA and UL CA)	Same as 6.3.5.3 for each CC	
6.3.5B.1 Power Control Absolute Power Tolerance for UL- MIMO	Same as 6.3.5.1 for each antenna	
6.3.5B.2 Power Control Relative power tolerance for UL-MIMO	Same as 6.3.5.2 for each antenna	
6.3.5B.3 Aggregate power control tolerance for UL- MIMO	Same as 6.3.5.3 for each antenna	
6.3.5E.1 Power Control Absolute power tolerance for UE category 0	Same as 6.3.5.1	
6.3.5E.2 Power Control Relative power tolerance for UE category 0	Same as 6.3.5.2	
6.3.5E.3 Aggregate power control tolerance for UE category 0	Same as 6.3.5.3	
6.3.5EA.1 Power Control Absolute power tolerance for UE category M1	$\pm 1.0$ dB, $f \leq 3.0$ GHz	Overall system uncertainty comprises two quantities: 1. Downlink signal level uncertainty 2. Uplink level measurement uncertainty Items 1 and 2 are assumed to be uncorrelated so can be root sum squared. Test System uncertainty = [SQRT (DL level uncert <sup>2</sup> + UL measurement uncert <sup>2</sup> )] $f \leq 3.0$ GHz DL signal level uncert $\pm 0.7$ dB UL meas't uncert $\pm 0.7$ dB
6.3.5EA.2 Power Control Relative power tolerance for UE category M1	$\pm 0.7$ dB	
6.3.5EA.3 Aggregate power control tolerance for UE category M1	Same as 6.3.5.3	
6.3.5F.1 Power Control Absolute power tolerance for UE category NB1	TBD	
6.3.5F.2 Power Control Relative power tolerance for UE category NB1	TBD	
6.5.1 Frequency Error	$\pm 15$ Hz DL Signal level: $\pm 0.7$ dB, $f \leq 3.0$ GHz DL Signal level: $\pm 1.0$ dB, $3.0$ GHz $< f \leq 4.2$ GHz	
6.5.1A.1 Frequency error for CA (intra-band contiguous DL CA and UL CA)	Same as 6.5.1 for each CC	
6.5.1A.2 Frequency error for CA (inter-band DL CA and UL CA)	Same as 6.5.1

6.5.2.3E In-band emissions for non allocated RB for UE category 0	Same as 6.5.2.3	
6.5.2.3EA In-band emissions for non allocated RB for UE category M1	Same as 6.5.2.3	
6.5.2.3F In-band emissions for non allocated RB for UE category NB1	FFS	

6.5.2.4E EVM equalizer spectrum flatness for UE category 0	Same as 6.5.2.4	
6.5.2.4EA EVM equalizer spectrum flatness for UE category M1	Same as 6.5.2.4	
6.6.1 Occupied bandwidth	1.4MHz, 3MHz: 30kHz 5MHz, 10MHz: 100kHz 15MHz, 20MHz: 300kHz	
6.6.1A.1 Occupied bandwidth for CA (intra-band contiguous DL CA and UL CA)	1.4MHz, 3MHz: 30kHz 5MHz, 10MHz: 100kHz 15MHz, 20MHz: 300kHz 20MHz < f ≤ 40MHz: 500kHz	
6.6.1A.2 Occupied bandwidth for CA (inter-band DL CA and UL CA)	Same as 6.6.1 for each CC	
6.6.1A.3 Occupied bandwidth for CA (intra-band non-contiguous DL CA and UL CA)	1.4MHz, 3MHz: 30kHz 5MHz, 10MHz: 100kHz 15MHz, 20MHz: 300kHz	
6.6.1B Occupied bandwidth for UL-MIMO	Same as 6.6.1 for each antenna	
6.6.1E Occupied bandwidth for UE category 0	Same as 6.6.1	
6.6.1EA Occupied bandwidth for UE category M1	Same as 6.6.1	
6.6.1F Occupied bandwidth for UE category NB1	200kHz: FFS	
6.6.2.1 Spectrum Emission Mask	±1.5 dB, f ≤ 3.0GHz ±1.8 dB, 3.0GHz < f ≤ 4.2GHz	
6.6.2.1_1 Spectrum Emission Mask for Multi-Cluster PUSCH	Same as 6.6.2.1	
6.6.2.1A.1 Spectrum emission mask for CA (intra-band contiguous DL CA and UL CA)	Same as 6.6.2.1	
6.6.2.1A.2 Spectrum Emission Mask for CA (inter-band DL CA and UL CA)	Same as 6.6.2.1 and 6.6.2.2	
6.6.2.1A.3 Spectrum Emission Mask for CA (intra-band non-contiguous DL CA and UL CA)	Same as 6.6.2.1	
6.6.2.1B Spectrum Emission Mask for UL-MIMO	Same as 6.6.2.1 for each antenna	
6.6.2.1E Spectrum Emission Mask for UE category 0	Same as 6.6.2.1	
6.6.2.1EA Spectrum Emission Mask for UE category M1	Same as 6.6.2.1	
6.6.2.1F Spectrum Emission Mask for UE category NB1	Same as 6.6.2.1	
6.6.2.2 Additional Spectrum Emission Mask	±1.5 dB, f ≤ 3.0GHz ±1.8 dB, 3.0GHz < f ≤ 4.2GHz	
6.6.2.2_1 Additional Spectrum Emission Mask for UL 64QAM	Same as 6.6.2.2	
6.6.2.2A.1 Additional Spectrum Emission Mask for CA (intra-band contiguous DL CA and UL CA)	±1.5 dB, f ≤ 3.0GHz ±1.8 dB, 3.0GHz < f ≤ 4.2GHz	
6.6.2.2E Additional Spectrum Emission Mask for UE category 0	Same as 6.6.2.2	

6.6.2.2EA Additional Spectrum Emission Mask for UE category M1	Same as 6.6.2.2	
6.6.2.2A.1_1 Additional Spectrum Emission Mask for CA (intra-band contiguous DL CA and UL CA) for UL 64QAM	Same as 6.6.2.2A	
6.6.2.2A.2 Additional Spectrum Emission Mask for CA (inter-band DL CA and UL CA)	Same as 6.6.2.2	
6.6.2.2A.2_1 Additional Spectrum Emission Mask for CA (inter-band DL CA and UL CA) for UL 64QAM	Same as 6.6.2.2	
6.6.2.2A.3 Additional Spectrum Emission Mask for CA (intra-band non-contiguous DL CA and UL CA)	Same as 6.6.2.2	
6.6.2.3_2 Adjacent Channel Leakage power Ratio for Multi-Cluster PUSCH	Same as 6.6.2.3	
6.6.2.3 Adjacent Channel Leakage power Ratio	$\pm 0.8$ dB	
6.6.2.3_1 Adjacent Channel Leakage power Ratio for HPUE	$\pm 0.8$ dB	
6.6.2.3A.1 Adjacent Channel Leakage power Ratio for CA (intra-band contiguous DL CA and UL CA)	$\pm 0.8$ dB	
6.6.2.3A.1_1 Adjacent Channel Leakage power Ratio for CA (intra-band contiguous DL CA and UL CA) for UL 64QAM	Same as 6.6.2.3A.1	
6.6.2.3A.2 Adjacent Channel Leakage power Ratio for CA (inter-band DL CA and UL CA)	$\pm 0.8$ dB	
6.6.2.3A.2_1 Adjacent Channel Leakage power Ratio for CA (inter-band DL CA and UL CA) for UL 64QAM	Same as 6.6.2.3A.2	
6.6.2.3A.3 Adjacent Channel Leakage power Ratio for CA (intra-band non-contiguous DL CA and UL CA)	Same as 6.6.2.3	
6.6.2.3A.3_1 Adjacent Channel Leakage power Ratio for CA (intra-band non-contiguous DL CA and UL CA) for UL 64QAM	Same as 6.6.2.3	
6.6.2.3B Adjacent Channel Leakage power Ratio for UL-MIMO	Same as 6.6.2.3 for each antenna	
6.6.2.3E Adjacent Channel Leakage power Ratio for UE category 0	Same as 6.6.2.3	Same as 6.6.2.3
6.6.2.3EA Adjacent Channel Leakage power Ratio for UE category M1	Same as 6.6.2.3	
6.6.2.3_3 Adjacent Channel Leakage power Ratio for UL 64QAM	Same as 6.6.2.3	

6.6.2.3_4 Adjacent Channel Leakage power Ratio for Multi-Cluster PUSCH with UL 64QAM	Same as 6.6.2.3	
6.6.2.3F Adjacent Channel Leakage power Ratio for UE category NB1	±0.8 dB	
6.6.2.4 Void	Void	
6.6.3.1 Transmitter Spurious emissions	9kHz < f ≤ 4 GHz: ± 2.0 dB 4 GHz < f ≤ 19 GHz: ± 4.0 dB	
6.6.3.1_1 Transmitter Spurious emissions for Multi-Cluster PUSCH	Same as 6.6.3.1	
6.6.3.1A.1 Transmitter Spurious emissions for CA (intra-band contiguous DL CA and UL CA)	Same as 6.6.3.1	
6.6.3.1A.2 Transmitter Spurious emissions for CA (inter-band DL CA and UL CA)	Same as 6.6.3.1	
6.6.3.1A.3 Transmitter Spurious emissions for CA (intra-band non-contiguous DL CA and UL CA)	Same as 6.6.3.1	
6.6.3B.1 Transmitter Spurious emissions for UL-MIMO	Same as 6.6.3.1, at each antenna used for transmission	The overall UL power is the linear sum of the output powers over all Tx antenna connectors
6.6.3E.1 Transmitter Spurious emissions for UE category 0	Same as 6.6.3.1	
6.6.3EA.1 Transmitter Spurious emissions for UE category M1	Same as 6.6.3.1	
6.6.3.2 Spurious emission band UE co-existence	± 2.0 dB for results > -60 dBm, f ≤ 3.0GHz ±2.5 dB, 3.0GHz < f ≤ 4.2GHz ± 3.0 dB for results ≤ -60 dBm, f ≤ 3.0GHz ±3.6 dB, 3.0GHz < f ≤ 4.2GHz	
6.6.3.2A.1 Spurious emission band UE co-existence for CA (intra-band contiguous DL CA and UL CA)	Same as 6.6.3.2	
6.6.3.2A.2 Spurious emission band UE co-existence for CA (inter-band DL CA and UL CA)	Same as 6.6.3.2	
6.6.3.2A.3 Spurious emission band UE co-existence for CA (intra-band non-contiguous DL CA and UL CA)	Same as 6.6.3.2	
6.6.3.3 Additional spurious emissions	9kHz < f ≤ 4 GHz: ± 2.0 dB  NS-07 769 ≤ f ≤ 775 MHz: ± 1.5 dB	
6.6.3.3_1 Additional spurious emissions for UL 64QAM	Same as 6.6.3.3	
6.6.3.3A.1 Additional spurious emissions for CA (intra-band contiguous DL CA and UL CA)	9kHz < f ≤ 4 GHz: ± 2.0 dB	
6.6.3.3A.1_1 Additional spurious emissions for CA (intra-band contiguous DL CA and UL CA) for UL 64QAM	Same as 6.6.3.3A.1	

6.6.3.3A.2 Additional spurious emissions for CA (inter-band DL CA and UL CA)	Same as 6.6.3.3	
6.6.3.3A.2_1 Additional spurious emissions for CA (inter-band DL CA and UL CA) for UL 64QAM	Same as 6.6.3.3	
6.6.3B.2 Spurious emission band UE co-existence for UL-MIMO	Same as 6.6.3.2 at each antenna used for transmission	
6.6.3B.3 Additional spurious emissions for UL-MIMO	Same as 6.6.3.3, at each antenna used for transmission	
6.6.3E.2 Spurious emission band UE co-existence for UE category 0	Same as 6.6.3.2	
6.6.3E.3 Additional spurious emissions for UE category 0	6.6.3.3	
6.6.3EA.2 Spurious emission band UE co-existence for UE category M1	Same as 6.6.3.2	
6.6.3EA.3 Additional spurious emissions for UE category M1	Same as 6.6.3.3	
6.7 Transmit intermodulation	$\pm 2.6$ dB, $f \leq 3.0$ GHz $\pm 3.6$ dB, $3.0$ GHz $< f \leq 4.2$ GHz	<p>Overall system uncertainty comprises four quantities:</p> <ol style="list-style-type: none"> <li>1. Wanted signal setting error</li> <li>2. CW Interferer level error</li> <li>3. Wanted signal meas. error</li> <li>4. Intermodulation product measurement error</li> </ol> <p>The relative level of the wanted signal and the CW interferer has 2 x effect on the intermodulation product.</p> <p>Items 1, 2, 3 and 4 are assumed to be uncorrelated so can be root sum squared to provide the combined effect.</p> <p>Test System uncertainty = <math>\text{SQRT} [(2 \times \text{SQRT} (\text{Wanted\_setting\_error}^2 + \text{CW\_level\_error}^2))^2 + \text{Wanted\_level\_meas\_error}^2 + \text{Intermodulation\_product\_measurement\_error}^2]</math></p> <p><math>f \leq 3.0</math>GHz  Wanted signal setting <math>\pm 0.7</math>dB  CW Interferer level <math>\pm 1.0</math>dB  Wanted signal meas <math>\pm 0.7</math>dB  Intermodulation product measurement error <math>\pm 0.7</math>dB</p> <p><math>3.0</math>GHz <math>&lt; f \leq 4.2</math>GHz  Wanted signal setting <math>\pm 1.0</math>dB  CW Interferer level <math>\pm 1.3</math>dB  Wanted signal meas <math>\pm 1.0</math>dB  Intermodulation product measurement error <math>\pm 1.0</math>dB</p>
6.7A.1 Transmit intermodulation for CA (intra-band contiguous DL CA and UL CA)	Same as 6.7, at each antenna used for transmission	

6.7A.2 Transmit intermodulation for CA (inter-band DL CA and UL CA)	Same as 6.7, at each antenna used for transmission	
6.7E Transmit intermodulation for UE category 0	Same as 6.7	
6.7F Transmit intermodulation for UE category NB1	Same as 6.7	
6.8B Time alignment error for UL-MIMO	$\pm 25$ ns	

## F.1.3 Measurement of receiver

**Table F.1.3-1: Maximum Test System Uncertainty for receiver tests**

Subclause	Maximum Test System Uncertainty <sup>1</sup>	Derivation of Test System Uncertainty
7.3 Reference sensitivity power level	Downlink power $\pm 0.7$ dB, $f \leq 3.0$ GHz $\pm 1.0$ dB, $3.0$ GHz $< f \leq 4.2$ GHz	
7.3_1 Reference sensitivity level with 4 Rx antenna ports	Same as 7.3	
7.3A.1 Reference sensitivity level for CA (intra-band contiguous DL CA and UL CA)	Same as 7.3 for each CC	
7.3A.2 Reference sensitivity level for CA (intra-band contiguous DL CA without UL CA)	Same as 7.3A.1	
7.3A.3 Reference sensitivity level for CA (inter-band DL CA without UL CA)	Same as 7.3A.1	
7.3A.4 Reference sensitivity level for CA (intra-band non-contiguous DL CA without UL CA)	Same as 7.3A.1	
7.3A.5 Reference sensitivity level for 3DL CA	Same as 7.3A.1	
7.3A.6 Reference sensitivity level for CA (inter-band DL CA and UL CA)	Same as 7.3A.1	
7.3A.7 Reference sensitivity level for CA (intra-band non-contiguous DL CA and UL CA)	Same as 7.3A.1	
7.3A.9 Reference sensitivity level for 4DL CA	Same as 7.3A.1	
7.3B Reference Sensitivity Level for UL-MIMO	Same as 7.3	
7.3D.1 Reference sensitivity level for ProSe Direct Discovery	Sidelink power $\pm 0.7$ dB, $f \leq 3.0$ GHz	
7.3D.2 Reference sensitivity level for ProSe Direct Communication	Same as 7.3D.1	
7.3E Reference Sensitivity Level for UE category 0	Same as 7.3	
7.3EA Reference Sensitivity Level for UE category M1	Same as 7.3	
7.3F Reference sensitivity level for UE category NB1	Downlink power $\pm 0.7$ dB, $f \leq 3.0$ GHz	
7.4 Maximum input level	Downlink power $\pm 0.7$ dB, $f \leq 3.0$ GHz $\pm 1.0$ dB, $3.0$ GHz $< f \leq 4.2$ GHz Uplink power measurement $\pm 0.7$ dB, $f \leq 3.0$ GHz $\pm 1.0$ dB, $3.0$ GHz $< f \leq 4.2$ GHz	
7.4_1 Maximum input level with 4 Rx antenna ports	Same as 7.4	
7.4A.1 Maximum input level for CA (intra band contiguous DL CA and UL CA)	Same as 7.4 for each CC	Uncertainties apply for each CC
7.4A.1 H Maximum input level for SCE-L1 for CA (intra-band contiguous DL CA and UL CA)	Downlink power same as 7.4 for each CC Uplink power measurement same as 7.4	Uncertainties apply for each CC

7.4A.2 Maximum input level for CA (intra band contiguous DL CA without UL CA)	Downlink power same as 7.4 for each CC Uplink power measurement same as 7.4	Uncertainties apply for each CC
7.4A.2_H Maximum input level for SCE-L1 for CA (intra-band contiguous DL CA without UL CA)	Downlink power same as 7.4 for each CC Uplink power measurement same as 7.4	Uncertainties apply for each CC
7.4A.3 Maximum input level for CA (inter-band DL CA without UL CA)	Downlink power same as 7.4 for each CC Uplink power measurement same as 7.4	Uncertainties apply for each CC
7.4A.4 Maximum input level for CA (intra band non-contiguous DL CA without UL CA)	Downlink power same as 7.4 for each CC Uplink power measurement same as 7.4	Uncertainties apply for each CC
7.4A.5 Maximum input level for 3DL CA	Downlink power same as 7.4 for each CC Uplink power measurement same as 7.4	Uncertainties apply for each CC
7.4A.5_H Maximum input level for SCE-L1 for 3DL CA	Downlink power same as 7.4 for each CC Uplink power measurement same as 7.4	Uncertainties apply for each CC
7.4A.7 Maximum input level for 4DL CA	Downlink power same as 7.4 for each CC Uplink power measurement same as 7.4	Uncertainties apply for each CC
7.4B Maximum Input Level for UL-MIMO	Downlink power same as 7.4 Uplink power measurement same as 7.4, at each antenna connector used for transmission	The overall UL power is the linear sum of the output powers over all Tx antenna connectors
7.4D.1 Maximum input level for ProSe Direct Discovery	Sidelink power $\pm 0.7$ dB, $f \leq 3.0$ GHz	
7.4D.2 Maximum input level for ProSe Direct Communication	Same as 7.4D.1	
7.4E Maximum input level for UE category 0	Same as 7.4	
7.4EA Maximum input level for UE category M1	Same as 7.4	
7.4F Maximum input level for UE category NB1	Downlink power $\pm 0.7$ dB, $f \leq 3.0$ GHz	
7.4_H Maximum input level for SCE-L1	Same as 7.4	

7.5 Adjacent Channel Selectivity (ACS)	ACS value $\pm 1.1$ dB, $f \leq 3.0$ GHz $\pm 1.5$ dB, $3.0$ GHz $< f \leq 4.2$ GHz Uplink power measurement $\pm 0.7$ dB, $f \leq 3.0$ GHz $\pm 1.0$ dB, $3.0$ GHz $< f \leq 4.2$ GHz	Overall ACS uncertainty comprises three quantities: 1. Wanted signal level error 2. Interferer signal level error 3. Additional impact of interferer ACLR  Items 1 and 2 are assumed to be uncorrelated so can be root sum squared to provide the ratio error of the two signals. The interferer ACLR effect is systematic, and is added arithmetically.  Test System uncertainty = [SQRT (wanted_level_error <sup>2</sup> + interferer_level_error <sup>2</sup> )] + ACLR effect.  f $\leq 3.0$ GHz Wanted signal level $\pm 0.7$ dB Interferer signal level $\pm 0.7$ dB 3.0GHz $< f \leq 4.2$ GHz Wanted signal level $\pm 1.0$ dB Interferer signal level $\pm 1.0$ dB  f $\leq 4.2$ GHz Impact of interferer ACLR 0.1dB
7.5_1 Adjacent Channel Selectivity (ACS) with 4 Rx antenna ports	Same as 7.5	
7.5A.1 Adjacent Channel Selectivity (ACS) for CA (intra band contiguous DL CA and UL CA)	Same as 7.5 for each CC	Same as 7.5 The wanted signal level uncertainty applies for each CC. Overall ACS uncertainty calculation includes the uncertainty for wanted level error only once, as the uncertainty of other CCs is not expected to have any significant effect.
7.5A.2 Adjacent Channel Selectivity (ACS) for CA (intra band contiguous DL CA without UL CA)	Downlink power same as 7.5 Uplink power measurement same as 7.5	The wanted signal level uncertainty applies for each CC
7.5A.3 Adjacent Channel Selectivity (ACS) for CA (inter band DL CA without UL CA)	Downlink power same as 7.5 Uplink power measurement same as 7.5	The wanted signal level uncertainty applies for each CC
7.5A.4 Adjacent Channel Selectivity (ACS) for CA (intra-band non-contiguous DL CA without UL CA)	Downlink power same as 7.5 Uplink power measurement same as 7.5	The wanted signal level uncertainty applies for each CC
7.5A.5 Adjacent Channel Selectivity (ACS) for 3DL CA	Downlink power same as 7.5 Uplink power measurement same as 7.5	The wanted signal level uncertainty applies for each CC
7.5A.7 Adjacent Channel Selectivity (ACS) for 4DL CA	Downlink power same as 7.5 Uplink power measurement same as 7.5	The wanted signal level uncertainty applies for each CC
7.5B Adjacent Channel Selectivity (ACS) for UL-MIMO	ACS value same as 7.5 Uplink power measurement same as 7.5, at each antenna connector used for transmission	The overall UL power is the linear sum of the output powers over all Tx antenna connectors

7.5D.1 Adjacent channel selectivity (ACS) for ProSe Direct Discovery	ACS value $\pm 1.1$ dB, $f \leq 3.0$ GHz	<p>Overall ACS uncertainty comprises three quantities:</p> <ol style="list-style-type: none"> <li>1. Wanted signal level error</li> <li>2. Interferer signal level error</li> <li>3. Additional impact of interferer ACLR</li> </ol> <p>Items 1 and 2 are assumed to be uncorrelated so can be root sum squared to provide the ratio error of the two signals. The interferer ACLR effect is systematic, and is added arithmetically.</p> <p>Test System uncertainty = <math>[\text{SQRT}(\text{wanted\_level\_error}^2 + \text{interferer\_level\_error}^2)] + \text{ACLR effect}</math>.</p> <p><math>f \leq 3.0</math>GHz  Wanted signal level <math>\pm 0.7</math>dB  Interferer signal level <math>\pm 0.7</math>dB</p> <p><math>f \leq 4.2</math>GHz  Impact of interferer ACLR  0.1dB</p>
7.5D.2 Adjacent channel selectivity (ACS) for ProSe Direct Communication	Same as 7.5D.1	Same as 7.5D.1
7.5E Adjacent Channel Selectivity (ACS) for UE category 0	Same as 7.5	Same as 7.5
7.5EA Adjacent Channel Selectivity (ACS) for UE category M1	Same as 7.5	Same as 7.5
7.5F Adjacent Channel Selectivity (ACS) for UE category NB1	ACS value $\pm 1.1$ dB, $f \leq 3.0$ GHz	<p>Overall ACS uncertainty comprises three quantities:</p> <ol style="list-style-type: none"> <li>1. Wanted signal level error</li> <li>2. Interferer signal level error</li> <li>3. Additional impact of interferer ACLR</li> </ol> <p>Items 1 and 2 are assumed to be uncorrelated so can be root sum squared to provide the ratio error of the two signals. The interferer ACLR effect is systematic, and is added arithmetically.</p> <p>Test System uncertainty = <math>[\text{SQRT}(\text{wanted\_level\_error}^2 + \text{interferer\_level\_error}^2)] + \text{ACLR effect}</math>.</p> <p><math>f \leq 3.0</math>GHz  Wanted signal level <math>\pm 0.7</math>dB  Interferer signal level <math>\pm 0.7</math>dB  Impact of interferer ACLR  0.1dB</p>

7.6.1 In-band blocking	Blocking $\pm 1.4$ dB, $f \leq 3.0$ GHz $\pm 1.8$ dB, $3.0$ GHz $< f \leq 4.2$ GHz Uplink power measurement $\pm 0.7$ dB, $f \leq 3.0$ GHz $\pm 1.0$ dB, $3.0$ GHz $< f \leq 4.2$ GHz	Overall blocking uncertainty can have these contributions: 1. Wanted signal level error 2. Interferer signal level error 3. Interferer ACLR 4. Interferer broadband noise Items 1 and 2 are assumed to be uncorrelated so can be root sum squared to provide the ratio error of the two signals. The Interferer ACLR or Broadband noise effect is systematic, and is added arithmetically. Test System uncertainty = [SQRT (wanted_level_error <sup>2</sup> + interferer_level_error <sup>2</sup> )] + ACLR effect + Broadband noise effect. <u>In-band blocking, using modulated interferer:</u> $f \leq 3.0$ GHz Wanted signal level $\pm 0.7$ dB Interferer signal level: $\pm 0.7$ dB $3.0$ GHz $< f \leq 4.2$ GHz Wanted signal level $\pm 1.0$ dB Interferer signal level $\pm 1.0$ dB $f \leq 4.2$ GHz Interferer ACLR 0.4dB Broadband noise not applicable
7.6.1_1 In-band blocking with 4 Rx antenna ports	Same as 7.6.1	Same as 7.6.1
7.6.1A.1 In-band blocking for CA (intra band contiguous DL CA and UL CA)	Same as 7.6.1 for each CC	Same as 7.6.1  The wanted signal level uncertainty applies for each CC.  Overall blocking uncertainty calculation includes the uncertainty for wanted level error only once, as the uncertainty of other CCs is not expected to have any significant effect.
7.6.1A.2 In-band blocking for CA (intra band contiguous DL CA without UL CA)	Same as 7.6.1A.1	Same as 7.6.1A.1
7.6.1A.3 In-band blocking for CA (inter band DL CA without UL CA)	Same as 7.6.1A.1	Same as 7.6.1A.1
7.6.1A.4 In-band blocking for CA (intra-band non-contiguous DL CA without UL CA)	Same as 7.6.1A.1	Same as 7.6.1A.1
7.6.1A.5 In-band blocking for 3DL CA	Same as 7.6.1A.1	Same as 7.6.1A.1
7.6.1A.7 In-band blocking for 4DL CA	Same as 7.6.1A.1	Same as 7.6.1A.1
7.6.1B In-band blocking for UL-MIMO	Blocking same as 7.6.1  Uplink power measurement same as 7.6.1, at each antenna connector used for transmission	The overall UL power is the linear sum of the output powers over all Tx antenna connectors

<p>7.6.1D.1 In-band blocking for ProSe Direct Discovery</p>	<p>Blocking <math>\pm 1.4</math> dB, <math>f \leq 3.0</math>GHz</p>	<p>Overall blocking uncertainty can have these contributions:                      1. Wanted signal level error                      2. Interferer signal level error                      3. Interferer ACLR                      4. Interferer broadband noise</p> <p>Items 1 and 2 are assumed to be uncorrelated so can be root sum squared to provide the ratio error of the two signals. The Interferer ACLR or Broadband noise effect is systematic, and is added arithmetically.</p> <p>Test System uncertainty = [SQRT (wanted_level_error<sup>2</sup> + interferer_level_error<sup>2</sup>)] + ACLR effect + Broadband noise effect.</p> <p><u>In-band blocking, using modulated interferer:</u>  <math>f \leq 3.0</math>GHz                      Wanted signal level <math>\pm 0.7</math>dB                      Interferer signal level: <math>\pm 0.7</math>dB</p> <p><math>f \leq 4.2</math>GHz                      Interferer ACLR 0.4dB                      Broadband noise not applicable</p>
<p>7.6.1D.2 In-band blocking for ProSe Direct Communication</p>	<p>Same as 7.6.1D.1</p>	<p>Same as 7.6.1D.1</p>
<p>7.6.1E In-band blocking for UE category 0</p>	<p>Same as 7.6.1</p>	<p>Same as 7.6.1</p>
<p>7.6.1EA In-band blocking for UE category M1</p>	<p>Blocking <math>\pm 1.4</math> dB, <math>f \leq 3.0</math>GHz                      Uplink power measurement <math>\pm 0.7</math> dB, <math>f \leq 3.0</math>GHz</p>	<p>Overall blocking uncertainty can have these contributions:                      1. Wanted signal level error                      2. Interferer signal level error                      3. Interferer ACLR                      4. Interferer broadband noise</p> <p>Items 1 and 2 are assumed to be uncorrelated so can be root sum squared to provide the ratio error of the two signals. The Interferer ACLR or Broadband noise effect is systematic, and is added arithmetically.</p> <p>Test System uncertainty = [SQRT (wanted_level_error<sup>2</sup> + interferer_level_error<sup>2</sup>)] + ACLR effect + Broadband noise effect.</p> <p><u>In-band blocking, using modulated interferer:</u>  <math>f \leq 3.0</math>GHz                      Wanted signal level <math>\pm 0.7</math>dB                      Interferer signal level: <math>\pm 0.7</math>dB</p>

7.6.2 Out of-band blocking	<p>Wanted signal <math>f \leq 3.0\text{GHz}</math>            Blocking, <math>1\text{MHz} &lt; f_{\text{interferer}} \leq 3\text{GHz}</math>: <math>\pm 1.3\text{ dB}</math>            Blocking, <math>3\text{GHz} &lt; f_{\text{interferer}} \leq 12.75\text{GHz}</math>: <math>\pm 3.2\text{ dB}</math>            Uplink power measurement <math>\pm 0.7\text{ dB}</math></p> <p>Wanted signal <math>3.0\text{GHz} &lt; f \leq 4.2\text{GHz}</math>            Blocking, <math>1\text{MHz} &lt; f_{\text{interferer}} \leq 3\text{GHz}</math>: <math>\pm 1.5\text{ dB}</math>            Blocking, <math>3\text{GHz} &lt; f_{\text{interferer}} \leq 12.75\text{GHz}</math>: <math>\pm 3.3\text{ dB}</math>            Uplink power measurement <math>\pm 1.0\text{ dB}</math></p>	<p>Out of band blocking, using CW interferer:  <math>f \leq 3.0\text{GHz}</math>            Wanted signal level <math>\pm 0.7\text{dB}</math>  <math>3.0\text{GHz} &lt; f \leq 4.2\text{GHz}</math>            Wanted signal level <math>\pm 1.0\text{dB}</math>            Interferer signal level:  <math>\pm 1.0\text{dB}</math> up to <math>3\text{GHz}</math>  <math>\pm 3.0\text{dB}</math> up to <math>12.75\text{GHz}</math>            Interferer ACLR not applicable            Impact of interferer            Broadband noise <math>0.1\text{dB}</math></p> <p>Figures are combined to give Test System uncertainty, using formula given for 7.6.1</p>
7.6.2_1 Out of-band blocking with 4 Rx antenna ports	Same as 7.6.2	Same as 7.6.2
7.6.2A.1 Out-of-band blocking for CA (intra band contiguous DL CA and UL CA)	Same as 7.6.2 for each CC	<p>Same as 7.6.2            The wanted signal level uncertainty applies for each CC.            Overall blocking uncertainty calculation includes the uncertainty for wanted level error only once, as the uncertainty of other CCs is not expected to have any significant effect.</p>
7.6.2A.2 Out-of-band blocking for CA (intra band contiguous DL CA without UL CA)	Same as 7.6.2A.1	Same as 7.6.2A.1
7.6.2A.3 Out-of-band blocking for CA (inter band DL CA without UL CA)	Same as 7.6.2A.1	Same as 7.6.2A.1
7.6.2A.4 Out-of-band blocking for CA (intra-band non-contiguous DL CA without UL CA)	Same as 7.6.2A.1	Same as 7.6.2A.1
7.6.2A.5 Out-of-band blocking for 3DL CA	Same as 7.6.2A.1	Same as 7.6.2A.1
7.6.2A.7 Out-of-band blocking for 4DL CA	Same as 7.6.2A.1	Same as 7.6.2A.1
7.6.2B Out-of-band blocking for UL-MIMO	<p>Blocking same as 7.6.2</p> <p>Uplink power measurement same as 7.6.2, at each antenna connector used for transmission</p>	The overall UL power is the linear sum of the output powers over all Tx antenna connectors
7.6.2D.1 Out-of-band blocking for ProSe Direct Discovery	<p>Wanted signal <math>f \leq 3.0\text{GHz}</math>            Blocking, <math>1\text{MHz} &lt; f_{\text{interferer}} \leq 3\text{GHz}</math>: <math>\pm 1.3\text{ dB}</math>            Blocking, <math>3\text{GHz} &lt; f_{\text{interferer}} \leq 12.75\text{GHz}</math>: <math>\pm 3.2\text{ dB}</math>  <math>\pm 0.7\text{ dB}</math></p>	<p>Out of band blocking, using CW interferer:  <math>f \leq 3.0\text{GHz}</math>            Wanted signal level <math>\pm 0.7\text{dB}</math></p> <p>Interferer signal level:  <math>\pm 1.0\text{dB}</math> up to <math>3\text{GHz}</math>  <math>\pm 3.0\text{dB}</math> up to <math>12.75\text{GHz}</math>            Interferer ACLR not applicable</p> <p>Impact of interferer            Broadband noise <math>0.1\text{dB}</math></p> <p>Figures are combined to give Test System uncertainty, using formula given for 7.6.1</p>
7.6.2D.2 Out-of-band blocking for ProSe Direct Communication	Same as 7.6.2D.1	Same as 7.6.2D.1

7.6.2E Out of-band blocking for UE category 0	Same as 7.6.2	Same as 7.6.2
7.6.2EA Out-of-band blocking for UE category M1	<p>Wanted signal <math>f \leq 3.0\text{GHz}</math></p> <p>Blocking, <math>1\text{MHz} &lt; f_{\text{interferer}} \leq 3\text{GHz}</math>: <math>\pm 1.3\text{ dB}</math></p> <p>Blocking, <math>3\text{GHz} &lt; f_{\text{interferer}} \leq 12.75\text{GHz}</math>: <math>\pm 3.2\text{ dB}</math></p> <p>Uplink power measurement <math>\pm 0.7\text{ dB}</math></p>	<p>Out of band blocking, using CW interferer:</p> <p><math>f \leq 3.0\text{GHz}</math></p> <p>Wanted signal level <math>\pm 0.7\text{dB}</math></p> <p>Interferer signal level:</p> <p><math>\pm 1.0\text{dB}</math> up to <math>3\text{GHz}</math></p> <p><math>\pm 3.0\text{dB}</math> up to <math>12.75\text{GHz}</math></p> <p>Interferer ACLR not applicable</p> <p>Impact of interferer</p> <p>Broadband noise <math>0.1\text{dB}</math></p> <p>Figures are combined to give Test System uncertainty, using formula given for 7.6.1</p>

7.6.3_1 Narrow band blocking with 4 Rx antenna ports	Same as 7.6.3	Same as 7.6.3
7.6.3A.1 Narrow band blocking for CA (intra band contiguous DL CA and UL CA)	Same as 7.6.3 for each CC	<p>Same as 7.6.3</p> <p>The wanted signal level uncertainty applies for each CC.</p> <p>Overall blocking uncertainty calculation includes the uncertainty for wanted level error only once, as the uncertainty of other CCs is not expected to have any significant effect.</p>
7.6.3A.2 Narrow band blocking for CA (intra band contiguous DL CA without UL CA)	Same as 7.6.3A.1	Same as 7.6.3A.1
7.6.3A.3 Narrow band blocking for CA (inter band DL CA without UL CA)	Same as 7.6.3A.1	Same as 7.6.3A.1
7.6.3A.4 Narrow band blocking for CA (intra-band non-contiguous DL CA without UL CA)	Same as 7.6.3A.1	Same as 7.6.3A.1
7.6.3A.5 Narrow band blocking for 3DL CA	Same as 7.6.3A.1	Same as 7.6.3A.1
7.6.3A.7 Narrow band blocking for 4DL CA	Same as 7.6.3A.1	Same as 7.6.3A.1
7.6.3B Narrow band blocking for UL-MIMO	<p>Blocking same as 7.6.3</p> <p>Uplink power measurement same as 7.6.3, at each antenna connector used for transmission</p>	The overall UL power is the linear sum of the output powers over all Tx antenna connectors

7.6.3D.1 Narrow band blocking for ProSe Direct Discovery	Blocking $\pm 1.1$ dB, $f \leq 3.0$ GHz	Narrow band blocking, using CW interferer: $f \leq 3.0$ GHz Wanted signal level $\pm 0.7$ dB Interferer signal level: $\pm 0.7$ dB  Interferer ACLR not applicable Impact of interferer Broadband noise 0.1dB  Figures are combined to give Test System uncertainty, using formula given for 7.6.1
7.6.3D.2 Narrow band blocking for ProSe Direct Communication	Same as 7.6.3D.1	Same as 7.6.3D.1
7.6.3E Narrow band blocking for UE category 0	Same as 7.6.3	Same as 7.6.3
7.6.3EA Narrow band blocking for UE category M1	Blocking $\pm 1.1$ dB, $f \leq 3.0$ GHz Uplink power measurement $\pm 0.7$ dB, $f \leq 3.0$ GHz	Narrow band blocking, using CW interferer: $f \leq 3.0$ GHz Wanted signal level $\pm 0.7$ dB Interferer signal level: $\pm 0.7$ dB  Interferer ACLR not applicable Impact of interferer Broadband noise 0.1dB  Figures are combined to give Test System uncertainty, using formula given for 7.6.1
7.7 Spurious response	Same as 7.6.2	Same as 7.6.2.
7.7_1 Spurious response with 4 Rx antenna ports	Same as 7.6.2	Same as 7.6.2
7.7A.1 Spurious response for CA (intra band contiguous DL CA and UL CA)	Same as 7.6.2A.1	Same as 7.6.2A.1
7.7A.2 Spurious response for CA (intra band contiguous DL CA without UL CA)	Same as 7.6.2A.1	Same as 7.6.2A.1
7.7A.3 Spurious response for CA (inter band DL CA without UL CA)	Same as 7.6.2A.1	Same as 7.6.2A.1
7.7A.4 Spurious response for CA (intra-band non-contiguous DL CA without UL CA)	Same as 7.6.2A.1	Same as 7.6.2A.1
7.7A.5 Spurious response for 3DL CA	Same as 7.6.2A.1	Same as 7.6.2A.1
7.7A.7 Spurious response for 4DL CA	Same as 7.6.2A.1	Same as 7.6.2A.1
7.7B Spurious response for UL-MIMO	Same as 7.7  Uplink power measurement same as 7.6.2, at each antenna connector used for transmission	The overall UL power is the linear sum of the output powers over all Tx antenna connectors
7.7D.1 Spurious response for ProSe Direct Discovery	Same as 7.6.2D.1	Same as 7.6.2D.1
7.7D.2 Spurious response for ProSe Direct Communication	Same as 7.6.2D.1	Same as 7.6.2D.1
7.7E Spurious response for UE category 0	Same as 7.7	Same as 7.7
7.7EA Spurious response for UE category M1	Same as 7.7	Same as 7.7

7.7F Spurious response for UE category NB1	TBD	TBD
7.8.1 Wide band intermodulation	Intermodulation $\pm 1.4$ dB, $f \leq 3.0$ GHz $\pm 2.6$ dB, $3.0$ GHz $< f \leq 4.2$ GHz Uplink power measurement $\pm 0.7$ dB, $f \leq 3.0$ GHz $\pm 1.0$ dB, $3.0$ GHz $< f \leq 4.2$ GHz	Overall intermodulation uncertainty comprises three quantities: 1. Wanted signal level error 2. CW Interferer level error 3. Modulated Interferer level error  Effect of interferer ACLR has not been included as modulated interferer has larger frequency offset The effect of the closer CW signal has twice the effect. Items 1, 2 and 3 are assumed to be uncorrelated so can be root sum squared to provide the combined effect of the three signals. Test System uncertainty = $\text{SQRT} [(2 \times \text{CW\_level\_error})^2 + (\text{mod interferer\_level\_error})^2 + (\text{wanted signal\_level\_error})^2]$ $f \leq 3.0$ GHz Wanted signal level $\pm 0.7$ dB CW Interferer level $\pm 0.5$ dB Mod Interferer level $\pm 0.7$ dB $3.0$ GHz $< f \leq 4.2$ GHz Wanted signal level $\pm 1.0$ dB CW Interferer level $\pm 0.8$ dB Mod Interferer level $\pm 1.0$ dB
7.8.1_1 Wide band Intermodulation with 4 Rx antenna ports	Same as 7.8.1	Same as 7.8.1
7.8.1A.1 Wideband intermodulation for CA (intra band contiguous DL CA and UL CA)	Same as 7.8.1 for each CC	Same as 7.8.1 The wanted signal level uncertainty applies for each CC. Overall intermodulation uncertainty calculation includes the uncertainty for wanted level error only once, as the uncertainty of other CCs is not expected to have any significant effect.
7.8.1A.2 Wideband intermodulation for CA (intra band contiguous DL CA without UL CA)	Same as 7.8.1A.1	Same as 7.8.1A.1
7.8.1A.3 Wideband intermodulation for CA (inter band DL CA without UL CA)	Same as 7.8.1A.1	Same as 7.8.1A.1
7.8.1A.4 Wideband intermodulation for CA (intra band non-contiguous DL CA without UL CA)	Same as 7.8.1A.1	Same as 7.8.1A.1
7.8.1A.5 Wideband intermodulation for 3DL CA	Same as 7.8.1A.1	Same as 7.8.1A.1
7.8.1A.7 Wideband intermodulation for 4DL CA	Same as 7.8.1A.1	Same as 7.8.1A.1
7.8.1B Wide band intermodulation for UL-MIMO	Intermodulation same as 7.8.1  Uplink power measurement same as 7.8.1, at each antenna connector used for transmission	The overall UL power is the linear sum of the output powers over all Tx antenna connectors

7.8.1D.1 Wide band Intermodulation for ProSe Direct Discovery	Intermodulation $\pm 1.4$ dB, $f \leq 3.0$ GHz $\pm 2$	Overall intermodulation uncertainty comprises three quantities: 1. Wanted signal level error 2. CW Interferer level error 3. Modulated Interferer level error  Effect of interferer ACLR has not been included as modulated interferer has larger frequency offset  The effect of the closer CW signal has twice the effect. Items 1, 2 and 3 are assumed to be uncorrelated so can be root sum squared to provide the combined effect of the three signals. Test System uncertainty = SQRT [(2 x CW_level_error) <sup>2</sup> + (mod interferer_level_error) <sup>2</sup> + (wanted signal_level_error) <sup>2</sup> ]  $f \leq 3.0$ GHz Wanted signal level $\pm 0.7$ dB CW Interferer level $\pm 0.5$ dB Mod Interferer level $\pm 0.7$ dB
7.8.1D.2 Wide band Intermodulation for ProSe Direct Communication	Same as 7.8.1D.2	Same as 7.8.1D.2
7.8.1E Wide band intermodulation for UE category 0	Same as 7.8.1	Same as 7.8.1
7.8.1EA Wide band Intermodulation for UE category M1	Same as 7.8.1	Same as 7.8.1
7.8.1F Wide band Intermodulation for UE category NB1	TBD	TBD
7.9 Spurious emissions	$30\text{MHz} \leq f \leq 4.0\text{GHz}$ : $\pm 2.0$ dB $4\text{ GHz} < f \leq 4.0\text{GHz}$ : $\pm 4.0$ dB	
7.9_1 Spurious emissions with 4 Rx antenna ports	Same as 7.9	
7.9A Spurious emissions for CA	$30\text{MHz} \leq f \leq 4.0\text{GHz}$ : $\pm 2.0$ dB $4\text{ GHz} < f \leq 12.75\text{ GHz}$ : $\pm 4.0$ dB	
7.9E Spurious emissions for UE category 0	Same as 7.9	
Note 1: Unless otherwise noted, only the Test System stimulus error is considered here. The effect of errors in the throughput measurements due to finite test duration is not considered.		

## F.1.4 Measurement of performance requirements

**Table F.1.4-1: Maximum Test System Uncertainty for Performance Requirements**

Subclause	Maximum Test System Uncertainty <sup>1</sup>	Derivation of Test System Uncertainty
8.2.1.1.1 Multiple PRBs - Propagation Condition EVA5 - Propagation Condition ETU70 - Propagation Condition ETU300	± 0.8 dB	Overall system uncertainty for fading conditions comprises three quantities: 1. Signal-to-noise ratio uncertainty 2. Fading profile power uncertainty 3. Effect of AWGN flatness and signal flatness  Items 1, 2 and 3 are assumed to be uncorrelated so can be root sum squared: AWGN flatness and signal flatness has x 0.25 effect on the required SNR, so use sensitivity factor of x 0.25 for the uncertainty contribution. Test System uncertainty = $\text{SQRT}(\text{Signal-to-noise ratio uncertainty}^2 + \text{Fading profile power uncertainty}^2 + (0.25 \times \text{AWGN flatness and signal flatness})^2)$ Signal-to-noise ratio uncertainty ±0.3 dB Fading profile power uncertainty ±0.5 dB for single Tx AWGN flatness and signal flatness ±2.0 dB
8.2.1.1.1 Multiple PRBs - Propagation Condition HST	± 0.6 dB	Overall system uncertainty for HST condition comprises two quantities: 1. Signal-to-noise ratio uncertainty 2. Effect of AWGN flatness and signal flatness  Items 1 and 2 are assumed to be uncorrelated so can be root sum squared: AWGN flatness and signal flatness has x 0.25 effect on the required SNR, so use sensitivity factor of x 0.25 for the uncertainty contribution. Test System uncertainty = $\text{SQRT}(\text{Signal-to-noise ratio uncertainty}^2 + (0.25 \times \text{AWGN flatness and signal flatness})^2)$ Signal-to-noise ratio uncertainty ±0.3 dB AWGN flatness and signal flatness ±2.0 dB
8.2.1.1.1 Single PRB - Propagation Condition ETU70	± 0.8 dB	Overall system uncertainty for fading condition comprises three quantities: 1. Average Signal-to-noise ratio uncertainty 2. Signal-to noise ratio variation for single PRB 3. Fading profile power uncertainty  Items 1, 2 and 3 are assumed to be uncorrelated so can be root sum squared: Test System uncertainty = $\text{SQRT}(\text{Average signal-to-noise ratio uncertainty}^2 + \text{Signal-to-noise ratio variation}^2 + \text{Fading profile power uncertainty}^2)$ Signal-to-noise ratio uncertainty ±0.3 dB Signal-to-noise ratio variation ±0.5 dB Fading profile power uncertainty ±0.5 dB for single Tx
8.2.1.1.1_A.1	Same as 8.2.1.1.1 Multiple PRBs, for each CC	Same as 8.2.1.1.1 Multiple PRBs Calculation applies for each CC
8.2.1.1.1_A.2	Same as 8.2.1.1.1 Multiple PRBs, for each CC	Same as 8.2.1.1.1 Multiple PRBs Calculation applies for each CC
8.2.1.1.1_1 Multiple PRBs - Propagation Condition EVA5 - Propagation Condition ETU70 - Propagation Condition ETU300	Same as 8.2.1.1.1 Multiple PRBs Propagation EVA5, ETU70, ETU300	

8.2.1.1.1_2 Multiple PRB - Propagation Condition EVA5	Same as 8.2.1.1.1 Multiple PRBs Propagation EVA5	
8.2.1.1.2 Single PRB	± 0.8 dB	Same as 8.2.1.1.1 Single PRB
8.2.1.2.1 - Propagation Condition EVA5	± 0.9 dB	Overall system uncertainty for fading conditions comprises three quantities: 1. Signal-to-noise ratio uncertainty 2. Fading profile power uncertainty 3. Effect of AWGN flatness and signal flatness  Items 1, 2 and 3 are assumed to be uncorrelated so can be root sum squared: AWGN flatness and signal flatness has x 0.25 effect on the required SNR, so use sensitivity factor of x 0.25 for the uncertainty contribution. Test System uncertainty = SQRT (Signal-to-noise ratio uncertainty <sup>2</sup> + Fading profile power uncertainty <sup>2</sup> + (0.25 x AWGN flatness and signal flatness) <sup>2</sup> ) Signal-to-noise ratio uncertainty ±0.3 dB Fading profile power uncertainty ±0.7 dB for Tx Diversity AWGN flatness and signal flatness ±2.0 dB
8.2.1.2.1 - Propagation Condition HST	± 0.6 dB	Overall system uncertainty for HST condition comprises two quantities: 1. Signal-to-noise ratio uncertainty 2. Effect of AWGN flatness and signal flatness  Items 1 and 2 are assumed to be uncorrelated so can be root sum squared: AWGN flatness and signal flatness has x 0.25 effect on the required SNR, so use sensitivity factor of x 0.25 for the uncertainty contribution. Test System uncertainty = SQRT (Signal-to-noise ratio uncertainty <sup>2</sup> + (0.25 x AWGN flatness and signal flatness) <sup>2</sup> ) Signal-to-noise ratio uncertainty ±0.3 dB AWGN flatness and signal flatness ±2.0 dB
8.2.1.2.1_1 - Propagation Condition EVA5	Same as 8.2.1.2.1 Propagation EVA5	
8.2.1.2.2	± 0.9 dB	Same as 8.2.1.2.1 Propagation Condition EVA5
8.2.1.2.2_1	Same as 8.2.1.2.2

10.2	± 0.9 dB	Same as 10.1
[Other tests FFS]		
In addition, the following Test System uncertainties and related constraints apply:		
AWGN Bandwidth		≥ 1.08MHz, 2.7MHz, 4.5MHz, 9MHz, 13.5MHz, 18MHz; N <sub>RB</sub> x 180kHz according to BW <sub>Config</sub>
AWGN absolute power uncertainty, averaged over BW <sub>Config</sub> <sup>Note 4</sup>		±3 dB
AWGN flatness and signal flatness, max deviation for any Resource Block, relative to average over BW <sub>Config</sub>		±2 dB
AWGN peak to average ratio		≥10 dB @0.001%
Signal-to noise ratio uncertainty, averaged over downlink transmission Bandwidth		±0.3 dB (includes uncertainty in precoding applied by the test system, where applicable)
Signal-to noise ratio variation for any resource block, relative to average over downlink transmission Bandwidth		±0.5 dB
N <sub>oc2</sub> absolute power uncertainty, averaged over BW <sub>Config</sub> <sup>Note 5</sup>		±3 dB
N <sub>oc1</sub> / N <sub>oc2</sub> ratio uncertainty, averaged over BW <sub>Config</sub> <sup>Note 5</sup>		±0.3 dB
N <sub>oc3</sub> / N <sub>oc2</sub> ratio uncertainty, averaged over BW <sub>Config</sub> <sup>Note 5</sup>		±0.3 dB
E <sub>s</sub> / N <sub>oc2</sub> ratio (SNR) uncertainty, averaged over downlink transmission Bandwidth <sup>Note 5</sup>		±0.3 dB (includes uncertainty in precoding applied by the test system, where applicable)
Fading profile power uncertainty		Test-specific
Fading profile delay uncertainty, relative to frame timing		±5 ns (excludes absolute errors related to baseband timing)

CA performance requirements only: Relative frequency error between carriers	30Hz, measured over a 1ms period, and maximum carrier spacing 80MHz
enhanced performance requirement Type B only: Frequency error on the frequency offset to cell 1	30Hz, measured over a 1ms period
Note 1: Only the overall stimulus error is considered here. The effect of errors in the throughput measurements due to finite test duration is not considered.	
Note 2: The AWGN or $N_{ocx}$ parameters apply to all test cases except 8.7.1 and 8.7.2. The fading parameters apply to test cases using fading	
Note 3: In CA test cases using multiple component carriers (CCs), the uncertainties and related constraints apply for each CC.	
Note 4: Applies for test cases which specify $N_{oc}$ , a single value that remains constant with time.	
Note 5: Applies for test cases which specify $N_{oc1}$ , $N_{oc2}$ and $N_{oc3}$ , that are symbol or subframe specific.	

## F.1.5 Measurement of Channel State Information reporting

**Table F.1.5-1: Maximum Test System Uncertainty for Channel State Information reporting**

Subclause	Maximum Test System Uncertainty <sup>1</sup>	Derivation of Test System Uncertainty
9.2.1.1 FDD CQI Reporting under AWGN conditions – PUCCH 1-0	$\pm 0.3$ dB	Signal-to-noise ratio uncertainty $\pm 0.3$ dB  <i>AWGN flatness and signal flatness <math>\pm 2.0</math> dB not expected to have any significant effect</i>  <i>AWGN absolute power uncertainty <math>\pm 3.0</math> dB not expected to have any significant effect</i>

In addition, the following Test System uncertainties and related constraints apply:		
AWGN Bandwidth	≥ 1.08MHz, 2.7MHz, 4.5MHz, 9MHz, 13.5MHz, 18MHz; N <sub>RB</sub> x 180kHz according to BW <sub>Config</sub>	

AWGN absolute power uncertainty, averaged over $BW_{Config}$ <sup>Note 4</sup>	±3 dB
AWGN flatness and signal flatness, max deviation for any Resource Block, relative to average over $BW_{Config}$	±2 dB
AWGN peak to average ratio	≥10 dB @0.001%
Signal-to noise ratio uncertainty, averaged over downlink transmission Bandwidth	±0.3 dB (includes uncertainty in precoding applied by the test system, where applicable)
Signal-to noise ratio variation for any resource block, relative to average over downlink transmission Bandwidth	±0.5 dB
$N_{oc2}$ absolute power uncertainty, averaged over $BW_{Config}$ <sup>Note 5</sup>	±3 dB
$N_{oc1} / N_{oc2}$ ratio uncertainty, averaged over $BW_{Config}$ <sup>Note 5</sup>	±0.3 dB
$N_{oc3} / N_{oc2}$ ratio uncertainty, averaged over $BW_{Config}$ <sup>Note 5</sup>	±0.3 dB
$E_s / N_{oc2}$ ratio (SNR) uncertainty, averaged over downlink transmission Bandwidth <sup>Note 5</sup>	±0.3 dB (includes uncertainty in precoding applied by the test system, where applicable)
Fading profile power uncertainty	Test-specific
Fading profile delay uncertainty, relative to frame timing	±5 ns (excludes absolute errors related to baseband timing)
Downlink channel matrix uncertainties:	
Tx phase error, as shown in Figure F.1.5-1	$\Theta_{Tx} = \begin{bmatrix} e^{j\theta_1} & 0 & \dots & 0 \\ 0 & e^{j\theta_2} & \ddots & 0 \\ \vdots & \ddots & \ddots & \vdots \\ 0 & 0 & \dots & e^{j\theta_{N_{Tx}}} \end{bmatrix}$ <p><math>\theta_n</math> is defined for each Tx antenna up to <math>N_{Tx}</math>  <math>\theta_n \in (-\theta_{MAX}, \theta_{MAX})</math>  <math>\theta_{MAX} \leq 10^\circ</math>  <math>\theta_n</math> is constant for the duration of the test</p>
Rx phase error, as shown in Figure F.1.5-1	$\Theta_{Rx} = \begin{bmatrix} e^{j\theta_1} & 0 & \dots & 0 \\ 0 & e^{j\theta_2} & \ddots & 0 \\ \vdots & \ddots & \ddots & \vdots \\ 0 & 0 & \dots & e^{j\theta_{N_{Rx}}} \end{bmatrix}$ <p><math>\theta_n</math> is defined for each Rx antenna up to <math>N_{Rx}</math>  There is no constraint on the value of <math>\theta_n</math> except that it is constant for the duration of the test</p>
Note 1:	Only the overall stimulus error is considered. The effect of errors in the throughput measurements due to finite test duration is not considered.
Note 2:	The AWGN parameters apply to all test cases except 9.3.3.1.1 and 9.3.3.1.2. The fading parameters apply to test cases using fading
Note 3:	Downlink channel matrix uncertainties apply to eDL-MIMO CSI test cases
Note 4:	Applies for test cases which specify $N_{oc}$ , a single value that remains constant with time.
Note 5:	Applies for test cases which specify $N_{oc1}$ , $N_{oc2}$ and $N_{oc3}$ , that are symbol or subframe specific.

Example for dual layer PDSCH, 4Tx antennas x 2Rx antennas, fading propagation, with correlation and AWGN

Figure F.1.5-1: Location of Tx Phase error and Rx Phase error for eDL-MIMO (Informative)

## F.2 Interpretation of measurement results (normative)

The measurement results returned by the Test System are compared – without any modification – against the Test Requirements as defined by the shared risk principle.

The Shared Risk principle is defined in ETR 273-1-2 clause 6.5.

The actual measurement uncertainty of the Test System for the measurement of each parameter shall be included in the test report.

The recorded value for the Test System uncertainty shall be, for each measurement, equal to or lower than the appropriate figure in clause F.1 of the present document.

If the Test System for a test is known to have a measurement uncertainty greater than that specified in clause F.1, it is still permitted to use this apparatus provided that an adjustment is made value as follows:

Any additional uncertainty in the Test System over and above that specified in clause F.1 shall be used to tighten the Test Requirement, making the test harder to pass. For some tests, for example receiver tests, this may require modification of stimulus signals. This procedure will ensure that a Test System not compliant with clause F.1 does not increase the chance of passing a device under test where that device would otherwise have failed the test if a Test System compliant with clause F.1 had been used.

## F.3 Test Tolerance and Derivation of Test Requirements (informative)

The Test Requirements in the present document have been calculated by relaxing the Minimum Requirements of the core specification using the Test Tolerances defined in this clause. When the Test Tolerance is zero, the Test Requirement will be the same as the Minimum Requirement. When the Test Tolerance is non-zero, the Test Requirements will differ from the Minimum Requirements, and the formula used for the relaxation is given in this clause.

The Test Tolerances are derived from Test System uncertainties, regulatory requirements and criticality to system performance. As a result, the Test Tolerances may sometimes be set to zero.

The test tolerances should not be modified for any reason e.g. to take account of commonly known test system errors (such as mismatch, cable loss, etc.).

The downlink Test Tolerances apply at each receiver antenna connector.

### F.3.1 Measurement of test environments

The UE test environments are set to the values defined in TS 36.508 subclause 4.1, without any relaxation. The applied Test Tolerance is therefore zero.

## F.3.2 Measurement of transmitter

Table F.3.2-1: Derivation of Test Requirements (Transmitter tests)

Test	Minimum Requirement in TS 36.101	Test Tolerance (TT)	Test Requirement in TS 36.521-1
6.2.2 UE Maximum Output Power	$f \leq 3.0\text{GHz}$ Power class 1: [FFS] Power class 2: [FFS] Power class 3: 23dBm $\pm 2$ dB Power class 4: [FFS]  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ Power class 3: 23dBm +2/-3 dB	0.7 dB 0.7 dB 0.7 dB 0.7 dB  1.0 dB	Formula: Upper limit + TT, Lower limit - TT  Power class 1: [FFS] Power class 2: [FFS] Power class 3: 23dBm $\pm 2.7$ dB Power class 4: [FFS]  Power class 3: 23dBm +3.0/-4.0 dB
6.2.2_1 UE Maximum Output Power for HPUE	$f \leq 3.0\text{GHz}$ Power class 1: 31dBm +2/-3dB	0.7dB	Formula: Upper limit + TT, Lower limit - TT  Power class 1: 31dBm +2.7/-3.7dB
6.2.2A.1 UE Maximum Output Power for CA (intra-band contiguous DL CA and UL CA)	Same as 6.2.2	Same as 6.2.2	Same as 6.2.2
6.2.2A.2 UE Maximum Output Power for CA (inter-band DL CA and UL CA)	Same as 6.2.2	Same as 6.2.2	Same as 6.2.2
6.2.2B UE Maximum Output Power for UL-MIMO	$f \leq 3.0\text{GHz}$ Power class 1: [FFS] Power class 2: [FFS] Power class 3: 23dBm +2/-3 dB Power class 4: [FFS]  $3.0\text{GHz} < f \leq 4.2\text{GHz}$ Power class 3: 23dBm +2/-4 dB	Same as 6.2.2	Formula: Upper limit +TT, Lower limit - TT  Power class 1: [FFS] Power class 2: [FFS] Power class 3: 23dBm +2.7/-3.7 dB Power class 4: [FFS]  Power class 3: 23dBm +3.0/-5.0 dB  Uplink power measurement applies to overall UL power, which is the linear sum of the output powers over all Tx antenna connectors
6.2.2E UE Maximum Output Power UE category 0	Same as 6.2.2	Same as 6.2.2	Same as 6.2.2

## F.3.5 Measurement of Channel State Information reporting

**Table F.3.5-1: Derivation of Test Requirements (Channel State Information reporting tests)**

Test	Minimum Requirement in TS 36.101	Test Tolerance (TT)	Test Requirement in TS 36.521-1
9.2.1.1 FDD CQI Reporting under AWGN conditions – PUCCH 1-0	SNRs as specified Limits as in the Test Procedure	No test tolerances applied	SNR and limits unchanged
9.2.1.2 TDD CQI Reporting under AWGN conditions – PUCCH 1-0	SNRs as specified Limits as in the Test Procedure	No test tolerances applied	SNR and limits unchanged
9.2.1.3_C.1 FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for eICIC (non-MBSFN ABS)	Values as specified Limits as in the Test Procedure	No test tolerances applied	The analysis is recorded in 3GPP TR 36.904 [17]
9.2.1.4_C.1 TDD CQI Reporting under AWGN conditions – PUCCH 1-0 for eICIC (non-MBSFN ABS)	Values as specified Limits as in the Test Procedure	No test tolerances applied	The analysis is recorded in 3GPP TR 36.904 [17]
9.2.1.5_E.1 FDD CQI Reporting under AWGN conditions - PUCCH 1-0 for feICIC (non-MBSFN ABS)	Values as specified Limits as in the Test Procedure	No test tolerances applied	The analysis is recorded in 3GPP TR 36.904 [17]
9.2.1.6_E.1 TDD CQI Reporting under AWGN conditions - PUCCH 1-0 for feICIC (non-MBSFN ABS)	Values as specified Limits as in the Test Procedure	No test tolerances applied	The analysis is recorded in 3GPP TR 36.904 [17]
9.2.1.7 FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for 256QAM in DL	SNRs as specified Limits as in the Test Procedure	No test tolerances applied	SNR and limits unchanged
9.2.1.8 TDD CQI Reporting under AWGN conditions – PUCCH 1-0 for 256QAM in DL	SNRs as specified Limits as in the Test Procedure	No test tolerances applied	SNR and limits unchanged
9.2.2.1 FDD CQI Reporting under AWGN conditions – PUCCH 1-1	SNRs as specified Limits as in the Test Procedure	No test tolerances applied	SNR and limits unchanged
9.2.2.2 TDD CQI Reporting under AWGN conditions – PUCCH 1-1	SNRs as specified Limits as in the Test Procedure	No test tolerances applied	SNR and limits unchanged
9.2.3.1_D FDD CQI Reporting under AWGN conditions – PUCCH 1-1 for eDL-MIMO	SNRs as specified Limits as in the Test Procedure	No test tolerances applied	SNR and limits unchanged
9.2.3.2_D TDD CQI Reporting under AWGN conditions – PUCCH 1-1 for eDL-MIMO	SNRs as specified Limits as in the Test Procedure	No test tolerances applied	SNR and limits unchanged
9.2.4.1_F FDD CQI Reporting under AWGN conditions - Single CSI Process for CoMP	SNRs as specified Limits as in the Test Procedure	No test tolerances applied	SNR and limits unchanged
9.2.4.2_F TDD CQI Reporting under AWGN conditions - Single CSI Process for CoMP	SNRs as specified Limits as in the Test Procedure	No test tolerances applied	SNR and limits unchanged

9.3.1.1.1 FDD CQI Reporting under fading conditions – PUSCH 3-0	SNRs as specified $\alpha$ 2% $\beta$ 55% $\gamma$ 1.10 BLER 0.05	SNR 0dB $\alpha$ 0% $\beta$ 0% $\gamma$ 0.01 BLER 0	SNR unchanged $\alpha$ limit unchanged $\beta$ limit unchanged $\gamma$ 1.09 as per Table G.5.4-1 BLER limit unchanged

9.3.2.1.1_1 FDD CQI Reporting under fading conditions – PUCCH 1-0	Same as 9.3.2.1.1	Same as 9.3.2.1.1	Same as 9.3.2.1.1
9.3.2.1.2 TDD CQI Reporting under fading conditions – PUCCH 1-0	Same as 9.3.2.1.1	Same as 9.3.2.1.1	Same as 9.3.2.1.1
9.3.2.1.2_1 TDD CQI Reporting under fading conditions – PUCCH 1-0	Same as 9.3.2.1.1	Same as 9.3.2.1.1	Same as 9.3.2.1.1
9.3.2.2.1_D FDD CQI Reporting under fading conditions – PUCCH 1-1 for eDL-MIMO	Same as 9.3.2.1.1	Same as 9.3.2.1.1	Same as 9.3.2.1.1
9.3.2.2.2_D TDD CQI Reporting under fading conditions – PUCCH 1-1 for eDL-MIMO	Same as 9.3.2.1.1	Same as 9.3.2.1.1	Same as 9.3.2.1.1

9.3.3.1.1 FDD CQI Reporting under fading conditions and frequency-selective interference – PUSCH 3-0	lor and lot as specified $\alpha$ 60% $\gamma$ 1.60	lor, lot 0dB $\alpha$ 20% $\gamma$ 0.10	lor and lot unchanged $\alpha$ 40%, Formula: Min Req't – Test Tol $\gamma$ 1.50, Formula: Min Req't – Test Tol  The effect of AWGN flatness and signal flatness on the $\alpha$ requirement was derived by simulation.  AWGN flatness / signal flatness and the statistical effect of a finite test time both affect the T-put result. The Test Tolerance comprises two quantities:  1. Effect of AWGN flatness and signal flatness, derived by simulation  2. Statistical effect as per Table G.5.4-1  Items 1 and 2 are assumed to be uncorrelated so can be root sum squared  T-put requirement Test Tol = SQRT (AWGN flatness and signal flatness effect <sup>2</sup> + Statistical effect <sup>2</sup> )  AWGN flatness and signal flatness effect 0.1, Statistical effect 0.01, giving overall effect 0.10
9.3.3.1.2 TDD CQI Reporting under fading conditions and frequency-selective interference – PUSCH 3-0	Same as 9.3.3.1.1	Same as 9.3.3.1.1	Same as 9.3.3.1.1
9.3.4.1.1 FDD CQI Reporting under fading conditions – PUSCH 2-0	SNRs as specified Limits as in the Test Procedure $\gamma$ 1.2	$\gamma$ 0.01	SNR unchanged $\gamma$ 1.19 as per Table G.5.4-1
9.3.4.1.2 TDD CQI Reporting under fading conditions – PUSCH 2-0	Same as 9.3.4.1.1	Same as 9.3.4.1.1	Same as 9.3.4.1.1
9.3.4.2.1 FDD CQI Reporting under fading conditions – PUCCH 2-0	SNRs as specified Limits as in the Test Procedure $\gamma$ 1.15	$\gamma$ 0.01	SNR unchanged $\gamma$ 1.14 as per Table G.5.4-1
9.3.4.2.2 TDD CQI Reporting under fading conditions – PUCCH 2-0	Same as 9.3.4.2.1	Same as 9.3.4.2.1	Same as 9.3.4.2.1
9.3.5.1.1 FDD CQI Reporting under fading conditions - PUCCH 1-0 - Enhanced Performance Requirement Type A	$N_{oc}$ : -98dBm/15kHz DIP 1: -0.41dB SINR: -2.00dB $\gamma$ 1.8 BLER 0.02	0dB +0.03dB +0.03dB $\gamma$ 0.01	$N_{oc}$ : -98dBm/15kHz DIP 1: -0.38dB SINR: -1.97dB $\gamma$ 1.79 as per Table G.5.4-1 BLER limit unchanged  The analysis is recorded in 3GPP TR 36.904 [17]
9.3.5.1.2 TDD CQI Reporting under fading conditions - PUCCH 1-0 - Enhanced Performance Requirement Type A	Same as 9.3.5.1.1	Same as 9.3.5.1.1	Same as 9.3.5.1.1

9.6.1.1_A.1 FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for CA (2DL CA)	SNRs as specified Limits as in the Test Procedure	No test tolerances applied	SNR ratios each have an uncertainty of $\pm 0.3$ dB. For uncorrelated uncertainties, the overall uncertainty in the SNR difference between any two CCs would be $\text{SQRT}(0.3^2 + 0.3^2) = 0.42$ dB. This could widen the Median CQI difference, but the uncertainty is significantly less than one reported CQI step. Relaxing the allowed Median CQI difference would relax the test excessively, so in this case the Test requirement should be left unchanged.

## Annex G (normative): Statistical Testing

### G.1 General

FFS.

---

## G.2 Statistical testing of receiver characteristics

### G.2.1 General

The test of receiver characteristics is two fold.

1. A signal or a combination of signals is offered to the RX port(s) of the receiver.
2. The ability of the receiver to demodulate /decode this signal is verified by measuring the throughput.

In (2) is the statistical aspect of the test and is treated here.

The minimum requirement for all receiver tests is >95% of the maximum throughput.

All receiver tests are performed in static propagation conditions. No fading conditions are applied.

### G.2.2 Mapping throughput to error ratio

- a) The measured information bit throughput  $R$  is defined as the sum (in kilobits) of the information bit payloads successfully received during the test interval, divided by the duration of the test interval (in seconds).
- b) In measurement practice the UE indicates successfully received information bit payload by signalling an ACK to the SS.  
If payload is received, but damaged and cannot be decoded, the UE signals a NACK.
- c) Only the ACK and NACK signals, not the data bits received, are accessible to the SS.  
The number of bits is known in the SS from knowledge of what payload was sent.
- d) For the reference measurement channel, applied for testing, the number of bits is different in different subframes, however in a radio frame it is fixed during one test.
- e) The time in the measurement interval is composed of successfully received subframes (ACK), unsuccessfully received subframes (NACK) and no reception at all (DTX-subframes).
- f) DTX-subframes may occur regularly according the applicable reference measurement channel (regDTX).  
In real live networks this is the time when other UEs are served. In TDD these are the UL and special subframes. regDTX vary from test to test but are fixed within the test.
- g) Additional DTX-subframes occur statistically when the UE is not responding ACK or NACK where it should. (statDTX)  
This may happen when the UE was not expecting data or decided that the data were not intended for it.

The pass / fail decision is done by observing the:

- number of NACKs
- number of ACKs and
- number of statDTXs (regDTX is implicitly known to the SS)

The ratio  $(NACK + statDTX)/(NACK + statDTX + ACK)$  is the Error Ratio (ER). Taking into account the time consumed by the ACK, NACK, and DTX-TTIs (regular and statistical), ER can be mapped unambiguously to throughput for any single reference measurement channel test.

## G.2.3 Design of the test

The test is defined by the following design principles (see clause G.x, Theory....):

1. The early decision concept is applied.
2. A second limit is introduced: Bad DUT factor  $M > 1$
3. To decide the test pass:

Supplier risk is applied based on the Bad DUT quality

To decide the test fail

Customer Risk is applied based on the specified DUT quality

The test is defined by the following parameters:

1. Limit ER = 0.05 (Throughput limit = 95%)
2. Bad DUT factor  $M = 1.5$  (selectivity)
3. Confidence level CL = 95% (for specified DUT and Bad DUT-quality)

## G.2.4 Numerical definition of the pass fail limits

**Table G.2.4-1: pass fail limits**

ne	ns <sub>p</sub>	ns <sub>f</sub>	ne	ns <sub>p</sub>	ns <sub>f</sub>	ne	ns <sub>p</sub>	ns <sub>f</sub>	ne	ns <sub>p</sub>	ns <sub>f</sub>

38	747	484	77	1351	1131	116	1936	1810	*) note 2 in G.2.5		

NOTE 1: The first column is the number of errors (ne = number of NACK + statDTX)

NOTE 2: The second column is the number of samples for the pass limit ( $ns_p$ ,  $ns$ =Number of Samples= number of NACK + statDTX + ACK)

NOTE 3: The third column is the number of samples for the fail limit ( $ns_f$ )

## G.2.5 Pass fail decision rules

The pass fail decision rules apply for a single test, comprising one component in the test vector. The over all Pass /Fail conditions are defined in clause G.2.1.5.

Having observed 0 errors, pass the test at 67+ samples,  
otherwise continue

Having observed 1 error, pass the test at 95+ otherwise continue

Having observed 2 errors, pass the test at 119+ samples, fail the test at 2- samples, otherwise continue

Etc. etc.

Having observed 151 errors, pass the test at 2452+ samples, fail the test at 2433- samples, otherwise continue

Having observed 152 errors, pass the test at 2466+ samples, fail the test at 2451- samples.

Where x+ means: x or more, x- means x or less

NOTE 1: an ideal DUT passes after 67 samples. The maximum test time is 2466 samples.

NOTE 2: It is allowed to deviate from the early decision concept by postponing the decision (pass/fail or continue). Postponing the decision to or beyond the end of Table G.2.4-1 requires a pass fail decision against the test limit: pass the DUT for  $ER < 0.0618$ , otherwise fail.

## G.2.6 Test conditions for receiver tests

**Table G.2.6-1: Test conditions for receiver tests**

Test	Statistical independence	Number of components in the test vector, as specified in the test requirements and initial conditions of the applicable test	Over all Pass/Fail condition
7.3 Reference sensitivity level	Yes: the inherent receiver noise is assumed to be AWGN	tbd	To pass 7.3 each component in the test vector must pass
7.4 Maximum input level	Unclear: in case, clipping causes errors, errors are data dependent. Statistical independence is assumed.	tbd	To pass 7.4 each component in the test vector must pass
7.4A.3 Maximum input level for CA (inter-band DL CA without UL CA)	Unclear: in case, clipping causes errors, errors are data dependent. Statistical independence is assumed.	tbd	To pass 7.4A.3 each component in the test vector must pass
7.5 Adjacent Channel Selectivity (ACS)	Unclear: errors are data dependent on the interferers data. Statistical independence is assumed.	tbd	To pass 7.5 each component in the test vector must pass
7.5A.3 Adjacent Channel Selectivity (ACS) for CA (inter-band DL CA without UL CA)	Unclear: errors are data dependent on the interferers data. Statistical independence is assumed.	tbd	To pass 7.5A.3 each component in the test vector must pass
7.5F Adjacent Channel Selectivity (ACS) for UE category NB1	[FFS]	[FFS]	[FFS]
7.6.1 In-band blocking	Unclear: errors are data dependent on the interferers data. Statistical independence is assumed.	tbd	To pass 7.6.1 each component in the test vector must pass
7.6.1_1 In-band blocking with 4 Rx antenna ports	Unclear: errors are data dependent on the interferers data. Statistical independence is assumed.	tbd	To pass 7.6.1_1 each component in the test vector must pass
7.6.1A.3 In-band blocking for CA (inter-band DL CA without UL CA)	Unclear: errors are data dependent on the interferers data. Statistical independence is assumed.	tbd	To pass 7.6.1A.3 each component in the test vector must pass
7.6.2 Out of-band blocking	yes: it is assumed that the CW interferer causes errors, which are independent and time invariant.	tbd	To pass 7.6.2, all except [tbd] components in the test vector must pass
7.6.2A.3 Out-of-band blocking for CA (inter-band DL CA without UL CA)	yes: it is assumed that the CW interferer causes errors, which are independent and time invariant.	tbd	To pass 7.6.2A.3, all except [tbd] components in the test vector must pass
7.6.3 Narrow band blocking	yes: it is assumed that the CW interferer causes errors, which are independent and time invariant.	tbd	To pass 7.6.3 each component in the test vector must pass
7.6.3A.3 Narrow band blocking for CA (inter-band DL CA without UL CA)	yes: it is assumed that the CW interferer causes errors, which are independent and time invariant.	tbd	To pass 7.6.3A.3 each component in the test vector must pass
7.7 Spurious	yes: it is assumed that the CW	tbd	To pass 7.7 each component in the

response	interferer causes errors, which are independent and time invariant.		test vector must pass
7.7A.3 Spurious response for CA (inter-band DL CA without UL CA)	yes: it is assumed that the CW interferer causes errors, which are independent and time invariant.	tbd	To pass 7.7A.3 each component in the test vector must pass
7.8.1 Wide band Intermodulation	Unclear: errors are dependent on the data content of the interferer. Statistical independence is assumed.	tbd	To pass 7.8.1 each component in the test vector must pass
7.8.1A.3 Wideband intermodulation for CA (inter-band DL CA without UL CA)	Unclear: errors are dependent on the data content of the interferer. Statistical independence is assumed.	tbd	To pass 7.8.1A.3 each component in the test vector must pass

## G.2A Statistical testing of receiver characteristics with CA

### G.2A.1 General

G.2.1 applies.

### G.2A.2 Mapping throughput to error ratio

The test is defined by the following design principles (see clause G.x, Theory...):

1. The standard concept is applied. (not the early decision concept).
2. A second limit is introduced, defining the Bad DUT.
3. To decide the test pass:
  - Supplier risk is applied based on the Bad DUT quality.
  - To decide the test fail.
  - Customer Risk is applied based on the specified DUT quality.

The test is defined by the following parameters:

- 1) Limit Error Ratio = 0.05 (95% throughput is tested).
- 2) Bad DUT factor  $M=1.5$  (selectivity).
- 3) Confidence level  $CL = 95\%$  (for specified DUT and Bad DUT-quality).

### G.2A.3

### G.2A.4 Pass fail limits

Apply 1003 samples to the DUT per CC.

Decide pass per CC in case of  $\leq 62$  errors, otherwise fail.

NOTE 1: The pass fail decision is done individually for each CC. The pass fail decision for one component in the test vector is as follows: pass if all CCs or SCC only according to the test cases pass, otherwise fail. The overall pass fail decision is according to clause G.2A.6

NOTE 2: It is allowed to apply more samples to the DUT, common for all CCs, (e.g. up to an integer number of frames). Use the ratio (62/1003) for the pass fail decision.

NOTE 3:  $62/1003 = 0.0618$ , the same test limit is used at the end of Table G.2.4-1

## G.2A.5 void

## G.2A.6 Test conditions for receiver tests with CA

**Table G.2A.6-1: Test conditions for receiver tests with CA**

Test	Statistical independence	Number of components in the test vector, as specified in the test requirements and initial conditions of the applicable test Note 1	Over all Pass/Fail condition Note 1
7.3A Reference sensitivity level for CA	Yes: the inherent receiver noise is assumed to be AWGN	tbd	To pass 7.3A each component in the test vector must pass
7.4A Maximum input level for CA	Unclear: in case, clipping causes errors, errors are data dependent. Statistical independence is assumed.	tbd	To pass 7.4A each component in the test vector must pass
7.5A Adjacent Channel Selectivity (ACS) for CA	Unclear: errors are data dependent on the interferers data. Statistical independence is assumed.	tbd	To pass 7.5A each component in the test vector must pass
7.6.1A In-band blocking for CA	Unclear: errors are data dependent on the interferers data. Statistical independence is assumed.	tbd	To pass 7.6.1A each component in the test vector must pass
7.6.2A Out-of-band blocking for CA	yes: it is assumed that the CW interferer causes errors, which are independent and time invariant.	tbd	To pass 7.6.2A, all except [tbd] components in the test vector must pass
7.6.3A Narrow band blocking for CA	yes: it is assumed that the CW interferer causes errors, which are independent and time invariant.	tbd	To pass 7.6.3A each component in the test vector must pass
7.7A Spurious response for CA	yes: it is assumed that the CW interferer causes errors, which are independent and time invariant.	tbd	To pass 7.7A each component in the test vector must pass
7.8.1A Wide band Intermodulation	[place holder]		
Note 1: A DUT with marginal performance on one component in the test vector passes this component with a confidence level of 95%, which is a false fail probability of 5%. All components in the test vector shall pass, to pass the test, For more than 1 component, performing marginal, there is an increased probability of a false fail for the test.			

## G.3 Statistical testing of Performance Requirements with throughput

### G.3.1 General

The test of receiver performance characteristics is two fold.

1. A signal or a combination of signals is offered to the RX port(s) of the receiver.
2. The ability of the receiver to demodulate /decode this signal is verified by measuring the throughput.

In (2) is the statistical aspect of the test and is treated here.

The minimum requirement for all receiver performance tests is either 70% or 30% of the maximum throughput.

All receiver performance tests are performed in fading conditions. In addition to the statistical considerations, this requires the definition of a minimum test time.

## G.3.2 Mapping throughput to error ratio

G.2.2 applies

## G.3.3 Design of the test

The test is defined by the following design principles (see clause G.x, Theory...):

1. The standard concept is applied. (not the early decision concept)
2. A second limit is introduced: The second limit is different, whether 30% or 70% throughput is tested.
3. To decide the test pass:

Supplier risk is applied based on the Bad DUT quality

To decide the test fail:

Customer Risk is applied based on the specified DUT quality

The test is defined by the following parameters:

- 1a) Limit Error Ratio = 0.3 (in case 70% Throughput is tested) or
- 1b) Limit Throughput = 0.3 (in case 30% Throughput is tested)
- 2a) Bad DUT factor  $M=1.378$  (selectivity)
- 2b) Bad DUT factor  $m=0.692$  (selectivity)
  - justification see: TS 34.121 Clause F.6.3.3
- 3) Confidence level  $CL = 95\%$  (for specified DUT and Bad DUT-quality)

## G.3.4 Pass Fail limit

Testing Throughput = 30%, then the test limit is

Number of successes (ACK) / number of samples  $\geq 59 / 233$

Testing Throughput = 70% then the test limit is

Number of fails (NACK and statDTX) / number of samples  $\leq 66 / 184$

We have to distinguish 3 cases:

- a) The duration for the number of samples (233 or 184) is greater than the minimum test time:

Then the number of samples (233 or 184) is predefined and the decision is done according to the number of events (59 successes or 66 fails)

- b) Since subframe 0 and 5 contain less bits than the remaining subframes, it is allowed to predefine a number of samples contained in an integer number of frames. In this case test-limit-ratio applies.

c) The minimum test time is greater than the duration for the number of samples:

The minimum test time is predefined and the decision is done comparing the measured ratio at that instant against the test-limit-ratio.

NOTE: The test time for most of the tests is governed by the Minimum Test Time

## G.3.5 Minimum Test time

If a pass fail decision in G.3.4 can be achieved earlier than the minimum test time, then the test shall not be decided, but continued until the minimum test time is elapsed.

The tables below contain the minimum number of subframes for FDD and TDD.

By simulations the minimum number of active subframes (carrying DL payload) was derived (MNAS),

then adding inactive subframes to the active ones (e.g. subframe 5 contains no DL payload. For TDD additional subframes contain no DL payload)

then rounding up to full thousand and

then adding a bias of 1000 (BMNSF).

Simulation method to derive minimum test time:

With a level, corresponding a throughput at the test limit (here 30% or 70% of the max. throughput) the preliminary throughput versus time converges towards the final throughput. The allowance of  $\pm 0.2$  dB around the above mentioned level is predefined by RAN5 to find the minimum test time. The allowance of  $\pm 0.2$  dB maps through the function “final throughput versus level” into a throughput corridor. The minimum test time is achieved when the preliminary throughput escapes the corridor the last time. The two functions “final throughput versus level” and “preliminary throughput versus time” are simulation results, which are done individual for each demodulation scenario. HST-scenarios and scenarios with  $MNAS \geq 50000$  are derived differently.

Figure G.3.5-1: Simulation method to derive minimum test time

Table G.3.5-1: Minimum Test time for PDSCH Single Antenna Port Performance

Test No	Demodulation scenario plain text: RMC (Bandwidth, allocated RBs, modulation, coding) Antenna (configuration, correlation) Propagation condition, Doppler [additional parameters, if applicable]  (info only)	Minimum Number of Active Subframes (MNAS) to reach the corridor (Simulation, info only)	Minimum Number of Subframes (MNS) to reach the corridor  (MNS = active and inactive subframes)  (Calculation, info only)		Biased Minimum Number of SubFrames (BMNSF)  $BMNSF = 1000 * \left\lceil \frac{MNS}{1000} \right\rceil + 1000$  (mandatory)

## G.3A Statistical testing of Performance Requirements with throughput for CA/DC

### G.3A.1 General

The minimum requirements for performance tests in fading conditions in clause 8 with respect to CA/DC are 70% of the maximum throughput. The minimum requirements in static conditions in clause 8 with respect to CA/DC are [TBD]. Statistical tests in static propagation conditions lead to a statistically justified number of samples (testtime) and a test limit. The fading conditions require a minimum test time, overriding the statistically justified test time. It can be found in Tables G.3A.5. The statistically justified test limit is also used for the tests under fading conditions. The throughput is measured on both carriers in parallel (unless otherwise stated). The test for both carriers need the same time. The sum of the CC's throughput is compared against the limit, where the limit is the sum of the individual carrier's limit.

### G.3A.2 Mapping throughput to error ratio

G.2.2 applies separate for each CC

### G.3A.3 Design of the test

The test is defined by the following design principles (see clause G.x, Theory...):

1. The standard concept is applied (not the early decision concept).
2. A second limit is introduced, defining the Bad DUT.
3. To decide the test pass:
  - Supplier risk is applied based on the Bad DUT quality.
  - To decide the test fails.
  - Customer Risk is applied based on the specified DUT quality.

The test is defined by the following parameters:

- 1) Limit Error Ratio = 0.3.  
(in case 70% throughput is tested , otherwise [TBD]).
- 2) Bad DUT factor  $M = 1.378$  (selectivity) justification see: TS 34.121 Clause F.6.3.3.  
( $M = 1.378$  is tied to 70% throughput, otherwise  $M$  is [TBD].)
- 3) Confidence level  $CL = 95\%$  (for specified DUT and Bad DUT-quality).

## G.3A.4 Pass Fail limit

Testing with the parameters from G.3A.3 (70% throughput,  $M = 1.378$ ,  $CL95\%$ ): Apply 184 samples to the DUT per CC and count the errors for each CC. The test limit to pass for one CC is  $\leq 66$  errors, however this is not individually applicable for CA/DC.

Pass fail decision for one test point in CA/DC: The sum of the CC's errors is compared against the test limit, where the test limit is the sum of the individual carrier's test limit.

It is allowed to apply more samples, in parallel for all CCs, to the DUT (e.g. up to an integer number of frames).

In fading conditions it is necessary to apply more samples, in parallel for all CCs, to the DUT, as in fading conditions the minimum test time overrides the statistically justified test time.

When more samples are applied, decide against the ratio  $66/184 = 0.3587$ .

Testing with parameters from G.3A.3 ([TBD]% throughput,  $M = [TBD]$ ,  $CL = 95\%$ ) is [TBD].

## G.3A.5 Minimum test time

In contrast to G.3.5, where the minimum test time is derived from simulations, the test time here is selected without simulation utilising test time information from similar demodulation scenarios in non-CA test cases and while maintaining the reasonable testing time.

Note MNAS values in this clause may need to be changed in future if current MNAS values turn out to be too short for giving stable CA/DC throughput results.

**Table G.3A.5-1: Minimum Test time FDD PDSCH Single Antenna Port Performance for CA (2DL CA)**

Clause 8.2.1.1.1_A.1 Test No	Demodulation scenario plain text:  RMC (Bandwidth, allocated RBs, modulation, coding) Antenna (configuration, correlation) Propagation condition, Doppler [additional parameters, if applicable]  (info only)	Minimum Number of Active Subframes in each CC	Minimum Number of Subframes (MNS) in each CC

## G.3A.6 Test conditions

**Table G.3A.6-1: Test conditions for CA/DC performance tests**

Test	Statistical independence	Number of components in the test vector, as specified in the test requirements and initial conditions of the applicable test	Over all Pass/Fail condition
8.2.1.1.1_A.1 FDD PDSCH Single Antenna Port Performance for CA (2DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.2.1.1.1_A.2 FDD PDSCH Single Antenna Port Performance for CA (3DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.2.1.3.1_A.1 FDD PDSCH Open Loop Spatial Multiplexing 2x2 for CA (2DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.2.1.3.1_A.2 FDD PDSCH Open Loop Spatial Multiplexing 2x2 for CA (3DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.2.1.3.1A_A.1 FDD PDSCH Soft buffer management test for CA (2 DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.2.1.4.2_A.1 FDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4 x 2 for CA (2DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.2.1.4.2_A.2 FDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4 x 2 for CA (3DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.2.1.4.3A FDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for Dual Connectivity	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.2.2.1.1_A.1 TDD PDSCH Single Antenna Port Performance for CA (2DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.2.2.1.1_A.2 TDD PDSCH Single Antenna Port Performance for CA (3DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.2.2.3.1_A.1 TDD PDSCH Open Loop Spatial Multiplexing 2x2 for CA (2DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.2.2.3.1_A.2 TDD PDSCH Open Loop Spatial Multiplexing 2x2 for CA (3DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.2.2.3.1A_A.1 TDD PDSCH Soft buffer management test (2 DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.2.2.4.2_A.1 TDD PDSCH Closed Loop	subframes are independent	1	To pass the test case all applicable components in the test vector must

Multi Layer Spatial Multiplexing 4x2 for CA (2DL CA)			pass
8.2.2.4.2_A.2 TDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for CA (3DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.2.2.4.4 TDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for Dual Connectivity	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.2.3.2.2.1 TDD FDD CA PDSCH Open Loop Spatial Multiplexing 2x2 for TDD PCell (2DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.2.3.2.2.2 TDD FDD CA PDSCH Open Loop Spatial Multiplexing 2x2 for TDD PCell (3DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.7.1.1_A.1 FDD Sustained data rate performance for CA (2DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.7.1.1_A.2 FDD Sustained data rate performance for CA (3DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.7.2.1_A.1 TDD Sustained data rate performance for CA (2DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass
8.7.2.1_A.2 TDD Sustained data rate performance for CA (3DL CA)	subframes are independent	1	To pass the test case all applicable components in the test vector must pass

## G.4 Statistical testing of Performance Requirements with probability of misdetection

### G.4.1 General

The test of receiver performance characteristics is two fold.

1. A signal or a combination of signals is offered to the RX port(s) of the receiver.
2. The ability of the receiver to demodulate /decode this signal is verified by analyzing the reaction of the UE to this signal.

In (2) is the statistical aspect of the test and is treated here.

The minimum requirement for those receiver performance tests are 1% or 0.1% misdetection probability

All receiver performance tests are performed in fading conditions. In addition to the statistical considerations, this requires the definition of a minimum test time.

NOTE: All demodulation performance tests (state from version 9.5.0) require a minimum test time, which exceeds the maximum test time in tables G.4.4. Under this circumstances only the test limit at the end of tables G.4.4.-1 resp. G.4.4.-2 is applicable.

## G.4.2 Mapping the UE reaction to error ratio

The UE can not indicate the detection or misdetection of the physical channel under test directly. Indirect methods are described in the procedure of the applicable test.

## G.4.3 Design of the test

G.2.3 applies, exception:

Limit ER = 0.01 and ER = 0.001

## G.4.4 Numerical definition of the pass fail limits

**Table G.4.4-1: pass fail limits for ER = 0.01**

## G.4.7 Test conditions for receiver performance tests

**Table G.4.7: Test conditions for receiver performance tests**

<b>Test</b>	<b>Statistical independence</b>	<b>Number of components in the test vector, as specified in the test requirements and initial conditions of the applicable test</b>	<b>Over all Pass/Fail condition Restrictions and extensions see Table G.3.6-1</b>
8.4.1.1 FDD PCFICH/PDCCH Single-antenna Port Performance	A misdetection is an independent event	1	NA
8.4.1.2 FDD PCFICH/PDCCH Transmit Diversity Performance	A misdetection is an independent event	2	To pass 8.4.1.2 each component in the test vector must pass
8.4.2.1 TDD PCFICH/PDCCH Single-antenna Port Performance	A misdetection is an independent event	1	NA
8.4.2.2 TDD PCFICH/PDCCH Transmit Diversity Performance	A misdetection is an independent event	2	To pass 8.4.2.2 each component in the test vector must pass
8.5.1.1 FDD PHICH Single-antenna Port Performance	A misdetection is an independent event	2	To pass 8.5.1.1 each component in the test vector must pass
8.5.1.2 FDD PHICH Transmit Diversity Performance	A misdetection is an independent event	2	To pass 8.5.1.2 each component in the test vector must pass
8.5.2.1 TDD PHICH Single-antenna Port Performance	A misdetection is an independent event	2	To pass 8.5.2.1 each component in the test vector must pass
8.5.2.2 TDD PHICH Transmit Diversity Performance	A misdetection is an independent event	2	To pass 8.5.2.2 each component in the test vector must pass

## G.5 Measuring throughput ratio

### G.5.1 General

Annex G.5 is applicable for clauses 9.3, 9.4, 9.5 and 9.7. Common to those clauses is, that a throughput ratio  $\gamma$  is measured. These clauses are tested exclusively with “slow” multipath fading profiles. Hence the test time is governed by test time due to fading, and number of samples due to statistical significance is not applicable.

The test requirements in clause 9.4 are a ratio of 2 throughput tests according to  $\gamma = \frac{t_{ue}}{t_{rnd}}$ . The denominator must be established by an approach, resulting in the denominator throughput  $t_{rnd}$  and the reference  $SNR_{rnd}$ , the latter is reused to measure the nominator throughput.

The test requirements in clauses 9.3 and 9.5 are a ratio of 2 throughput tests according to  $\gamma = \frac{t_{subband}}{t_{median}}$ ,  $\gamma = \frac{t_{reported}}{t_{fix}}$  etc.

Nominator and denominator are ordinary throughput tests

$t_{ue}$ ,  $t_{rnd}$ ,  $t_{reported}$ ,  $t_{fix}$ ,  $t_{subband}$ ,  $t_{median}$ ,  $t_{wideband}$  are throughputs, derived under different conditions and are defined in clause s 9.3, 9.4 and 9.5.

$SNR_{rnd}$  is the signal noise ratio, derived together with  $t_{rnd}$  and is defined in clause 9.4.

### G.5.2 Establishing $t_{rnd}$

Adjust SNR such that the measured throughput is  $58\% \leq t_{rnd} \leq 62\%$ .

The resulting SNR is declared  $SNR_{rnd}$

To achieve statistical significance the final throughput measurement must be done with MNS samples, given table G.5.4-1

The approach, leading to  $t_{rnd}$  and  $SNR_{rnd}$  is not specified.

### G.5.3 Measuring T-put

To achieve statistical significance the final throughput measurement must be done with MNS samples, given in table.G.5.4 -1. Number of samples due to statistical significance is not applicable.

For measuring  $t_{subband}$ ,  $t_{wideband}$ ,  $t_{reported}$  and  $t_{fix}$ , the SS collects ACK, NACK and statDTX from the UE and records the time, elapsed from the beginning of the test. The payload size, received by the UE and acknowledged towards the SS, may vary within a test versus time (e.g. due to subband changes upon a UE report) Throughput is calculated in the SS by summing up the payload, associated to each ACK, from the start of the test and dividing the accumulated payload in kilobits by the time in seconds, elapsed from the beginning of the test. This is similar but not same as in G.2.2. (Main difference in bullet d, where the payload size is constant).

For measuring  $t_{median}$ ,  $t_{ue}$ , and  $t_{rnd}$ , the SS collects ACK, NACK and statDTX from the UE and records the time, elapsed from the beginning of the test. The payload size, received by the UE and acknowledged towards the SS, is constant. Throughput can be calculated in the SS by multiplying the payload size with the number of ACKs and dividing the accumulated payload in kilobits by the time in seconds, elapsed from the beginning of the test, being associated to the following ratio: ACK/ (ACK+NACK + DTX).

### G.5.4 Number of samples for throughput ratios

TT for  $\gamma$  and MNS are based on theoretical estimations.

Table G.5.4-1: Test time for testing throughput ratios

Test	Demodulation scenario:  RMC (Bandwidth, allocated RBs, modulation, coding) [Antenna configuration, correlation] Propagation condition, Doppler	$\Gamma$	Minimum Number of Subframes (MNS)		$\Gamma$ including TT	BLER
			FDD	TDD		
9.3.1.1.1 9.3.1.1.2	(10 MHz, 6, variable modulation and coding) [1x2, full] Special propagation according to clause B.2.4, 5Hz	1.1	100000 For denominator- and nominator-measurement each	170000 For denominator- and nominator-measurement each	$\gamma = 1.09$	BLER=0.05, no TT No of samples: subset of ACKs and NACKs in the MNS for throughput.

## G.6 Statistical testing of MBMS Performance

### G.6.1 General

The system simulator sends MBMS packets to the UE under test. The number of packets, the SS sends, is predefined by the test time in G.6.4. The UE under tests demodulates the MBMS packets and counts the successfully received number of MBMS packets into the UE internal MBMS packet counter. The SS reads out the counter and issues a pass fail decision.

### G.6.2 Mapping of MBMS Packet ratio to BLER

The minimum requirements are designed in terms of BLER = 1%. 10 MBMS packets are included in one Transport block, constant throughout the test. The ratio of correct received MBMS packets ( $M_{ok}$ ) to transmitted packets ( $M_{tot}$ ) is assumed to be equal to the ratio of correct received transport blocks to transmitted transport blocks. This assumption ignores the unlikely case that payload and CRC for a transport block are consistent but wrong.

### G.6.3 Design of the test

The minimum requirement for all MBMS tests is BLER = 1%. All MBMS tests are performed under a fading scenario: MBSFN channel model (Table B.2.6-1). It is obvious, that this fading scenario requires a minimum test time, greater than the time, required for statistical significance. In addition the test design with the MBMS packet counter in the UE suggest a fixed test time. Without simulation the test time is set to 200 000 active subframes (Transport blocks), leading to 333 333 subframes (333sec) for FDD and 400 000 subframes (400sec) for TDD. In order to avoid the fail of a good DUT due to statistical uncertainty the minimum requirement of BLER = 1% leads to a

Test limit = 1.2352 %. (refer Table G.4.4-1)

This means a DUT actually on the limit (1%) is measured and passed with a confidence level of greater than 95%.

## G.6.4 Test time for MBMS performance tests

**Table G.6.4-1: Minimum Test time for MBMS**

Test No	Demodulation scenario (info only)	Min No of Sub Frames	
		FDD (6 of 10 subframes are active)	TDD (5 of 10 subframes are active)
1	R.37 (10 MHz, full, QPSK 1/3) (1x2 Low) MBSFN channel model	333 333	400 000
2	R.38 (10MHz, full, 16QAM 1/2) (1x2 Low) MBSFN channel model	333 333	400 000
3	R.39 (10 MHz, full, 64QAM 2/3) (1x2 Low) MBSFN channel model	333 333	400 000
3	R.39-1 (5 MHz, full, 64QAM 2/3) (1x2 Low) MBSFN channel model	333 333	400 000
4	R.40 (1.4 MHz, full, QPSK 1/3) (1x2 Low) MBSFN channel model	333 333	400 000

---

## G.X Theory to derive the numbers in Table G.2.4-1 (Informative)

*Editor's note: This clause of the Annex G is for information only and it described the background theory and information to derive the entries in the table G.2.4-1.*

### G.X.1 Error Ratio (ER)

The Error Ratio (ER) is defined as the ratio of number of errors (ne) to all results, number of samples (ns).

(1-ER is the success ratio).

### G.X.2 Test Design

A statistical test is characterised by:

Test-time, Selectivity and Confidence level.

### G.X.3 Confidence level

The outcome of a statistical test is a decision. This decision may be correct or in-correct. The Confidence Level CL describes the probability that the decision is a correct one. The complement is the wrong decision probability (risk)  $D = 1 - CL$

## G.X.4 Introduction: Supplier Risk versus Customer Risk

There are two targets of decision:

- (a) A measurement on the pass-limit shows, that the DUT has the specified quality or is better with probability CL (CL e.g.95%) This shall lead to a "pass decision"

The pass-limit is on the good side of the specified DUT-quality. A more stringent CL (CL e.g.99%) shifts the pass-limit farer into the good direction. Given the quality of the DUTs is distributed, a greater CL passes less and better DUTs.

A measurement on the bad side of the pass-limit is simply “not pass” (undecided or artificial fail).

- (aa) Complementary:

A measurement on the fail-limit shows, that the DUT is worse than the specified quality with probability CL.

The fail-limit is on the bad side of the specified DUT-quality. A more stringent CL shifts the fail-limit farer into the bad direction. Given the quality of the DUTs is distributed, a greater CL fails less and worse DUTs.

A measurement on the good side of the fail-limit is simply “not fail”.

- (b) A DUT, known to have the specified quality, shall be measured and decided pass with probability CL. This leads to the test limit.

For CL e.g. 95%, the test limit is on the bad side of the specified DUT-quality. CL e.g.99% shifts the pass-limit farer into the bad direction. Given the DUT-quality is distributed, a greater CL passes more and worse DUTs.

- (bb) A DUT, known to be an ( $\epsilon \rightarrow 0$ ) beyond the specified quality, shall be measured and decided fail with probability CL.

For CL e.g.95%, the test limit is on the good side of the specified DUT-quality.

NOTE 1: The different sense for CL in (a), (aa) versus (b), (bb).

NOTE 2: For constant CL in all 4 bullets (a) is equivalent to (bb) and (aa) is equivalent to (b).

## G.X.5 Supplier Risk versus Customer Risk

The table below summarizes the different targets of decision.

**Table G.X.5-1: Equivalent statements**

	<b>Equivalent statements, using different cause-to-effect-directions, and assuming CL = constant &gt;1/2</b>	
cause-to-effect-directions	Known measurement result → estimation of the DUT's quality	Known DUT's quality → estimation of the measurement's outcome
Supplier Risk	A measurement on the pass-limit shows, that the DUT has the specified quality or is better (a)	A DUT, known to have an ( $\epsilon \rightarrow 0$ ) beyond the specified DUT-quality, shall be measured and decided fail (bb)
Customer Risk	A measurement on the fail-limit shall shows, that the DUT is worse than the specified quality (aa)	A DUT, known to have the specified quality, shall be measured and decided pass (b)

The shaded area shown the direct interpretation of Supplier Risk and Customer Risk.

The same statements can be based on other DUT-quality-definitions.

## G.X.6 Introduction: Standard test versus early decision concept

In standard statistical tests, a certain number of results ( $n_s$ ) is predefined in advance to the test. After  $n_s$  results the number of bad results ( $n_e$ ) is counted and the error ratio (ER) is calculated by  $n_e/n_s$ .

Applying statistical theory, a decision limit can be designed, against which the calculated ER is compared to derive the decision. Such a limit is one decision point and is characterised by:

- D: the wrong decision probability (a predefined parameter)
- $n_s$ : the number of results (a fixed predefined parameter)
- $n_e$ : the number of bad results (the limit based on just  $n_s$ )

In the formula for the limit, D and  $n_s$  can be understood as variable parameter and variable. However the standard test execution requires fixed  $n_s$  and D. The property of such a test is: It discriminate between two states only, depending on the test design:

- pass (with CL) / undecided (undecided in the sense: finally undecided)
- fail (with CL) / undecided (undecided in the sense: finally undecided)
- pass(with CL) / fail (with CL) (however against two limits).

In contrast to the standard statistical tests, the early decision concept predefines a set of ( $n_e, n_s$ ) co-ordinates, representing the limit-curve for decision. After each result a preliminary ER is calculated and compared against the limit-curve. After each result one may make the decision or not (undecided for later decision). The parameters and variables in the limit-curve for the early decision concept have a similar but not equal meaning:

- D: the wrong decision probability (a predefined parameter)
- $n_s$ : the number of results (a variable parameter)
- $n_e$ : the number of bad results (the limit. It varies together with  $n_s$ )

To avoid a “final undecided” in the standard test, a second limit must be introduced and the single decision co-ordinate ( $n_e, n_s$ ) needs a high  $n_e$ , leading to a fixed (high) test time. In the early decision concept, having the same selectivity and the same confidence level an “undecided” need not to be avoided, as it can be decided later. A perfect DUT will hit the decision coordinate ( $n_e, n_s$ ) with  $n_e=0$ . This test time is short.

## G.X.7 Standard test versus early decision concept

For Supplier Risk:

The wrong decision probability D in the standard test is the probability, to decide a DUT in-correct in the single decision point. In the early decision concept there is a probability of in-correct decisions  $d$  at each point of the limit-curve. The sum of all those wrong decision probabilities accumulate to D. Hence  $d < D$

For Customer Risk:

The correct decision probability CL in the standard test is the probability, to decide a DUT correct in the single decision point. In the early decision concept there is a probability of correct decisions  $cl$  at each point of the limit-curve. The sum of all those correct decision probabilities accumulate to CL. Hence  $cl < CL$  or  $d > D$

## G.X.8 Selectivity

There is no statistical test which can discriminate between a limit DUT and a DUT which is an ( $\epsilon \rightarrow 0$ ) apart from the limit in finite time and high confidence level CL. Either the test discriminates against one limit with the results pass (with CL)/undecided or fail (with CL)/undecided, or the test ends in a result pass (with CL)/fail (with CL) but this requires a second limit.

For  $CL > 1/2$ , a (measurement-result = specified-DUT-quality), generates undecided in test “supplier risk against pass limit” (a, from above) and also in the test “customer risk against the fail limit” (aa)

For  $CL > 1/2$ , a DUT, known to be on the limit, will be decided pass for the test “customer risk against pass limit” (b) and also “supplier risk against fail limit” (bb).

This overlap or undecided area is not a fault or a contradiction, however it can be avoided by introducing a Bad or a Good DUT quality according to:

- Bad DUT quality: specified DUT-quality \* M ( $M > 1$ )
- Good DUT quality: specified DUT-quality \* m ( $m < 1$ )

Using e.g.  $M > 1$  and  $CL = 95\%$  the test for different DUT qualities yield different pass probabilities:

**Figure G.X.8-1: Pass probability versus DUT quality**

## G.X.9 Design of the test

The receiver characteristic test are defined by the following design principles:

1. The early decision concept is applied.
2. A second limit is introduced: Bad DUT factor  $M > 1$
3. To decide the test pass:

Supplier risk is applied based on the Bad DUT quality

To decide the test fail

Customer Risk is applied based on the specified DUT quality

The receiver characteristic test are defined by the following parameters:

1. Limit ER = 0.05
2. Bad DUT factor  $M = 1.5$  (selectivity)
3. Confidence level CL = 95% (for specified DUT and Bad DUT-quality)

This has the following consequences:

1. A measurement on the fail limit is connected with 2 equivalent statements:

A measurement on the fail-limit shows, that the DUT is worse than the specified DUT-quality	A DUT, known have the specified quality, shall be measured and decided pass
---	---

2. A measurement on the pass limit is connected with the complementary statements:

A measurement on the pass limit shows, that the DUT is better than the Bad DUT-quality.	A DUT, known to have the Bad DUT quality, shall be measured and decided fail
---	--

The left column is used to decide the measurement.

The right column is used to verify the design of the test by simulation.

The simulation is based on the two fulcrums A and B only in Figure G.x.8-1

3. Test time

The minimum and maximum test time is fixed.

The average test time is a function of the DUT's quality.

The individual test time is not predictable.

4. The number of decision co-ordinates (ne,ns) in the early decision concept is responsible for the selectivity of the test and the maximum test time. Having fixed the number of decision co-ordinates there is still freedom to select the individual decision co-ordinates in many combinations, all leading to the same confidence level.

## G.X.10 Simulation to derive the pass fail limits in Table G.2.4-1

There is freedom to design the decision co-ordinates (ne,ns).

The binomial distribution and its inverse is used to design the pass and fail limits. Note that this method is not unique and that other methods exist.

$$\text{fail}(ne, d_f) := \frac{ne}{(ne + \text{qnbinom}(d_f, ne, ER))}$$

$$\text{pass}(ne, cl_p, M) := \frac{ne}{(ne + \text{qnbinom}(cl_p, ne, ER \cdot M))}$$

Where

- fail(..) is the error ratio for the fail limit
- pass(..) is the error ratio for the pass limit
- ER is the specified error ratio 0.05
- ne is the number of bad results. This is the variable in both equations
- M is the Bad DUT factor M=1.5
- d<sub>f</sub> is the wrong decision probability of a single (ne,ns) co-ordinate for the fail limit.  
It is found by simulation to be d<sub>f</sub> = 0.004
- cl<sub>p</sub> is the confidence level of a single (ne,ns) co-ordinate for the pass limit.  
It is found by simulation to be cl<sub>p</sub> = 0.9975
- qnbinom(.): The inverse cumulative function of the negative binomial distribution

The simulation works as follows:

- A large population of limit DUTs with true ER = 0.05 is decided against the pass and fail limits.
- $cl_p$  and  $d_f$  are tuned such that CL (95%) of the population passes and D (5%) of the population fails.
- A population of Bad DUTs with true ER =  $M \cdot 0.05$  is decided against the same pass and fail limits.
- $cl_p$  and  $d_f$  are tuned such that CL (95%) of the population fails and D (5%) of the population passes.
- This procedure and the relationship to the measurement is justified in clause G.x.9. The number of DUTs decrease during the simulation, as the decided DUTs leave the population. That number decreases with an approximately exponential characteristics. After 169 bad results all DUTs of the population are decided.

NOTE: The exponential decrease of the population is an optimal design goal for the decision co-ordinates ( $n_e, n_s$ ), which can be achieved with other formulas or methods as well.

# Annex H (normative): Uplink Physical Channels

## H.0 Uplink Signal Levels

Uplink signal power is a UE figure, which is configured by the Test System by means of:

RRC messages (IE-s), such as:

- UplinkPowerControlCommon (-v1020, SCell-r10),
- UplinkPowerControlDedicated (-v1020, SCell-r10),
- Other IE-s affecting directly or indirectly the uplink power,

and L1/2 Power control commands (TPC).

The uplink power settings are specified in the test case.

Otherwise, the uplink power settings result from the default RRC messages described in 3GPP TS 36.508 [7], and appropriate TPC-s, which are sent to the UE to transmit with an UL power level necessary for maintaining the call during the test.

## H.1 General

This annex specifies the uplink physical channels that are needed for setting a connection and channels that are needed during a connection. Table H.1-1 describes the mapping of uplink physical channels and signals to physical resources for FDD. Table H.1-2 describes the mapping of uplink physical channels and signals to physical resources for TDD.

**Table H.1-1: Mapping of uplink physical channels and signals to physical resources for FDD**

Physical channel	Time Domain Location	Frequency Domain Location	Note
PRACH	Allowed for the parameter <i>prach-Configuration Index</i> provided by higher layers	Allowed for the parameter <i>prach-FrequencyOffset</i> provided by higher layers	Mapping rule is specified in TS 36.211 [8] Section 5.7.1
DMRS	For PUCCH: Symbols 2 to 4 of each slot (PUCCH format: 1, 1a, 1b)  Symbol 1 and 5 of each slot (PUCCH format: 2, 2a, 2b)  For PUSCH: Symbol 3 of each slot	Uplink system bandwidth dependent.	Mapping rule of DMRS for PUCCH is specified in TS 36.211 [8] 5.5.2.2.2  Mapping rule of DMRS for PUSCH is specified in TS 36.211 [8] 5.5.2.1.2
PUCCH	Slot 0 and 1 of each subframe	Each 12 subcarriers of both ends of the bandwidth	Mapping rule is specified in TS 36.211 [8] Section 5.4.3
PUSCH	All remaining SC-FDMA symbols of each subframe not allocated to DMRS	RBs allocated according to Reference Measurement channel in Annex A.2	Mapping rule is specified in TS 36.211 [8] Section 5.4.2
SRS	Allowed for the cell-specific parameter <i>srs-BandwidthConfig</i> and the UE-specific parameter <i>srs-Bandwidth</i> provided by higher layers	Allowed for the cell-specific parameter <i>srsMaxUpPt</i> and the UE-specific parameter <i>transmissionComb</i> or <i>transmissionComb-ap</i> provided by higher layers	Mapping rule is specified in TS 36.211 [8] Section 5.5.3.2

**Table H.1-2: Mapping of uplink physical channels and signals to physical resources for TDD**

Physical channel	Time Domain Location	Frequency Domain Location	Note
PRACH	Allowed for the parameters $(t_{RA}^0, t_{RA}^1, t_{RA}^2)$ in <i>prach-Configuration Index</i> provided by higher layers	For format 0-3, the frequency location allowed is by <i>prach-FrequencyOffset</i> and $(f_{RA})$ in <i>prach-Configuration Index</i> provided by higher layers. Preamble format 4 is mapped only on UpPTS, where the frequency location allowed is only by $(f_{RA})$ in <i>prach-Configuration Index</i> provided by higher layers.	Mapping rule is specified in TS 36.211 [8] Section 5.7.1
DMRS	For PUCCH: Symbols 2 to 4 of each slot (PUCCH format: 1, 1a, 1b)  Symbol 1 and 5 of each slot (PUCCH format: 2, 2a, 2b)  For PUSCH: Symbol 3 of each slot	Uplink system bandwidth dependent.	Mapping rule of DMRS for PUCCH is specified in TS 36.211 [8] 5.5.2.2.2  Mapping rule of DMRS for PUSCH is specified in TS 36.211 [8] 5.5.2.1.2
PUCCH	Slot 0 and 1 of each subframe	Each 12 subcarriers of both ends of the bandwidth	Mapping rule is specified in TS 36.211 [8] Section 5.4.3
PUSCH	All remaining SC-FDMA symbols of each subframe not allocated to DMRS	RBs allocated according to Reference Measurement channel in Annex A.2	Mapping rule is specified in TS 36.211 [8] Section 5.4.2
SRS	Allowed for the cell-specific parameter <i>srs-BandwidthConfig</i> and the UE-specific parameter <i>srs-Bandwidth</i> provided by higher layers	Allowed for the cell-specific parameter <i>srsMaxUpPt</i> and the UE-specific parameter <i>transmissionComb</i> or <i>transmissionComb-ap</i> provided by higher layers	Mapping rule is specified in TS 36.211 [8] Section 5.5.3.2

NOTE: PUSCH, PUCCH, DMRS are not present in UpPTS for TDD.

## H.2 Set-up

Table H.2-1 describes the uplink physical channels that are required for connection set up.

**Table H.2-1: Uplink Physical Channels required for connection set-up**

Physical Channel
PRACH
DMRS
PUCCH
PUSCH

## H.3 Connection

The following clauses describes the uplink physical channels that are transmitted during a connection i.e., when measurements are done.

### H.3.0 Measurement of Transmitter Characteristics

As specified in the test case. Otherwise:

- PUSCH + DMRS for PUSCH (and DMRS) measurements.
- PUCCH + DMRS for PUCCH (and DMRS) measurements.
- PRACH for PRACH measurements.

SRS for SRS measurements.

### H.3.1 Measurement of Receiver Characteristics

As specified in the test case. Otherwise:

- PUSCH + DMRS for measurements with uplink interference configured.
- PUCCH + DMRS for measurements without uplink interference configured.

### H.3.2 Measurement of Performance Requirements

As specified in the test case. Otherwise:

- PUCCH + DMRS for measurements without CSI feedback, or with CSI feedback in PUCCH mode.
- PUSCH + DMRS for measurements with CSI feedback in PUSCH mode.

---

# Annex I (informative): Handling requirements and tests for different releases and UE capabilities

This annex gives guidance on how minimum requirements in different releases of 3GPP TS 36.101 [2] and different UE capabilities are handled in the specification 3GPP TS 36.521-1.

---

## I.1 General Considerations

Conformance tests in TS 36.521-1 are derived and specified by RAN WG5 based on minimum requirements in TS 36.101 [2] defined by RAN WG4. The actual practice of RAN WG5 is to specify conformance tests only in a single release of TS 36.521-1, capturing requirements defined by RAN WG4 in all releases of TS 36.101 [2].

- 1) In general the structure of TS 36.521-1 follows the structure of TS 36.101 [2].
- 2) In general for minimum requirements specified in a single clause in TS 36.101 [2], a corresponding conformance test is specified in a single clause in TS 36.521-1.
- 3) Exceptions to rule 2) occur in the following cases:
  - a) Coverage of minimum requirements is too wide, in term of different test environments required for verifying all of them.
  - b) Coverage of minimum requirements is too wide, in term of different features which need to be tested for verifying all of them.
  - c) Coverage of minimum requirements is too wide, in term of different UE capabilities required for verifying all of them.

A set of conformance tests is generated in TS 36.521-1 based on the same clause with minimum requirements in TS 36.101 [2]. This "test group" consists in several "individual tests".

- 4) Exceptions to rule 2) occur also in the case when minimum requirements (including test conditions, test points etc.) are not the same in different releases of TS 36.101 [2]. More in details the differences may consist in:
  - a) Different requirement values / test conditions for the same test points.
  - b) Exclusion / Replacement / Addition of test points without introduction of new features
  - c) Addition of test points introducing new features.

A set of conformance tests is generated in TS 36.521-1 based on the same clause with minimum requirements in TS 36.101 [2]. This set consists in one "original test" and one or several "additional tests".

- 5) The clause-number and the title of the "test group" / "original test" is derived based on the number and title of the corresponding minimum requirements in TS 36.101 [2], while the clause-numbers and titles of the "individual tests" / "additional tests" are derived based on those of the "test group" / "original test". In any case it should be avoided to have in TS 36.521-1 specification tests with the same title, even though they have different clause-numbers.
- 6) In case of high similarity between "individual tests", or between "additional tests" and "original test", in order to reduce the standardization and maintenance work the content of clauses for "individual tests" / "additional tests" may be reduced to a minimum by referencing to the analogue clauses of other "individual tests" / the "original test" and specifying the exceptions (requirement-tables, test parameter tables etc). This method should be applied very carefully considering differences in core functionalities of different E-UTRAN releases.

Details how to apply the above principles to concrete scenarios are defined in Annex I.2.

## I.2 Concrete scenarios

### I.2.1 Tests for minimum requirements varying between releases, without introduction of new features

Different minimum requirement between different releases of 3GPP TS 36.101 [2] without introduction of new features represent scenarios according to Annex I.1 bullets 4) a) and b).

In TS 36.521-1 are specified one "original test" and several "additional tests" respectively applicable to the appropriate releases. This is shown graphically in Figure I.2.1-1.

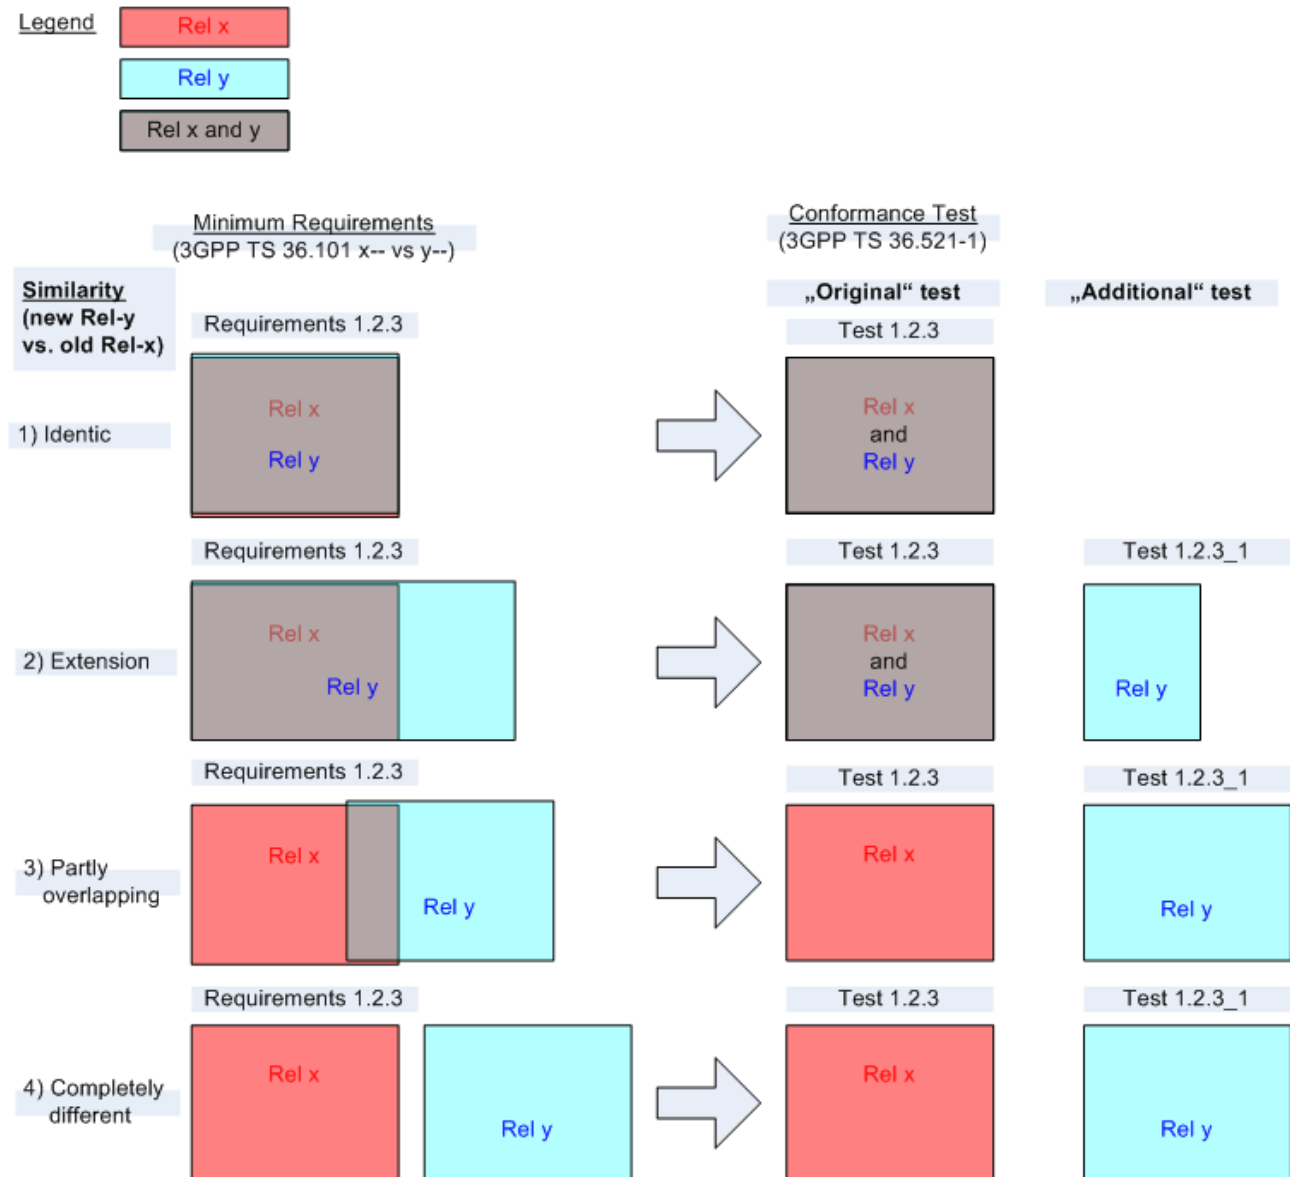

Figure I.2.1-1: Mapping of minimum requirements to conformance tests, when minimum requirements are specified in multiple releases

**Rule:**

Following tests and clauses are specified in TS 36.521-1:

*Original tests:*

<x.x.x>            <Test>

*Additional tests:*

<x.x.x>\_<y>       <Test> (<Release> <UE capability>)

**where:**

<x.x.x>            = number of the original test

<y>                = incrementing clause number (Arabic numeral)

<Test>            = title of the original test

<Release>        = optional identifier showing the release applicability of the test. To be included only when there is already a test with the same title for earlier releases.

<UE capability> = optional identifier showing the UE capability, which leads to additional test. To be included only when there is already a test with the same title for the same release.

**Examples:**

1.2.3        Virtual test

1.2.3\_1     Virtual test (Rel-9 and forward)

1.2.3\_2     Virtual test (Rel-10 and forward)

## 1.2.2 Tests for CA (Carrier aggregation)

### 1.2.2.1 CA Tx tests (Chapter 6)

CA Transmitter minimum requirements in 3GPP TS 36.101 [2] are already specified in separate clauses from the legacy requirements, bearing the suffix "A" in the number and "for CA" in the title. However minimum requirements have a wide coverage in terms of Annex I.1 bullet 3).

In TS 36.521-1 are specified several separate "individual tests" for different CA scenarios and UE capabilities.

**Rule:**

Following tests and clauses are specified in TS 36.521-1:

*Test group clause:*

<x.x.x>A           <Test> for CA

*Individual tests:*

<x.x.x>A.<y>       <Test> for CA (<CA type> <DL/UL support> <BW Class> <Release>)

**where:**

<x.x.x>            = number of the corresponding legacy test (if available), or number derived from TS 36.101 without potential suffix "A" (if no legacy test available)

<y>                = incrementing clause number (Arabic numeral)

<Test>            = title of the corresponding legacy test (if available), or title derived from TS 36.101 without potential suffix "for CA" (if no legacy test available)

- <CA type> = mandatory identifier {intra-band contiguous; intra-band non-contiguous; inter-band}
- <DL/UL support>= mandatory identifier {DL CA without UL CA; DL CA and UL CA}
- <BW Class> = optional identifier showing UE CA Bandwidth class {Class B; Class C}. To be included only for intra-band contiguous scenarios, if there is already a test with the same title.
- <Release> = optional identifier showing the release applicability of the test. To be included only when there is already a test with the same title for earlier releases.

**Examples:**

- 1.2.3 Virtual test
- 1.2.3A Virtual test for CA
- 1.2.3A.1 Virtual test for CA (intra-band contiguous DL CA and UL CA)
- 1.2.3A.2 Virtual test for CA (inter-band DL CA without UL CA)
- 1.2.3A.3 Virtual test for CA (intra-band contiguous DL CA and UL CA Class B)

### 1.2.2.2 CA Rx tests (Chapter 7)

Same as for Transmitter tests (Chapter 6) in Annex I.2.2.1.

### 1.2.2.3 CA Performance tests (Chapter 8)

CA Performance minimum requirements in 3GPP TS 36.101 [2] are specified mostly in the same clause with the legacy requirements, as additional test points marked with CA capability identifiers. CA introduces a new feature in terms of Annex I.1 bullet 4) c). Furthermore the set of CA test points has a wide coverage in terms of Annex I.1 bullet 3).

In TS 36.521-1 are specified several separate "individual tests" for different CA scenarios and UE capabilities.

**Rule:**

Following tests and clauses are specified in TS 36.521-1:

*Test group clause:*

<x.x.x>\_A <Test> for CA

*Individual tests:*

<x.x.x>\_A.<y> <Test> for CA (<CA type > <DL/UL support> <Release>)

where:

- <x.x.x> = number of the corresponding legacy test (if available), or number derived from TS 36.101 without potential suffix "A" (if no legacy test available)
- <y> = incrementing clause number (Arabic numeral)
- <Test> = title of the corresponding legacy test (if available), or title derived from TS 36.101 without potential "for CA" (if no legacy test available)
- <CA type> = mandatory identifier {intra-band contiguous; intra-band non-contiguous; inter-band}
- <DL/UL support> = mandatory identifier {DL CA}
- <Release> = optional identifier showing the release applicability of the test. To be included only when there is already a test with the same title for earlier releases.

**Examples:**

1.2.3	Virtual test
1.2.3_A	Virtual test for CA
1.2.3_A.1	Virtual test for CA (intra-band contiguous DL CA)
1.2.3_A.2	Virtual test for CA (inter-band DL CA)
1.2.3_A.3	Virtual test for CA (intra-band non-contiguous)
1.2.3_A.4	Virtual test for CA (intra-band contiguous DL CA Rel-11 and forward)

## I.2.3 Tests for UL-MIMO (Uplink Multiple Antenna Transmission)

### I.2.3.1 UL-MIMO Tx tests (Chapter 6)

UL-MIMO Transmitter minimum requirements in 3GPP TS 36.101 [2] are already specified in separate clauses from the legacy requirements, bearing the suffix "B" in the number and "for UL-MIMO" in the title.

**Rule:**

Following tests and clauses are specified in TS 36.521-1:

*Test group clause:*

<x.x.x>B      <Test> for UL-MIMO

*Individual tests:*

<x.x.x>B.<y>      <Test> for UL-MIMO (<Release>)

where:

<x.x.x>      = number of the corresponding legacy test (if available), or number derived from TS 36.101 without potential suffix "B" (if no legacy test available)

<y>      = incrementing clause number (Arabic numeral)

<Test>      = title of the corresponding legacy test (if available), or title derived from TS 36.101 without potential suffix "for UL-MIMO" (if no legacy test available)

<Release>      = optional identifier showing the release applicability of the test. To be included only when there is already a test with the same title for earlier releases.

**Examples:**

1.2.3	Virtual test
1.2.3B	Virtual test for UL-MIMO

### I.2.3.2 UL-MIMO Rx tests (Chapter 7)

Same as for Transmitter tests (Chapter 6) in Annex I.2.3.1.

## 1.2.4 Tests for eDL-MIMO (Enhanced Downlink Multiple Antenna Transmission)

### 1.2.4.1 eDL MIMO Performance tests (Chapter 8)

eDL MIMO Performance minimum requirements in 3GPP TS 36.101 [2] are specified in separate clauses from the legacy requirements. In some cases the minimum requirements have a wide coverage in terms of Annex I.1 bullet 3) a) with respect of the presence of a simultaneous interfering transmission a) with respect of the presence of a simultaneous interfering transmission.

In TS 36.521-1 are specified several separate "individual tests" for eDL-MIMO.

#### Rule:

Following tests and clauses are specified in TS 36.521-1:

*Test group clause:*

<x.x.x>\_D      <Test> for eDL-MIMO

*Individual tests:*

<x.x.x>\_D.<y>   <Test> for eDL-MIMO (<Release>)

where:

<x.x.x>          = number of the corresponding legacy test (if available), or number derived from TS 36.101 without potential suffix (if no legacy test available).

<y>                = optional incrementing clause number (Arabic numeral) (if many individual tests).

<Test>            = title of the corresponding legacy test (if available), or title derived from TS 36.101 without potential suffix (if no legacy test available).

<Release>        = optional identifier showing the release applicability of the test. To be included only when there is already a test with the same title for earlier releases.

#### Examples:

1.2.4             Virtual test

1.2.4\_D          Virtual test for eDL-MIMO

### 1.2.4.2 eDL MIMO CSI tests (Chapter 9)

eDL MIMO CSI minimum requirements in 3GPP TS 36.101 [2] are specified in separate clauses from legacy requirements.

#### Rule:

Following tests and clauses are specified in TS 36.521-1:

*Test group clause:*

<x.x.x>\_D      <Test> for eDL-MIMO

*Individual tests:*

<x.x.x>\_D.<y>   <Test> for eDL-MIMO (<Release>)

where:

<x.x.x>          = number of the corresponding legacy test (if available), or number derived from TS 36.101 without potential suffix (if no legacy test available).

- <y> = optional incrementing clause number (Arabic numeral) (if many individual tests).
- <Test> = title of the corresponding legacy test (if available), or title derived from TS 36.101 without potential suffix (if no legacy test available).
- <Release> = optional identifier showing the release applicability of the test. To be included only when there is already a test with the same title for earlier releases.

**Examples:**

- 1.2.4 Virtual test
- 1.2.4\_D Virtual test for eDL-MIMO

## 1.2.5 Tests for eICIC (Enhanced Inter-carrier Interference Cancellation / Coordination)

### 1.2.5.1 eICIC Performance tests (Chapter 8)

eICIC Performance minimum requirements in 3GPP TS 36.101 [2] are specified in separate clauses from the legacy requirements. The set of eICIC test points have a wide coverage in terms of Annex I.1 bullet 3)a) with respect of the ABS type (Non-MBSFN / MBSFN). In TS 36.521-1 are specified several separate "individual tests" for eICIC.

**Rule:**

Following tests and clauses are specified in TS 36.521-1:

*Test group clause:*

<x.x.x>\_C <Test> for eICIC

*Individual tests:*

<x.x.x>\_C.<y> <Test> for eICIC (<ABS-type> <Release>)

where:

- <x.x.x> = number of the corresponding legacy test (if available), or number derived from TS 36.101 without potential suffix (if no legacy test available).
- <y> = optional incrementing clause number (Arabic numeral) (if many individual tests).
- <Test> = title of the corresponding legacy test (if available), or title derived from TS 36.101 without potential suffix (if no legacy test available).
- <ABS-Type> = mandatory identifier {non-MBSFN ABS, MBSFN ABS}
- <Release> = optional identifier showing the release applicability of the test. To be included only when there is already a test with the same title for earlier releases.

**Examples:**

- 1.2.4 Virtual test
- 1.2.4\_C Virtual test for eICIC
- 1.2.4\_C.1 Virtual test for eICIC (non-MBSFN ABS)
- 1.2.4\_C.2 Virtual test for eICIC (MBSFN ABS)

### 1.2.5.2 eICIC CSI tests (Chapter 9)

Same as for Performance tests (Chapter 8) in Annex I.2.5.1.

## 1.2.6 Tests for feICIC (Further Enhanced Non CA-based ICIC for LTE)

### 1.2.6.1 feICIC Performance tests (Chapter 8)

feICIC Performance minimum requirements in 3GPP TS 36.101 [2] are specified in separate clauses from the legacy requirements. The set of feICIC test points have a wide coverage in terms of Annex I.1 bullet 3)a) with respect of the ABS type (Non-MBSFN / MBSFN). In TS 36.521-1 are specified several separate "individual tests" for feICIC.

Rule:

Following tests and clauses are specified in TS 36.521-1:

*Test group clause:*

<x.x.x>\_E<Test> for feICIC

*Individual tests:*

<x.x.x>\_E.<y> <Test> for feICIC (<ABS-type> <Release>)

where:

<x.x.x> = number of the corresponding legacy test (if available), or number derived from TS 36.101 without potential suffix (if no legacy test available).

<y> = optional incrementing clause number (Arabic numeral) (if many individual tests).

<Test> = title of the corresponding legacy test (if available), or title derived from TS 36.101 without potential suffix (if no legacy test available).

<ABS-Type> = mandatory identifier {non-MBSFN ABS, MBSFN ABS}

<Release> = optional identifier showing the release applicability of the test. To be included only when there is already a test with the same title for earlier releases.

Examples:

1.2.6	Virtual test
1.2.6_E	Virtual test for feICIC
1.2.6_E.1	Virtual test for feICIC (non-MBSFN ABS)
1.2.6_E.2	Virtual test for eICIC (MBSFN ABS)

### 1.2.6.2 feICIC CSI tests (Chapter 9)

Same as for Performance tests (Chapter 8) in Annex I.2.6.1.

## 1.2.7 Tests for DL CoMP (Downlink Coordinated Multipoint Transmission)

### 1.2.7.1 CoMP Performance tests (Chapter 8)

CoMP Performance minimum requirements in 3GPP TS 36.101 [2] are specified in separate clauses from the legacy requirements. The set of CoMP test points may have a wide coverage in terms of Annex I.1 bullet 3)a) with respect of the number of CSI processes (Single / Multiple CSI process) etc. In such cases in TS 36.521-1 are specified several separate "individual tests" for CoMP.

**Rule:**

Following tests and clauses are specified in TS 36.521-1:

*Test (group) clause:*

<x.x.x>\_F <Test> for CoMP

*Individual tests:*

<x.x.x>\_F.<y> <Test> < CSI Process number > for CoMP (<Release>)

where:

<x.x.x> = number derived from TS 36.101.

<y> = optional incrementing clause number (Arabic numeral) (if many individual tests).

<Test> = title derived from TS 36.101.

<CSI Process number> = optional identifier { with Single CSI process, with Multiple CSI processes } (if many individual tests)

<Release> = optional identifier showing the release applicability of the test. To be included only when there is already a test with the same title for earlier releases.

**Examples:**

1.2.3	Virtual test
1.2.3_F	Virtual test for CoMP
1.2.3_F.1	Virtual test with Single CSI process for CoMP
1.2.3_F.2	Virtual test with Multiple CSI processes for CoMP

## 1.2.7.2 CoMP CSI tests (Chapter 9)

Same as for Performance tests (Chapter 8) in Annex I.2.7.1.

## 1.2.8 Tests for Further eDL-MIMO (Enhanced Downlink Multiple Antenna Transmission) Enhancement for LTE-A

### 1.2.8.1 eDL MIMO Enhancement CSI tests (Chapter 9)

Further eDL MIMO Enhancement for LTE-A CSI minimum requirements in 3GPP TS 36.101 [2] are specified in separate clauses from the legacy requirements.

**Rule:**

Following tests and clauses are specified in TS 36.521-1:

<x.x.x> <Test> for eDL-MIMO Enhancement

*Individual tests:*

<x.x.x><\_y> <Test> for eDL-MIMO Enhancement (<Release>)

where:

<x.x.x> = number derived from the corresponding requirement clause in TS 36.101.

<\_y> = optional incrementing clause number (Arabic numeral) with preceding underscore. To be applied only when there is already a test with the same title for earlier releases.

- <Test> = title derived from the corresponding requirement clause in TS 36.101.
- <Release> = optional identifier showing the release applicability of the test. To be included only when there is already a test with the same title for earlier releases.

**Examples:**

- 1.2.3 Virtual test for eDL-MIMO Enhancement
- 1.2.3\_1 Virtual test for eDL-MIMO Enhancement (Rel-13 and forward)

## 1.2.9 Tests for UE category 0

### 1.2.9.1 UE category 0 Tx tests (Chapter 6)

UE category 0 specific Transmitter minimum requirements in 3GPP TS 36.101 [2] are specified in separate clauses from the legacy requirements, bearing the suffix "E" in the number and "for UE category 0" in the title. In other cases where no category 0 specific requirements exist, the legacy requirements apply. To maintain consistency all test cases for UE category 0 to be specified in TS 36.521-1 are handled similarly.

**Rule:**

Following tests and clauses are specified in TS 36.521-1:

- <x.x.x>E <Test> for UE category 0
- <x.x.x>E<\_y> <Test> for UE category 0 (<Release>)

where:

- <x.x.x> = number of the corresponding legacy test (if available), or number derived from TS 36.101 without potential suffix "E" (if no legacy test available)
- <\_y> = optional incrementing clause number (Arabic numeral) with preceding underscore. To be applied only when there is already a test with the same title for earlier releases.
- <Test> = title of the corresponding legacy test (if available), or title derived from TS 36.101 without potential "for UE category 0" (if no legacy test available)
- <Release> = optional identifier showing the release applicability of the test. To be included only when there is already a test with the same title for earlier releases.

**Examples:**

- 1.2.3 Virtual test
- 1.2.3E Virtual test for UE category 0
- 1.2.3E\_1 Virtual test for UE category 0 (Rel-13 and forward)

### 1.2.9.2 UE category 0 Rx tests (Chapter 7)

Same as for Transmitter tests (Chapter 6) in Annex I.2.9.1.

### 1.2.9.3 UE category 0 Performance tests (Chapter 8)

UE category 0 Performance minimum requirements in 3GPP TS 36.101 [2] are already specified in separate clauses from the legacy requirements.

**Rule:**

Following tests and clauses are specified in TS 36.521-1:

<x.x.x>            <Test> for UE category 0

<x.x.x><\_y>       <Test> for UE category 0 (<Release>)

where:

<x.x.x>            = number derived from the corresponding requirement clause in TS 36.101

<\_y>               = optional incrementing clause number (Arabic numeral) with preceding underscore. To be applied only when there is already a test with the same title for earlier releases.

<Test>             = title derived from the corresponding requirement clause in TS 36.101

<Release>         = optional identifier showing the release applicability of the test. To be included only when there is already a test with the same title for earlier releases.

**Examples:**

1.2.3              Virtual test for UE category 0

1.2.3\_1           Virtual test for UE category 0 (Rel-13 and forward)

**1.2.9.4 UE category 0 CSI tests (Chapter 9)**

Same as for Performance tests (Chapter 8) in Annex I.2.9.3.

**1.2.10 Tests for SCE-L1 (Small Cell Enhancements-Physical layer)****1.2.10.1 SCE-L1 Receiver tests (Chapter 7)**

The set of 256QAM test points may have a wide coverage in terms of Annex I.1 bullet 3)c) with respect of the different UE capabilities (UE category 11-16), modulation mode and coding rate required and Annex I.1 bullet 4)a)etc with the addition of new requirements and new defined RMC for SCE-L1. In such cases in TS 36.521-1 are specified several separate "individual tests" for SCE-L1.

**Rule:**

Following tests and clauses are specified in TS 36.521-1:

*Test (group) clause:*

<x.x.x>\_H       <Test> for SCE-L1

*Individual tests:*

<x.x.x>\_H.<y>   <Test> for SCE-L1 (<Release>)

where:

<x.x.x>            = number derived from TS 36.101.

<y>                 = optional incrementing clause number (Arabic numeral) (if many individual tests).

<Test>             = title derived from TS 36.101.

<Release>         = optional identifier showing the release applicability of the test. To be included only when there is already a test with the same title for earlier releases.

Examples:

1.2.3           Virtual test  
1.2.3\_H        Virtual test for SCE-L1

### I.2.10.2 SCE-L1 Performance tests (Chapter 8)

The set of 256QAM test points may have a wide coverage in terms of Annex I.1 bullet 3)c) with respect of the different UE capabilities (UE category 11-16) and demodulation mode required and Annex I.1 bullet 4)c)etc with the addition of new test points introducing new features of 256QAM for SCE-L1. In such cases in TS 36.521-1 are specified several separate "individual tests" for SCE-L1.

Rule:

Following tests and clauses are specified in TS 36.521-1:

*Test (group) clause:*

<x.x.x>\_H   <Test> for SCE-L1

*Individual tests:*

<x.x.x>\_H.<y>   <Test> for SCE-L1 (<Release>)

where:

<x.x.x>                   = number derived from TS 36.101.  
<y>                        = optional incrementing clause number (Arabic numeral) (if many individual tests).  
<Test>                    = title derived from TS 36.101.  
<Release>                 = optional identifier showing the release applicability of the test. To be included only when there is already a test with the same title for earlier releases.

Examples:

1.2.3           Virtual test  
1.2.3\_H        Virtual test for SCE-L1  
1.2.3\_H.1      Virtual test for SCE-L1(Single Carrier)  
1.2.3\_H.2      Virtual test for SCE-L1(2DL CA)  
1.2.3\_H.3      Virtual test for SCE-L1(3DL CA)

### I.2.10.3 SCE-L1 CSI tests (Chapter 9)

SCE-L1 Performance minimum requirements in 3GPP TS 36.101 [2] are specified in separate clauses from the legacy requirements. The set of SCE-L1 test points may have a wide coverage in terms of Annex I.1 bullet 3)b) and c) etc. In such cases in TS 36.521-1 are specified several separate "individual tests" for SCE-L1.

Rule:

Following tests and clauses are specified in TS 36.521-1:

*Test (group) clause:*

<x.x.x>\_H   <Test> for SCE-L1

*Individual tests:*

<x.x.x>\_H.<y>   <Test> for SCE-L1 (<Release>)

where:

- <x.x.x> = number derived from TS 36.101.
- <y> = optional incrementing clause number (Arabic numeral) (if many individual tests).
- <Test> = title derived from TS 36.101.
- <Release> = optional identifier showing the release applicability of the test. To be included only when there is already a test with the same title for earlier releases.

Examples:

- 1.2.3 Virtual test
- 1.2.3\_H Virtual test for SCE-L1

## I.2.11 Tests for ProSe

### I.2.11.1 ProSe Tx tests (Chapter 6)

ProSe specific Transmitter minimum requirements in 3GPP TS 36.101 [2] are specified in separate clauses from the legacy requirements, bearing the suffix "D" in the number and "for ProSe" in the title. The set of ProSe test points may have a wide coverage in terms of Annex I.1 bullet 3)b) and c) with respect of type of ProSe operation and UE capability (Discovery / Communication) etc. In such cases in TS 36.521-1 are specified several separate "individual tests" for ProSe.

#### Rule:

Following tests and clauses are specified in TS 36.521-1:

<x.x.x>D            <Test> for ProSe  
 <x.x.x>D<.y><\_z>   <Test> for ProSe <Mode> (<Release>)

where:

<x.x.x>            = number derived from TS 36.101 without suffix "D"  
 <.y>                = incrementing clause number (Arabic numeral).  
 <\_z>                = optional incrementing clause number (Arabic numeral) with preceding underscore. To be applied only when there is already a test with the same title for earlier releases.  
 <Test>             = title derived from TS 36.101 without "for ProSe"  
 <Mode>             = mandatory identifier {Direct Discovery; Direct Communication}  
 <Release>         = optional identifier showing the release applicability of the test. To be included only when there is already a test with the same title for earlier releases.

#### Examples:

1.2.3D             Virtual test for ProSe  
 1.2.3D.1          Virtual test for ProSe Direct Discovery  
 1.2.3D.2          Virtual test for ProSe Direct Communication  
 1.2.3D.2\_1        Virtual test for ProSe Direct Communication (Release 13 and forward)

### I.2.11.2 ProSe Rx tests (Chapter 7)

Same as for Transmitter tests (Chapter 6) in Annex I.2.11.1.

### I.2.11.3 ProSe Performance tests (Chapter 8)

ProSe Performance minimum requirements in 3GPP TS 36.101 [2] are already specified in separate clauses from the legacy requirements.

#### Rule:

Following tests and clauses are specified in TS 36.521-1:

FFS

### I.2.11.4 ProSe CSI tests (Chapter 9)

Same as for Performance tests (Chapter 8) in Annex I.2.11.3.

## I.2.12 Tests for 4 Rx antenna ports

### I.2.12.1 4 Rx antenna ports Rx tests (Chapter 7)

4 Rx antenna ports minimum requirements in 3GPP TS 36.101 [2] are specified in the same clauses as the legacy requirements. The reference sensitivity requirements in section 7.3 are separate from the old test, but the rest of the Receiver tests have the same requirements as the old tests (tested at a level based on REFSENS). But since the test points are different, new variant test cases are still needed.

In TS 36.521-1 separate 2Rx and 4Rx tests are specified for Rel8 and Rel9 tests, but 4Rx is added to the existing tests starting from Rel10 test cases.

#### Rule:

Following tests and clauses are specified in TS 36.521-1:

*Test group before introducing 4Rx:*

<x.x.x>	<Test> (Rel8 or Rel9)
<y.y.y>	<Test> (Rel10 or later)

*Test group after introducing 4Rx:*

<x.x.x>	<Test> for 2Rx
<x.x.x>_1	<Test> for 4Rx
<y.y.y>	<Test> for 2Rx and 4Rx

where:

<x.x.x>	= number of the corresponding legacy test.
<y>	= incrementing clause number (Arabic numeral)
<Test>	= title of the corresponding legacy test
(Release)	= Release applicability (applicable from), which is not part of the title

#### Examples:

1.2.3	Virtual test (Rel8)
1.2.3_1	Virtual test with 4 Rx antenna ports (Rel10)
1,2,4	Virtual test (Rel10)

### I.2.12.2 4 Rx antenna ports Performance tests (Chapter 8)

4 Rx antenna ports Performance minimum requirements in 3GPP TS 36.101 [2] are specified in separate clauses from the legacy requirements. Separate test cases for 4Rx antenna ports are needed in TS 36.521-1 with test case numbering following TS 36.101[2] numbering,

### I.2.12.3 4 Rx antenna ports CSI tests (Chapter 9)

TBD

## Annex J (normative): Modified MPR behaviour

*Editor's note: The *modifiedMPRbehavior* is given in the Annex H.1 of TS 36.101.*

### J.1 Indication of modified MPR behaviour

This annex contains the definitions of the bits in the field *modifiedMPRbehavior* indicated in the IE UE Radio Access Capability [5] by a UE supporting an MPR or A-MPR modified in a later release of this specification.

**Table J.1-1: Definitions of the bits in the field *modifiedMPRbehavior* (Rel-10 and Rel-11)**

<b>Index of field (bit number)</b>	<b>Definition</b> (description of the supported functionality if indicator set to one)	<b>Notes</b>
0 (leftmost bit)	The MPR for intra-band contiguous carrier aggregation bandwidth class C with non-contiguous resource allocation specified in Clause 6.2.3A in version 12.5.0 of TS36.101[2]	This bit can be set to 1 by a UE supporting intra-band contiguous CA bandwidth class C
1	The A-MPR associated with NS_05 for Band 1 in Clause 6.2.4 in version 12.10.0 of TS36.101[2]	This bit can be set to 1 by a UE supporting A-MPR associated to NS_05 for Band 1

**Table J.1-2: Definitions of the bits in the field *modifiedMPRbehavior* (Rel-12 and later)**

<b>Index of field (bit number)</b>	<b>Definition</b> (description of the supported functionality if indicator set to one)	<b>Notes</b>
0 (leftmost bit)	The MPR for intra-band contiguous carrier aggregation bandwidth class C with non-contiguous resource allocation specified in Clause 6.2.3A in version 12.5.0 of TS36.101 [2]	This bit shall be set to 1 by a UE supporting intra-band contiguous CA bandwidth class C
1	The A-MPR associated with NS_05 for Band 1 in Clause 6.2.4 in version 12.10.0 of TS36.101[2]	This bit shall be set to 1 by a UE supporting A-MPR associated to NS_05 for Band 1

## Annex J (informative): Change history

Change history							
Date	TSG #	TSG Doc.	CR	R ev	Subject/Comment	Old	New
2007-08	RAN5 #36	R5-072185			Skeleton proposed for RAN5#36Athens		0.0.1
2007-08	RAN5 #36	R5-072419			Update the skeleton base on R4-071234_TR36.803.0.4.0.doc	0.0.1	0.0.2
2007-08	RAN5 #36	R5-072424			Update with editorial changes	0.0.2	0.0.3
2007-11	RAN5 #37	R5-073043			Update document with some info as following: Section 5: Frequency band information Section 6.2: Maximum output power Section 6.5: Output RF spectrum emissions Section 6.5.1: Occupied bandwidth Section 6.5.2: Out of band emission Section 6.5.3: Spurious emissions	0.0.3	0.0.4
2007-11	RAN5 #37	R5-073360			Editorial change to split MOP and UE Power classes	0.0.4	0.0.5
2008-03	RAN5 #38	R5-080069			Editorial changes to sync up with 36.101 v1.0.0 as much as feasible for the moment: Update definitions, symbols and abbreviations Update frequency bands, channel bandwidth, channel numbers information. Restructure document to move "frequency error" sub-section inside Transmit signal quality. Add "additional spectrum Emission Mask" sub-test (mask A,B,C) section to address the regulatory requirements that are not met with the general mask (OOB and spurious emission). Add "Additional ACLR requirements" to address additional requirements that the network might indicate to the UE via signalling for a specific deployment scenario (in terms of additional requirements for UTRA/ACLR2 Restructure "Spurious Emission" to indicate we need to have 3 test cases to address: "E-UTRA Spurious Emission" requirements, "Spurious Emission band UE co-existence" requirements, and "Additional spurious emissions" requirements Separate wide band and narrow band intermodulation in the intermodulation characteristics	0.0.5	0.0.6
2008-03	RAN5 #38	R5-080408			LTE Reference Sensitivity test Text proposal		0.0.7
2008-03	RAN5 #38	R5-080409			LTE Maximum Rx input level test Text proposal		0.0.7
2008-03	RAN5 #38	R5-080410			LTE Adjacent Channel Selectivity test Text proposal		0.0.7
2008-03	RAN5 #38	R5-080064			LTE RF Receiver tests, General section Text proposal		0.0.7
2008-03	RAN5 #38	R5-080412			LTE RF: transmission modulation initial EVM test proposal		0.0.7
2008-03	RAN5 Workshop- UE LTE Test (9-11 April)	R5w0800027			Modify styles and formats of tables and others according to drafting rules. Add some definitions and abbreviations Modified section 6.2 structure to be aligned with 36.101 v8.1.0 Modify tables of requirements to remove 1.6 MHz and 3.2MHz channel bandwidth according to new requirements 36.101 v8.1.0		0.0.9
2008-03	RAN5 Workshop- UE LTE Test (9-11 April)	R5w0800028			Following TPs have been included: R5w080013r1 R5w080014r1 R5w080008r2 R5w080009r2 R5w080040r1 R5w080015r1 R5w080016r1 R5w080017r1 R5w080018r2	0.0.9	0.1.0
2008-05	RAN5#39	R5-081046			36-521-1 alignment of measurement state for test cases	0.1.0	0.1.1

2008-05	RAN5#39	R5-081042		<p>Following approved TPs have been included:</p> <p>R5-081040 36.521-1 after April LTE-RF workshop</p> <p>R5-081415 36-521-1 alignment of measurement state for test cases – also the measurement state for each test cases has been updated according to R5-081404</p> <p>R5-081416 Cover for LTE E-UTRAN RRC_IDLE State Mobility text proposal</p> <p>R5-081417 Cover for LTE E-UTRAN RRC_CONNECTED State Mobility text proposal</p> <p>R5-081404 LTE Rx Intermodulation test case text proposal</p> <p>R5-081409 Annex structure for Measurement uncertainty &amp; Test Tools</p> <p>R5-081405 Text Proposal for TS 36.521-1 TC7.6 Blocking Characteristics</p> <p>R5-081406 Text Proposal for TS 36.521-1 TC7.7 Spurious Response</p> <p>R5-081403 Text Proposal for TS 36.521-1 TC7.9 Spurious Emissions</p> <p>R5-081410 Uncertainties and Test Tools for subset of UE tests</p> <p>R5-081331 Clarification of diversity characteristics section for multiple UE antennas</p> <p>R5-081335 36-521-1 update of nominal and additional channel bandwidths</p>	0.1.1	0.2.0
2008-06	RAN5 #39bis	R5-082029		<p>Following approved TPs have been included:</p> <p>R5-082129: Restructure of TS 36.521-1 and RRM proposal (Split of RRM from 36.521-1 v0.2.0 in its own specification 36.521-3.)</p> <p>R5-082166: Text Proposal for Annex C Downlink Physical Channels</p> <p>R5-082130: Text Proposal for Chan bandwidths in TS 36.521-1</p> <p>R5-082155: Text Proposal for LTE Tx Minimum Output Power</p> <p>R5-082027: Text Proposal for Occupied bandwidth in TS 36.521-1</p> <p>R5-082171: Text Proposal for LTE Adjacent Channel Leakage power Ratio</p> <p>R5-082134: Text Proposal for LTE Tx Spurious Emissions</p> <p>R5-082135: Text Proposal for LTE UE Maximum Output Power</p> <p>R5-082136: Text Proposal for LTE Spectrum Emission Mask</p> <p>R5-082138: UE Spurious Emissions Measurement uncertainty &amp; Test Tolerances</p> <p>R5-082169: LTE Spectrum Emission Mask test uncertainties and TTs</p> <p>R5-082151: LTE UE Max Power and ACLR tests uncertainties and TTs</p> <p>R5-082152: Text proposal for LTE Transmit OFF Power</p> <p>R5-082153: LTE UE Max Rx Input and ACS test cases update</p> <p>R5-082082: LTE Rx Intermodulation test case uncertainties and TTs</p> <p>R5-082093: Text Proposal for TS 36.521-1 TC7.6 Blocking Characteristics</p> <p>R5-082154: Text Proposal for TS 36.521-1 TC7.7 Spurious Response</p> <p>R5-082167: OBW Measurement uncertainty &amp; Test Tolerances</p> <p>R5-082158: Cover for LTE Performance Requirement text proposal</p> <p>R5-082159: Text Proposal for LTE Demodulation of PCFICH/PDCCH and PHICH</p> <p>R5-082156: Text proposal for LTE Tx Minimum Output Power Uncertainty</p> <p>R5-082157: Text proposal for LTE Tx Minimum Output Power Tolerance</p> <p>R5-082164: Statistical testing of receiver characteristics</p> <p>R5-082170: Cover for LTE Propagation Conditions Text Proposal</p> <p>Editorial changes to align tables and figures numbering with R5-082025</p>	0.2.0	0.3.0

2008-08	RAN5 #40	R5-083163		<p>Following approved TPs have been included:</p> <p>R5-083804: LTE Demodulation Performance text proposal</p> <p>R5-083159: LTE-RF Occupied bandwidth test case / measurement uncertainty and TT text proposal</p> <p>R5-083160: Transmission OFF power: TP, measurement uncertainty and test tolerances proposal</p> <p>R5-083805: Frequency Error test case / measurement uncertainty and TT test proposal</p> <p>R5-083162: Propagation conditions correction text proposal</p> <p>R5-083220: Text Proposal for LTE Tx Minimum Output Power</p> <p>R5-083806: TP of section 8 for E-UTRAN TDD in 36.521-1</p> <p>R5-083344: Test Tolerance and System uncertainty for OBW test</p> <p>R5-083848: Test Tolerance and System uncertainty for Reference sensitivity test</p> <p>R5-083840: Test Tolerances for Spectrum Emission Mask</p> <p>R5-083808: Reference Measurement Channel for LTE UE Receiver tests</p> <p>R5-083350: Test Tolerance and System uncertainty for Blocking and Spurious response</p> <p>R5-083366: Text Proposal for LTE Reporting of CQI/PMI</p> <p>R5-083810: LTE PBCH Demodulation Performance Requirements</p> <p>R5-083482: LTE-RF TP for Test Case 7.6 Blocking Characteristics</p> <p>R5-083809: LTE-RF TP for Test Case 7.7 Spurious Response</p> <p>R5-083484: LTE-RF TP for Test Case 7.9 Spurious Emissions</p> <p>R5-083811: Annex E Global In-Channel TX-Test</p> <p>R5-083163: TS 36.521-1 after RAN5#40</p>	0.3.0	1.0.0

2010-09	RAN#49	R5-104888	0344	-	Update of Annex C.2 for AG level	9.1.0	9.2.0
2010-09	RAN#49	R5-105055	0345	-	Introduction of a new RF test case (8.7) to verify downlink sustained data rate performance	9.1.0	9.2.0
2010-09	RAN#49	R5-105061	0347	-	CR to 36.521-1: Modification to Additional Maximum Power Reduction Test Case	9.1.0	9.2.0
2010-09	RAN#49	R5-105062	0348	-	Modification to Additional Spectrum Emission Mask	9.1.0	9.2.0
2010-09	RAN#49	R5-105063	0349	-	Modification to Additional Spurious Emissions	9.1.0	9.2.0
2010-09	RAN#49	R5-105064	0350	-	Modification to Maximum Power Reduction	9.1.0	9.2.0
2010-09	RAN#49	R5-105065	0351	-	Modification to Adjacent Channel Leakage Power Ratio	9.1.0	9.2.0
2010-09	RAN#49	RP-100987	0352	-	Correction of status for RF performance test case	9.1.0	9.2.0
2010-12	RAN#50	R5-106073	0353	-	Corrections to receiver spurious emissions test	9.2.0	9.3.0
2010-12	RAN#50	R5-106074	0354	-	Update of downlink power for receiver tests	9.2.0	9.3.0
2010-12	RAN#50	R5-106076	0355	-	CQI: Side condition when CQI median equals min or max CQI-values	9.2.0	9.3.0
2010-12	RAN#50	R5-106077	0356	-	Update of the throughput-definition for multi-data stream transmission	9.2.0	9.3.0
2010-12	RAN#50	R5-106078	0357	-	Update of RF OCNG patterns	9.2.0	9.3.0
2010-12	RAN#50	R5-106092	0358	-	Correction of DCI format used in PDSCH performance test 8.2.1.4.2	9.2.0	9.3.0
2010-12	RAN#50	R5-106249	0359	-	CR to 36.521-1: Correction to Spurious emission band UE co-existence test case	9.2.0	9.3.0
2010-12	RAN#50	R5-106250	0360	-	CR to 36.521-1: Correction to Additional Tx spurious emissions test case	9.2.0	9.3.0
2010-12	RAN#50	R5-106374	0361	-	Correction of FDD CQI reporting test under AWGN - PUCCH 1-1	9.2.0	9.3.0
2010-12	RAN#50	R5-106394	0362	-	Correction of clause 9.3.1 and 9.3.3	9.2.0	9.3.0
2010-12	RAN#50	R5-106399	0363	-	"Correction of G.2.5 Pass fail decision rules"	9.2.0	9.3.0
2010-12	RAN#50	R5-106420	0364	-	Introduction of test uncertainties and tolerances for TDD PDSCH DRS test cases	9.2.0	9.3.0
2010-12	RAN#50	R5-106440	0365	-	Correction to unsigned numbers in Annex F.1.2	9.2.0	9.3.0
2010-12	RAN#50	R5-106443	0366	-	Correction to the exceptional messages in 9.4 Reporting of PMI TCs	9.2.0	9.3.0
2010-12	RAN#50	R5-106491	0367	-	CR to 36.521-1: Correction to Table Numbering Error in TDD PDSCH Closed Loop Single/Multi Layer Spatial Multiplexing 2x2	9.2.0	9.3.0
2010-12	RAN#50	R5-106512	0368	-	Transport format table clarification in CSI test cases	9.2.0	9.3.0
2010-12	RAN#50	R5-106801	0369	-	HARQ scheduling in TDD performance tests using special subframes	9.2.0	9.3.0
2010-12	RAN#50	R5-106803	0370	-	Correction to Fading Profiles in TCs 8.4 and 8.5	9.2.0	9.3.0
2010-12	RAN#50	R5-106816	0372	-	CR to 36.521-1: Modification to Spectrum Emissions Mask	9.2.0	9.3.0
2010-12	RAN#50	R5-106817	0373	-	Introduction of test uncertainties and tolerances for TDD PCFICH/PDCCH and PHICH test cases	9.2.0	9.3.0
2010-12	RAN#50	R5-106818	0374	-	Update of TDD PDSCH CRS Demodulation test cases	9.2.0	9.3.0
2010-12	RAN#50	R5-106821	0375	-	PUSCH-EVM with exclusion period	9.2.0	9.3.0
2010-12	RAN#50	R5-106822	0376	-	Maintenance of Band 20 for receiver tests	9.2.0	9.3.0
2010-12	RAN#50	R5-106823	0377	-	Completion of clause 9.3.1 and 9.3.2	9.2.0	9.3.0
2010-12	RAN#50	R5-106824	0378	-	Update of FDD RI Reporting TC	9.2.0	9.3.0
2010-12	RAN#50	R5-106825	0379	-	Correction to 9.2.2 CQI TCs	9.2.0	9.3.0
2010-12	RAN#50	R5-106826	0380	-	G.3.5 on PDCCH&PHICH Minimum Test Times	9.2.0	9.3.0
2010-12	RAN#50	R5-106827	0381	-	Completion of test time and $\frac{TT}{T}$ -TT for clauses 9.3 to 9.5	9.2.0	9.3.0
2010-12	RAN#50	R5-106828	0382	-	EVM window length for PRACH	9.2.0	9.3.0
2010-12	RAN#50	R5-106842	0383	-	Modification of TC 8.3.2.1 - TDD PDSCH Single-layer SM Performance (UE-Specific Reference Symbols)	9.2.0	9.3.0
2010-12	RAN#50	R5-106843	0384	-	Power control relative power tolerance: Missing band edge relaxation	9.2.0	9.3.0
2010-12	RAN#50	R5-106844	0385	-	SRS time mask test procedure update	9.2.0	9.3.0
2010-12	RAN#50	R5-106845	0386	-	Correction of TC General ON/OFF time mask	9.2.0	9.3.0

2010-12	RAN#50	R5-106846	0387	-	Update of TDD CQI reporting test under frequency selective interference conditions	9.2.0	9.3.0
2010-12	RAN#50	R5-106847	0388	-	Update of TDD RI reporting test	9.2.0	9.3.0
2010-12	RAN#50	R5-106848	0389	-	lot setting in CQI test clarification	9.2.0	9.3.0
2010-12	RAN#50	R5-106850	0390	-	Correction of Test Uncertainties and Test Tolerances for Reference Sensitivity-Band 4	9.2.0	9.3.0
2010-12	RAN#50	R5-106855	0391	-	Correction to DL and UL RMC configurations in 6.5.1 Frequency Error	9.2.0	9.3.0
2010-12	RAN#50	R5-106858	0392	-	CR to 36.521-1: Update LTE RF test cases with test requirements for EUTRA TDD LTE band 41.	9.2.0	9.3.0
2011-03	RAN#51	R5-110138	0393	-	Spurious emission band co-existence test: Remaining old test requirement table	9.3.0	9.4.0
2011-03	RAN#51	R5-110139	0394	-	Transmit intermodulation test: Interferer offset for Band 20, Bandwidth 20 MHz	9.3.0	9.4.0
2011-03	RAN#51	R5-110141	0395	-	PMI Performance tests: Corrections to test settings	9.3.0	9.4.0
2011-03	RAN#51	R5-110143	0396	-	PDCCH Performance test: Correction to TDD DL RMC-s	9.3.0	9.4.0
2011-03	RAN#51	R5-110144	0397	-	OCNG for RF tests: Updates	9.3.0	9.4.0
2011-03	RAN#51	R5-110158	0398	-	CQI Performance tests: Clarification on subbands used in the test	9.3.0	9.4.0
2011-03	RAN#51	R5-110302	0399	-	LTE RF: PCFICH/PDCCH Transmit Diversity Performance	9.3.0	9.4.0
2011-03	RAN#51	R5-110349	0401	-	Correction of OFF power measurements in 6.3.4 ON/OFF time mask	9.3.0	9.4.0
2011-03	RAN#51	R5-110354	0402	-	Correction of Annex E (Global In-Channel TX-Test)	9.3.0	9.4.0
2011-03	RAN#51	R5-110506	0403	-	Addition of 3500 MHz TDD bands into chapter 5 of 36.521-1	9.3.0	9.4.0
2011-03	RAN#51	R5-110747	0404	-	Updates to section 8.7 DL sustained data rate test case	9.3.0	9.4.0
2011-03	RAN#51	R5-110850	0405	-	Sustained data rate: Definition of UL RMC-s	9.3.0	9.4.0
2011-03	RAN#51	R5-110860	0400	-	Update measurement period from test procedure of 6.2.2	9.3.0	9.4.0
2011-03	RAN#51	R5-110861	0428	-	A-MPR Test requirement update	9.3.0	9.4.0
2011-03	RAN#51	R5-110862	0437	-	Measuring throughput with different payload size.	9.3.0	9.4.0
2011-03	RAN#51	R5-110900	0406	-	Correction to SNR reference in FDD PCFICH/PDCCH Single Antenna Port Performance Test	9.3.0	9.4.0
2011-03	RAN#51	R5-110901	0407	-	CR to 36.521-1: Correction of Additional Maximum Power Reduction (A-MPR) test case	9.3.0	9.4.0
2011-03	RAN#51	R5-110915	0408	-	Uncertainties and Test Tolerances for CSI Test cases 9.3.1.1.x and 9.3.2.1.x	9.3.0	9.4.0
2011-03	RAN#51	R5-110916	0409	-	Uncertainties and Test Tolerances for CSI Test cases 9.3.3.1.x	9.3.0	9.4.0
2011-03	RAN#51	R5-110917	0410	-	Uncertainties and Test Tolerances for CSI Test cases 9.4.1.1.x and 9.4.2.1.x	9.3.0	9.4.0
2011-03	RAN#51	R5-110918	0411	-	Uncertainties and Test Tolerances for CSI Test cases 9.5.1.x	9.3.0	9.4.0
2011-03	RAN#51	R5-110919	0412	-	Editorial errors in CSI test cases 9.2.1.x Test procedure	9.3.0	9.4.0
2011-03	RAN#51	R5-110933	0413	-	Handling of different releases in RAN5 LTE RF specification	9.3.0	9.4.0
2011-03	RAN#51	R5-110938	0414	-	PRACH Time mask and EVM tests: TDD Special subframe configuration	9.3.0	9.4.0
2011-03	RAN#51	R5-110939	0415	-	Update on PRACH time mask for TDD	9.3.0	9.4.0
2011-03	RAN#51	R5-110940	0416	-	Correction of the connection diagram reference in the initial conditions for Transmitter Characteristics	9.3.0	9.4.0
2011-03	RAN#51	R5-110941	0417	-	Update of the reference sensitivity requirement for the 1.4MHz and 3MHz bandwidths and note correction for Band 3 and Band 9	9.3.0	9.4.0
2011-03	RAN#51	R5-110942	0418	-	CR Removing brackets of band 41 reference sensitivity in 36.521-1	9.3.0	9.4.0
2011-03	RAN#51	R5-110949	0419	-	PDCCH and PHICH performance tests: Updates and corrections	9.3.0	9.4.0
2011-03	RAN#51	R5-110950	0420	-	Addition of CodeBookSubsetRestriction bitmap for Multi-Layer Spatial Multiplexing	9.3.0	9.4.0
2011-03	RAN#51	R5-110951	0421	-	Addition of exceptional message in 8.4.1.2.2	9.3.0	9.4.0
2011-03	RAN#51	R5-110952	0422	-	CQI test 9.2.2.2: Update acc TS 36.101	9.3.0	9.4.0
2011-03	RAN#51	R5-110953	0423	-	Maximum input level test: Correction to DL-RMC	9.3.0	9.4.0
2011-03	RAN#51	R5-110954	0424	-	Correction of E.7, EVM with exclusion period	9.3.0	9.4.0
2011-03	RAN#51	R5-110967	0425	-	Updates to Additional Spurious emissions and Spurious emission band UE co-existence test	9.3.0	9.4.0
2011-03	RAN#51	R5-110970	0426	-	LTE RF: references to state 3A in 36.521-1	9.3.0	9.4.0
2011-03	RAN#51	R5-110973	0429	-	RI Performance tests: Corrections	9.3.0	9.4.0
2011-03	RAN#51	R5-110975	0430	-	Completion of annex G.3.5 (Minimum test time, performance tests)	9.3.0	9.4.0
2011-03	RAN#51	R5-110978	0431	-	Correction to Band 12 frequency range	9.3.0	9.4.0
2011-03	RAN#51	R5-110979	0432	-	Additional in-band blocking requirement for Band 12	9.3.0	9.4.0
2011-03	RAN#51	R5-110989	0433	-	Completion of annex G.3.6 (test conditions, performance tests)	9.3.0	9.4.0
2011-03	RAN#51	R5-110990	0434	-	Addition of test cases of TDD PDSCH Single-layer and Dual-layer Spatial Multiplexing Performance	9.3.0	9.4.0
2011-03	RAN#51	R5-110991	0435	-	Correction to Times Mask and Power Control tests	9.3.0	9.4.0
2011-03	RAN#51	R5-110992	0436	-	Add requirement of QPSK with partial RB allocation into test requirement of 6.2.3	9.3.0	9.4.0

2011-04	-	-	-	-	Added approved R5-110967 which was missing.	9.4.0	9.4.1
2011-06	RAN#52	R5-112148	0438	-	ON/OFF time mask for PRACH: PRACH configuration index	9.4.1	9.5.0
2011-06	RAN#52	R5-112149	0439	-	CQI tests with frequency selective scheduling mode: Random selection of Sub-Bands	9.4.1	9.5.0
2011-06	RAN#52	R5-112150	0440	-	DL-RMC for receiver tests: Obsolete editors note	9.4.1	9.5.0
2011-06	RAN#52	R5-112211	0441	-	Adding Band 24 to TS 36.521-1	9.4.1	9.5.0
2011-06	RAN#52	R5-112311	0442	-	Correction to the sustained data rate tests	9.4.1	9.5.0
2011-06	RAN#52	R5-112312	0443	-	Correction to the multi-antenna transmission tests	9.4.1	9.5.0
2011-06	RAN#52	R5-112349	0444	-	Update Annex G.3.6 for spatial multiplexing test cases	9.4.1	9.5.0
2011-06	RAN#52	R5-112412	0445	-	Correction to DL RMC for Max input for UE category 2	9.4.1	9.5.0
2011-06	RAN#52	R5-112459	0446	-	EVM window length for PRACH	9.4.1	9.5.0
2011-06	RAN#52	R5-112460	0447	-	Removal of square brackets in Annex G.5.4	9.4.1	9.5.0
2011-06	RAN#52	R5-112462	0448	-	Test tolerances for EVM with exclusion period	9.4.1	9.5.0
2011-06	RAN#52	R5-112808	0449	-	LTE RF - UEs Demodulation and CSI Band applicability	9.4.1	9.5.0
2011-06	RAN#52	R5-112810	0450	-	Correction on test requirement of test case 6.5.2.3	9.4.1	9.5.0
2011-06	RAN#52	R5-112811	0451	-	LTE RF - TC6.3.5.2 Change in Minimum Requirements	9.4.1	9.5.0
2011-06	RAN#52	R5-112812	0452	-	Removable of NS values for TDD	9.4.1	9.5.0
2011-06	RAN#52	R5-112813	0453	-	Correction on initial condition for test cases of 9.3.3	9.4.1	9.5.0
2011-06	RAN#52	R5-112814	0454	-	Correction to 9.4 PMI test cases	9.4.1	9.5.0
2011-06	RAN#52	R5-112816	0455	-	Test procedure change on Tx spurious emissions test cases	9.4.1	9.5.0
2011-06	RAN#52	R5-112850	0456	-	Update of Initial conditions according to table 7.3.3-2 for the 5MHz and 10MHz bandwidths	9.4.1	9.5.0
2011-06	RAN#52	R5-112851	0457	-	lot modelling in frequency-selective interference CQI tests	9.4.1	9.5.0
2011-06	RAN#52	R5-112852	0458	-	Correction to test procedure in 9.5.1	9.4.1	9.5.0
2011-06	RAN#52	R5-112859	0459	-	Introduction of additional PDCCH test cases for Rel-9	9.4.1	9.5.0
2011-06	RAN#52	R5-112860	0460	-	Introduction of additional PHICH test cases for Rel-9	9.4.1	9.5.0
2011-06	RAN#52	R5-112861	0461	-	Introducing UE-selected subband CQI tests for Rel-9	9.4.1	9.5.0
2011-06	RAN#52	R5-112862	0462	-	Introduction of new PMI test cases for UE-selected sub-band reporting for Rel-9	9.4.1	9.5.0
2011-06	RAN#52	R5-112863	0463	-	Addition of a new TC for FDD MBMS performance	9.4.1	9.5.0
2011-06	RAN#52	R5-112864	0464	-	Addition of a new TC for TDD MBMS performance	9.4.1	9.5.0
2011-06	RAN#52	R5-112866	0465	-	Addition of UE category 1 coverage for single-layer spatial multiplexing transmission on antenna port 7 or 8	9.4.1	9.5.0
2011-06	RAN#52	R5-112870	0466	-	Removal of square brackets in annex G.3.5 (Minimum test time, performance tests)	9.4.1	9.5.0
2011-06	RAN#52	R5-112871	0467	-	Update minimum requirements and test requirements for spatial multiplexing test cases	9.4.1	9.5.0
2011-06	RAN#52	R5-112873	0468	-	Test procedure change on few Rx test cases	9.4.1	9.5.0
2011-09	RAN#53	R5-113178	0506	-	RF TC 8.7.2: Correction of the ACK/NACK feedback mode	9.5.0	9.6.0
2011-09	RAN#53	R5-113179	0469	-	RF TC-s 9.3.4: Updates to minimum requirements and corrections to test procedures	9.5.0	9.6.0
2011-09	RAN#53	R5-113180	0470	-	RF: New UL RMC for 10 MHz 15RB-s	9.5.0	9.6.0
2011-09	RAN#53	R5-113181	0471	-	RF: Use of State 3A-RF	9.5.0	9.6.0
2011-09	RAN#53	R5-113233	0472	-	LTE RF: EVM Annex E correction	9.5.0	9.6.0
2011-09	RAN#53	R5-113238	0473	-	RF TC 6.3.4.2.2: Correction to SRS configuration	9.5.0	9.6.0
2011-09	RAN#53	R5-113368	0474	-	Correction in test cases of 8.2.2.1.2 and 8.5.1	9.5.0	9.6.0
2011-09	RAN#53	R5-113369	0475	-	Correction in test cases of 9.5	9.5.0	9.6.0
2011-09	RAN#53	R5-113380	0476	-	Update of minimum test time for PCFICH/PDCCH and PHICH tests	9.5.0	9.6.0
2011-09	RAN#53	R5-113383	0477	-	Correction of Table G.3.5-1 (minimum test time)	9.5.0	9.6.0
2011-09	RAN#53	R5-113419	0478	-	Correction for spurious emission band UE co-existence limits of Band 3	9.5.0	9.6.0
2011-09	RAN#53	R5-113454	0479	-	Correction to test procedure in 6.5.1	9.5.0	9.6.0
2011-09	RAN#53	R5-113455	0480	-	Correction to Minimum requirement in 6.6.2.2	9.5.0	9.6.0
2011-09	RAN#53	R5-113456	0481	-	Correction to RMC for PDCCH/PCFICH performance requirements	9.5.0	9.6.0
2011-09	RAN#53	R5-113458	0482	-	Correction to CSI TCs	9.5.0	9.6.0
2011-09	RAN#53	R5-113541	0483	-	Introduction of Expanded 1900MHz Band (Band 25) into section 5 of 36.521-1	9.5.0	9.6.0
2011-09	RAN#53	R5-113596	0506	-	Abbreviation update and Editorial corrections in TS 36.521-1	9.5.0	9.6.0
2011-09	RAN#53	R5-114000	0484	-	Correction in 6.3.5.2 Power Control Relative power tolerance	9.5.0	9.6.0
2011-09	RAN#53	R5-114001	0485	-	Correction in 6.3.4.2.2 SRS time mask	9.5.0	9.6.0
2011-09	RAN#53	R5-114002	0486	-	Addition of PDSCH TDD performance tests for Low UE categories	9.5.0	9.6.0

2012-09	RAN#57	R5-123989	0743	-	Update test case of in-band blocking for UL-MIMO	10.2.0	10.3.0
2012-09	RAN#57	R5-123990	0744	-	Update test case of out-of-band blocking for UL-MIMO	10.2.0	10.3.0
2012-09	RAN#57	R5-123991	0745	-	Update test case of spurious response for UL-MIMO	10.2.0	10.3.0
2012-09	RAN#57	R5-123992	0746	-	Update test case of wide band Intermodulation for UL-MIMO	10.2.0	10.3.0
2012-09	RAN#57	R5-123994	0747	-	Update test case of Adjacent Channel Selectivity (ACS) for UL-MIMO	10.2.0	10.3.0
2012-12	RAN#58	R5-125109	0749	-	Update of TC6.6.3B.2 for Spurious emissions band UE co-existence for UL-MIMO	10.3.0	10.4.0

2012-12	RAN#58	R5-125110	0750	-	Update of TC6.6.3B.3 for Additional spurious emissions for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125146	0751	-	Corrections to Test Procedure of TC 6.6.2.3 ACLR	10.3.0	10.4.0
2012-12	RAN#58	R5-125147	0752	-	Updates for TC 6.2.3B MPR for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125148	0753	-	Updates for TC 6.6.2.1B SEM for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125149	0754	-	Updates for TC 6.6.2.2B A-SEM for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125150	0755	-	Updates for TC 6.6.2.3B ACLR for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125215	0756	-	Correction of TC 6.6.2.1	10.3.0	10.4.0
2012-12	RAN#58	R5-125252	0757	-	Adding normative reference for core requirements in TC 6.2.4	10.3.0	10.4.0
2012-12	RAN#58	R5-125253	0758	-	Adding normative reference for core requirements for many section 9 tests	10.3.0	10.4.0
2012-12	RAN#58	R5-125254	0759	-	Correction of table references in sub clause G.X	10.3.0	10.4.0
2012-12	RAN#58	R5-125260	0760	-	CR to TC 7.4A: Splitting the CA Maximum input level test case	10.3.0	10.4.0
2012-12	RAN#58	R5-125263	0761	-	RF CI G.3A: General corrections and completion of Annex G.3A with TDD tests	10.3.0	10.4.0
2012-12	RAN#58	R5-125304	0762	-	Updates for Minimum requirements of 6.2.5 Configured UE transmitted Output Power	10.3.0	10.4.0
2012-12	RAN#58	R5-125309	0763	-	Addition of Band 28 definition to Chap.5	10.3.0	10.4.0
2012-12	RAN#58	R5-125311	0764	-	Addition of Band 28 to 6.2.2 MOP	10.3.0	10.4.0
2012-12	RAN#58	R5-125314	0765	-	Addition of Band 28 to 7.3 Refsens	10.3.0	10.4.0
2012-12	RAN#58	R5-125321	0766	-	Updates for TC6.6.1A: Occupied bandwidth for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-125322	0767	-	Updates for TC6.6.2.3A: ACLR for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-125323	0768	-	Updates for TC6.6.3.1A: Transmitter Spurious emissions for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-125346	0769	-	TC 6.2.4A.1 A-MPR for CA updates	10.3.0	10.4.0
2012-12	RAN#58	R5-125351	0770	-	Correction to LTE Rx TCs UL allocation location	10.3.0	10.4.0
2012-12	RAN#58	R5-125365	0771	-	Uncertainties and Test Tolerances for Rel-9 CQI Reporting under fading conditions, PUCCH 1-0 Tests	10.3.0	10.4.0
2012-12	RAN#58	R5-125374	0772	-	Clean up of Tx tests	10.3.0	10.4.0
2012-12	RAN#58	R5-125405	0773	-	Addition of 15MHz and 20MHz Bandwidths for Band 23	10.3.0	10.4.0
2012-12	RAN#58	R5-125407	0774	-	RF TC 6.6.3.2: Clarification and corrections	10.3.0	10.4.0
2012-12	RAN#58	R5-125417	0775	-	Additions to test description for TC 7.5A.1 Adjacent Channel Selectivity (ACS) for CA (intra-band contiguous DL CA and UL CA)	10.3.0	10.4.0
2012-12	RAN#58	R5-125422	0776	-	Introduction to CA_1 & CA_40 TC 7.5A.2 Adjacent Channel Selectivity (ACS) for CA (intra-band contiguous DL CA without UL CA)	10.3.0	10.4.0
2012-12	RAN#58	R5-125443	0777	-	Corrections of RMC for receiver characteristics	10.3.0	10.4.0
2012-12	RAN#58	R5-125445	0778	-	Corrections of FRC subframe allocations for performance requirements	10.3.0	10.4.0
2012-12	RAN#58	R5-125450	0779	-	Introduction of TC 9.2.2.1_D FDD CQI Reporting under AWGN conditions - PUCCH 1-1 for eDL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125451	0780	-	Introduction of TC 9.2.2.2_D TDD CQI Reporting under AWGN conditions - PUCCH 1-1 for eDL-MIMO	10.3.0	10.4.0

2012-12	RAN#58	R5-125452	0781	-	Introduction of TC 9.3.2.2.1_D FDD CQI Reporting under fading conditions - PUCCH 1-1 for eDL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125453	0782	-	Introduction of TC 9.3.2.2.2_D TDD CQI Reporting under fading conditions - PUCCH 1-1 for eDL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125454	0783	-	Additions of eDL-MIMO to Annex A	10.3.0	10.4.0
2012-12	RAN#58	R5-125455	0784	-	Additions of eDL-MIMO to Annex B Propagation Conditions for eDL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125456	0785	-	Additions of eDL-MIMO to Annex F	10.3.0	10.4.0
2012-12	RAN#58	R5-125463	0786	-	Additions to TC 9.4.2.1.1_D FDD PMI Reporting - PUSCH 1-2 (Multiple PMI) for eDL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125464	0787	-	Additions to TC 9.4.2.1.2_D TDD PMI Reporting - PUSCH 1-2 (Multiple PMI) for eDL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125465	0788	-	Additions to TC 9.5.1.1_D FDD RI Reporting for eDL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125466	0789	-	Additions to TC 9.5.1.2_D TDD RI Reporting for eDL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125593	0790	-	RF TC 6.2.4: Minor correction to test points for NS_15	10.3.0	10.4.0
2012-12	RAN#58	R5-125594	0791	-	RF TC 6.2.4B: Minor correction to test points for NS_15	10.3.0	10.4.0
2012-12	RAN#58	R5-125610	0792	-	TS 36-521-1: MPR correction for band 26	10.3.0	10.4.0
2012-12	RAN#58	R5-125801	0793	-	Updates of 6.3.3A UE Transmit OFF power for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-125802	0794	-	Update of Annex F in 36.521-1	10.3.0	10.4.0
2012-12	RAN#58	R5-125803	0795	-	Updates for 6.3.4A ON/OFF time mask for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-125804	0796	-	Addition of Transmitter test case - Transmit intermodulation for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-125835	0797	-	Update of TC6.6.3B.1 for Transmitter Spurious emissions for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125851	0798	-	Introduction of TC 8.3.1.2.1_D FDD PDSCH Dual-layer Spatial Multiplexing for eDL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125852	0799	-	Introduction of TC 8.3.2.2.1_D TDD PDSCH Dual-layer Spatial Multiplexing for eDL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125853	0800	-	Additions to Annex G for eDL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125854	0801	-	Corrections to Annex H for eDL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125855	0802	-	Additions to TC 8.3.2.1.2_D TDD Single-Layer Spatial Multiplexing on antenna ports without a simultaneous transmission for eDL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125856	0803	-	Additions to TC 8.3.2.1.3_D TDD Single-Layer Spatial Multiplexing on antenna ports with a simultaneous transmission for eDL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125857	0804	-	Introduction of Band 27 to TS 36.521-1	10.3.0	10.4.0
2012-12	RAN#58	R5-125858	0805	-	Updates to TC 8.2.2.3.1_A.1 for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-125859	0806	-	Addition of new test case 8.2.1.4.2_A.1 for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-125860	0807	-	Addition of new test case 8.2.2.4.2_A.1 for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-125861	0808	-	Addition of sustained downlink data rate TC 8.7.1.1_A.1 for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-125862	0809	-	Addition of sustained downlink data rate TC 8.7.1.1_A.2 for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-125866	0810	-	Update of RF TC for 36.521-1 _ 6.3.5A.2.1 Power Control Relative power tolerance for CA	10.3.0	10.4.0

2012-12	RAN#58	R5-125867	0811	-	Update TC 6.6.3.2_1 Spurious emission band UE co-existence(Release 9 and forward)	10.3.0	10.4.0
2012-12	RAN#58	R5-125868	0812	-	Correction to test applicability in 6.2.4 A-MPR test case	10.3.0	10.4.0
2012-12	RAN#58	R5-125869	0813	-	Correction to test parameter in Perf 8.2.1 of 36.521-1	10.3.0	10.4.0
2012-12	RAN#58	R5-125870	0814	-	Clarification of AG level for 8.7 sustained data rate test of 36.521-1	10.3.0	10.4.0
2012-12	RAN#58	R5-125871	0815	-	Correction to SNR test points in test procedure	10.3.0	10.4.0
2012-12	RAN#58	R5-125872	0816	-	Clarification of random precoding granularity	10.3.0	10.4.0
2012-12	RAN#58	R5-125873	0817	-	Update of General sections for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-125874	0818	-	Introduction to CA_1-5 TC 7.5A.3 Adjacent Channel Selectivity (ACS) for CA (inter-band DL CA without UL CA)	10.3.0	10.4.0
2012-12	RAN#58	R5-125875	0819	-	Addition of a new TC 6.3.5A.3.1 Aggregate power control tolerance for CA(intra-band contiguous DL CA and UL CA)	10.3.0	10.4.0
2012-12	RAN#58	R5-125876	0820	-	Addition of a new TC 6.6.3.2A.1 Spurious emission band UE co-existence for CA(intra-band contiguous DL CA and UL CA)	10.3.0	10.4.0
2012-12	RAN#58	R5-125890	0821	-	Addition of Band 28 to 6.6.3.2 Spurious emission band UE co-existence	10.3.0	10.4.0
2012-12	RAN#58	R5-125891	0822	-	Addition of Band 28 to 6.6.3.3 Additional spurious emissions	10.3.0	10.4.0
2012-12	RAN#58	R5-125892	0823	-	UE output power definition for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125893	0824	-	Update TC 6.2.4B Additional maximum power reduction (A-MPR) for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125894	0825	-	Update TC 6.5.2B.1 Error vector magnitude (EVM) for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125895	0826	-	Update TC 6.2.5B Configured transmitted output power for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125896	0827	-	Update TC 7.3B Reference sensitivity level for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125897	0828	-	Update TC 7.4B Maximum input level for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125898	0829	-	Update TC 7.5B Adjacent Channel Selectivity (ACS) for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125899	0830	-	Update TC 7.6.1B In-band blocking for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125900	0831	-	Update TC 7.6.2B Out-of-band blocking for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125901	0832	-	Update TC 7.6.3B Narrow band blocking for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125902	0833	-	Update TC 7.7B Spurious response for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125903	0834	-	Update TC 7.8.1B Wide band intermodulation for UL-MIMO	10.3.0	10.4.0
2012-12	RAN#58	R5-125906	0835	-	New RF TC for 36.521-1_8.2.1.2.3_Enhanced ICIC for LTE	10.3.0	10.4.0
2012-12	RAN#58	R5-125907	0836	-	New RF TC for 36.521-1_8.4.1.2.3_Enhanced ICIC for LTE	10.3.0	10.4.0
2012-12	RAN#58	R5-125908	0837	-	TDD CQI Reporting under AWGN conditions-PUCCH 1-0-Demod subframe overlaps with aggressor cell ABS (eICIC)	10.3.0	10.4.0
2012-12	RAN#58	R5-125909	0838	-	TDD PHICH Transmit Diversity 2x2-Demod subframe overlaps with aggressor cell ABS (eICIC)	10.3.0	10.4.0
2012-12	RAN#58	R5-125910	0839	-	TDD PDSCH Open Loop Spatial Multiplexing 2x2 Demod subframe overlaps with aggressor cell ABS (eICIC)	10.3.0	10.4.0
2012-12	RAN#58	R5-125924	0841	-	CR to 8.2.1.1.1_A: Correction to an average throughput measurement	10.3.0	10.4.0

2012-12	RAN#58	R5-125925	0842	-	CR to 8.2.1.3.1_A: Correction to an average throughput measurement	10.3.0	10.4.0
2012-12	RAN#58	R5-125931	0844	-	Additions to test description TC 6.2.5A.1 and 6.2.5A.2 including CA_1A-19A and CA_1A-21A updates	10.3.0	10.4.0
2012-12	RAN#58	R5-125932	0845	-	Updates for TC7.3A: Reference sensitivity level for CA including CA_41C, CA_1-19 and CA_1-21	10.3.0	10.4.0
2012-12	RAN#58	R5-125934	0846	-	Update of RF TC for 36.521-1_6.3.5A.1.1 Power Control Absolute power tolerance for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-125935	0847	-	Updates for TC6.5.1A: Frequency error for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-126043	0849	-	Updates for 5.2A operating bands for CA_7, CA_38, CA_41, CA_1-18, CA_1-19, CA_1-21, CA_2-17, CA_3-5, CA_3-7, CA_3-8, CA_3-20, CA_4-12, CA_4-13, CA_4-17, CA_4-20	10.3.0	10.4.0
2012-12	RAN#58	R5-126044	0850	-	Updates for 5.4.2A channel bandwidth for CA_7, CA_38, CA_41, CA_1-18, CA_1-19, CA_1-21, CA_2-17, CA_3-5, CA_3-7, CA_3-8, CA_3-20, CA_4-12, CA_4-13, CA_4-17, CA_4-20	10.3.0	10.4.0
2012-12	RAN#58	R5-126063	0840	-	Update of Perf 8.7.1.1 and 8.7.2.1 of 36.521-1	10.3.0	10.4.0
2012-12	RAN#58	R5-126065	0843	-	Clarification of RB position in 9.4.1 and 9.4.2	10.3.0	10.4.0
2012-12	RAN#58	R5-126066	0848	-	Update of minimum test time in Annex G.3.5	10.3.0	10.4.0
2012-12	RAN#58	R5-124010	0851	-	RF CI 8.1.1: Update of the CA capability table	10.3.0	10.4.0
2012-12	RAN#58	R5-124013	0852	-	RF CI 8.7.2.1A: Update of test structure according to the work plan	10.3.0	10.4.0
2012-12	RAN#58	R5-124082	0853	-	Correction to TC 7.5.1 Adjacent Channel Selectivity (ACS)	10.3.0	10.4.0
2012-12	RAN#58	R5-124116	0854	-	Addition to test description for SEM for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-124123	0855	-	Addition to minimum requirement for TC 6.5.2A.3.1 in-band emissions for non allocated RB for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-124125	0856	-	TC 6.2.2A.1 UE MOP for CA updates	10.3.0	10.4.0
2012-12	RAN#58	R5-124126	0857	-	CR to Annex G.3A.5: Minimum number of samples for CA performance tests	10.3.0	10.4.0
2012-12	RAN#58	R5-124131	0858	-	Additions to test case for TC 6.2.3A.1 Maximum Power Reduction (MPR) for CA (intra-band contiguous DL CA and UL CA)	10.3.0	10.4.0
2012-12	RAN#58	R5-124133	0859	-	Introduction to TC 6.6.3.3A.1 Additional spurious emissions for CA (intra-band contiguous DL CA and UL CA)	10.3.0	10.4.0
2012-12	RAN#58	R5-124139	0860	-	TC 6.3.2A.1 Minimum Output Power for CA introduction	10.3.0	10.4.0
2012-12	RAN#58	R5-124149	0861	-	RF TC 8.2.2.1.1_A: Adjusting test procedure and requirements to completed Annex G.3A	10.3.0	10.4.0
2012-12	RAN#58	R5-124160	0862	-	TC 7.6.1A.x In-band blocking for CA introduction	10.3.0	10.4.0
2012-12	RAN#58	R5-124163	0863	-	TC 7.6.2A.x Out-of-band blocking for CA introduction	10.3.0	10.4.0
2012-12	RAN#58	R5-124164	0864	-	TC 7.6.3A.x Narrow-band blocking for CA introduction	10.3.0	10.4.0
2012-12	RAN#58	R5-124165	0865	-	TC 7.7A.x Spurious response for CA introduction	10.3.0	10.4.0
2012-12	RAN#58	R5-124166	0866	-	Addition of Receiver test case - Wideband intermodulation for CA	10.3.0	10.4.0
2012-12	RAN#58	R5-124186	0867	-	RF: Addition of references to connection diagrams in CA tests	10.3.0	10.4.0
2013-03	RAN#59	R5-130092	0851	-	Updates of 6.6.3.3 - Addition of Low-channel Band 1 coexistence with PHS condition	10.4.0	10.5.0

2013-03	RAN#59	R5-130105	0854	-	Update of TC6.6.3B.2 for Spurious emissions band UE co-existence for UL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130125	0856	-	Update of TC6.6.3B.3 for Additional spurious emissions for UL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130128	0857	-	Update TC 6.2.4B Additional Maximum Power Reduction (AMPR) for UL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130129	0858	-	Update TC 6.3.5B.1 Power control absolute power tolerance for UL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130130	0859	-	Update TC 6.3.5B.2 Power Control Relative power tolerance for UL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130131	0860	-	Update TC 6.3.5B.3 Aggregate power control tolerance for UL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130132	0861	-	Update TC 6.5.2B.2 Carrier leakage for UL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130133	0862	-	Update TC 6.3.2B Minimum Output Power for UL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130134	0863	-	Update TC 6.6.1B Occupied bandwidth for UL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130135	0864	-	Update TC 6.7B Transmit intermodulation for UL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130176	0869	-	Introduction of new rel-10 Reporting of RI test cases into annexes	10.4.0	10.5.0
2013-03	RAN#59	R5-130182	0870	-	CA RF: Correction to Annex I	10.4.0	10.5.0
2013-03	RAN#59	R5-130183	0871	-	UL-MIMO RF: Correction to Annex I	10.4.0	10.5.0
2013-03	RAN#59	R5-130184	0872	-	eICIC RF: Correction to Annex I	10.4.0	10.5.0
2013-03	RAN#59	R5-130185	0873	-	eDL-MIMO RF: Correction to Annex I	10.4.0	10.5.0
2013-03	RAN#59	R5-130188	0874	-	RF: Correction to TC 8.2.1.1.1 - Frequency range for partial allocation	10.4.0	10.5.0
2013-03	RAN#59	R5-130245	0877	-	Additions to TC 6.6.2.3A.1 Adjacent Channel Leakage power Ratio for CA (intra-band contiguous DL CA and UL CA)	10.4.0	10.5.0
2013-03	RAN#59	R5-130273	0880	-	Corrections to Annex A DL Reference Measurement and PMI Accuracy Measurements	10.4.0	10.5.0
2013-03	RAN#59	R5-130285	0881	-	Correction to TC 8.3.2.1.3 TDD PDSCH Single-layer Spatial Multiplexing on antenna port 7 or 8 with a simultaneous transmission	10.4.0	10.5.0
2013-03	RAN#59	R5-130288	0882	-	Addition to TC 9.2.2.2_D TDD CQI Reporting under AWGN conditions - PUCCH 1-1 for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130291	0883	-	Addition to TC 9.3.2.2.2_D TDD CQI Reporting under fading conditions " PUCCH 1-1 for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130292	0884	-	Additions to TC 9.4.2.1.1_D FDD PMI Reporting - PUSCH 1-2 (Multiple PMI) for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130293	0885	-	Additions to TC 9.4.2.1.2_D TDD PMI Reporting - PUSCH 1-2 (Multiple PMI) for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130298	0886	-	CA RF: Correction to TC 7.6.1A	10.4.0	10.5.0
2013-03	RAN#59	R5-130299	0887	-	Uncertainties and Test Tolerances for Test case 7.4A	10.4.0	10.5.0
2013-03	RAN#59	R5-130308	0888	-	Corrections to test procedure of TC 6.2.2 UE Maximum Output Power	10.4.0	10.5.0
2013-03	RAN#59	R5-130309	0889	-	Corrections to test purpose of TC 6.2.3 Maximum Power Reduction (MPR)	10.4.0	10.5.0
2013-03	RAN#59	R5-130310	0890	-	Correction to test procedure of TC 6.7A.1 Transmit Intermodulation for CA	10.4.0	10.5.0

2013-03	RAN#59	R5-130407	0894	-	Correction to test requirement of 6.2.4A	10.4.0	10.5.0
2013-03	RAN#59	R5-130408	0895	-	Correction to test procedure in 6.3.5A.1	10.4.0	10.5.0
2013-03	RAN#59	R5-130411	0896	-	Correction to test procedure in 6.6.2.3A	10.4.0	10.5.0
2013-03	RAN#59	R5-130413	0897	-	Correction to 7.6.3A.3 test procedure	10.4.0	10.5.0
2013-03	RAN#59	R5-130415	0898	-	Correction to 6.6.3.2A and 6.6.3.3A	10.4.0	10.5.0
2013-03	RAN#59	R5-130416	0899	-	Correction to 6.6.3B.2 and 6.6.3B.3	10.4.0	10.5.0
2013-03	RAN#59	R5-130419	0900	-	Correction to 9.3.4 UE-selected subband CQI	10.4.0	10.5.0
2013-03	RAN#59	R5-130421	0901	-	Correction to wideband CQI-samples	10.4.0	10.5.0
2013-03	RAN#59	R5-130427	0902	-	Update of minimum test time in Annex G.5.4	10.4.0	10.5.0
2013-03	RAN#59	R5-130471	0905	-	Update of spurious emission test cases for introduction of Japanese Regulatory Requirements for LTE Band 8	10.4.0	10.5.0
2013-03	RAN#59	R5-130779	0875	1	CA RF: Clarification on Cell ID	10.4.0	10.5.0
2013-03	RAN#59	R5-130780	0903	1	Correction to 941 and 942	10.4.0	10.5.0
2013-03	RAN#59	R5-130801	0908	-	Additions of CA RF test cases to Annex F	10.4.0	10.5.0
2013-03	RAN#59	R5-130804	0909	-	Correction to 6.6.3.2 and 6.6.3.3	10.4.0	10.5.0
2013-03	RAN#59	R5-130806	0911	-	Update TC 6.6.3.2 Spurious emission band UE co-existence	10.4.0	10.5.0
2013-03	RAN#59	R5-130808	0912	-	CA RF - SCC configuration references	10.4.0	10.5.0
2013-03	RAN#59	R5-130809	0913	-	CA RF Rx - Update of blocking characteristics	10.4.0	10.5.0
2013-03	RAN#59	R5-130811	0915	-	LTE RF - Correction to LTE Rx TCs UL allocation location	10.4.0	10.5.0
2013-03	RAN#59	R5-130901	0916	-	Update of TC 8.7.2.1_A.1 TDD sustained data rate performance for CA (intra-band contiguous DL CA)	10.4.0	10.5.0
2013-03	RAN#59	R5-130902	0917	-	Editorial correction for ON/OFF time mask for CA	10.4.0	10.5.0
2013-03	RAN#59	R5-130903	0918	-	Correction to Band 12 frequency for CA_4-12	10.4.0	10.5.0
2013-03	RAN#59	R5-130908	0920	-	Additions of eDL-MIMO to Annex A.4 CQI Reference Measurement Channels	10.4.0	10.5.0
2013-03	RAN#59	R5-130909	0921	-	Introduction of TC 8.3.1.1.1_D FDD Single-Layer Spatial Multiplexing on antenna ports without a simultaneous transmission for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130910	0922	-	Introduction of FDD TC 8.3.1.1.2_D FDD Single-Layer Spatial Multiplexing on antenna ports with a simultaneous transmission for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130911	0923	-	Additions to TC 8.3.1.2.1_D FDD PDSCH Dual-layer Spatial Multiplexing for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130912	0924	-	Additions to TC 8.3.2.2.1_D TDD PDSCH Dual-layer Spatial Multiplexing for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130913	0925	-	Additions to TC 8.3.2.1.2_D TDD Single-Layer Spatial Multiplexing on antenna ports without a simultaneous transmission for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130914	0926	-	Additions to TC 8.3.2.1.3_D TDD Single-Layer Spatial Multiplexing on antenna ports with a simultaneous transmission for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130924	0934	-	Update RF TC for 36.521-1_8.2.1.2.3_C FDD PDSCH Transmit div 2x2 Enhanced ICIC for LTE	10.4.0	10.5.0
2013-03	RAN#59	R5-130925	0935	-	Update RF TC for 36.521-1_8.4.1.2.3_C FDD PCFICH PDCCH Transmit div 2x2 Enhanced ICIC for LTE	10.4.0	10.5.0

2013-03	RAN#59	R5-130935	0937	-	SNR uncertainty	10.4.0	10.5.0
2013-03	RAN#59	R5-130936	0938	-	Introduction of new rel-10 Reporting of RI test cases	10.4.0	10.5.0
2013-03	RAN#59	R5-130937	0939	-	RF: Corrections to Annex H - Default uplink settings	10.4.0	10.5.0
2013-03	RAN#59	R5-130938	0940	-	Update of TC 8.7.2.1_1 TDD sustained data rate performance (Rel-10 and forward)	10.4.0	10.5.0
2013-03	RAN#59	R5-130939	0941	-	Clarification to Soft Channel Bit size used by SS and UE	10.4.0	10.5.0
2013-03	RAN#59	R5-130940	0942	-	Correction to sustained data rate performance test	10.4.0	10.5.0
2013-03	RAN#59	R5-130941	0943	-	Clean up on performance tests	10.4.0	10.5.0
2013-03	RAN#59	R5-130944	0944	-	Update TC 6.3.5A.3.1 Aggregate power control tolerance for CA (intra-band contiguous DL CA and UL CA)	10.4.0	10.5.0
2013-03	RAN#59	R5-130945	0945	-	Update TC 6.6.3.2A.1 Spurious emission band UE co-existence for CA (intra-band contiguous DL CA and UL CA)	10.4.0	10.5.0
2013-03	RAN#59	R5-130946	0946	-	Additions to TC 6.2.5A.1 Configured UE transmitted Power for CA (intra-band contiguous DL CA and UL CA)	10.4.0	10.5.0
2013-03	RAN#59	R5-130947	0947	-	Additions to TC 6.6.3.3A.1 Additional spurious emissions for CA (intra-band contiguous DL CA and UL CA)	10.4.0	10.5.0
2013-03	RAN#59	R5-130948	0948	-	Additions to TC 7.5A.1 Adjacent Channel Selectivity (ACS) for CA (intra-band contiguous DL CA and UL CA)	10.4.0	10.5.0
2013-03	RAN#59	R5-130949	0949	-	Additions to TC 7.5A.2 Adjacent Channel Selectivity (ACS) for CA (intra-band contiguous DL CA without UL CA)	10.4.0	10.5.0
2013-03	RAN#59	R5-130950	0950	-	Additions to TC 7.5A.3 Adjacent Channel Selectivity (ACS) for CA (inter-band contiguous DL CA without UL CA)	10.4.0	10.5.0
2013-03	RAN#59	R5-130951	0951	-	Correction to test point of Frequency Error for CA and addition of TC for intra-band contiguous DL CA without UL CA	10.4.0	10.5.0
2013-03	RAN#59	R5-130961	0955	-	Channel matrix impairments for eDL-MIMO CSI tests	10.4.0	10.5.0
2013-03	RAN#59	R5-130965	0957	-	TC 9.4.1.1.1_D FDD Reporting of PMI - PUSCH 3-1 (Single PMI) for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130966	0958	-	TC 9.4.1.1.2_D TDD Reporting of PMI -PUSCH 3-1 (Single PMI) for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130967	0959	-	Additions of eDL-MIMO to Annex C Measurement of Performance Requirements	10.4.0	10.5.0
2013-03	RAN#59	R5-130968	0960	-	Additions of eDL-MIMO test cases to Annex F	10.4.0	10.5.0
2013-03	RAN#59	R5-130969	0961	-	Additions to Annex G for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130970	0962	-	Addition to TC 9.2.2.1_D FDD CQI Reporting under AWGN conditions - PUCCH 1-1 for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130971	0963	-	Addition to TC 9.3.2.2.1_D FDD CQI Reporting under fading conditions - PUCCH 1-1 for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130972	0964	-	Additions to TC 9.5.1.1_D FDD RI Reporting for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130973	0965	-	Additions to TC 9.5.1.2_D TDD RI Reporting for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130978	0966	-	Correcting TS 36.521-1 to reflect changes in 36.101	10.4.0	10.5.0
2013-03	RAN#59	R5-130979	0967	-	Correction of RF conformance Test case: 8.2.1.3.3	10.4.0	10.5.0
2013-03	RAN#59	R5-130980	0968	-	Addition new TC 8.2.2.3.3 TDD PDSCH Open Loop Spatial Multiplexing 2x2-Demod subframe overlaps with aggressor cell ABS (eICIC)	10.4.0	10.5.0
2013-03	RAN#59	R5-130994	0969	-	Corrections to 7.8.1A Wideband intermodulation for CA	10.4.0	10.5.0

2013-03	RAN#59	R5-130998	0970	-	TC 9.3.1.2.1_D FDD CQI Reporting under fading conditions - PUSCH 3-1 for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130999	0971	-	TC 9.3.1.2.2_D TDD CQI Reporting under fading conditions - PUSCH 3-1 for eDL-MIMO	10.4.0	10.5.0
2013-03	RAN#59	R5-130093	0852	-	Updates of 5.2A Operating bands for CA_11-18	10.5.0	11.0.0
2013-03	RAN#59	R5-130094	0853	-	Updates of 5.4.2A Channel bandwidth combination for CA_11-18	10.5.0	11.0.0
2013-03	RAN#59	R5-130124	0855	-	Additions to the inter-band relaxation term for CA 3A-8A in Table 6.2.5A.1.3-3	10.5.0	11.0.0
2013-03	RAN#59	R5-130140	0865	-	Update TC 7.3A.3 Reference sensitivity level for CA_3-7 and CA_7-20 (inter-band DL CA without UL CA)	10.5.0	11.0.0
2013-03	RAN#59	R5-130141	0866	-	Update TC 7.6.2A.1 Out-of-band blocking for CA_38 (intra-band contiguous DL CA and UL CA)	10.5.0	11.0.0
2013-03	RAN#59	R5-130142	0867	-	Update TC 6.2.2A.1 UE Maximum Output Power for CA_38 (intra-band contiguous DL CA and UL CA)	10.5.0	11.0.0
2013-03	RAN#59	R5-130144	0868	-	Update TC 6.2.4A.1 Additional Maximum Power Reduction (A-MPR) for CA_38 (intra-band contiguous DL CA and UL CA)	10.5.0	11.0.0
2013-03	RAN#59	R5-130239	0876	-	Updates of 6.2.5A - inter-band relaxation term for CA_1A-18A and CA_11A-18A	10.5.0	11.0.0
2013-03	RAN#59	R5-130257	0878	-	Addition of TDD operating band 44 in receiver characteristic test cases	10.5.0	11.0.0
2013-03	RAN#59	R5-130258	0879	-	Addition of TDD operating band 44 in transmitter characteristic test cases	10.5.0	11.0.0
2013-03	RAN#59	R5-130329	0891	-	Updates for 7.6.1A.1 in-band blocking for CA_7 and CA_41	10.5.0	11.0.0
2013-03	RAN#59	R5-130330	0892	-	Updates for 7.6.2A.1 Out-of-band blocking for CA_7 and CA_41	10.5.0	11.0.0
2013-03	RAN#59	R5-130348	0972	-	Correction to Spurious emission band UE co-existence and Additional spurious emissions for Band 28	10.5.0	11.0.0
2013-03	RAN#59	R5-130349	0893	-	Addition of Band 28 to MPR and A-MPR	10.5.0	11.0.0
2013-03	RAN#59	R5-130769	0907	-	Updates of Refsens for inter-band CA test points for CA_1A-19A and CA_1A-21A	10.5.0	11.0.0
2013-03	RAN#59	R5-130783	0906	-	Update TC 6.2.3A.1 Maximum Power Reduction (MPR) for CA_38 (intra-band contiguous DL CA and UL CA)	10.5.0	11.0.0
2013-03	RAN#59	R5-130805	0910	-	Update TC 7.3A.1 Reference sensitivity level for CA_38, CA_3-7 and CA_7-20 (intra-band contiguous DL CA and UL CA)	10.5.0	11.0.0
2013-03	RAN#59	R5-130810	0914	-	CA_2-17 and CA_4-17 addition to 36.521-1 Rx characteristics	10.5.0	11.0.0
2013-03	RAN#59	R5-130905	0919	-	Addition of TDD operating band 44 in chapter 5	10.5.0	11.0.0
2013-03	RAN#59	R5-130915	0927	-	Addition of band 38 and band 41 in intra-band contiguous CA transmitter test cases	10.5.0	11.0.0
2013-03	RAN#59	R5-130916	0928	-	Update TC 7.6.1A.1 In-band blocking for CA_38 (intra-band contiguous DL CA and UL CA)	10.5.0	11.0.0
2013-03	RAN#59	R5-130917	0929	-	Addition of Inter Band CA combo CA_2A-29A	10.5.0	11.0.0
2013-03	RAN#59	R5-130918	0930	-	Update of 6.2.5A Configured transmitted power for CA	10.5.0	11.0.0
2013-03	RAN#59	R5-130919	0931	-	CA_2-17 and CA_4-17 addition to 36.521-1 Tx characteristics	10.5.0	11.0.0
2013-03	RAN#59	R5-130920	0932	-	Adding transmit power relaxation value for inter-band CA configurations CA_4A-5A and CA_4A-13A	10.5.0	11.0.0

2013-03	RAN#59	R5-130921	0933	-	Adding refsens relaxation value for inter-band CA configurations CA_4A-5A and CA_4A-13A	10.5.0	11.0.0
2013-03	RAN#59	R5-130926	0936	-	Updates for 6.6.2.1A Spectrum emission mask for CA for CA_7 and CA_41	10.5.0	11.0.0
2013-03	RAN#59	R5-130956	0952	-	Updates for 7.3A.1 Reference sensitivity level for CA_7C	10.5.0	11.0.0
2013-03	RAN#59	R5-130957	0953	-	Updates for 6.2.2A UE Maximum Output Power for CA_7 and CA_41	10.5.0	11.0.0
2013-03	RAN#59	R5-130958	0954	-	Updates of 7.3A - Reference sensitivity level for CA_11A-18A	10.5.0	11.0.0
2013-03	RAN#59	R5-130964	0956	-	Adding Band 27 to TS 36.521-1	10.5.0	11.0.0
2013-03	RAN#59	-	-	-	Correction of missing small changes of R5-130806 in Table 6.6.3.2.3-1, 6.6.3.2.5-1, 6.6.3.2_1.3-1 and 6.6.3.2_1.5-1.	11.0.0	11.0.1
2013-06	RAN#60	R5-131085	0973	-	Removal of technical content in 36.521-1 v10.5.0 and substitution with pointer to the next Release	11.0.1	11.1.0
2013-06	RAN#60	R5-131147	0974	-	Updates to Chapter7 for Inter Band CA combo CA_2A-29A	11.0.1	11.1.0
2013-06	RAN#60	R5-131149	0975	-	New chap8 TDD TC 8.2.2.2.3_C for eICIC	11.0.1	11.1.0
2013-06	RAN#60	R5-131150	0976	-	New chap 8 TDD TC 8.4.2.2.3_C for eICIC	11.0.1	11.1.0
2013-06	RAN#60	R5-131153	0977	-	Introduction of new rel-11 Reporting of RI test cases	11.0.1	11.1.0
2013-06	RAN#60	R5-131154	0978	-	Introduction of new rel-11 Reporting of RI test cases into annexes	11.0.1	11.1.0
2013-06	RAN#60	R5-131156	0979	-	Correction to TC 8.4.1.1 test procedure	11.0.1	11.1.0
2013-06	RAN#60	R5-131158	0980	-	Introduction of Maximum Input Level test case for CA (inter-band DL CA without UL CA) into annexes	11.0.1	11.1.0
2013-06	RAN#60	R5-131210	0981	-	Correction of test applicability for TC 8.2.1.1.1_1: TC 8.2.1.2.1_1 and TC 8.3.2.1.1_1 in 36.521-1	11.0.1	11.1.0
2013-06	RAN#60	R5-131222	0982	-	Update of TC6.6.3B.1 for Transmitter Spurious emissions for UL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131226	0983	-	Clarification to test procedure on applying timing offset between CCs for Chap8 inter-band CA test cases	11.0.1	11.1.0
2013-06	RAN#60	R5-131238	0984	-	Update TC 6.2.4A.1 Additional Maximum Power Reduction (A-MPR) for CA_38C (intra-band contiguous DL CA and UL CA)	11.0.1	11.1.0
2013-06	RAN#60	R5-131241	0985	-	Update TC 7.3A.1 Reference sensitivity level for CA_4A-12A (intra-band contiguous DL CA and UL CA)	11.0.1	11.1.0
2013-06	RAN#60	R5-131242	0986	-	Update TC 7.3A.3 Reference sensitivity level for CA_4A-12A (inter-band DL CA without UL CA)	11.0.1	11.1.0
2013-06	RAN#60	R5-131245	0987	-	Update TT of 6.3.5A.3.1 Aggregate power control tolerance for CA (intra-band contiguous DL CA and UL CA)	11.0.1	11.1.0
2013-06	RAN#60	R5-131289	0988	-	Uncertainties and Test Tolerances for CA spectrum emission mask	11.0.1	11.1.0
2013-06	RAN#60	R5-131358	0989	-	RF: Corrections to RMC-s for sustained data rate test	11.0.1	11.1.0
2013-06	RAN#60	R5-131379	0990	-	CA RF - Corrections to 6.2.4A.1 requirements	11.0.1	11.1.0
2013-06	RAN#60	R5-131381	0991	-	LTE RF - Editorial correction to 8.2.2.4.2_1	11.0.1	11.1.0
2013-06	RAN#60	R5-131415	0992	-	Updates for 6.6.1A Occupied bandwidth for CA_41C	11.0.1	11.1.0
2013-06	RAN#60	R5-131450	0993	-	Addition of band44 in MPR for UL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131473	0994	-	References to wrong section in TS 36.508	11.0.1	11.1.0
2013-06	RAN#60	R5-131518	0995	-	Corrections to Common Test Parameters User-Specific	11.0.1	11.1.0

2013-06	RAN#60	R5-131519	0996	-	Corrections to Beamforming Model Parameters	11.0.1	11.1.0
2013-06	RAN#60	R5-131521	0997	-	Corrections to Reporting of Channel State Requirements	11.0.1	11.1.0
2013-06	RAN#60	R5-131522	0998	-	Corrections to Reporting of Precoding Matrix Indicator Requirements	11.0.1	11.1.0
2013-06	RAN#60	R5-131527	0999	-	Additions to Annex G for eDL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131528	1000	-	Additions of eDL-MIMO test cases to Annex F	11.0.1	11.1.0
2013-06	RAN#60	R5-131539	1001	-	LTE RF: Minor changes to test case 7.5A.3	11.0.1	11.1.0
2013-06	RAN#60	R5-131540	1002	-	LTE-RF: Clarification to 7.6.1A.3 test procedure	11.0.1	11.1.0
2013-06	RAN#60	R5-131541	1003	-	Corrections to TC 6.6.2.3A.1 Adjacent Channel Leakage power Ratio for CA (intra-band contiguous DL CA and UL CA)	11.0.1	11.1.0
2013-06	RAN#60	R5-131545	1004	-	Additions to TC 9.2.3.1_D for FDD CQI reporting under AWGN conditions - PUCCH 1-1 for eDL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131546	1005	-	LTE-RF: Corrections to CA Open Loop Spatial Multiplexing Performance test cases	11.0.1	11.1.0
2013-06	RAN#60	R5-131553	1006	-	Additions to TC 9.2.3.2_D for TDD CQI reporting under AWGN conditions - PUCCH 1-1 for eDL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131555	1007	-	Additions to TC 9.3.1.2.2_D for TDD CQI reporting under fading conditions - PUSCH 3-1 for eDL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131559	1008	-	Additions to TC 9.3.2.2.2_D for TDD CQI reporting under fading conditions - PUCCH 1-1 for eDL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131561	1009	-	Update of 6.2.5A - Delta TIB for CA_11A-18A	11.0.1	11.1.0
2013-06	RAN#60	R5-131562	1010	-	Additions to TC 9.4.1.3.2_D for TDD reporting of PMI-PUSCH 3-1 (Single PMI) for eDL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131563	1011	-	Update of 7.3A - Delta RIB for CA_11A-18A	11.0.1	11.1.0
2013-06	RAN#60	R5-131567	1012	-	Additions to TC 9.4.2.3.2_D for TDD PMI reporting - PUSCH 1-2 (Multiple PMI) for eDL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131569	1013	-	Additions to TC 9.5.2.2_D for TDD RI reporting - PUCCH 1-1 for eDL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131634	1014	-	Removal of Spurious emission UE co-existence test case 6.6.3.2_1 from annex F	11.0.1	11.1.0
2013-06	RAN#60	R5-131649	1015	-	Adding Band28 in some Receiver test cases in section 7	11.0.1	11.1.0
2013-06	RAN#60	R5-131677	1016	-	Correction to the contents of the chapter 5.	11.0.1	11.1.0
2013-06	RAN#60	R5-131711	1017	-	Corrections to test procedure of TC 7.5B Adjacent Channel Selectivity (ACS) for UL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131900	1018	-	RF: Correction of Imcs for CQI index 10 (15 RBs)	11.0.1	11.1.0
2013-06	RAN#60	R5-131901	1019	-	Corrections to Frequency non-selective scheduling mode	11.0.1	11.1.0
2013-06	RAN#60	R5-131902	1020	-	Correction to the missing title of Rel-9 close loop tests	11.0.1	11.1.0
2013-06	RAN#60	R5-131903	1021	-	Correction to the references of connection diagrams	11.0.1	11.1.0
2013-06	RAN#60	R5-131904	1022	-	Maintenance of Band 23 additional regulatory requirements	11.0.1	11.1.0
2013-06	RAN#60	R5-131905	1023	-	Realignment of A-MPR Configuration Tables for Band 27 in TS 36.521-1	11.0.1	11.1.0
2013-06	RAN#60	R5-131906	1024	-	Update on General section of Tx and Rx for Cell IDs	11.0.1	11.1.0
2013-06	RAN#60	R5-131907	1025	-	LTE RF: Initial conditions update for test 6.2.5A.2	11.0.1	11.1.0

2013-06	RAN#60	R5-131908	1026	-	CA RF: Alignment for inter-band Rx tests with DL tested only as S-Cell	11.0.1	11.1.0
2013-06	RAN#60	R5-131909	1027	-	36.521-1: Inter-band CA operating bands update	11.0.1	11.1.0
2013-06	RAN#60	R5-131911	1028	-	Updates for 7.7A.1 Spurious response for CA	11.0.1	11.1.0
2013-06	RAN#60	R5-131915	1029	-	Additions to TC 9.3.1.2.1_D for FDD CQI reporting under fading conditions - PUSCH 3-1 for eDL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131916	1030	-	Additions to TC 9.3.2.2.1_D for FDD CQI reporting under fading conditions - PUCCH 1-1 for eDL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131917	1031	-	Additions to TC 9.4.1.3.1_D for FDD reporting of PMI - PUSCH 3-1 (Single PMI) for eDL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131918	1032	-	Additions to TC 9.4.2.3.1_D for FDD PMI reporting - PUSCH 1-2 (Multiple PMI) for eDL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131919	1033	-	Additions to TC 9.5.2.1_D for FDD RI reporting - PUCCH 1-1 for eDL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131920	1034	-	Adding Band28 in some Transmitter test cases in section 6	11.0.1	11.1.0
2013-06	RAN#60	R5-131921	1035	-	New RF TC for 36.521-1_8.5.1.2.3_C.1_Enhanced ICIC for LTE	11.0.1	11.1.0
2013-06	RAN#60	R5-131929	1036	-	Update TT of 6.2.2B_6.2.3B_6.2.4B and 6.2.5B for UL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131930	1037	-	Update TT of 6.3.2B_6.3.3B and 6.3.4B for UL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131931	1038	-	Update TT of 6.3.5B.1_6.3.5B.2 and 6.3.5B.3 for UL- MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131932	1039	-	Update TT of 6.5.1B_6.5.2B.1_6.5.2B.2_6.5.2B.3_6.5.2B.4 for UL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131933	1040	-	Update TT of 6.6.1B Occupied bandwidth for UL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131934	1041	-	Update TT of 6.6.2.1B_6.6.2.2B and 6.6.2.3B for UL- MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131935	1042	-	Update TT of 6.7B Transmit intermodulation for UL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131936	1043	-	Update TT of 6.8B Time alignment error for UL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131937	1044	-	Update TT of 7.3B Reference sensitivity level for UL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131952	1045	-	Corrections to TC 6.2.5A.1 Configured UE transmitted Power for CA (intra-band contiguous DL CA and UL CA)	11.0.1	11.1.0
2013-06	RAN#60	R5-131954	1046	-	Maintenance of Band 23 Spurious Emissions Requirements	11.0.1	11.1.0
2013-06	RAN#60	R5-131955	1047	-	Corrections to Demodulation Requirements	11.0.1	11.1.0
2013-06	RAN#60	R5-131956	1048	-	Updates to sustained data rate test case	11.0.1	11.1.0
2013-06	RAN#60	R5-131957	1049	-	New RF TC for 36.521-1_9.2.1.3_C.1_Enhanced ICIC for LTE	11.0.1	11.1.0
2013-06	RAN#60	R5-131958	1050	-	RF: Structure clean-up for chapter 9 (including eICIC and eDL-MIMO tests)	11.0.1	11.1.0
2013-06	RAN#60	R5-131959	1051	-	Update TT of 7.4B_7.5B_7.6.1B_7.6.2B_7.6.3B_7.7B and 7.8.1B for UL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131960	1052	-	Update of TC6.6.3B.3 for Additional spurious emissions for UL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131961	1053	-	Update of TC6.6.3B.2 for Spurious emissions band UE co-existence for UL-MIMO	11.0.1	11.1.0
2013-06	RAN#60	R5-131962	1054	-	Updates of 6.2.2.3 - maximum output power for UE that supports both Band 18 and 26	11.0.1	11.1.0
2013-06	RAN#60	R5-131963	1055	-	Update of 6.2.4 Test points for A-MPR when NS_05 is signalled	11.0.1	11.1.0

2013-06	RAN#60	R5-131964	1056	-	Updates of 7.3.3 - Refsens for UE that supports both Band 18 and Band 26	11.0.1	11.1.0
2013-06	RAN#60	R5-131969	1057	-	CA RF: Alignment for tests with PCC and SCC switching	11.0.1	11.1.0
2013-06	RAN#60	R5-131971	1059	-	Introduction of Maximum Input Level test case for CA (inter-band DL CA without UL CA)	11.0.1	11.1.0
2013-06	RAN#60	R5-131972	1060	-	Addition of Maximum input level for inter-band CA and updates to test configuration for some Rx TCs	11.0.1	11.1.0
2013-06	RAN#60	R5-131973	1061	-	Updates to FDD sustained data rate test case for CA	11.0.1	11.1.0
2013-06	RAN#60	R5-131974	1062	-	Clarification on Time offset between cells	11.0.1	11.1.0
2013-06	RAN#60	R5-131975	1063	-	Update TC 6.2.3A.1 Maximum Power Reduction (MPR) for CA (intra-band contiguous DL CA and UL CA)	11.0.1	11.1.0
2013-06	RAN#60	R5-131976	1064	-	Update of UE co-existence requirement for CA	11.0.1	11.1.0
2013-06	RAN#60	R5-131977	1065	-	Update TC 6.2.5A.1 Configured UE transmitted Output Power for CA_3A-7A, CA_4A-12A and CA_7A-20A (intra-band contiguous DL CA and UL CA)	11.0.1	11.1.0
2013-06	RAN#60	R5-131978	1066	-	Updates for 6.2.4A A-MPR for CA_41C	11.0.1	11.1.0
2013-06	RAN#60	R5-131979	1067	-	Updates for 7.5A.1 Adjacent Channel Selectivity (ACS) for CA_41C	11.0.1	11.1.0
2013-06	RAN#60	R5-131980	1068	-	Updates for 7.6.1A.1 in-band blocking for CA_41C	11.0.1	11.1.0
2013-06	RAN#60	R5-131981	1069	-	Updates for 7.6.2A.1 Out-of-band blocking for CA_41C	11.0.1	11.1.0
2013-06	RAN#60	R5-131982	1070	-	Updates for 7.6.3A.1 Narrow band blocking for CA_41C	11.0.1	11.1.0
2013-06	RAN#60	R5-131983	1071	-	Updates for 7.8.1A.1 Wideband intermodulation for CA_41C	11.0.1	11.1.0
2013-06	RAN#60	R5-131985	1072	-	Update of CA refsens test 7.3A for inter-band CA configurations CA_4A-5A and CA_4A-13A	11.0.1	11.1.0
2013-06	RAN#60	R5-131987	1073	-	Addition of band 44 in MPR	11.0.1	11.1.0
2013-06	RAN#60	R5-131990	1074	-	CA_1A-18A, CA_2A-17A, CA_3A-8A, CA_4A-5A, CA_4A-13A, CA_4A-17A, CA_11A-18A addition and corrections to Reference Sensitivity TC 7.3A	11.0.1	11.1.0
2013-06	RAN#60	R5-132079	1058	-	Corrections to TC 6.6.3.3A.1 Additional spurious emissions for CA (intra-band contiguous DL CA and UL CA)	11.0.1	11.1.0
2013-06	RAN#60	R5-132080	1075	-	CA RF - Corrections to Blocking Characteristics in 7.6	11.0.1	11.1.0
2013-06	RAN#60	R5-132103	1076	-	Change Spurious emission UE co-existence test cases to align with release independence rule	11.0.1	11.1.0
2013-06	RAN#60	R5-132105	1077	-	CA RF: Corrections to message contents with regard to transmission mode	11.0.1	11.1.0
2013-06	RAN#60	R5-132110	1078	-	Updated test points test case 6.2.3 A-MPR for NS_15 band26	11.0.1	11.1.0
2013-06	RAN#60	R5-132113	1079	-	New test cases for LTE B14 public safety high power UE	11.0.1	11.1.0
2013-09	RAN#61	R5-133070	1080	-	Correction to test points in Additional Spurious Emissions Coexistence test case	11.1.0	11.2.0
2013-09	RAN#61	R5-133073	1081	-	LTE Type A performance requirements - Changes to clause 3	11.1.0	11.2.0
2013-09	RAN#61	R5-133074	1082	-	LTE Type A performance requirements - Changes to clause 8.1.1	11.1.0	11.2.0
2013-09	RAN#61	R5-133075	1083	-	LTE Type A performance requirements - Changes to Annex A	11.1.0	11.2.0
2013-09	RAN#61	R5-133076	1084	-	LTE Type A performance requirements - Introduction of Annex B.5	11.1.0	11.2.0

2013-09	RAN#61	R5-133077	1085	-	LTE Type A performance requirements - Introduction of the new test case 9.3.5.1.1.	11.1.0	11.2.0
2013-09	RAN#61	R5-133232	1086	-	Corrections to CA TC 6.5.2A.3	11.1.0	11.2.0
2013-09	RAN#61	R5-133247	1087	-	Addition of Band 31 to 36.521-1 General s05	11.1.0	11.2.0
2013-09	RAN#61	R5-133248	1088	-	Addition of Band 31 to 36.521-1 RX s07	11.1.0	11.2.0
2013-09	RAN#61	R5-133249	1089	-	Addition of Band 31 to 36.521-1 TX s06	11.1.0	11.2.0
2013-09	RAN#61	R5-133252	1090	-	RF: Minor correction to test points for spurious emissions UE co-existence	11.1.0	11.2.0
2013-09	RAN#61	R5-133258	1091	-	Update TC 7.3A.3 Reference sensitivity level for CA_5A-12A (inter-band DL CA without UL CA)	11.1.0	11.2.0
2013-09	RAN#61	R5-133261	1092	-	Update the minimum requirements of TCs 7.6.3A.1, 7.7A.1 and 7.8.1A.1 for CA	11.1.0	11.2.0
2013-09	RAN#61	R5-133262	1093	-	Update TC 6.6.3B.2 of Spurious emission band UE co-existence for UL-MIMO	11.1.0	11.2.0
2013-09	RAN#61	R5-133263	1094	-	Update TCs 6.2.2B and 6.2.5B for UL-MIMO	11.1.0	11.2.0
2013-09	RAN#61	R5-133265	1095	-	RF: Addition of missing UL-RMC-s for Tx testing	11.1.0	11.2.0
2013-09	RAN#61	R5-133266	1096	-	Correction of TCs 7.3 and 7.3B Reference sensitivity level for Band 27	11.1.0	11.2.0
2013-09	RAN#61	R5-133268	1097	-	CA RF: Addition of new CQI tests for CA	11.1.0	11.2.0
2013-09	RAN#61	R5-133298	1098	-	Correction to Spurious emission band UE co-existence	11.1.0	11.2.0
2013-09	RAN#61	R5-133415	1099	-	Correction to the repeat steps in 7.6.1A, 7.6.3A and 7.8.1A	11.1.0	11.2.0
2013-09	RAN#61	R5-133418	1100	-	Correction to CA sustained data rate performance test	11.1.0	11.2.0
2013-09	RAN#61	R5-133423	1101	-	Correction to eICIC Performance test cases	11.1.0	11.2.0
2013-09	RAN#61	R5-133425	1102	-	Correction to UE category in Tx test cases	11.1.0	11.2.0
2013-09	RAN#61	R5-133426	1103	-	Correction to Spurious emission band UE co-existence	11.1.0	11.2.0
2013-09	RAN#61	R5-133431	1104	-	Correction to MBMS Performance test cases	11.1.0	11.2.0
2013-09	RAN#61	R5-133474	1105	-	Update TC of 8.7.2.1_A.1 TDD sustained data rate performance for CA (intra-band contiguous DL CA)	11.1.0	11.2.0
2013-09	RAN#61	R5-133517	1106	-	Adding the minimum channel spacing for intra-band non-contiguous CA	11.1.0	11.2.0
2013-09	RAN#61	R5-133522	1107	-	Corrections to Annex F for Maintenance of Band 23	11.1.0	11.2.0
2013-09	RAN#61	R5-133523	1108	-	Corrections to description for definition of MIMO Correlation Matrices using cross polarized antennas	11.1.0	11.2.0
2013-09	RAN#61	R5-133524	1109	-	Corrections to UE maximum output power for CA	11.1.0	11.2.0
2013-09	RAN#61	R5-133525	1110	-	Corrections to General Maintenance of Operating Bands and Channel Arrangements	11.1.0	11.2.0
2013-09	RAN#61	R5-133532	1111	-	Introduction of eICIC_enh_LTE to Annex C	11.1.0	11.2.0
2013-09	RAN#61	R5-133534	1112	-	Corrections to TC 6.6.2.3A.1 Adjacent Channel Leakage power Ratio for CA (intra-band contiguous DL CA and UL CA)	11.1.0	11.2.0
2013-09	RAN#61	R5-133535	1113	-	Corrections to TC 7.5A.1 Adjacent Channel Selectivity (ACS) for CA (intra-band contiguous DL CA and UL CA)	11.1.0	11.2.0
2013-09	RAN#61	R5-133800	1114	-	Correction to test frequency in Additional Spurious Emissions test cases for NS_15	11.1.0	11.2.0
2013-09	RAN#61	R5-133801	1115	-	Update applicability of test cases 9.4.2.2.1 and 9.4.2.2.2	11.1.0	11.2.0

2013-09	RAN#61	R5-133802	1116	-	Correction to applicability for TDD-TM8 test cases	11.1.0	11.2.0
2013-09	RAN#61	R5-133803	1117	-	Editorial correction to 6.6.3.3 Additional spurious emissions	11.1.0	11.2.0
2013-09	RAN#61	R5-133804	1118	-	Correction the Minimum conformance requirements for test case 6.2.2B	11.1.0	11.2.0
2013-09	RAN#61	R5-133805	1119	-	CA RF: Adding missing DL-RMC-s	11.1.0	11.2.0
2013-09	RAN#61	R5-133806	1120	-	Update TC of 8.2.1.1 FDD PDSCH Single Antenna Port Performance (Cell-Specific Reference Symbols) for CA	11.1.0	11.2.0
2013-09	RAN#61	R5-133807	1121	-	Update TC of 8.2.1.4 FDD PDSCH Closed Loop Spatial Multiplexing Performance (Cell-Specific Reference Symbols) for CA	11.1.0	11.2.0
2013-09	RAN#61	R5-133808	1122	-	Addition of new TC 8.2.1.4.2_A.2 for FDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for CA (inter band DL CA)	11.1.0	11.2.0
2013-09	RAN#61	R5-133811	1123	-	Update of CA TC 7.3A.1	11.1.0	11.2.0
2013-09	RAN#61	R5-133812	1124	-	Update of CA TC 7.4A.1	11.1.0	11.2.0
2013-09	RAN#61	R5-133819	1125	-	Correction of applicability for FDD RF TCs 9.3.4.1.1, 9.3.4.2.1 & 9.4.1.2.1 and TDD RF TCs 9.3.4.1.2, 9.3.4.2.2 & 9.4.1.2.2	11.1.0	11.2.0
2013-09	RAN#61	R5-133823	1126	-	Introduction of eICIC_enh_LTE to Annex A to reference measurement channels for PDCCH/PCFICH	11.1.0	11.2.0
2013-09	RAN#61	R5-133824	1127	-	Introduction of eICIC_enh_LTE to Annex A DL reference measurement channels	11.1.0	11.2.0
2013-09	RAN#61	R5-133828	1128	-	Corrections to 6.2.4 A-MPR for Maintenance of Band 23	11.1.0	11.2.0
2013-09	RAN#61	R5-133829	1129	-	Corrections to Transmitter Characteristics Maintenance	11.1.0	11.2.0
2013-09	RAN#61	R5-133830	1130	-	Alignment of test configuration tables (test frequencies) in Additional Spurious Emissions tests cases	11.1.0	11.2.0
2013-09	RAN#61	R5-133831	1131	-	Corrections to Receiver Characteristics Maintenance	11.1.0	11.2.0
2013-09	RAN#61	R5-133832	1132	-	Corrections to 6.6.2.2 Additional Spectrum Emission Mask for Maintenance of Band 23	11.1.0	11.2.0
2013-09	RAN#61	R5-133833	1133	-	Updates to Chapter7 for Inter Band CA combo CA_4A-29A	11.1.0	11.2.0
2013-09	RAN#61	R5-133838	1134	-	Update Minimum Requirements of TCs 6.2.4 and 6.2.5	11.1.0	11.2.0
2013-09	RAN#61	R5-133845	1135	-	Correction to Configured UE transmitted output power for CA	11.1.0	11.2.0
2013-09	RAN#61	R5-133846	1136	-	Corrections to TC 6.2.5A.2 Configured UE transmitted Power for CA (inter-band DL CA without UL CA)	11.1.0	11.2.0
2013-09	RAN#61	R5-133847	1137	-	Updates to Wideband intermodulation for CA test cases	11.1.0	11.2.0
2013-09	RAN#61	R5-133850	1138	-	Correction to measurement target of CA Rx test cases	11.1.0	11.2.0
2013-09	RAN#61	R5-133851	1139	-	Corrections to TC 7.5A.2 Adjacent Channel Selectivity (ACS) for CA (intra-band contiguous DL CA without UL CA)	11.1.0	11.2.0
2013-09	RAN#61	R5-133852	1140	-	Update TC of 8.7.1.1_A.1 FDD Sustained data rate performance for CA (intra band contiguous DL CA)	11.1.0	11.2.0
2013-09	RAN#61	R5-133853	1141	-	Update TC of 8.7.1.1_A.2 FDD Sustained data rate performance for CA (inter band DL CA)	11.1.0	11.2.0
2013-09	RAN#61	R5-133854	1142	-	Updates of Annex for CA test cases	11.1.0	11.2.0
2013-09	RAN#61	R5-133863	1143	-	Clarification on Bandwidth Combination Set for Carrier Aggregation Transmitter tests	11.1.0	11.2.0
2013-09	RAN#61	R5-133865	1144	-	Update TC 6.2.5A.1 Configured UE transmitted Output Power for CA_5A-12A (intra-band contiguous DL CA and UL CA)	11.1.0	11.2.0

2013-09	RAN#61	R5-133866	1145	-	Update the minimum requirements of TCs 7.5A.1, 7.6.1A.1 and 7.6.2A.1 for CA	11.1.0	11.2.0
2013-09	RAN#61	R5-133867	1146	-	Update TC 7.3A.1 Reference sensitivity level for CA (intra-band contiguous DL CA and UL CA)	11.1.0	11.2.0
2013-09	RAN#61	R5-133869	1147	-	Addition of Refsens for intra-band non-contiguous CA	11.1.0	11.2.0
2013-09	RAN#61	R5-133870	1148	-	Update TC 7.3A.3 reference sensitivity level for CA_3-8 (inter-band DL CA without UL CA)	11.1.0	11.2.0
2013-09	RAN#61	R5-133871	1149	-	Test cases and test system uncertainty for LTE B14 public safety highpower UE	11.1.0	11.2.0
2013-09	RAN#61	R5-133873	1150	-	Addition of new TC 8.3.1.1.3 for FDD PDSCH Single-layer Spatial Multiplexing on antenna ports 7 or 8 with TM9 Interference Model	11.1.0	11.2.0
2013-09	RAN#61	R5-133874	1151	-	Addition of new TC 8.3.2.1.4 for TDD PDSCH Single-layer Spatial Multiplexing on antenna ports 7 or 8 with TM9 Interference Model	11.1.0	11.2.0
2013-09	RAN#61	R5-133886	1152	-	eICIC RF: Addition of new RI tests and OCNG patterns for eICIC	11.1.0	11.2.0
2013-09	RAN#61	R5-133887	1153	-	Update of CA TC 6.2.3A and TC 6.2.4A	11.1.0	11.2.0
2013-09	RAN#61	R5-133888	1154	-	CA RF: Corrections to reference sensitivity requirements for CA	11.1.0	11.2.0
2013-09	RAN#61	R5-133889	1155	-	Correction to Test Requirement in 7.3A.3	11.1.0	11.2.0
2013-09	RAN#61	R5-133890	1156	-	Update TC of 8.2.1.3 FDD PDSCH Open Loop Spatial Multiplexing Performance (Cell-Specific Reference Symbols)for CA	11.1.0	11.2.0
2013-09	RAN#61	R5-133898	1157	-	Clarification on Bandwidth Combination Set for Carrier Aggregation Receiver tests	11.1.0	11.2.0
2013-09	RAN#61	R5-133899	1158	-	Addition of CA TC 6.6.2.2A	11.1.0	11.2.0
2013-12	RAN#62	R5-134130	1159	-	RF: Corrections to the notes in the band UE co-existence requirements table	11.2.0	11.3.0
2013-12	RAN#62	R5-134131	1160	-	RF: Corrections to sustained data rate test case	11.2.0	11.3.0
2013-12	RAN#62	R5-134132	1161	-	RF: Clean-up of uplink reference measurement channels	11.2.0	11.3.0
2013-12	RAN#62	R5-134139	1162	-	eICIC RF: Corrections to PHICH demodulation test	11.2.0	11.3.0
2013-12	RAN#62	R5-134161	1163	-	Corrections to Transmitter Requirements for Intra-band Non-contiguous CA	11.2.0	11.3.0
2013-12	RAN#62	R5-134169	1164	-	Introduction of I.2.6 Tests for feICIC (Further Enhanced Non CA- based ICIC for LTE)	11.2.0	11.3.0
2013-12	RAN#62	R5-134170	1165	-	Introduction of TC 8.2.1.2.3_E.1 FDD PDSCH Transmit diversity 2x2 for feICIC (non-MBSFN ABS)	11.2.0	11.3.0
2013-12	RAN#62	R5-134171	1166	-	Introduction of TC 8.2.2.2.3_E.1 TDD PDSCH Transmit diversity 2x2 for feICIC (non-MBSFN ABS)	11.2.0	11.3.0
2013-12	RAN#62	R5-134172	1167	-	Introduction of TC 8.2.1.4.1_E.1 FDD PDSCH Closed Loop Single Layer Spatial Multiplexing 2x2 for feICIC (non-MBSFN ABS)	11.2.0	11.3.0
2013-12	RAN#62	R5-134173	1168	-	Introduction of TC 8.2.2.4.1_E.1 TDD PDSCH Closed Loop Single Layer Spatial Multiplexing 2x2 for feICIC (non-MBSFN ABS)	11.2.0	11.3.0
2013-12	RAN#62	R5-134174	1169	-	Introduction of TC 8.4.1.2.3_E.1 FDD PCFICH/PDCCH Transmit Diversity 2x2 for feICIC (non-MBSFN ABS)	11.2.0	11.3.0
2013-12	RAN#62	R5-134175	1170	-	Introduction of TC 8.4.1.2.3_E.2 FDD PCFICH/PDCCH Transmit Diversity 2x2 for feICIC (MBSFN ABS)	11.2.0	11.3.0

2013-12	RAN#62	R5-134176	1171	-	Introduction of TC 8.4.2.2.3_E.1 TDD PCFICH/PDCCH Transmit Diversity 2x2 for feICIC (non-MBSFN ABS)	11.2.0	11.3.0
2013-12	RAN#62	R5-134177	1172	-	Introduction of TC 8.4.2.2.3_E.2 TDD PCFICH/PDCCH Transmit Diversity 2x2 for feICIC (MBSFN ABS)	11.2.0	11.3.0
2013-12	RAN#62	R5-134178	1173	-	Introduction of Demodulation feICIC Test Cases to Annex F	11.2.0	11.3.0
2013-12	RAN#62	R5-134179	1174	-	Introduction of TC 9.2.1.5_E.1 FDD CQI Reporting under AWGN conditions - PUCCH 1-0 for feICIC (non-MBSFN ABS)	11.2.0	11.3.0
2013-12	RAN#62	R5-134180	1175	-	Introduction of TC 9.2.1.6_E.1 TDD CQI Reporting under AWGN conditions - PUCCH 1-0 for feICIC (non-MBSFN ABS)	11.2.0	11.3.0
2013-12	RAN#62	R5-134181	1176	-	Introduction of TC 9.3.1.3.1_E.1 FDD CQI Reporting under fading conditions - PUSCH 3-0 for feICIC (non-MBSFN ABS)	11.2.0	11.3.0
2013-12	RAN#62	R5-134182	1177	-	Introduction of TC 9.3.1.3.2_E.1 TDD CQI Reporting under fading conditions - PUSCH 3-0 for feICIC (non-MBSFN ABS)	11.2.0	11.3.0
2013-12	RAN#62	R5-134183	1178	-	Introduction of TC 9.5.4.1_E FDD RI Reporting - PUCCH 1-0 for feICIC (non-MBSFN ABS)	11.2.0	11.3.0
2013-12	RAN#62	R5-134184	1179	-	Introduction of TC 9.5.4.2_E TDD RI Reporting - PUCCH 1-0 for feICIC (non-MBSFN ABS)	11.2.0	11.3.0
2013-12	RAN#62	R5-134185	1180	-	Introduction of Reporting of Channel State Information feICIC Test Cases to Annex F	11.2.0	11.3.0
2013-12	RAN#62	R5-134196	1181	-	Corrections to 7.5A.3 Adjacent Channel Selectivity (ACS) for CA (inter-band DL CA without UL CA)	11.2.0	11.3.0
2013-12	RAN#62	R5-134199	1182	-	Corrections to MPR for intra-band non-contiguous CA	11.2.0	11.3.0
2013-12	RAN#62	R5-134234	1183	-	CA RF: Corrections to requirements for In-Band blocking for Inter-Band without UL-CA	11.2.0	11.3.0
2013-12	RAN#62	R5-134247	1184	-	RF: Corrections to requirements for NS_11 (Band 23)	11.2.0	11.3.0
2013-12	RAN#62	R5-134250	1185	-	RF: Band edge relaxation for UE-s supporting Band 18 and Band 26	11.2.0	11.3.0
2013-12	RAN#62	R5-134289	1187	-	Correction to Maximum Power Reduction (MPR) for CA Test Procedure	11.2.0	11.3.0
2013-12	RAN#62	R5-134413	1189	-	Update TT of TC 8.2.1.4.2_A.2 FDD PDSCH Closed Loop Multi Layer 4x2 for CA	11.2.0	11.3.0
2013-12	RAN#62	R5-134414	1190	-	Correction of TC 6.2.4A Test Requirements for CA_38C	11.2.0	11.3.0
2013-12	RAN#62	R5-134421	1191	-	The addition of Beamforming model for EPDCCH localized transmission	11.2.0	11.3.0
2013-12	RAN#62	R5-134423	1192	-	The addition of Beamforming model for EPDCCH distributed transmission	11.2.0	11.3.0
2013-12	RAN#62	R5-134424	1193	-	The addition of Downlink physical setup for EPDCCH	11.2.0	11.3.0
2013-12	RAN#62	R5-134431	1194	-	LTE Type A performance requirements - Introduction of the new test case 8.2.1.2.4	11.2.0	11.3.0
2013-12	RAN#62	R5-134432	1195	-	LTE Type A performance requirements - adding TC 8.2.1.2.4 and 9.3.5.1.1 to Annex E and G	11.2.0	11.3.0
2013-12	RAN#62	R5-134445	1196	-	TU and TT for 36.521-1 eICIC FDD PCFICH/PDCCH and PHICH demodulation tests	11.2.0	11.3.0
2013-12	RAN#62	R5-134477	1197	-	Correction to CA Sustained data rate tests	11.2.0	11.3.0
2013-12	RAN#62	R5-134478	1198	-	Correction to CQI-ReportConfig-DEFAULT for CA performance tests	11.2.0	11.3.0
2013-12	RAN#62	R5-134485	1199	-	Clarification of UL resource blocks for CA_4A-17A in 7.3A.3	11.2.0	11.3.0

2013-12	RAN#62	R5-134488	1200	-	Correction to test requirement in 6.2.4	11.2.0	11.3.0
2013-12	RAN#62	R5-134489	1201	-	Correction to test requirement in 6.6.3.2	11.2.0	11.3.0
2013-12	RAN#62	R5-134490	1202	-	Additional exception message for SIB3 in MBMS performance test	11.2.0	11.3.0
2013-12	RAN#62	R5-134800	1204	-	Introduction of UE TM3 Demodulation Performance under High Speed to Annex F	11.2.0	11.3.0
2013-12	RAN#62	R5-134801	1205	-	Introduction of UE TM3 Demodulation Performance under High Speed	11.2.0	11.3.0
2013-12	RAN#62	R5-134802	1206	-	Corrections to eDL-MIMO Channel State Information Test	11.2.0	11.3.0
2013-12	RAN#62	R5-134805	1207	-	Update Minimum Requirements of TCs 6.6.3.2 and 6.6.3.2A Spurious emission band UE co-existence	11.2.0	11.3.0
2013-12	RAN#62	R5-134806	1208	-	Change Spurious emission UE co-existence test case for LTE CA to align with release independence rule	11.2.0	11.3.0
2013-12	RAN#62	R5-134807	1209	-	Clarification of applicability of additional relaxation RIB,c on Reference Sensitivity Test Cases	11.2.0	11.3.0
2013-12	RAN#62	R5-134816	1215	-	Addition of new Test Case PUCCH 1-1 for Interference rejection	11.2.0	11.3.0
2013-12	RAN#62	R5-134817	1216	-	Addition of interference rejection test cases TC 8.2.2.2.4 and TC 8.2.2.4.3	11.2.0	11.3.0
2013-12	RAN#62	R5-134828	1217	-	Clarification of multi-cluster transmission terminology	11.2.0	11.3.0
2013-12	RAN#62	R5-134829	1218	-	Corrections to P <sub>cm</sub>	11.2.0	11.3.0
2013-12	RAN#62	R5-134830	1219	-	Corrections to test descriptions reference tables for Transmitter Characteristics test cases	11.2.0	11.3.0
2013-12	RAN#62	R5-134832	1220	-	Corrections to definition of 5+20 MHz for spectrum emission mask for CA in Annex F	11.2.0	11.3.0
2013-12	RAN#62	R5-134857	1223	-	Update TC 6.2.4 A-MPR for NS_19	11.2.0	11.3.0
2013-12	RAN#62	R5-134858	1224	-	Update TC 6.6.3.3 Additional Spurious Emissions for NS_19	11.2.0	11.3.0
2013-12	RAN#62	R5-134859	1225	-	Simplification of test points in Additional Spurious Emissions Coexistence test case	11.2.0	11.3.0
2013-12	RAN#62	R5-134861	1227	-	Addition of Sustained data rate test(FDD) for category 6 and 7 UEs	11.2.0	11.3.0
2013-12	RAN#62	R5-134865	1228	-	CA RF: Power alignment between uplink component carriers	11.2.0	11.3.0
2013-12	RAN#62	R5-134866	1229	-	Completion of test case 6.7A Transmit intermodulation for CA	11.2.0	11.3.0
2013-12	RAN#62	R5-134867	1230	-	Update Minimum Requirements of TCs 7.3 and 7.3.1A Reference sensitivity power level	11.2.0	11.3.0
2013-12	RAN#62	R5-134868	1231	-	Clean-up of CA Rx test cases	11.2.0	11.3.0
2013-12	RAN#62	R5-134871	1232	-	Update Minimum Requirements and TT of TC 8.2.1.3.1_A	11.2.0	11.3.0
2013-12	RAN#62	R5-134875	1233	-	Addition of Inter Band CA combo CA_3A-5A, CA_3A-20A	11.2.0	11.3.0
2013-12	RAN#62	R5-134876	1234	-	Addition of Inter Band CA combo CA_4A-7A	11.2.0	11.3.0
2013-12	RAN#62	R5-134878	1235	-	Correction and applicability clarification to multi-cluster allocations for UL CA TCs 6.2.3A, 6.2.4A, 6.6.2.1A, 6.6.2.2A, 6.6.2.3A and 6.6.3.3A	11.2.0	11.3.0
2013-12	RAN#62	R5-134879	1236	-	Clarification of CA Reference sensitivity level	11.2.0	11.3.0
2013-12	RAN#62	R5-134880	1237	-	Correction to blocking requirements and use of delta RIB	11.2.0	11.3.0

2013-12	RAN#62	R5-134881	1238	-	Addition of new TC 7.4A.4 Maximum input level for CA (intra band non-contiguous DL CA without UL CA)	11.2.0	11.3.0
2013-12	RAN#62	R5-134882	1239	-	Addition of new TC 7.5A.4 Adjacent Channel Selectivity (ACS) for CA(intra band non-contiguous DL CA without UL CA)	11.2.0	11.3.0
2013-12	RAN#62	R5-134889	1244	-	Uncertainties and Test Tolerances for eICIC PDSCH demodulation tests	11.2.0	11.3.0
2013-12	RAN#62	R5-134893	1247	-	Addition of applicabilities of LTE Type A performance requirements	11.2.0	11.3.0
2013-12	RAN#62	R5-134894	1248	-	Test Procedure, uncerts and TT for Rx Test cases with intra-band contiguous UL CA	11.2.0	11.3.0
2013-12	RAN#62	R5-134976	1251	-	Update TT of TC 8.2.1.4.2_A.1 FDD PDSCH Closed Loop Multi Layer 4x2 for CA	11.2.0	11.3.0
2013-12	RAN#62	R5-134977	1252	-	Update of CA CSI tests	11.2.0	11.3.0
2013-12	RAN#62	R5-134978	1253	-	Update of eICIC Performance test cases	11.2.0	11.3.0
2013-12	RAN#62	R5-134985	1254	-	LTE Type A performance requirements - Changes to TC 9.3.5.1.1	11.2.0	11.3.0
2013-12	RAN#62	R5-134987	1255	-	RF: Corrections to requirements for NS_15 (Band 26)	11.2.0	11.3.0
2013-12	RAN#62	R5-134988	1256	-	Corrections to Band 23 NS_11 and NS_20 Test Points	11.2.0	11.3.0
2013-12	RAN#62	R5-134995	1259	-	Update on MPR and A-MPR test requirements	11.2.0	11.3.0
2013-12	RAN#62	R5-135012	1261	-	Clarification in regard to 36.521-1 tests not included in 36.521-2 Applicability table	11.2.0	11.3.0
2013-12	RAN#62	R5-135031	1222	-	RF TC Update for 36.521-1_9.2.1.3_C1 eICIC	11.2.0	11.3.0
2013-12	RAN#62	R5-135046	1226	-	RF: Updates to the downlink reference measurement channels	11.2.0	11.3.0
2013-12	RAN#62	R5-134277	1186	-	Addition of Rel-12 CA band combinations(CA_3-19 and CA_19-21) to Chap. 5	11.3.0	12.0.0
2013-12	RAN#62	R5-134339	1188	-	Updates to TC 6.2.2A.1 for CA_3C	11.3.0	12.0.0
2013-12	RAN#62	R5-134540	1203	-	Applicability statement of new 5MHz BB tests for Band 31 in TS 36.521-1	11.3.0	12.0.0
2013-12	RAN#62	R5-134808	1210	-	Updates of 5.4.2A Channel bandwidth for CA_1A-18A	11.3.0	12.0.0
2013-12	RAN#62	R5-134809	1211	-	Updates of 5.2A Operating bands for CA_1A-26A	11.3.0	12.0.0
2013-12	RAN#62	R5-134810	1212	-	Updates of 5.4.2A Channel bandwidth for CA_1A-26A	11.3.0	12.0.0
2013-12	RAN#62	R5-134811	1213	-	Updates of 6.2.5A Delta TIB for CA_1A-26A	11.3.0	12.0.0
2013-12	RAN#62	R5-134812	1214	-	Updates of 7.3A Delta RIB for CA_1A-26A	11.3.0	12.0.0
2013-12	RAN#62	R5-134833	1221	-	Correction to Tx TCs for lower tolerance relaxation, removal of 6.2.5A.2 and addition of Rel-12 CA band combinations(CA_3-19 and CA_19-21) to 6.2.5	11.3.0	12.0.0
2013-12	RAN#62	R5-134884	1240	-	Addition of Rel-12 CA band combination(CA_3-19 and CA_19-21) to Refsens	11.3.0	12.0.0
2013-12	RAN#62	R5-134886	1241	-	Updates for 5.2A operating bands and 5.4.2A channel bandwidth for CA_3C	11.3.0	12.0.0
2013-12	RAN#62	R5-134887	1242	-	Updates to TC 6.2.3A.1 for CA_3C	11.3.0	12.0.0
2013-12	RAN#62	R5-134888	1243	-	Updates to TC 6.6.2.1A.1 for CA_3C	11.3.0	12.0.0
2013-12	RAN#62	R5-134891	1245	-	Updates to FDD PDSCH Single Antenna and Transmit Diversity 2x2 performance test cases for 5MHz BW	11.3.0	12.0.0

2013-12	RAN#62	R5-134892	1246	-	Updates to 8.2.1.3.1 for FDD PDSCH Open Loop Spatial Multiplexing 2x2 for 5MHz BW	11.3.0	12.0.0
2013-12	RAN#62	R5-134896	1249	-	Updates to TC 9.2.1.1 FDD CQI reporting under AWGN conditions - PUCCH 1-0 test case for 5MHz BW	11.3.0	12.0.0
2013-12	RAN#62	R5-134897	1250	-	Updates to TC 9.3.2.1.1 and 9.3.2.1.1_1 FDD CQI Reporting under fading conditions - PUCCH 1-0 test case for 5MHz BW	11.3.0	12.0.0
2013-12	RAN#62	R5-134989	1257	-	Corrections to definition of 5+20 MHz for spectrum emission mask for CA	11.3.0	12.0.0
2013-12	RAN#62	R5-134992	1258	-	Updates to 8.5.1.2 FDD PHICH Transmit Diversity Performance tests	11.3.0	12.0.0
2013-12	RAN#62	R5-135068	1262	-	Updates to 8.2.1.4 FDD PDSCH Closed Loop Single/Multiple layer Spatial Multiplexing 2x2 for 5MHz BW	11.3.0	12.0.0
2014-03	RAN#63	R5-140228	1264	-	Uncertainties for eCIC 9.x CSI Test Cases	12.0.0	12.1.0
2014-03	RAN#63	R5-140245	1265	-	eDL-MIMO RF: Corrections to 8x2 MIMO tests	12.0.0	12.1.0
2014-03	RAN#63	R5-140247	1266	-	CA RF: Corrections to sustained data rate tests	12.0.0	12.1.0
2014-03	RAN#63	R5-140248	1267	-	RF: Corrections to OCNG pattern for PMI tests	12.0.0	12.1.0
2014-03	RAN#63	R5-140249	1268	-	RF: Corrections to cross references between tests	12.0.0	12.1.0
2014-03	RAN#63	R5-140250	1269	-	feCIC RF: Corrections to some subclause-titles	12.0.0	12.1.0
2014-03	RAN#63	R5-140261	1270	-	CoMP RF: Introduction of CoMP section in Annex I	12.0.0	12.1.0
2014-03	RAN#63	R5-140388	1272	-	LTE Type A performance requirements - Introduction of the new test case 9.3.5.1.2	12.0.0	12.1.0
2014-03	RAN#63	R5-140444	1273	-	Updates of 6.2.5 Delta TIB for CA_1A-26A	12.0.0	12.1.0
2014-03	RAN#63	R5-140446	1274	-	Updates of 7.3 Delta RIB for CA_1A-26A	12.0.0	12.1.0
2014-03	RAN#63	R5-140448	1275	-	Updates of 6.6.3.2 Spurious emission band UE co-existence for B41	12.0.0	12.1.0
2014-03	RAN#63	R5-140499	1276	-	Update of eCIC Performance tests	12.0.0	12.1.0
2014-03	RAN#63	R5-140505	1277	-	Correction to test configuration parameter in Tx	12.0.0	12.1.0
2014-03	RAN#63	R5-140508	1278	-	Update of CA FDD and TDD performance tests	12.0.0	12.1.0
2014-03	RAN#63	R5-140509	1279	-	Addition of CQI configuration in CA closed loop performance tests	12.0.0	12.1.0
2014-03	RAN#63	R5-140511	1280	-	Addition of SCC activation and CQI configuration in CA CQI Reporting tests	12.0.0	12.1.0
2014-03	RAN#63	R5-140561	1281	-	Removal of [ ]s in Annex G.6	12.0.0	12.1.0
2014-03	RAN#63	R5-140800	1282	-	Corrections to NS signalling for CA refsens	12.0.0	12.1.0
2014-03	RAN#63	R5-140801	1283	-	Correction to statistical testing for Inter-band CA Rx tests	12.0.0	12.1.0
2014-03	RAN#63	R5-140802	1284	-	Additions to combinations of channel model parameters	12.0.0	12.1.0
2014-03	RAN#63	R5-140803	1285	-	Addition of a Fixed Reference Channel two antenna ports	12.0.0	12.1.0
2014-03	RAN#63	R5-140804	1286	-	Corrections to TDD eDL-MIMO test cases	12.0.0	12.1.0
2014-03	RAN#63	R5-140805	1287	-	Correction the category information of Table 8.2.1.1.2.3-2 and Table 8.2.1.1.2.5-1 in test case 8.2.1.1.2	12.0.0	12.1.0
2014-03	RAN#63	R5-140806	1288	-	Correction the category information in Table 8.2.1.2.1.3-2 and Table 8.2.1.2.1.3-2 for Test case 8.2.1.2.1	12.0.0	12.1.0
2014-03	RAN#63	R5-140807	1289	-	Correction the test case applicability of test case 8.2.1.3.2	12.0.0	12.1.0

2014-03	RAN#63	R5-140811	1290	-	Addition of A.3.9.4 TDD SDR Reference Channel for EPDCCH	12.0.0	12.1.0
2014-03	RAN#63	R5-140812	1291	-	Addition of A.3.9.3 FDD SDR Reference Channel for EPDCCH	12.0.0	12.1.0
2014-03	RAN#63	R5-140813	1292	-	Addition of OCNG Pattern for EPDCCH TDD performance requirements	12.0.0	12.1.0
2014-03	RAN#63	R5-140814	1293	-	Addition of OCNG Pattern for EPDCCH FDD performance requirements	12.0.0	12.1.0
2014-03	RAN#63	R5-140815	1294	-	Addition of Reference Measurement Channels for EPDCCH performance requirements	12.0.0	12.1.0
2014-03	RAN#63	R5-140816	1295	-	Introduction of RMCs and power levels for CoMP in annex	12.0.0	12.1.0
2014-03	RAN#63	R5-140818	1296	-	Addition of CA_1A-8A to 36.521-1 Chapter 5	12.0.0	12.1.0
2014-03	RAN#63	R5-140819	1297	-	Addition of CA_1A-8A to 36.521-1 Chapter 6	12.0.0	12.1.0
2014-03	RAN#63	R5-140820	1298	-	Addition of CA_1A-8A to 36.521-1 Chapter 7	12.0.0	12.1.0
2014-03	RAN#63	R5-140823	1300	-	Corrections to definition of 20 MHz and 5MHz for transmit intermodulation for CA in 6.7A	12.0.0	12.1.0
2014-03	RAN#63	R5-140824	1301	-	Updates to TC 7.4A.1 for CA_3C	12.0.0	12.1.0
2014-03	RAN#63	R5-140825	1302	-	Updates to TC 6.6.3.2A for CA_3C	12.0.0	12.1.0
2014-03	RAN#63	R5-140826	1303	-	Corrections to definition of 20 MHz and 5MHz for occupied bandwidth for CA in 6.6.1A	12.0.0	12.1.0
2014-03	RAN#63	R5-140827	1304	-	Updates to TC 7.3A.1 for CA_3C	12.0.0	12.1.0
2014-03	RAN#63	R5-140828	1305	-	Updates to TC 7.3A.2 for CA_3C	12.0.0	12.1.0
2014-03	RAN#63	R5-140831	1306	-	Additions to TC 8.2.2.2.3_E.1 TDD PDSCH Transmit diversity 2x2 for feICIC (non-MBSFN ABS)	12.0.0	12.1.0
2014-03	RAN#63	R5-140832	1307	-	Additions to TC 8.2.1.4.1_E.1 FDD PDSCH Closed Loop Single Layer Spatial Multiplexing 2x2 for feICIC (non-MBSFN ABS)	12.0.0	12.1.0
2014-03	RAN#63	R5-140833	1308	-	Additions to TC 8.2.2.4.1_E.1 TDD PDSCH Closed Loop Single Layer Spatial Multiplexing 2x2 for feICIC (non-MBSFN ABS)	12.0.0	12.1.0
2014-03	RAN#63	R5-140834	1309	-	Additions to TC 8.4.1.2.3_E.1 FDD PCFICH/PDCCH Transmit Diversity 2x2 for feICIC (non-MBSFN ABS)	12.0.0	12.1.0
2014-03	RAN#63	R5-140835	1310	-	Additions to TC 8.4.2.2.3_E.1 TDD PCFICH/PDCCH Transmit Diversity 2x2 for feICIC (non-MBSFN ABS)	12.0.0	12.1.0
2014-03	RAN#63	R5-140836	1311	-	Additions to TC 8.4.1.2.3_E.2 FDD PCFICH/PDCCH Transmit Diversity 2x2 for feICIC (MBSFN ABS)	12.0.0	12.1.0
2014-03	RAN#63	R5-140837	1312	-	Additions to TC 8.4.2.2.3_E.2 TDD PCFICH/PDCCH Transmit Diversity 2x2 for feICIC (MBSFN ABS)	12.0.0	12.1.0
2014-03	RAN#63	R5-140838	1313	-	Additions to TC 9.2.1.5_E.1 FDD CQI Reporting under AWGN conditions - PUCCH 1-0 for feICIC (non-MBSFN ABS)	12.0.0	12.1.0
2014-03	RAN#63	R5-140839	1314	-	Additions to TC 9.2.1.6_E.1 TDD CQI Reporting under AWGN conditions - PUCCH 1-0 for feICIC (non-MBSFN ABS)	12.0.0	12.1.0
2014-03	RAN#63	R5-140840	1315	-	Additions to TC 9.3.1.3.1_E.1 FDD CQI Reporting under fading conditions - PUSCH 3-0 for feICIC (non-MBSFN ABS)	12.0.0	12.1.0
2014-03	RAN#63	R5-140841	1316	-	Additions to TC 9.3.1.3.2_E.1 TDD CQI Reporting under fading conditions - PUSCH 3-0 for feICIC (non-MBSFN ABS)	12.0.0	12.1.0
2014-03	RAN#63	R5-140842	1317	-	Additions to TC 9.5.4.1_E FDD RI Reporting - PUCCH 1-0 for feICIC (non-MBSFN ABS)	12.0.0	12.1.0

2014-03	RAN#63	R5-140843	1318	-	Additions to TC 9.5.4.2_E TDD RI Reporting - PUCCH 1-0 for feICIC (non-MBSFN ABS)	12.0.0	12.1.0
2014-03	RAN#63	R5-140844	1319	-	Introduction of feICIC to Annex G	12.0.0	12.1.0
2014-03	RAN#63	R5-140845	1361	-	Addition of PHICH demod requirements for feICIC	12.0.0	12.1.0
2014-03	RAN#63	R5-140846	1320	-	Addition to TC 8.2.2.3.3_E.1 TDD PDSCH Open Loop Spatial Multiplexing 2x2 for feICIC (non-MBSFN ABS)	12.0.0	12.1.0
2014-03	RAN#63	R5-140847	1321	-	Corrections to test configuration notes of CA soft buffer	12.0.0	12.1.0
2014-03	RAN#63	R5-140856	1322	-	Additions to TC 8.2.1.2.3_E.1 FDD PDSCH Transmit diversity 2x2 for feICIC (non-MBFSN ABS)	12.0.0	12.1.0
2014-03	RAN#63	R5-140868	1323	-	Uncertainties and Test Tolerances for Interf_Rej Test case 8.2.1.2.4	12.0.0	12.1.0
2014-03	RAN#63	R5-140877	1324	-	Introduction of TC 9.5.5.1_F.1 FDD RI Reporting with Single CSI process	12.0.0	12.1.0
2014-03	RAN#63	R5-140878	1325	-	Introduction of TC 9.5.5.2_F.1 TDD RI Reporting with Single CSI process	12.0.0	12.1.0
2014-03	RAN#63	R5-140881	1326	-	Addition to TC 8.2.1.3.3_E.1 FDD FDD PDSCH Open Loop Spatial Multiplexing 2x2 for feICIC (non-MBSFN ABS)	12.0.0	12.1.0
2014-03	RAN#63	R5-140887	1327	-	Correction to eICIC CQI Reporting tests	12.0.0	12.1.0
2014-03	RAN#63	R5-140888	1328	-	eICIC RF: Corrections to requirements, procedure and UL-RMCs for CQI tests	12.0.0	12.1.0
2014-03	RAN#63	R5-140889	1329	-	Addition of TC 8.7.3.1 FDD sustained data rate performance for EPDCCH scheduling	12.0.0	12.1.0
2014-03	RAN#63	R5-140890	1330	-	Addition of TC 8.8.1.1.1 FDD distributed EPDCCH performance	12.0.0	12.1.0
2014-03	RAN#63	R5-140891	1331	-	Addition of TC 8.7.4.1 TDD sustained data rate performance for EPDCCH scheduling	12.0.0	12.1.0
2014-03	RAN#63	R5-140892	1332	-	Addition of TC 8.8.1.2.1 TDD distributed EPDCCH performance	12.0.0	12.1.0
2014-03	RAN#63	R5-140893	1333	-	Addition of TC 8.8.2.1.1 FDD localized EPDCCH performance	12.0.0	12.1.0
2014-03	RAN#63	R5-140894	1334	-	Addition of TC 8.8.2.1.2 FDD EPDCCH localized transmission with TM10 quasi co-location Type-B	12.0.0	12.1.0
2014-03	RAN#63	R5-140895	1335	-	Addition of TC 8.8.2.2.1 TDD localized EPDCCH performance	12.0.0	12.1.0
2014-03	RAN#63	R5-140896	1336	-	Addition of TC 8.8.2.2.2 TDD EPDCCH localized transmission with TM10 quasi co-location Type-B	12.0.0	12.1.0
2014-03	RAN#63	R5-140922	1337	-	Modify Applicability for LTE B14 public safety high power UE test cases	12.0.0	12.1.0
2014-03	RAN#63	R5-141003	1338	-	Addition of FDD CQI Reporting under AWGN conditions - Single CSI Process TC 9.2.4.1	12.0.0	12.1.0
2014-03	RAN#63	R5-141004	1339	-	Addition of TDD CQI Reporting under AWGN conditions - Single CSI Process TC 9.2.4.2	12.0.0	12.1.0
2014-03	RAN#63	R5-141006	1340	-	Addition of TC 8.2.1.7 FDD Carrier Aggregation with power imbalance	12.0.0	12.1.0
2014-03	RAN#63	R5-141007	1341	-	Updates to TC 7.4A.2 for CA_3C	12.0.0	12.1.0
2014-03	RAN#63	R5-141008	1342	-	Addition of TC 9.3.6.1_F FDD CQI Reporting under fading conditions multiple CSI processes for CoMP	12.0.0	12.1.0
2014-03	RAN#63	R5-141009	1343	-	Addition of TC 9.3.6.2_F TDD CQI Reporting under fading conditions multiple CSI processes for CoMP	12.0.0	12.1.0

2014-03	RAN#63	R5-141011	1345	-	Corrections to definition of 20 MHz and 5MHz for minimum output power for CA in 6.3.2A	12.0.0	12.1.0
2014-03	RAN#63	R5-141012	1346	-	Addition of Intra NC CA to chap. 5 and related symbol to chap. 3	12.0.0	12.1.0
2014-03	RAN#63	R5-141016	1347	-	Correction and proposed resolution to TBDs UL CA TCs 6.2.4A and 6.6.3.3A	12.0.0	12.1.0
2014-03	RAN#63	R5-141017	1348	-	Update for CA Rx TCs	12.0.0	12.1.0
2014-03	RAN#63	R5-141018	1349	-	PCC/SCC switching in inter-band CA Rx test cases	12.0.0	12.1.0
2014-03	RAN#63	R5-141026	1350	-	Introduction of new TC 8.3.1.3.2_F FDD PDSCH Performance with DCI format 2D, non Quasi Co-located Antenna Ports, Same Cell ID and multiple NZP CSI-RS resources for CoMP	12.0.0	12.1.0
2014-03	RAN#63	R5-141027	1351	-	Introduction of TC 8.3.1.3.3_F FDD PDSCH Performance with DCI format 2D, non Quasi Co-located Antenna Ports, Different Cell ID, Colliding CRS and single NZP CSI-RS for CoMP	12.0.0	12.1.0
2014-03	RAN#63	R5-141028	1352	-	Addition of new demod scenario for DL COMP - Same Cell ID and single NZP CSI-RS resource	12.0.0	12.1.0
2014-03	RAN#63	R5-141029	1353	-	Corrections to TM9 test to verify correct SNR estimation	12.0.0	12.1.0
2014-03	RAN#63	R5-141038	1354	-	Correction to sustained downlink data rate tests	12.0.0	12.1.0
2014-03	RAN#63	R5-141040	1355	-	Changes to test frequencies in Tx test cases for Band 28	12.0.0	12.1.0
2014-03	RAN#63	R5-141041	1356	-	Updates of Reference sensitivity for Intra-band non-contiguous CA	12.0.0	12.1.0
2014-03	RAN#63	R5-141042	1357	-	Update TC of 7.4A.4 Maximum input level for CA (intra band non-contiguous DL CA without UL CA)	12.0.0	12.1.0
2014-03	RAN#63	R5-141043	1358	-	Update TC of 7.5A.4 Adjacent Channel Selectivity (ACS) for CA (intra band non-contiguous DL CA without UL CA)	12.0.0	12.1.0
2014-03	RAN#63	R5-141044	1359	-	Corrections to maximum output power for multiple transmissions in a subframe	12.0.0	12.1.0
2014-03	RAN#63	R5-141045	1360	-	Correction to test configuration of Maximum input for CA	12.0.0	12.1.0
2014-03	RAN#63	R5-141047	1271	-	eICIC RF: Corrections to TDD PHICH test	12.0.0	12.1.0
2014-06	RAN#64	R5-142069	1362	-	LTE Type A performance requirements - adding TC 8.2.1.4.3 into annex F and G	12.1.0	12.2.0
2014-06	RAN#64	R5-142071	1363	-	Addition of connection diagram references to LTE Type A performance tests	12.1.0	12.2.0
2014-06	RAN#64	R5-142072	1364	-	Addition of connection diagram references to LTE Type A CSI tests	12.1.0	12.2.0
2014-06	RAN#64	R5-142111	1365	-	Addition of CA 3A-28A to 36.521-1 Chapter 6	12.1.0	12.2.0
2014-06	RAN#64	R5-142112	1366	-	Addition of CA 3A-28A to 36.521-1 Chapter 7	12.1.0	12.2.0
2014-06	RAN#64	R5-142172	1367	-	Addition of TC 6.2.2A.1 for CA_39C	12.1.0	12.2.0
2014-06	RAN#64	R5-142176	1368	-	Corrections to configured transmitted power for CA	12.1.0	12.2.0
2014-06	RAN#64	R5-142177	1369	-	Corrections to OCN pattern	12.1.0	12.2.0
2014-06	RAN#64	R5-142295	1370	-	Updates of 6.2.5 Delta TIB for CA_3A-26A and CA_3A-27A	12.1.0	12.2.0
2014-06	RAN#64	R5-142296	1371	-	Updates of 7.3.3 Delta RIB for CA_3A-26A and CA_3A-27A	12.1.0	12.2.0
2014-06	RAN#64	R5-142307	1372	-	RF: Corrections to spurious emission requirements with NS different than NS_01	12.1.0	12.2.0
2014-06	RAN#64	R5-142309	1373	-	RF: Editorial corrections to the annexes	12.1.0	12.2.0

2014-06	RAN#64	R5-142312	1374	-	CA RF: Several corrections to some Tx tests	12.1.0	12.2.0
2014-06	RAN#64	R5-142317	1375	-	eICIC RF: Corrections to RI performance tests	12.1.0	12.2.0
2014-06	RAN#64	R5-142343	1376	-	Addition of LTE CA_39A-41A into Table 6.2.5.3-2	12.1.0	12.2.0
2014-06	RAN#64	R5-142366	1377	-	Update of TC 8.7.4.1 TDD sustained data rate performance for EPDCCH scheduling	12.1.0	12.2.0
2014-06	RAN#64	R5-142372	1378	-	Update of TC 8.8.2.1.2 FDD EPDCCH localized transmission with TM10 quasi co-location Type-B	12.1.0	12.2.0
2014-06	RAN#64	R5-142376	1379	-	Update of TC 8.8.2.2.2 TDD EPDCCH localized transmission with TM10 quasi co-location Type-B	12.1.0	12.2.0
2014-06	RAN#64	R5-142384	1380	-	Update of TC 9.3.6.1_F FDD CQI Reporting under fading conditions multiple CSI processes for CoMP	12.1.0	12.2.0
2014-06	RAN#64	R5-142387	1381	-	Update overview of DL reference measurement channels for EPDCCH	12.1.0	12.2.0
2014-06	RAN#64	R5-142391	1382	-	Uncertainties and Test Tolerances for Enhanced Performance Requirement Type A 9.3.5.1.1 and 9.3.5.1.2 CQI Test cases	12.1.0	12.2.0
2014-06	RAN#64	R5-142393	1383	-	Test Tolerances for eICIC 9.2.x CQI Test cases	12.1.0	12.2.0
2014-06	RAN#64	R5-142394	1384	-	Correction of the test cases 8.2.1.2.2 and 8.2.1.2.2_1	12.1.0	12.2.0
2014-06	RAN#64	R5-142420	1386	-	Corrections to Annex G.5.4	12.1.0	12.2.0
2014-06	RAN#64	R5-142444	1387	-	Introduction of transmission mode 10 in precoder update granularity in FDD and TDD common test parameters	12.1.0	12.2.0
2014-06	RAN#64	R5-142446	1388	-	Introduction of new TC 8.3.2.4.2_F TDD PDSCH Performance with DCI format 2D, non Quasi Co-located Antenna Ports, Same Cell ID and multiple NZP CSI-RS resources for CoMP	12.1.0	12.2.0
2014-06	RAN#64	R5-142449	1389	-	Introduction of TC 8.3.2.4.3_F TDD PDSCH Performance with DCI format 2D, non Quasi Co-located Antenna Ports, Different Cell ID, Colliding CRS and single NZP CSI-RS for CoMP	12.1.0	12.2.0
2014-06	RAN#64	R5-142515	1390	-	Corrections to MBMS performance test cases	12.1.0	12.2.0
2014-06	RAN#64	R5-142576	1391	-	Update UE Transmit OFF power for CA_39C (intra-band contiguous DL CA and UL CA)	12.1.0	12.2.0
2014-06	RAN#64	R5-142588	1392	-	Remove the square bracket in TC 8.3.1.3.2_F and TC 8.3.1.3.3_F	12.1.0	12.2.0
2014-06	RAN#64	R5-142590	1393	-	Uncertainties and Test Tolerances for eICIC PDCCH/PCFICH and PHICH demodulation tests	12.1.0	12.2.0
2014-06	RAN#64	R5-142596	1394	-	Addition of message exception for PHICH duration	12.1.0	12.2.0
2014-06	RAN#64	R5-142597	1515	-	Correction to eICIC CSI tests	12.1.0	12.2.0
2014-06	RAN#64	R5-142601	1395	-	Correction to title in eICIC PDSCH demodulation tests	12.1.0	12.2.0
2014-06	RAN#64	R5-142605	1396	-	Correction to measurement bandwidth in 6.6.2.1A.1	12.1.0	12.2.0
2014-06	RAN#64	R5-142616	1399	-	Correction to MBMS performance	12.1.0	12.2.0
2014-06	RAN#64	R5-142672	1400	-	Correction to in-band blocking requirements	12.1.0	12.2.0
2014-06	RAN#64	R5-142676	1401	-	Correction to 6.6.2.1A test environment	12.1.0	12.2.0
2014-06	RAN#64	R5-142692	1402	-	Correction to 8.2.2.1.1_1 and 8.2.2.2.1_1 applicability	12.1.0	12.2.0
2014-06	RAN#64	R5-142697	1403	-	36.521-1: Corrections to section 7.3A	12.1.0	12.2.0
2014-06	RAN#64	R5-142701	1404	-	Introduction of NC CA TC 7.7A.4	12.1.0	12.2.0
2014-06	RAN#64	R5-142703	1405	-	Uncertainties and Derivation of Test Requirements for TCs 7.6.xA.4 and 7.7A.4	12.1.0	12.2.0

2014-06	RAN#64	R5-142710	1406	-	36-521-1: Clarification on Averaged EVM for PRACH	12.1.0	12.2.0
2014-06	RAN#64	R5-142749	1407	-	Correction to CA band combo CA_3A-5A	12.1.0	12.2.0
2014-06	RAN#64	R5-142750	1408	-	Verification of exceptions of REFSENS requirements for carrier aggregation	12.1.0	12.2.0
2014-06	RAN#64	R5-142771	1409	-	Addition of CA_2A-4A and CA_5A-7A to 36.521-1 Chapter 7	12.1.0	12.2.0
2014-06	RAN#64	R5-143003	1410	-	36.521-1: Editorial correction on 6.6.3.3 Initial conditions for NS_19	12.1.0	12.2.0
2014-06	RAN#64	R5-143004	1411	-	36.521-1: Editorial correction on 6.6.2.2B test requirements for NS_06 or NS_07	12.1.0	12.2.0
2014-06	RAN#64	R5-143005	1412	-	Correction for CA_4A-12A uplink configuration in inter-band CA reference sensitivity	12.1.0	12.2.0
2014-06	RAN#64	R5-143006	1413	-	CA RF: Clarification of test parameters and requirements for Inter-band CA Rx tests	12.1.0	12.2.0
2014-06	RAN#64	R5-143007	1414	-	Corrections to SNR test for TM9 minimum requirements	12.1.0	12.2.0
2014-06	RAN#64	R5-143008	1415	-	Correction to ACK NAK Reporting mode for TDD CA test cases	12.1.0	12.2.0
2014-06	RAN#64	R5-143009	1416	-	Addition of TC 8.2.1.1.1_2 and 8.2.2.1.1_2	12.1.0	12.2.0
2014-06	RAN#64	R5-143010	1417	-	Correction of FDD PDSCH Open Loop Spatial Multiplexing 2x2 for CA test cases of TCs 8.2.1.3.1_A.2 and 8.2.1.3.1_A.2_1	12.1.0	12.2.0
2014-06	RAN#64	R5-143011	1418	-	Updates to 8.2.1.3 FDD PDSCH Open Loop Spatial Multiplexing 2x2 related test cases	12.1.0	12.2.0
2014-06	RAN#64	R5-143012	1419	-	Updates to 8.2.2.3 TDD PDSCH Open Loop Spatial Multiplexing 2x2 related test cases	12.1.0	12.2.0
2014-06	RAN#64	R5-143013	1420	-	36.521-1: Editorial correction on 8.2.1.4.2_A.2 message contents	12.1.0	12.2.0
2014-06	RAN#64	R5-143014	1421	-	Clarification the minimum conformance requirement and test parameter for 8.2.1.3.3_C1 and 8.2.1.3.3_C2 test cases	12.1.0	12.2.0
2014-06	RAN#64	R5-143015	1422	-	Correction to minimum test time for eICIC tests	12.1.0	12.2.0
2014-06	RAN#64	R5-143025	1423	-	LTE Type A performance requirements - Introduction of the new test case 8.2.1.4.3	12.1.0	12.2.0
2014-06	RAN#64	R5-143026	1424	-	Test Tolerances for eICIC 9.5.x RI Test cases	12.1.0	12.2.0
2014-06	RAN#64	R5-143027	1425	-	Uncertainties and Test Tolerances for EPDCCH 8.8.1.x demodulation Test cases	12.1.0	12.2.0
2014-06	RAN#64	R5-143031	1426	-	Update to operating bands for CA	12.1.0	12.2.0
2014-06	RAN#64	R5-143032	1427	-	Update to channel bandwidths for CA	12.1.0	12.2.0
2014-06	RAN#64	R5-143033	1428	-	Update to TC 6.3.2A.1 for CA_39C	12.1.0	12.2.0
2014-06	RAN#64	R5-143034	1429	-	Updates of 7.3A.3 Refsens for CA_3A-26A and CA_3A-27A	12.1.0	12.2.0
2014-06	RAN#64	R5-143035	1430	-	Addition of CA band Combo CA_2A-13A	12.1.0	12.2.0
2014-06	RAN#64	R5-143036	1431	-	Addition of CA_39A-41A to Refsens in chap.7	12.1.0	12.2.0
2014-06	RAN#64	R5-143037	1432	-	Updates to Chap.5 for CA_27B	12.1.0	12.2.0
2014-06	RAN#64	R5-143038	1433	-	Addition of CA_2A-4A and CA_5A-7A to 36.521-1 Clause 6	12.1.0	12.2.0
2014-06	RAN#64	R5-143039	1434	-	TC 8.2.1.3.3_E.1 FDD PDSCH Open Loop Spatial Multiplexing 2x2 for feICIC (non-MBSFN ABS)	12.1.0	12.2.0
2014-06	RAN#64	R5-143040	1435	-	TC 8.2.2.3.3_E.1 TDD PDSCH Open Loop Spatial Multiplexing 2x2 for feICIC (non-MBSFN ABS)	12.1.0	12.2.0

2014-06	RAN#64	R5-143041	1436	-	Corrections applicability statement including UE category for feICIC	12.1.0	12.2.0
2014-06	RAN#64	R5-143042	1437	-	Additions to TC 8.2.1.2.3_E.1 FDD PDSCH Transmit diversity 2x2 for feICIC (non-MBSFN ABS)	12.1.0	12.2.0
2014-06	RAN#64	R5-143043	1438	-	Additions to TC 8.2.2.2.3_E.1 TDD PDSCH Transmit diversity 2x2 for feICIC (non-MBSFN ABS)	12.1.0	12.2.0
2014-06	RAN#64	R5-143044	1439	-	Additions to TC 8.2.1.4.1_E.1 FDD PDSCH Closed Loop Single Layer Spatial Multiplexing 2x2 for feICIC (non-MBSFN ABS)	12.1.0	12.2.0
2014-06	RAN#64	R5-143045	1440	-	Additions to TC 8.2.2.4.1_E.1 TDD PDSCH Closed Loop Single Layer Spatial Multiplexing 2x2 for feICIC (non-MBSFN ABS)	12.1.0	12.2.0
2014-06	RAN#64	R5-143046	1441	-	Additions to TC 9.2.1.5_E.1 FDD CQI Reporting under AWGN conditions - PUCCH 1-0 for feICIC (non-MBSFN ABS)	12.1.0	12.2.0
2014-06	RAN#64	R5-143047	1442	-	Additions to TC 9.2.1.6_E.1 TDD CQI Reporting under AWGN conditions - PUCCH 1-0 for feICIC (non-MBSFN ABS)	12.1.0	12.2.0
2014-06	RAN#64	R5-143048	1443	-	Additions to TC 9.3.1.3.1_E.1 FDD CQI Reporting under fading conditions - PUSCH 3-0 for feICIC (non-MBSFN ABS)	12.1.0	12.2.0
2014-06	RAN#64	R5-143049	1444	-	Additions to TC 9.3.1.3.2_E.1 TDD CQI Reporting under fading conditions - PUSCH 3-0 for feICIC (non-MBSFN ABS)	12.1.0	12.2.0
2014-06	RAN#64	R5-143050	1445	-	Additions to TC 9.5.4.1_E.1 FDD RI Reporting - PUCCH 1-0 for feICIC (non-MBSFN ABS)	12.1.0	12.2.0
2014-06	RAN#64	R5-143051	1446	-	Additions to TC 9.5.4.2_E.1 TDD RI Reporting - PUCCH 1-0 for feICIC (non-MBSFN ABS)	12.1.0	12.2.0
2014-06	RAN#64	R5-143052	1447	-	Additions to Reporting of Channel State Information feICIC Test Cases to Annex F	12.1.0	12.2.0
2014-06	RAN#64	R5-143076	1448	-	Update of TC 9.3.6.2_F TDD CQI Reporting under fading conditions multiple CSI processes for CoMP	12.1.0	12.2.0
2014-06	RAN#64	R5-143077	1449	-	Correction parameter and reference table number in test case 8.3.2.4.1_F	12.1.0	12.2.0
2014-06	RAN#64	R5-143079	1450	-	Update of TC 8.7.3.1 FDD sustained data rate performance for EPDCCH scheduling	12.1.0	12.2.0
2014-06	RAN#64	R5-143080	1451	-	Addition of TC 8.8.3.1 FDD Localized transmission with TM10 Type B quasi co-location type	12.1.0	12.2.0
2014-06	RAN#64	R5-143081	1452	-	Addition of TC 8.8.3.2 TDD Localized transmission with TM10 Type B quasi co-location type	12.1.0	12.2.0
2014-06	RAN#64	R5-143082	1453	-	Update initial condition and test requirement in test case 8.7.1.1_A.2_1 for two 15MHz CCs	12.1.0	12.2.0
2014-06	RAN#64	R5-143097	1454	-	Addition of message content exception in eICIC performance tests with MBSFN ABS	12.1.0	12.2.0
2014-06	RAN#64	R5-143098	1455	-	Additions to TC 8.4.1.2.3_E.1 FDD PCFICH/PDCCH Transmit Diversity 2x2 for feICIC (non-MBSFN ABS)	12.1.0	12.2.0
2014-06	RAN#64	R5-143099	1456	-	Additions to TC 8.4.2.2.3_E.1 TDD PCFICH/PDCCH Transmit Diversity 2x2 for feICIC (non-MBSFN ABS)	12.1.0	12.2.0
2014-06	RAN#64	R5-143100	1457	-	Additions to TC 8.4.2.2.3_E.2 TDD PCFICH/PDCCH Transmit Diversity 2x2 for feICIC (MBSFN ABS)	12.1.0	12.2.0
2014-06	RAN#64	R5-143101	1458	-	Additions to Demodulation feICIC Test Cases to Annex F	12.1.0	12.2.0
2014-06	RAN#64	R5-143104	1459	-	Introduction of TC 8.2.2.4.2_A.3 TDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4 x 2 for CA	12.1.0	12.2.0
2014-06	RAN#64	R5-143105	1460	-	Updates to Refsens for Intra-band non-contiguous CA	12.1.0	12.2.0

2014-06	RAN#64	R5-143106	1461	-	Correction of interference rejection test cases TC 8.2.2.4.3	12.1.0	12.2.0
2014-06	RAN#64	R5-143107	1462	-	Correction to eICIC PDSCH demodulation tests	12.1.0	12.2.0
2014-06	RAN#64	R5-143113	1463	-	Introduction of TC 8.2.2.1.1_A.3 TDD PDSCH Single Antenna Port Performance for CA	12.1.0	12.2.0
2014-06	RAN#64	R5-143114	1464	-	Additions to TC 8.4.1.2.3_E.2 FDD PCFICH/PDCCH Transmit Diversity 2x2 for feICIC (MBSFN ABS)	12.1.0	12.2.0
2014-06	RAN#64	R5-143115	1465	-	Update of TC 8.8.1.1 FDD distributed EPDCCH performance	12.1.0	12.2.0
2014-06	RAN#64	R5-143116	1466	-	Update of TC 8.8.2.1 FDD localized transmission with TM9	12.1.0	12.2.0
2014-06	RAN#64	R5-143117	1467	-	Update of TC 8.8.2.2 TDD localized transmission with TM9	12.1.0	12.2.0
2014-06	RAN#64	R5-143118	1468	-	Update sections of A.3.9 and A.3.10 reference channel for EPDCCH test	12.1.0	12.2.0
2014-06	RAN#64	R5-143129	1469	-	Addition of FDD CQI Reporting under AWGN conditions - PUCCH 1-0 for CA (intra band non-contiguous DL CA) TC 9.6.1.1_A.3	12.1.0	12.2.0
2014-06	RAN#64	R5-143130	1470	-	Addition of TDD CQI Reporting under AWGN conditions - PUCCH 1-0 for CA (intra band non-contiguous DL CA) TC 9.6.1.2_A.3	12.1.0	12.2.0
2014-06	RAN#64	R5-143131	1471	-	Addition of TC 6.2.4A.1 for CA_39C	12.1.0	12.2.0
2014-06	RAN#64	R5-143133	1472	-	Update additional spurious emissions for CA_38C (intra-band contiguous DL CA and UL CA)	12.1.0	12.2.0
2014-06	RAN#64	R5-143134	1473	-	Update In-band blocking for CA_39C (intra-band contiguous DL CA and UL CA)	12.1.0	12.2.0
2014-06	RAN#64	R5-143135	1474	-	Update Out-of-band blocking for CA_39C (intra-band contiguous DL CA and UL CA)	12.1.0	12.2.0
2014-06	RAN#64	R5-143136	1475	-	Update Reference sensitivity level for CA_39C (intra-band contiguous DL CA and UL CA)	12.1.0	12.2.0
2014-06	RAN#64	R5-143137	1476	-	RF: Corrections to CSI RMCs	12.1.0	12.2.0
2014-06	RAN#64	R5-143138	1477	-	CA RF: Corrections to CQI performance tests	12.1.0	12.2.0
2014-06	RAN#64	R5-143140	1478	-	CA RF: Corrections to performance test with power imbalance (Class C)	12.1.0	12.2.0
2014-06	RAN#64	R5-143141	1479	-	Correction of test case 8.2.1.1.1_1	12.1.0	12.2.0
2014-06	RAN#64	R5-143142	1480	-	Correction of the test applicability for test cases 8.2.1.1.1_A.2, 8.2.1.3.1_A.1, 8.2.1.3.1_A.2 and 8.2.1.4.2_A.2	12.1.0	12.2.0
2014-06	RAN#64	R5-143143	1481	-	Correction of the test applicability of the test cases 8.2.1.1.1_A.1, 8.2.1.4.2_A.1, 8.2.2.1.1_A.1 and 8.2.2.4.2_A.1	12.1.0	12.2.0
2014-06	RAN#64	R5-143144	1482	-	Correction of the applicability for the test case 8.7.1.1	12.1.0	12.2.0
2014-06	RAN#64	R5-143146	1483	-	Addition of TC 9.5.5.1_F.2 FDD RI Reporting with Multiple CSI processes for CoMP	12.1.0	12.2.0
2014-06	RAN#64	R5-143147	1484	-	Addition of TC 9.5.5.2_F.2 TDD RI Reporting with Multiple CSI processes for CoMP	12.1.0	12.2.0
2014-06	RAN#64	R5-143148	1485	-	Clarification of test parameters for eICIC PDCCH performance tests	12.1.0	12.2.0
2014-06	RAN#64	R5-143149	1486	-	Correction to Intra-band CA uplink configuration for reference sensitivity	12.1.0	12.2.0
2014-06	RAN#64	R5-143151	1487	-	Correction to CQI reference measurement channels	12.1.0	12.2.0
2014-06	RAN#64	R5-143154	1488	-	Introduction of NC CA TC 7.6.1A.4	12.1.0	12.2.0

2014-06	RAN#64	R5-143155	1489	-	Introduction of NC CA TC 7.6.2A.4	12.1.0	12.2.0
2014-06	RAN#64	R5-143156	1490	-	Introduction of NC CA TC 7.6.3A.4	12.1.0	12.2.0
2014-06	RAN#64	R5-143161	1491	-	Update Spurious emission band UE co-existence for CA_39C (intra-band contiguous DL CA and UL CA)	12.1.0	12.2.0
2014-06	RAN#64	R5-143162	1492	-	Update additional spurious emissions for CA_39C (intra-band contiguous DL CA and UL CA)	12.1.0	12.2.0
2014-06	RAN#64	R5-143163	1493	-	Updates to TC 7.3A.2 Reference sensitivity level for CA_27B	12.1.0	12.2.0
2014-06	RAN#64	R5-143164	1494	-	Updates to TC 7.4A.2 maximum input level for intra-band contiguous CA for CA_27B	12.1.0	12.2.0
2014-06	RAN#64	R5-143165	1495	-	Updates to TC 7.5A.2 ACS for CA_27B	12.1.0	12.2.0
2014-06	RAN#64	R5-143166	1496	-	Updates to 7.6.1A.2 IBB for CA of CA_27B	12.1.0	12.2.0
2014-06	RAN#64	R5-143167	1497	-	Updates to TC 7.6.2A.2 OOB for CA of CA_27B	12.1.0	12.2.0
2014-06	RAN#64	R5-143168	1498	-	Updates to TC 7.6.3A.2 Narrow band blocking for CA_27B	12.1.0	12.2.0
2014-06	RAN#64	R5-143169	1499	-	Updates to TC 7.7A.2 Spurious response for CA_27B	12.1.0	12.2.0
2014-06	RAN#64	R5-143170	1500	-	Updates to TC 7.8.1A.2 Wideband intermodulation for CA_27B	12.1.0	12.2.0
2014-06	RAN#64	R5-143175	1502	-	Updates to 8.7.2.1 TDD sustained data rate performance related test cases	12.1.0	12.2.0
2014-06	RAN#64	R5-143178	1504	-	Additions to TC 9.5.5.1_F.1 FDD RI Reporting with Single CSI process	12.1.0	12.2.0
2014-06	RAN#64	R5-143179	1505	-	Additions to TC 9.5.5.2_F.1 TDD RI Reporting with Single CSI process	12.1.0	12.2.0
2014-06	RAN#64	R5-143181	1506	-	Splitting of FDD CA TM3 and soft buffer management tests	12.1.0	12.2.0
2014-06	RAN#64	R5-143182	1507	-	Removal of soft buffer test points from FDD TM3 test cases in 8.2.1.3.1 and move to new soft buffer test cases in section 8.2.1.3.1A	12.1.0	12.2.0
2014-06	RAN#64	R5-143183	1508	-	Splitting of TDD CA TM3 and soft buffer management tests	12.1.0	12.2.0
2014-06	RAN#64	R5-143184	1509	-	Removal of soft buffer test points from TDD TM3 test cases in 8.2.2.3.1 and move to new soft buffer test case in section 8.2.2.3.1A	12.1.0	12.2.0
2014-06	RAN#64	R5-143188	1512	-	Addition of TC 8.2.2.7 TDD Carrier Aggregation with power imbalance	12.1.0	12.2.0
2014-06	RAN#64	R5-143189	1513	-	Corrections to test case 8.2.1.4.2_1, 8.2.2.4.1_1, and 8.2.2.4.2_1	12.1.0	12.2.0
2014-06	RAN#64	R5-143190	1514	-	Uncertainties and Test Tolerances for CoMP Test case 8.3.1.3.2_F	12.1.0	12.2.0
2014-06	RAN#64	R5-143203	1385	-	Throughput calculation for eCIC demodulation requirements	12.1.0	12.2.0
2014-06	RAN#64	R5-143204	1503	-	Correction to eCIC TDD RI requirements	12.1.0	12.2.0
2014-06	RAN#64	R5-143205	1510	-	Updates to 8.7.1.1_A FDD sustained data rate performance for CA related test cases	12.1.0	12.2.0
2014-06	RAN#64	R5-143206	1511	-	Updates to 8.7.2.1_A TDD sustained data rate performance for CA related test cases	12.1.0	12.2.0
2014-06	RAN#64	R5-143207	1397	-	Correction to CA Rx test cases	12.1.0	12.2.0
2014-06	RAN#64	R5-143208	1398	-	Correction to call setup in 8.7.1 and 8.7.2	12.1.0	12.2.0
2014-06	RAN#64	R5-143216	1501	-	Updates to 8.7.1.1 FDD sustained data rate performance related test cases	12.1.0	12.2.0

2014-09	RAN#65	R5-144068	1516	-	Uncertainties and test tolerances for test case 8.2.2.2.4	12.2.0	12.3.0
2014-09	RAN#65	R5-144072	1517	-	Uncertainties and test tolerances for test case 8.3.1.1.3	12.2.0	12.3.0

2014-09	RAN#65	R5-144123	1541	-	Corrections to Annex G for feICIC	12.2.0	12.3.0

2014-09	RAN#65	R5-144173	1542	-	RF: Corrections to spurious emission band co-existence test	12.2.0	12.3.0
2014-09	RAN#65	R5-144174	1543	-	RF: Missing test coverage for Band 31	12.2.0	12.3.0
2014-09	RAN#65	R5-144176	1544	-	IR RF: Correction to TCs 8.3.1.1.3 and 8.3.2.1.4	12.2.0	12.3.0
2014-09	RAN#65	R5-144244	1545	-	Correction of clause 6.2.4.5 in 36.521-1	12.2.0	12.3.0
2014-09	RAN#65	R5-144248	1546	-	Addition of operating band 30 to TS 36.521-1, clause 5	12.2.0	12.3.0
2014-09	RAN#65	R5-144283	1547	-	Add static propagation condition matrix for 1 x 2	12.2.0	12.3.0
2014-09	RAN#65	R5-144299	1548	-	Update of TC 8.3.1.3.2_F CoMP	12.2.0	12.3.0
2014-09	RAN#65	R5-144300	1549	-	Update of TC 8.3.1.3.3_F CoMP	12.2.0	12.3.0
2014-09	RAN#65	R5-144301	1550	-	Update of TC 8.3.2.4.2_F CoMP	12.2.0	12.3.0
2014-09	RAN#65	R5-144302	1551	-	Update of TC 8.3.2.4.3_F CoMP	12.2.0	12.3.0
2014-09	RAN#65	R5-144310	1552	-	Update minimum requirements and test tolerance for TC 8.7.3.1	12.2.0	12.3.0
2014-09	RAN#65	R5-144311	1553	-	Update minimum requirements and test tolerance for TC 8.7.4.1	12.2.0	12.3.0
2014-09	RAN#65	R5-144312	1554	-	Update minimum requirements and test tolerance for TC 8.8.2.1	12.2.0	12.3.0
2014-09	RAN#65	R5-144313	1555	-	Update minimum requirements and test tolerance for TC 8.8.2.2	12.2.0	12.3.0
2014-09	RAN#65	R5-144347	1556	-	Correction to Inter-band CA operating bands	12.2.0	12.3.0
2014-09	RAN#65	R5-144352	1557	-	Correction to eICIC performance test cases	12.2.0	12.3.0
2014-09	RAN#65	R5-144353	1558	-	Correction to UL/DL configuration in CQI requirements	12.2.0	12.3.0
2014-09	RAN#65	R5-144393	1559	-	RF: Corrections to A-MPR test requirements	12.2.0	12.3.0
2014-09	RAN#65	R5-144416	1560	-	Update configurations of CA_39C in A-MPR for CA	12.2.0	12.3.0
2014-09	RAN#65	R5-144420	1561	-	Update configurations of CA_39C in Additional spurious emissions for CA	12.2.0	12.3.0
2014-09	RAN#65	R5-144436	1562	-	Update of test applicabilities for TDD PDSCH Transmit Diversity	12.2.0	12.3.0
2014-09	RAN#65	R5-144439	1563	-	Update of test applicability for TDD PDSCH Transmit Diversity 4x2	12.2.0	12.3.0
2014-09	RAN#65	R5-144441	1564	-	Update test applicabilities for TDD interference rejection test cases	12.2.0	12.3.0
2014-09	RAN#65	R5-144474	1565	-	Updates to TC 8.7.2.1 and 8.7.2.1_1 for TDD SDR	12.2.0	12.3.0
2014-09	RAN#65	R5-144766	1567	-	Correction to CA Rx Blocking TCs	12.2.0	12.3.0
2014-09	RAN#65	R5-144775	1568	-	Correction of the ePDCCH TCs for applying default parameter	12.2.0	12.3.0
2014-09	RAN#65	R5-144787	1566	-	Addition of new TC 8.2.1.3.1_A.3 FDD PDSCH Open Loop Spatial Multiplexing 2x2 for intra-band NC DL CA	12.2.0	12.3.0
2014-09	RAN#65	R5-144801	1569	-	Removal of TBDs in Clause 6.2.4A.1 (A-MPR for UL intra-band cont. CA), CA_NS_02 and 03, correction of Test Requirements	12.2.0	12.3.0
2014-09	RAN#65	R5-144802	1570	-	Correction to in-band blocking for CA requirements	12.2.0	12.3.0
2014-09	RAN#65	R5-144803	1571	-	Corrections to TM9 SNR requirements for eDL-MIMO	12.2.0	12.3.0
2014-09	RAN#65	R5-144804	1572	-	Addition of exception message for TDD MBMS	12.2.0	12.3.0
2014-09	RAN#65	R5-144805	1573	-	RF: Corrections to sustained data rate tests	12.2.0	12.3.0

2014-09	RAN#65	R5-144806	1574	-	Correction of TDD CQI Reporting under AWGN conditions - PUCCH 1-0 for CA (intra band contiguous DL CA) TC 9.6.1.2_A.1	12.2.0	12.3.0
2014-09	RAN#65	R5-144807	1575	-	Correction of TDD CQI Reporting under AWGN conditions - PUCCH 1-0 for CA (intra band non-contiguous DL CA) TC 9.6.1.2_A.3	12.2.0	12.3.0
2014-09	RAN#65	R5-144808	1576	-	Correction to the test cases 8.3.2.1.1, 8.3.2.1.2, 8.3.2.1.3 and 8.3.2.2.1	12.2.0	12.3.0
2014-09	RAN#65	R5-144809	1577	-	Correction to RF General section on CA configurations	12.2.0	12.3.0
2014-09	RAN#65	R5-144814	1578	-	Update TC 9.3.6.1_F FDD CQI Reporting under fading conditions multiple CSI processes for CoMP	12.2.0	12.3.0
2014-09	RAN#65	R5-144815	1579	-	Update TC 9.3.6.2_F TDD CQI Reporting under fading conditions multiple CSI processes for CoMP	12.2.0	12.3.0
2014-09	RAN#65	R5-144817	1580	-	Addition of CoMP AWGN CQI Tests to Test Requirements Derivation in Annex F	12.2.0	12.3.0
2014-09	RAN#65	R5-144818	1581	-	Update minimum requirements and test tolerance for TC 8.8.3.1	12.2.0	12.3.0
2014-09	RAN#65	R5-144819	1582	-	Update minimum requirements and test tolerance for TC 8.8.3.2	12.2.0	12.3.0
2014-09	RAN#65	R5-144820	1583	-	Uncertainties and test tolerances for test cases 8.2.1.3.3_E.1 and 8.2.2.3.3_E.1	12.2.0	12.3.0
2014-09	RAN#65	R5-144821	1584	-	Uncertainties and Test Tolerances for felCIC Test cases 8.2.1.2.3_E.1 and 8.2.2.2.3_E.1.	12.2.0	12.3.0
2014-09	RAN#65	R5-144822	1585	-	Uncertainties and test tolerances for test case 8.2.2.4.3	12.2.0	12.3.0
2014-09	RAN#65	R5-144824	1586	-	Uncertainties and test tolerances for test cases 9.3.5.2.1 and 9.3.5.2.2	12.2.0	12.3.0
2014-09	RAN#65	R5-144826	1587	-	eICIC Test Tolerance references to TS 36.904	12.2.0	12.3.0
2014-09	RAN#65	R5-144827	1588	-	Addition of CA aQI Tests to Test Requirements Derivation in Annex F	12.2.0	12.3.0
2014-09	RAN#65	R5-144828	1589	-	ePDCCH RF: Corrections to sustained data rate tests	12.2.0	12.3.0
2014-09	RAN#65	R5-144836	1590	-	Update to CoMP test case 9.5.5.1_F.2 and 9.5.5.2_F.2	12.2.0	12.3.0
2014-09	RAN#65	R5-144839	1591	-	New CA band combination CA_NC_42 and CA_4-27-Update to 36.521-1 Chapter 6	12.2.0	12.3.0
2014-09	RAN#65	R5-144840	1592	-	New CA band combination CA_NC_42 and CA_4-27-Update to 36.521-1 Chapter 7	12.2.0	12.3.0
2014-09	RAN#65	R5-144841	1593	-	Addition of CA band Combo CA_7A-28A	12.2.0	12.3.0
2014-09	RAN#65	R5-144842	1594	-	Addition of CA_2A-2A to 36.521-1	12.2.0	12.3.0
2014-09	RAN#65	R5-144844	1595	-	Existing CA band combination CA_3A-28A update to 36.521-1 7.3	12.2.0	12.3.0
2014-09	RAN#65	R5-144845	1596	-	Addition of new CA band combo CA_2A-5A to 36.521-1	12.2.0	12.3.0
2014-09	RAN#65	R5-144859	1597	-	New TC: TDD CQI Reporting under AWGN conditions - PUCCH 1-0 for CA (inter band DL CA)	12.2.0	12.3.0
2014-09	RAN#65	R5-144873	1599	-	Correction of clause 6.3.4.1.4 in 36.521-1	12.2.0	12.3.0
2014-09	RAN#65	R5-144874	1600	-	Removal of transition period for Band 28 test frequency definition	12.2.0	12.3.0
2014-09	RAN#65	R5-144875	1601	-	Clarification of tables used in TDD Intra band non-contiguous DL CA TCs	12.2.0	12.3.0

2014-09	RAN#65	R5-144876	1602	-	Introduction of new Wideband Intermodulation test for Intra-band NC CA	12.2.0	12.3.0
2014-09	RAN#65	R5-144879	1603	-	New CA band combination CA_NC_42 and CA_4-27-Update to 36.521-1 Chapter 5	12.2.0	12.3.0
2014-09	RAN#65	R5-144880	1604	-	Update reference sensitivity level for CA (intra-band contiguous DL CA without UL CA)	12.2.0	12.3.0
2014-09	RAN#65	R5-144881	1605	-	Update In-band blocking for CA (intra-band contiguous DL CA without UL CA)	12.2.0	12.3.0
2014-09	RAN#65	R5-144891	1606	-	CA RF: Adopting test frequencies selection to the new structure proposed for TS 36.508	12.2.0	12.3.0
2014-09	RAN#65	R5-144894	1607	-	Corrections to 8.3.1.2.1_D_1 FDD PDSCH Dual-layer Spatial Multiplexing for eDL-MIMO (Release 11 and forward)	12.2.0	12.3.0
2014-09	RAN#65	R5-144895	1608	-	Corrections to 8.3.2.2.1_D_1 TDD PDSCH Dual-layer Spatial Multiplexing for eDL-MIMO (Release 11 and forward)	12.2.0	12.3.0
2014-09	RAN#65	R5-144896	1609	-	Correct errors in TDD PDSCH Single Antenna Port Performance test case	12.2.0	12.3.0
2014-09	RAN#65	R5-144897	1610	-	Separation of minimum requirements for CA UE PDSCH demodulation from single carrier	12.2.0	12.3.0
2014-09	RAN#65	R5-144898	1611	-	Introduction of FDD CQI Reporting under AWGN conditions - PUCCH 1-0 for CA (intra band contiguous DL CA) TC 9.6.1.1_A.1	12.2.0	12.3.0
2014-09	RAN#65	R5-144899	1612	-	Correction of FDD CQI Reporting under AWGN conditions - PUCCH 1-0 for CA (inter band DL CA) TC 9.6.1.1_A.2	12.2.0	12.3.0
2014-09	RAN#65	R5-144900	1613	-	Correction of FDD CQI Reporting under AWGN conditions - PUCCH 1-0 for CA (intra band non-contiguous DL CA) TC 9.6.1.1_A.3	12.2.0	12.3.0
2014-09	RAN#65	R5-144901	1614	-	Updates to 8.2.1.4.2_A.1/A.2 FDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for CA related test cases	12.2.0	12.3.0
2014-09	RAN#65	R5-144902	1615	-	Updates to 8.2.2.3.1_A TDD PDSCH Open Loop Spatial Multiplexing 2x2 for CA	12.2.0	12.3.0
2014-09	RAN#65	R5-144903	1616	-	Updates to 8.2.2.4.2_A TDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for CA	12.2.0	12.3.0
2014-09	RAN#65	R5-144904	1617	-	Updates to 8.2.2.3.1 TDD PDSCH Open Loop Spatial Multiplexing 2x2	12.2.0	12.3.0
2014-09	RAN#65	R5-144905	1618	-	Updates to 8.2.2.3.2 TDD PDSCH Open Loop Spatial Multiplexing 4x2	12.2.0	12.3.0
2014-09	RAN#65	R5-144906	1619	-	Updates to 8.2.2.4 TDD PDSCH Closed Loop Single/Multi Layer Spatial Multiplexing 2x2 and 4x2	12.2.0	12.3.0
2014-09	RAN#65	R5-144907	1620	-	Updates to 9.2.x CQI Reporting under AWGN conditions	12.2.0	12.3.0
2014-09	RAN#65	R5-144916	1621	-	Message contents updates for TC 9.5.5.1_F.1+9.5.5.2_F.1 CoMP	12.2.0	12.3.0
2014-09	RAN#65	R5-144917	1622	-	FDD CQI Reporting under AWGN conditions - Single CSI Process TC 9.2.4.1_F - Editor Notes Resolution	12.2.0	12.3.0
2014-09	RAN#65	R5-144918	1623	-	TDD CQI Reporting under AWGN conditions - Single CSI Process TC 9.2.4.2_F - Editor Notes Resolution	12.2.0	12.3.0
2014-09	RAN#65	R5-144920	1624	-	Addition of SDR test case 8.7.1.1_A.3 for intra-band NC DL CA	12.2.0	12.3.0
2014-09	RAN#65	R5-144922	1625	-	New TC: TDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for CA (inter band DL CA)	12.2.0	12.3.0
2014-09	RAN#65	R5-144923	1626	-	New TC: TDD PDSCH Single Antenna Port Performance for CA (inter-band DL CA)	12.2.0	12.3.0

2014-09	RAN#65	R5-144924	1627	-	New TC: TDD PDSCH Open Loop Spatial Multiplexing 2x2 for CA (inter-band DL CA)	12.2.0	12.3.0
2014-09	RAN#65	R5-144925	1628	-	New TC: TDD sustained data rate performance for CA (inter-band DL CA)	12.2.0	12.3.0
2014-09	RAN#65	R5-144926	1629	-	Update Out-of-band blocking for CA (intra-band contiguous DL CA without UL CA)	12.2.0	12.3.0
2014-09	RAN#65	R5-144928	1630	-	Message contents updates for Demod feICIC test cases	12.2.0	12.3.0
2014-09	RAN#65	R5-144930	1631	-	Addition of new TC 8.2.2.3.1A_A.3 TDD Soft buffer management test for intra-band NC DL CA	12.2.0	12.3.0
2014-09	RAN#65	R5-144931	1632	-	Addition of new TC 8.2.1.4.2_A.3 FDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for CA (intra band NC DL CA)	12.2.0	12.3.0
2014-09	RAN#65	R5-144932	1633	-	Updates to TCs 8.2.1.3.1_A.1/A.2 for FDD PDSCH Open Loop Spatial Multiplexing 2x2 for CA	12.2.0	12.3.0
2014-09	RAN#65	R5-144933	1634	-	Updates to 8.7.1.1_A FDD SDR for CA related test cases	12.2.0	12.3.0
2014-09	RAN#65	R5-144934	1635	-	Addition of new TC 8.2.2.3.1A_A.2 TDD Soft buffer management test for inter-band DL CA	12.2.0	12.3.0
2014-09	RAN#65	R5-144936	1636	-	Updates of Annex F.1.4 and F.3.4 for newly added performance test cases	12.2.0	12.3.0
2014-09	RAN#65	R5-144938	1637	-	Updates to TC 8.2.2.1 TDD PDSCH Single Antenna Port Performance (Cell-Specific Reference Symbols) related test cases	12.2.0	12.3.0
2014-09	RAN#65	R5-144939	1638	-	Updates to 8.2.2.2 TDD PDSCH Transmit Diversity Performance (Cell-Specific Reference Symbols)	12.2.0	12.3.0
2014-09	RAN#65	R5-144942	1640	-	Updates to TC 9.6.1.1_A.2 FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for CA (inter band DL CA)	12.2.0	12.3.0
2014-12	RAN#66	R5-145014	1641	-	Corrections to CA Blocking TCs minimum requirements	12.3.0	12.4.0
2014-12	RAN#66	R5-145015	1642	-	Correction to CA Spurious Response TC minimum requirements	12.3.0	12.4.0
2014-12	RAN#66	R5-145125	1645	-	RF: Review of definition of CSI measurement channels with dynamic coding rate	12.3.0	12.4.0
2014-12	RAN#66	R5-145128	1646	-	RF: Review of references to CSI measurement channels with dynamic coding rate	12.3.0	12.4.0
2014-12	RAN#66	R5-145175	1647	-	New CA band combination CA_1A-3A - Updates of 5.2A Operating bands	12.3.0	12.4.0
2014-12	RAN#66	R5-145176	1648	-	New CA band combination CA_1A-3A - Updates of 5.4.2A Channel Bandwidth	12.3.0	12.4.0
2014-12	RAN#66	R5-145177	1649	-	New CA band combination CA_1A-3A - Updates of 6.2.5 Delta TIB	12.3.0	12.4.0
2014-12	RAN#66	R5-145178	1650	-	New CA band combination CA_1A-3A - Updates of 7.3.3 Delta RIB	12.3.0	12.4.0
2014-12	RAN#66	R5-145189	1651	-	eICIC-RF: Corrections to PDCCH performance tests	12.3.0	12.4.0
2014-12	RAN#66	R5-145196	1652	-	RF: Corrections to RMC-s tables	12.3.0	12.4.0
2014-12	RAN#66	R5-145210	1653	-	CA-RF: Correction to OBW requirement	12.3.0	12.4.0
2014-12	RAN#66	R5-145222	1654	-	Introduction of UE maximum output power for CA_42C	12.3.0	12.4.0
2014-12	RAN#66	R5-145223	1655	-	Introduction of Spurious emission band UE co-existence for CA_42C	12.3.0	12.4.0

2014-12	RAN#66	R5-145229	1656	-	Update the minimum requirement and test requirements of TC 8.8.3 localized transmission with TM10	12.3.0	12.4.0
2014-12	RAN#66	R5-145232	1657	-	Existing CA band combination CA_4A-27A and new CA band combination CA_41A-42A update to 36.521-1 section 5.4.2A.1	12.3.0	12.4.0
2014-12	RAN#66	R5-145234	1658	-	New CA band combination CA_41A-42A update to 36.521-1 section 5.2A	12.3.0	12.4.0
2014-12	RAN#66	R5-145235	1659	-	New CA band combination CA_41A-42A update to 36.521-1 section 6.2.5	12.3.0	12.4.0
2014-12	RAN#66	R5-145236	1660	-	New CA band combination CA_41A-42A update to 36.521-1 section 7.3.3	12.3.0	12.4.0
2014-12	RAN#66	R5-145291	1661	-	CQI reporting in AWGN and in fading: CQI indices in set	12.3.0	12.4.0

2015-03	RAN#67	R5-150476	1775	-	Removal of Note 1 in requirements of TC 6.2.2A	12.4.0	12.5.0
2015-03	RAN#67	R5-150478	1776	-	Addition of RIB,c to requirements of blocking and spurious response test cases	12.4.0	12.5.0
2015-03	RAN#67	R5-150479	1777	-	Correction to PUSCH configuration details for 36.521-1 4x2 CA test cases	12.4.0	12.5.0
2015-03	RAN#67	R5-150505	1778	-	Added TT in annex for TDD inter band CA performance tests	12.4.0	12.5.0
2015-03	RAN#67	R5-150506	1779	-	Updated TT in TDD inter band CA performance tests	12.4.0	12.5.0
2015-03	RAN#67	R5-150522	1780	-	Addition of CA_1A-20A to TS 36.521-1	12.4.0	12.5.0
2015-03	RAN#67	R5-150543	1781	-	Addition of 2A-12A and 5A-13A 2DL Interband CA to 36.521-1	12.4.0	12.5.0
2015-03	RAN#67	R5-150606	1782	-	Clarification on bandwidth to be tested	12.4.0	12.5.0
2015-03	RAN#67	R5-150800	1783	-	Correction to 6.6.3.2 of Tx Spurious	12.4.0	12.5.0
2015-03	RAN#67	R5-150801	1784	-	Correction in 6.2.5A and 6.5.1A of 36.521-1	12.4.0	12.5.0
2015-03	RAN#67	R5-150802	1785	-	Fixing numbering in Table 6.6.2.3A.1.4.1-1	12.4.0	12.5.0
2015-03	RAN#67	R5-150803	1786	-	Change of test points for A-MPR in band 26	12.4.0	12.5.0
2015-03	RAN#67	R5-150809	1787	-	Addition of BCS1 to 25A-25A CA	12.4.0	12.5.0
2015-03	RAN#67	R5-150810	1788	-	Introduction of CA_1A-7A to TS 36.521-1	12.4.0	12.5.0
2015-03	RAN#67	R5-150811	1789	-	Correction to test points for intra-band contiguous receiver test cases	12.4.0	12.5.0
2015-03	RAN#67	R5-150816	1790	-	Addition of CA_2A-30A to Clause 7.3.3 of TS 36.521-1.	12.4.0	12.5.0
2015-03	RAN#67	R5-150817	1791	-	Addition of CA_2A-30A to Clause 6.2.5 of TS 36.521-1.	12.4.0	12.5.0
2015-03	RAN#67	R5-150818	1792	-	Addition of CA_2A-30A to Clause 5.4.2A of TS 36.521-1.	12.4.0	12.5.0
2015-03	RAN#67	R5-150819	1793	-	Addition of CA_4A-30A to Clause 7.3.3 of TS 36.521-1.	12.4.0	12.5.0
2015-03	RAN#67	R5-150820	1794	-	Addition of CA_4A-30A to Clause 6.2.5 of TS 36.521-1.	12.4.0	12.5.0
2015-03	RAN#67	R5-150821	1795	-	Addition of CA_4-30 to Clause 5.2A of TS 36.521-1.	12.4.0	12.5.0
2015-03	RAN#67	R5-150822	1796	-	Addition of CA_4A-30A to Clause 5.4.2A of TS 36.521-1.	12.4.0	12.5.0

2015-03	RAN#67	R5-150823	1797	-	Addition of CA_5A-30A to Clause 7.3.3 of TS 36.521-1.	12.4.0	12.5.0
2015-03	RAN#67	R5-150824	1798	-	Addition of CA_5A-30A to Clause 6.2.5 of TS 36.521-1.	12.4.0	12.5.0
2015-03	RAN#67	R5-150825	1799	-	Addition of CA_4-5-30 to Clause 5.2A of TS 36.521-1.	12.4.0	12.5.0
2015-03	RAN#67	R5-150826	1800	-	Addition of new TC FDD PDSCH Single Antenna Port Performance for CA (3DL CA)	12.4.0	12.5.0
2015-03	RAN#67	R5-150827	1801	-	Addition of CA_2A-2A-13A to TS 36.521-1	12.4.0	12.5.0
2015-03	RAN#67	R5-150828	1802	-	Addition of 40D,41D,41C-41A and 25A-25A BCS1 to Channel BW for CA tables	12.4.0	12.5.0
2015-03	RAN#67	R5-150829	1803	-	Addition of multiple interband 3DL CA Combinations to Channel BW for CA tables	12.4.0	12.5.0
2015-03	RAN#67	R5-150848	1804	-	Addition of new TC 9.3.6.1_F.1 FDD CQI Reporting under fading conditions with Single CSI process for CoMP	12.4.0	12.5.0
2015-03	RAN#67	R5-150849	1805	-	Addition of new TC 9.3.6.1_F.3 FDD CQI Reporting under fading conditions with Four CSI processes for CoMP	12.4.0	12.5.0
2015-03	RAN#67	R5-150850	1806	-	Addition of new TC 9.3.6.2_F.1 TDD CQI Reporting under fading conditions with Single CSI process for CoMP	12.4.0	12.5.0
2015-03	RAN#67	R5-150851	1807	-	Addition of new TC 9.3.6.2_F.3 TDD CQI Reporting under fading conditions with Four CSI processes for CoMP	12.4.0	12.5.0
2015-03	RAN#67	R5-150860	1808	-	Introduction of new CA band combinations 5+25 and 12+25 for Receiver Characteristics	12.4.0	12.5.0
2015-03	RAN#67	R5-150861	1809	-	Addition of CA_1A-7A-20A to TS 36.521-1	12.4.0	12.5.0
2015-03	RAN#67	R5-150862	1810	-	Update of minimum requirements for TC 6.2.5 Configured UE transmitted Output Power	12.4.0	12.5.0
2015-03	RAN#67	R5-150863	1811	-	Updates of minimum requirement to reference sensitivity for CA	12.4.0	12.5.0
2015-03	RAN#67	R5-150865	1812	-	Addition of new TC TDD PDSCH Single Antenna Port Performance for CA (3DL CA)	12.4.0	12.5.0
2015-03	RAN#67	R5-150866	1813	-	Addition of new TC FDD Sustained data rate performance for CA (3DL CA)	12.4.0	12.5.0
2015-03	RAN#67	R5-150867	1814	-	Addition of new TC TDD Sustained data rate performance for CA (3DL CA)	12.4.0	12.5.0
2015-03	RAN#67	R5-150869	1839	-	Addition of Cell IDs for 3DL CA Rx tests	12.4.0	12.5.0
2015-03	RAN#67	R5-150870	1815	-	New CA band combinations (CA_1A-41A, CA_1A-41C) - Updates of 5.4.2A Channel bandwidth	12.4.0	12.5.0
2015-03	RAN#67	R5-150871	1816	-	New CA band combinations (CA_26A-41A, CA_26A-41C) - Updates of 5.4.2A Channel bandwidth	12.4.0	12.5.0
2015-03	RAN#67	R5-150935	1817	-	Change in UE co-existence 6.6.3.2 harmonic emissions exceptions	12.4.0	12.5.0
2015-03	RAN#67	R5-150874	1818	-	CA RF: Updates to in-band emissions requirements	12.4.0	12.5.0
2015-03	RAN#67	R5-150875	1819	-	Correction to test procedure of TC 7.6.1A.4	12.4.0	12.5.0
2015-03	RAN#67	R5-150880	1820	-	Update of CA sustained data rate tests	12.4.0	12.5.0
2015-03	RAN#67	R5-150881	1821	-	Aligning Bandwidth Combination Sets with latest core specification	12.4.0	12.5.0
2015-03	RAN#67	R5-150892	1822	-	Update to TC 7.5A.4 Adjacent Channel Selectivity (ACS) for CA (intra-band non-contiguous DL CA without UL CA)	12.4.0	12.5.0
2015-03	RAN#67	R5-150897	1823	-	New CA band combination CA_1A-28A - Updates of 7.3A Refsens	12.4.0	12.5.0

2015-03	RAN#67	R5-150928	1824	-	Updates to Spurious emission band UE co-existence test case 6.6.3.2	12.4.0	12.5.0
2015-03	RAN#67	R5-150906	1825	-	Updates to FDD and TDD RI Reporting test cases for CoMP	12.4.0	12.5.0
2015-03	RAN#67	R5-150929	1827	-	Addition of CA capability in Rx tests	12.4.0	12.5.0
2015-03	RAN#67	R5-150913	1828	-	Addition of Multi-Cluster PUSCH with One Uplink Carrier test cases to 36.521-1	12.4.0	12.5.0
2015-03	RAN#67	R5-150915	1829	-	Addition of CA capability and applicability changes to Section 8 36.521-1 FDD TM3 CA test cases	12.4.0	12.5.0
2015-03	RAN#67	R5-150916	1830	-	Changes to Annex F of 36.521-1 related to CA capability and applicability changes to FDD CA test cases	12.4.0	12.5.0
2015-03	RAN#67	R5-150917	1831	-	Correction to CA applicability and test rules	12.4.0	12.5.0
2015-03	RAN#67	R5-150918	1832	-	Addition of CA capability and applicability changes to 36.521-1 FDD TM1 CA test cases	12.4.0	12.5.0
2015-03	RAN#67	R5-150919	1833	-	Update to LTE CA Sustained Data rate test cases	12.4.0	12.5.0
2015-03	RAN#67	R5-150920	1834	-	CA demod Soft Buffer test case variants merge	12.4.0	12.5.0
2015-03	RAN#67	R5-150921	1835	-	Addition of CA capability and applicability changes to Section 8 36.521-1 FDD TM4 CA test cases	12.4.0	12.5.0
2015-03	RAN#67	R5-150922	1836	-	Addition of CA capability and applicability changes to FDD chap9 CA test cases	12.4.0	12.5.0
2015-03	RAN#67	R5-150925	1837	-	Introduction of Test Case for Maximum input level for 3DL CA	12.4.0	12.5.0
2015-03	RAN#67	R5-150926	1838	-	Addition of new TC of reference sensitivity for 3DL CA	12.4.0	12.5.0
2015-06	RAN#68	R5-151067	1841	-	Removal of Extreme Conditions from TC 6.6.2.1A test environment	12.5.0	12.6.0
2015-06	RAN#68	R5-151114	1843	-	RF: Missing power class information	12.5.0	12.6.0
2015-06	RAN#68	R5-151116	1845	-	CA RF: Clarification of PHICH configuration	12.5.0	12.6.0
2015-06	RAN#68	R5-151117	1846	-	RF: Corrections to CSI RMCs references	12.5.0	12.6.0
2015-06	RAN#68	R5-151121	1850	-	ePDCCH RF: Corrections to sustained data rate test	12.5.0	12.6.0
2015-06	RAN#68	R5-151122	1851	-	feICIC RF: Updates to TC 9.2.1.6_E.1	12.5.0	12.6.0
2015-06	RAN#68	R5-151123	1852	-	feICIC RF: Corrections to CSI TCs	12.5.0	12.6.0
2015-06	RAN#68	R5-151151	1853	-	Correction to the requirements of test case 6.6.2.1A	12.5.0	12.6.0
2015-06	RAN#68	R5-151152	1854	-	Addition of Rx parameter for test case 7.6.2A.1 and 7.6.2A.2	12.5.0	12.6.0
2015-06	RAN#68	R5-151181	1855	-	CA RF: Corrections to the applicability clause	12.5.0	12.6.0
2015-06	RAN#68	R5-151195	1857	-	Corrections to CSI Reference Measurement Channel	12.5.0	12.6.0
2015-06	RAN#68	R5-151213	1871	-	Updating Annex A relevant for the introduced of eDL MIMO enhancement Tests	12.5.0	12.6.0
2015-06	RAN#68	R5-151214	1872	-	Updating Annex B Beam steering approach for eDL MIMO enhancement Tests	12.5.0	12.6.0
2015-06	RAN#68	R5-151215	1873	-	Updating Annex I relevant for the introduced of eDL MIMO enhancement Tests	12.5.0	12.6.0
2015-06	RAN#68	R5-151231	1874	-	CoMP TCs applicability update section 8	12.5.0	12.6.0
2015-06	RAN#68	R5-151237	1876	-	Update of CoMP TCs 9.2.4.1_F and 9.2.4.2_F	12.5.0	12.6.0
2015-06	RAN#68	R5-151238	1877	-	Update of CoMP TCs in sections 9.3.6.1_F and 9.3.6.2_F	12.5.0	12.6.0
2015-06	RAN#68	R5-151256	1884	-	Update of CoMP TCs in section 8	12.5.0	12.6.0

2015-06	RAN#68	R5-151257	1885	-	Update of CoMP TCs 9.5.5.1_F.1 and 9.5.5.2_F.1	12.5.0	12.6.0
2015-06	RAN#68	R5-151329	1902	-	Addition of band 32 to clause 6 in 36.521-1	12.5.0	12.6.0

2015-12	RAN#70	R5-155460	2265	-	CA RF: Update 3DL Refsense test requirements	12.7.0	12.8.0
2015-12	RAN#70	R5-155462	2267	-	Corrections to Refsense minimum requirements	12.7.0	12.8.0
2015-12	RAN#70	R5-155464	2269	-	CA RF: Update of test points for Rx inter-band test cases	12.7.0	12.8.0
2015-12	RAN#70	R5-155471	2274	-	Corrections to message contents for CSI 3DL CA TCs 9.6.1.3.2+9.6.1.4.2	12.7.0	12.8.0
2015-12	RAN#70	R5-155474	2275	-	Corrections to CA demodulation tests	12.7.0	12.8.0
2015-12	RAN#70	R5-155476	2276	-	Corrections to message exceptions for CSI-RS setting	12.7.0	12.8.0
2015-12	RAN#70	R5-155478	2278	-	Updates to Annexes A.2 and A.3	12.7.0	12.8.0
2015-12	RAN#70	R5-155530	2282	-	Addition of measurement uncertainty and test tolerances for TC 9.7.1.2 TDD CQI reporting definition under AWGN conditions for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-155543	2283	-	Correction to Test Parameters for the test cases 10.1 and 10.2	12.7.0	12.8.0
2015-12	RAN#70	R5-155554	2289	-	Correction to 6.6.3.3A.1	12.7.0	12.8.0
2015-12	RAN#70	R5-155668	2325	-	Addition of CA configuration CA_2A-4A-5A in Reference sensitivity level for 3DL CA	12.7.0	12.8.0
2015-12	RAN#70	R5-155670	2326	-	Correction to DL RMCs for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-155709	2331	-	Editorial corrections to TC 8.2.2.1.1_A.1	12.7.0	12.8.0
2015-12	RAN#70	R5-155745	2346	-	Correction to CQI test cases for LTE CA	12.7.0	12.8.0
2015-12	RAN#70	R5-155801	2288	1	Correction to 6.2.4A.1	12.7.0	12.8.0
2015-12	RAN#70	R5-155802	2254	1	Correction to 2DL CA Rx test cases	12.7.0	12.8.0
2015-12	RAN#70	R5-155803	2266	1	CA RF: Correction to message contents for 2DL Max Input Power TCs	12.7.0	12.8.0
2015-12	RAN#70	R5-155804	2213	1	Update of UE categories for R10 in 36.521-1	12.7.0	12.8.0
2015-12	RAN#70	R5-155807	2176	1	Add new LC MTC test case 9.7.2.1 FDD CQI Reporting under fading conditions for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-155808	2177	1	Add new LC MTC test case 9.7.2.2 TDD CQI Reporting under fading conditions for UE category 0	12.7.0	12.8.0

2015-12	RAN#70	R5-155809	2318	1	Test case 6.2.4E – Additional Maximum Power Reduction (A-MPR) for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-155810	2321	1	Additions to test case 6.3.3E – UE Transmit OFF Power for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-155811	2322	1	Additions to test case 6.3.4E.1 – General ON/OFF time mask for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-155812	2329	1	Additions to test case 6.3.5E.1 – Power Control Absolute power tolerance for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-155813	2330	1	Additions to test case 6.3.5E.2 – Power Control Relative power tolerance for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-155814	2333	1	Additions to test case 6.5.1E – Frequency Error for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-155815	2334	1	Additions to test case 6.5.2.1E.1 – Error Vector Magnitude for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-155816	2336	1	Additions to test case 6.5.2.2E – Carrier Leakage for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-155817	2338	1	Additions to test case 6.5.2.3E – In-band emissions for non allocated RB for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-155818	2339	1	Additions to test case 6.5.2.4E – EVM equalizer spectrum flatness for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-155819	2342	1	Additions to test case 6.2.5E – Configured Transmitted Power for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-155840	2158	1	Uncertainty and Test Tolerance for FDD TM4 test case for LTE Type C performance requirements (8.2.1.4.2A)	12.7.0	12.8.0
2015-12	RAN#70	R5-155841	2159	1	Uncertainty and Test Tolerance for TDD TM4 test case for LTE Type C performance requirements (8.2.2.4.2A)	12.7.0	12.8.0
2015-12	RAN#70	R5-155842	2165	1	Update of SUMIMO for LTE Type C performance TC 8.2.2.3.1B	12.7.0	12.8.0
2015-12	RAN#70	R5-155844	2151	1	New CA band combination CA_1A-3A-8A - Updates of 7.3A.5 RefSens	12.7.0	12.8.0
2015-12	RAN#70	R5-155845	2152	1	New CA band combination CA_1A-3A-8A - Updates of 7.3.3 Delta RIB	12.7.0	12.8.0
2015-12	RAN#70	R5-155846	2183	1	LTE Type B performance requirements - Addition of fixed reference channels into Annex A	12.7.0	12.8.0
2015-12	RAN#70	R5-155847	2184	1	LTE Type B performance requirements - Introduction of new interference models into Annex B.6	12.7.0	12.8.0
2015-12	RAN#70	R5-155848	2182	1	LTE Type B performance requirements - Changes to clause 3	12.7.0	12.8.0
2015-12	RAN#70	R5-155850	2236	1	Addition of new test cases for TDD FDD CA PDSCH Open Loop for FDD PCell(2DL and 3DL)	12.7.0	12.8.0
2015-12	RAN#70	R5-155851	2224	1	Update of 2DL TDD FDD CA PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for TDD PCell (8.2.3.3.2.1)	12.7.0	12.8.0
2015-12	RAN#70	R5-155852	2225	1	Update of 3DL TDD FDD CA PDSCH Closed Loop Multi Layer Spatial Multiplexing 4x2 for TDD PCell (8.2.3.3.2.2)	12.7.0	12.8.0
2015-12	RAN#70	R5-155853	2248	1	Update for Annex for TDD/FDD Perf test cases	12.7.0	12.8.0
2015-12	RAN#70	R5-155855	2250	1	Clean up of 3DL CA Rx test cases	12.7.0	12.8.0

2015-12	RAN#70	R5-156016	2242	1	Introduction of FDD PDSCH Closed Loop Multi-Layer Spatial Multiplexing 4x2 for Dual Connectivity	12.7.0	12.8.0
2015-12	RAN#70	R5-156017	2243	1	Introduction of TDD PDSCH Closed Loop Multi-Layer Spatial Multiplexing 4x2 for Dual Connectivity	12.7.0	12.8.0
2015-12	RAN#70	R5-156018	2244	1	Introduction of FDD sustained data rate performance for Dual Connectivity	12.7.0	12.8.0
2015-12	RAN#70	R5-156019	2245	1	Introduction of TDD sustained data rate performance for Dual Connectivity	12.7.0	12.8.0
2015-12	RAN#70	R5-156020	2207	1	Update of RB configurations for TC 7.3A.5	12.7.0	12.8.0
2015-12	RAN#70	R5-156021	2222	1	Addition of soft-buffer test cases for FDD-TDD 2DL CA (8.2.3.2.1A, 8.2.3.2.2A)	12.7.0	12.8.0
2015-12	RAN#70	R5-156022	2234	1	Delta RIB,c updates for 3DL CA supporting UE	12.7.0	12.8.0
2015-12	RAN#70	R5-156023	2237	1	Addition of new test cases for TDD FDD CA PDSCH Closed Loop 4x2 for FDD PCell (2DL and 3DL)	12.7.0	12.8.0
2015-12	RAN#70	R5-156024	2239	1	Correction to test point selection table for TDD-FDD CA cases	12.7.0	12.8.0
2015-12	RAN#70	R5-156025	2251	1	Correction to 7.3A.5	12.7.0	12.8.0
2015-12	RAN#70	R5-156026	2252	1	Update CA perf test cases in clause 8	12.7.0	12.8.0
2015-12	RAN#70	R5-156027	2271	1	CA RF: Update to 3DL Refsense test configurations	12.7.0	12.8.0
2015-12	RAN#70	R5-156028	2281	1	Improvements to 3DL OOB Testcase (7.6.2A.5)	12.7.0	12.8.0
2015-12	RAN#70	R5-156029	2295	1	Updates to 8.7.5 about TDD-FDD CA SDR performance test	12.7.0	12.8.0
2015-12	RAN#70	R5-156030	2337	1	36.521-1: CA_1A-3A-20A & CA_1A-7A-20A updates	12.7.0	12.8.0
2015-12	RAN#70	R5-156031	2346	1	Addition of 2x2 FDD-TDD CA test cases with TDD PCELL	12.7.0	12.8.0
2015-12	RAN#70	R5-156035	2170	1	New TC: 8.9.1.1.2 FDD Closed-loop spatial multiplexing performance (Cell-Specific Reference Symbols) for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-156036	2171	1	New TC: 8.9.1.2.2 TDD Closed-loop spatial multiplexing performance (Cell-Specific Reference Symbols) for UE category 0	12.7.0	12.8.0

2015-12	RAN#70	R5-156037	2173	1	Add new LC MTC test case 8.9.1.1.3 FDD PDSCH Single-layer Spatial Multiplexing on antenna ports 7 or 8 for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-156038	2174	1	Add new LC MTC test case 8.9.1.2.1 TDD PDSCH Transmit Diversity for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-156039	2175	1	Add new LC MTC test case 8.9.1.2.3 TDD PDSCH Single-layer Spatial Multiplexing on antenna ports 7 or 8 for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-156040	2189	1	Addition of Minimum test time for Demodulation performance for UE category 0 in Annex G	12.7.0	12.8.0
2015-12	RAN#70	R5-156041	2191	1	Introduction of new test case 8.9.2.2.1 MTC	12.7.0	12.8.0
2015-12	RAN#70	R5-156042	2240	1	Update of TC 9.7.1.2 TDD CQI reporting definition under AWGN conditions for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-156043	2315	1	Update test requirement for MTC test cases: 7.6.1E, 7.6.2E and 7.6.3E	12.7.0	12.8.0
2015-12	RAN#70	R5-156044	2316	1	Addition of Maximum Test System Uncertainty and Derivation of Test Requirements in Annex F for MTC test cases	12.7.0	12.8.0
2015-12	RAN#70	R5-156045	2317	1	Additions to test case 6.2.3E - Maximum Power Reduction (MPR) for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-156046	2320	1	Additions to test case 6.3.2E – Minimum Output Power for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-156047	2332	1	Additions to test case 6.3.5E.3 – Aggregate power control tolerance for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-156048	2340	1	Additions to test case 6.6.1E – Occupied bandwidth for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-156049	2341	1	Additions to test case 6.6.2.1E – Spectrum Emission Mask for UE category 0	12.7.0	12.8.0
2015-12	RAN#70	R5-156057	2193	1	New CA 2UL Tx test case 6.5.1A.3 Frequency Error for CA (intra-band non-contiguous DL CA and UL CA)	12.7.0	12.8.0
2015-12	RAN#70	R5-156058	2291	1	New TC of A-MPR for 2UL inter-band CA (6.2.4A.2)	12.7.0	12.8.0
2015-12	RAN#70	R5-156059	2293	1	New TC of Additional spurious emissions for intra-band non-contiguous CA 6.6.3.3A.3	12.7.0	12.8.0
2015-12	RAN#70	R5-156062	2166	1	Addition of Minimum test time for LTE Type C performance in Annex G	12.7.0	12.8.0
2015-12	RAN#70	R5-156063	2297	1	Addition of new TC 7.4_H Maximum input level for SCE-L1	12.7.0	12.8.0
2015-12	RAN#70	R5-156064	2298	1	Addition of new TC 7.4A.1_H Maximum input level for SCE-L1 for CA (intra-band contiguous DL CA and UL CA)	12.7.0	12.8.0
2015-12	RAN#70	R5-156065	2299	1	Addition of new TC 7.4A.2_H Maximum input level for SCE-L1 for CA (intra-band contiguous DL CA without UL CA)	12.7.0	12.8.0
2015-12	RAN#70	R5-156066	2300	1	Addition of new TC 7.4A.5_H Maximum input level for SCE-L1 for CA (3DL CA without UL CA)	12.7.0	12.8.0
2015-12	RAN#70	R5-156089	2185	1	LTE Type B performance requirements - Introduction of new test cases 8.2.1.2.5 and 8.2.1.2.6	12.7.0	12.8.0
2015-12	RAN#70	R5-156090	2186	1	LTE Type B performance requirements - Introduction of new test cases 8.2.2.2.6 and 8.2.2.2.7	12.7.0	12.8.0
2015-12	RAN#70	R5-156091	2187	1	LTE Type B performance requirements - Introduction of new test cases 9.3.8.1.1 and 9.3.8.1.2	12.7.0	12.8.0
2015-12	RAN#70	R5-156092	2188	1	LTE Type B performance requirements - Adding six NAICS test cases into Annex F and G	12.7.0	12.8.0
2015-12	RAN#70	R5-156095	2155	1	Update Minimum requirements for test case 6.2.3A.1	12.7.0	12.8.0

2015-12	RAN#70	R5-156096	2227	1	Updates of test configuration for OBW for intra-band contiguous UL CA	12.7.0	12.8.0
2015-12	RAN#70	R5-156097	2268	1	CA RF: Minor corrections to section 6.6.3.3A	12.7.0	12.8.0
2015-12	RAN#70	R5-156098	2292	1	Revise Configured UE transmitted Output Power for 2UL intra-band contiguous CA test case 6.2.5A.1	12.7.0	12.8.0
2015-12	RAN#70	R5-156100	2167	1	Deleting redundant and outdated Demod scenario in Minimum test time	12.7.0	12.8.0
2015-12	RAN#70	R5-156101	2258	1	Clarification of DL configuration for wideband	12.7.0	12.8.0
2015-12	RAN#70	R5-156102	2260	1	Correction to Enhanced Performance Type A performance test cases	12.7.0	12.8.0
2015-12	RAN#70	R5-156103	2277	1	Correction and addition of minimum test time for several tests	12.7.0	12.8.0
2015-12	RAN#70	R5-156104	2284	1	Correction to test cases of the section of 9.5.1	12.7.0	12.8.0
2015-12	RAN#70	R5-156110	2190	1	Introduction of new test case 8.9.2.1.1 MTC	12.7.0	12.8.0
2015-12	RAN#70	R5-156113	2301	1	Addition of new TC 8.2.1.4.1_H FDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 2x2 for SCE-L1	12.7.0	12.8.0
2015-12	RAN#70	R5-156114	2302	1	Addition of new TC 8.2.2.4.1_H TDD PDSCH Closed Loop Multi Layer Spatial Multiplexing 2x2 for SCE-L1	12.7.0	12.8.0
2015-12	RAN#70	R5-156115	2303	1	Addition of new TC 8.3.1.1.1_H FDD PDSCH Single-layer Spatial Multiplexing on antenna ports 7 or 8 without a simultaneous transmission for SCE-L1 for eDL-MIMO	12.7.0	12.8.0
2015-12	RAN#70	R5-156116	2304	1	Addition of new TC 8.3.2.1.2_H TDD PDSCH Single-layer Spatial Multiplexing on antenna ports 7 or 8 without a simultaneous transmission for eDL-MIMO for SCE-L1	12.7.0	12.8.0
2015-12	RAN#70	R5-156117	2305	1	Addition of new TC 8.7.1.1_H FDD sustained data rate performance for SCE-L1	12.7.0	12.8.0
2015-12	RAN#70	R5-156118	2306	1	Addition of new TC 8.7.1.1_H.2 FDD Sustained data rate performance for CA for SCE-L1 (2DL CA)	12.7.0	12.8.0
2015-12	RAN#70	R5-156119	2307	1	Addition of new TC 8.7.1.1_H.3 FDD Sustained data rate performance for CA for SCE-L1 (3DL CA)	12.7.0	12.8.0
2015-12	RAN#70	R5-156120	2308	1	Addition of new TC 8.7.2.1_H.1 TDD sustained data rate performance for SCE-L1 (Single Carrier)	12.7.0	12.8.0
2015-12	RAN#70	R5-156121	2309	1	Addition of new TC 8.7.2.1_H.2 TDD sustained data rate performance for CA for SCE-L1 (2DL CA)	12.7.0	12.8.0
2015-12	RAN#70	R5-156122	2310	1	Addition of new TC 8.7.2.1_H.3 TDD Sustained data rate performance for CA for SCE-L1 (3DL CA)	12.7.0	12.8.0
2015-12	RAN#70	R5-156124	2312	1	Addition of new TC 8.7.5.1_H.2 TDD FDD CA Sustained data rate performance for FDD PCell for SCE-L1 (3DL CA)	12.7.0	12.8.0
2015-12	RAN#70	R5-156125	2313	1	Addition of new TC 8.7.5.2_H.1 TDD FDD CA Sustained data rate performance for TDD PCell for SCE-L1 (2DL CA)	12.7.0	12.8.0
2015-12	RAN#70	R5-156126	2314	1	Addition of new TC 8.7.5.2_H.2 TDD FDD CA Sustained data rate performance for TDD PCell for SCE-L1 (3DL CA)	12.7.0	12.8.0
2015-12	RAN#70	R5-156130	2192	2	New CA 2UL Tx test case 6.3.5A.3.3 of Aggregate Power Control Tolerance for CA (intra-band non-contiguous DL CA and UL CA)	12.7.0	12.8.0
2015-12	RAN#70	R5-156131	2290	2	New TC of Aggregate Power Control Tolerance for 2UL inter-band CA(6.3.5A.3.2)	12.7.0	12.8.0
2015-12	RAN#70	R5-156133	2294	1	Correction to the applicable test release of 1.4MHz Bandwidth MBMS test	12.7.0	12.8.0
2015-12	RAN#70	R5-156134	2164	1	Update to in-band Emissions Limits for less than 1GHz Carrier Frequencies	12.7.0	12.8.0

2015-12	RAN#70	R5-156183	2311	1	Addition of new TC 8.7.5.1_H.1 TDD FDD CA Sustained data rate performance for FDD PCell for SCE-L1 (2DL CA)	12.7.0	12.8.0
2015-12	RAN#70	R5-156071	2153	1	New TC: Maximum Power Reduction (MPR) for CA (intra-band contiguous DL CA and UL CA) for UL 64QAM	12.8.0	13.0.0
2015-12	RAN#70	R5-156073	2194	1	New TC: 6.2.3_3 MPR for UL 64QAM	12.8.0	13.0.0
2015-12	RAN#70	R5-156074	2195	1	New TC: 6.2.3_4 MPR for Multi-Cluster PUSCH with UL 64QAM	12.8.0	13.0.0
2015-12	RAN#70	R5-156075	2196	1	New TC: 6.2.4_2 AMPR for UL 64QAM	12.8.0	13.0.0
2015-12	RAN#70	R5-156076	2197	1	New TC: 6.5.2.1_1 EVM for UL 64QAM	12.8.0	13.0.0
2015-12	RAN#70	R5-156077	2198	1	New TC: 6.5.2A.1.1_1 EVM for CA with UL 64QAM	12.8.0	13.0.0
2015-12	RAN#70	R5-156078	2199	1	New TC: 6.6.2.2_1 Additional Spectrum Emission Mask for UL 64QAM	12.8.0	13.0.0
2015-12	RAN#70	R5-156079	2200	1	New TC: 6.6.2.3_3 ACLR for UL 64QAM	12.8.0	13.0.0
2015-12	RAN#70	R5-156080	2201	1	New TC: 6.6.2.3_4 ACLR for Multi-Cluster PUSCH with UL 64QAM	12.8.0	13.0.0
2015-12	RAN#70	R5-156081	2202	1	New TC: 6.6.3.3_1 Additional spurious emissions for UL 64QAM	12.8.0	13.0.0
2015-12	RAN#70	R5-156082	2203	1	Addition of RMCs for UL 64QAM	12.8.0	13.0.0
2015-12	RAN#70	R5-156083	2204	1	Introduction of uncertainties and TTs in Annex F for UL 64QAM	12.8.0	13.0.0
2015-12	RAN#70	R5-156084	2285	1	New TC: A-MPR for CA (intra-band contiguous DL CA and UL CA) for UL 64QAM	12.8.0	13.0.0
2015-12	RAN#70	R5-156085	2286	1	New TC: A-SEM for CA (intra-band contiguous DL CA and UL CA) for UL 64QAM	12.8.0	13.0.0
2015-12	RAN#70	R5-156086	2287	1	New TC: Additional spurious emissions for CA (intra-band contiguous DL CA and UL CA) for UL 64QAM	12.8.0	13.0.0
2015-12	RAN#70	R5-156188	2154	2	New TC: Adjacent Channel Leakage power Ratio for CA (intra-band contiguous DL CA and UL CA) for UL 64QAM	12.8.0	13.0.0
2016-01	RAN#70	R5-156099	2324	1	introduction of R5-156099 "Introduction of new A-MPR test with PUSCH frequency hopping" with the test case renumbered to 6.2.4_3 after working group agreement to avoid duplication	13.0.0	13.0.1
2016-03	RAN#71	R5-160025	2347	-	Update to NAICS test cases to release NAICS configuration	13.0.1	13.1.0
2016-03	RAN#71	R5-160026	2348	-	Test Tolerances for FDD PDSCH Transmit Diversity 2x2 with TM2 Interference Model– Enhanced Performance Requirement Type B (8.2.1.2.5)	13.0.1	13.1.0
2016-03	RAN#71	R5-160027	2349	-	Test Tolerances for FDD PDSCH Transmit Diversity 2x2 with TM9 Interference Model– Enhanced Performance Requirement Type B (8.2.1.2.6)	13.0.1	13.1.0
2016-03	RAN#71	R5-160028	2350	-	Test Tolerances for TDD PDSCH Transmit Diversity 2x2 with TM2 Interference Model– Enhanced Performance Requirement Type B (8.2.2.2.6)	13.0.1	13.1.0
2016-03	RAN#71	R5-160029	2351	-	Test Tolerances for TDD PDSCH Transmit Diversity 2x2 with TM9 Interference Model– Enhanced Performance Requirement Type B (8.2.2.2.7)	13.0.1	13.1.0
2016-03	RAN#71	R5-160030	2352	-	Test Tolerances FDD and TDD CQI reporting under fading conditions (PUCCH) TM4 - Enhanced Receiver Type B (9.3.8.1.1 and 9.3.8.1.2)	13.0.1	13.1.0
2016-03	RAN#71	R5-160067	2362	-	Correction to UE output power of Tx test cases 6.5.2.3	13.0.1	13.1.0

2016-03	RAN#71	R5-160068	2363	-	Correction to some incorrect sentences of Tx test case 6.5.2A.3.1	13.0.1	13.1.0
2016-03	RAN#71	R5-160106	2368	-	Update of Test Tolerance for eDL MIMO enhancement test cases	13.0.1	13.1.0
2016-03	RAN#71	R5-160107	2369	-	Removal of technical content in 36.521-1 v12.8.0 and substitution with pointer to the next Release	13.0.1	13.1.0
2016-03	RAN#71	R5-160124	2371	-	Correction to test case 8.7.1.1_A.1	13.0.1	13.1.0
2016-03	RAN#71	R5-160125	2372	-	Correction to test case 9.3.2.1.1	13.0.1	13.1.0
2016-03	RAN#71	R5-160139	2375	-	Test Tolerances for 9.6.1.3.1+9.6.1.3.2+9.6.1.4.1+9.6.1.4.2 2DL-3DL CA	13.0.1	13.1.0
2016-03	RAN#71	R5-160141	2376	-	TTs to Annex F for 2DL and 3DL CA	13.0.1	13.1.0
2016-03	RAN#71	R5-160155	2382	-	Test Tolerances for 9.3.7.1+9.3.7.2 eDL MIMO enhancement	13.0.1	13.1.0
2016-03	RAN#71	R5-160159	2383	-	Test Tolerances for 9.4.1.4.1+9.4.1.4.2+9.4.2.3.3+9.4.2.3.4 eDL MIMO enhancement	13.0.1	13.1.0
2016-03	RAN#71	R5-160162	2385	-	Corrections to eDL MIMO enhancements Annex B to include High XP 4x2	13.0.1	13.1.0
2016-03	RAN#71	R5-160164	2386	-	Corrections to EVM test case 6.5.2A.1.1	13.0.1	13.1.0
2016-03	RAN#71	R5-160165	2387	-	Update of uncertainty and TT references for TC 6.2.4E and 6.2.5E	13.0.1	13.1.0
2016-03	RAN#71	R5-160169	2390	-	Addition of 4 Rx part to Diversity characteristics	13.0.1	13.1.0
2016-03	RAN#71	R5-160203	2391	-	Revise Power Control Relative power tolerance for CA (intra-band contiguous DL CA and UL CA) test case 6.3.5A.2.1	13.0.1	13.1.0
2016-03	RAN#71	R5-160281	2419	-	Addition of delta TIB for the new CA configuration CA_3A-41A in sub-clause 6.2.5	13.0.1	13.1.0
2016-03	RAN#71	R5-160334	2423	-	Updates of Spurious emission band UE co-existence for CA (inter-band DL CA and UL CA)	13.0.1	13.1.0
2016-03	RAN#71	R5-160337	2425	-	Annex F update for frequency error for inter-band 2UL CA	13.0.1	13.1.0
2016-03	RAN#71	R5-160338	2426	-	Correction and updates to test requirements of Reference sensitivity for inter-band 2DL CA	13.0.1	13.1.0
2016-03	RAN#71	R5-160344	2428	-	Updates of some Rel-13 defined CA combinations to minimum requirements of Reference sensitivity for CA	13.0.1	13.1.0
2016-03	RAN#71	R5-160345	2429	-	Updates of delta TIB,c values and table references for delta TIB,c	13.0.1	13.1.0
2016-03	RAN#71	R5-160377	2437	-	R10 Remove editor's note for CA_39C spurious emission test	13.0.1	13.1.0
2016-03	RAN#71	R5-160441	2439	-	Update to MTC test case 8.9.2.1.1	13.0.1	13.1.0
2016-03	RAN#71	R5-160442	2440	-	Update to MTC RF test applicability for Editor's Note	13.0.1	13.1.0
2016-03	RAN#71	R5-160459	2443	-	Rel-13 Test point reduction for UL 64QAM multi-cluster MPR and ACLR tests	13.0.1	13.1.0
2016-03	RAN#71	R5-160461	2445	-	Rel-13 Test point reduction for UL 64QAM AMPR and ASEM tests	13.0.1	13.1.0
2016-03	RAN#71	R5-160462	2446	-	Rel-13 Test point reduction for UL 64QAM CA MPR and ACLR tests	13.0.1	13.1.0
2016-03	RAN#71	R5-160464	2448	-	Rel-13 Test point reduction for UL 64QAM CA AMPR, ASEM and ASE tests	13.0.1	13.1.0
2016-03	RAN#71	R5-160482	2451	-	Correction to the minimum test time reference in TDD/FDD CA performance	13.0.1	13.1.0

2016-03	RAN#71	R5-160483	2452	-	Correction to UL CA Tx tests	13.0.1	13.1.0
2016-03	RAN#71	R5-160484	2453	-	Clean up on performance test cases	13.0.1	13.1.0
2016-03	RAN#71	R5-160485	2454	-	Correction to 9.5.5.1_F.1 and 9.5.5.1_F.2 for RI Reporting test with CoMP	13.0.1	13.1.0
2016-03	RAN#71	R5-160486	2455	-	Correction to 8.2.2.2.4 and 8.2.2.4.3 for Enhanced Performance Type A	13.0.1	13.1.0
2016-03	RAN#71	R5-160487	2456	-	Correction to CQI reporting tests for Enhanced Performance Type A	13.0.1	13.1.0
2016-03	RAN#71	R5-160488	2457	-	Correction to CQI and RI reporting tests for felCIC	13.0.1	13.1.0
2016-03	RAN#71	R5-160490	2459	-	Correction to PCFICH/PDCCH and PHICH Tx Diversity for felCIC	13.0.1	13.1.0
2016-03	RAN#71	R5-160491	2460	-	Correction to G.5.4 for minimum test time	13.0.1	13.1.0
2016-03	RAN#71	R5-160504	2462	-	New CA band combination CA_41A_42C - Updates of 6.2.5.3 Delta TIB	13.0.1	13.1.0
2016-03	RAN#71	R5-160506	2463	-	New CA band combination CA_41A_42C - Updates of 7.3.3 Delta RIB	13.0.1	13.1.0
2016-03	RAN#71	R5-160527	2468	-	Addition of operating band and channel assignments for the new Intel assigned CA configuration	13.0.1	13.1.0
2016-03	RAN#71	R5-160569	2477	-	Correction to PMI Reporting for eDL-MIMO	13.0.1	13.1.0
2016-03	RAN#71	R5-160578	2480	-	Minor corrections to applicabilities of TCs 8.2.2.2.3_E.1 & 8.2.2.3.3_E.1	13.0.1	13.1.0
2016-03	RAN#71	R5-160580	2482	-	Correction to PDCP SDU size in TC 8.7.2.1	13.0.1	13.1.0
2016-03	RAN#71	R5-160582	2484	-	CA RF: Corrections to Notes in TC 7.3A.3	13.0.1	13.1.0
2016-03	RAN#71	R5-160583	2485	-	CA RF: Corrections to Notes in TC 7.3A.5	13.0.1	13.1.0
2016-03	RAN#71	R5-160584	2486	-	CA RF: Minor correction to Note in TC 7.3A.6	13.0.1	13.1.0
2016-03	RAN#71	R5-160586	2488	-	Corrections to DL 256QAM SDR Test Cases	13.0.1	13.1.0
2016-03	RAN#71	R5-160587	2489	-	Corrections to TDD FDD CA SDR Test Cases	13.0.1	13.1.0
2016-03	RAN#71	R5-160588	2490	-	Addition of Maximum Wgap definition	13.0.1	13.1.0
2016-03	RAN#71	R5-160590	2492	-	Corrections to TDD FDD CA Closed Loop Spatial Multiplexing TCs	13.0.1	13.1.0
2016-03	RAN#71	R5-160592	2494	-	Corrections to TDD FDD CA Test Applicability tables in section 8.1.2.3B	13.0.1	13.1.0
2016-03	RAN#71	R5-160622	2497	-	Addition of delta RIB for CA_3A-41A in TC 7.3.3	13.0.1	13.1.0
2016-03	RAN#71	R5-160681	2516	-	Introduction of test case 6.6.2.3A.3 - Adjacent Channel Leakage power Ratio for CA (intra-band non-contiguous DL CA and UL CA)	13.0.1	13.1.0
2016-03	RAN#71	R5-160686	2519	-	Add reference to TR 36.905 in 36.521-1	13.0.1	13.1.0
2016-03	RAN#71	R5-160801	2479	1	Annex F: Corrections for intra-band contiguous UL CA Test Cases	13.0.1	13.1.0
2016-03	RAN#71	R5-160802	2483	1	Minor correction to TC 6.6.3.2	13.0.1	13.1.0
2016-03	RAN#71	R5-160803	2487	1	Removal of editor's notes in TC 6.5.2A.2.1 & 6.5.2A.3.1	13.0.1	13.1.0
2016-03	RAN#71	R5-160804	2466	1	Correction to UE category information in test case 8.2.1.1.1	13.0.1	13.1.0
2016-03	RAN#71	R5-160805	2467	1	Correction to test case applicability for test case 9.2.1.3_C.1 and 9.2.1.4_C.1	13.0.1	13.1.0

2016-03	RAN#71	R5-160811	2430	1	Updates of delta RIB,c values and table references for delta RIB,c	13.0.1	13.1.0
2016-03	RAN#71	R5-160812	2431	1	Addition of CA_19A-28A and CA_21A-42A to refsens for inter-band 2DL CA	13.0.1	13.1.0
2016-03	RAN#71	R5-160813	2432	1	Updates of test points and test requirements of some Rel-13 defined CA combinations for Reference sensitivity for 3DL CA	13.0.1	13.1.0
2016-03	RAN#71	R5-160814	2469	1	Addition of CA configurations and bandwidth combination sets for the new CA configuration	13.0.1	13.1.0
2016-03	RAN#71	R5-160815	2496	1	Add delta TIB for the new CA_20A-67A configuration in sub-clause 6.2.5.	13.0.1	13.1.0
2016-03	RAN#71	R5-160819	2400	1	Addition of new TC 7.4A.3_H Maximum input level for CA (inter-band DL CA without UL CA) for 256QAM in DL	13.0.1	13.1.0
2016-03	RAN#71	R5-160820	2401	1	Addition of new TC 7.4A.4_H Maximum input level for CA (intra band non-contiguous DL CA without UL CA) for 256QAM in DL	13.0.1	13.1.0
2016-03	RAN#71	R5-160825	2436	1	Rel-10 Test point reduction for UL 64QAM multi-cluster MPR and ACLR tests	13.0.1	13.1.0
2016-03	RAN#71	R5-160828	2422	1	Updates to TM3 TDD-FDD Soft buffer 2DLCA test cases	13.0.1	13.1.0
2016-03	RAN#71	R5-160829	2493	1	Corrections to TDD FDD CA TCs 9.6.1.3.1 and 9.6.1.4.1	13.0.1	13.1.0
2016-03	RAN#71	R5-160831	2520	1	Test points for CA_4A-4A-13A in Reference sensitivity test case	13.0.1	13.1.0
2016-03	RAN#71	R5-160835	2379	1	Addition of UL CA capability for CA_4A-4A in Table 5.4.2A.1-3	13.0.1	13.1.0
2016-03	RAN#71	R5-160836	2380	1	Correction for table references in TC 6.6.3.2A.1	13.0.1	13.1.0
2016-03	RAN#71	R5-160837	2381	1	Renaming of Table 6.6.3.2A-3a	13.0.1	13.1.0
2016-03	RAN#71	R5-160838	2409	1	Update to Annex F for TC 6.3.5A.1.2, 6.3.5A.1.3	13.0.1	13.1.0
2016-03	RAN#71	R5-160839	2411	1	Update to TC 6.3.5A.1.2 Power Control Absolute Power Tolerance for CA (inter-band DL CA and UL CA).	13.0.1	13.1.0
2016-03	RAN#71	R5-160840	2412	1	Update to TC 6.3.5A.1.3 Power Control Absolute power tolerance for CA (intra-band non-contiguous DL CA and UL CA).	13.0.1	13.1.0
2016-03	RAN#71	R5-160841	2416	1	Correction to test case 6.2.5A.3	13.0.1	13.1.0
2016-03	RAN#71	R5-160845	2424	1	Addition of new test case for additional spurious for inter-band 2UL CA and updates for A-MPR for inter-band 2UL CA	13.0.1	13.1.0
2016-03	RAN#71	R5-160846	2518	1	Introduction of test case 7.3A.7 - Reference sensitivity level for CA (intra-band non-contiguous DL CA and UL CA)	13.0.1	13.1.0
2016-03	RAN#71	R5-160849	2470	1	New TC: FDD CQI Reporting under fading conditions - PUCCH 1-1 (CSI Reference Symbol) TM9 - Enhanced Receiver Type B	13.0.1	13.1.0
2016-03	RAN#71	R5-160850	2471	1	New TC: TDD CQI Reporting under fading conditions - PUCCH 1-1 (CSI Reference Symbol) TM9 - Enhanced Receiver Type B	13.0.1	13.1.0
2016-03	RAN#71	R5-160852	2393	1	Update to TC 8.9.1.1.3 FDD PDSCH Single-layer Spatial Multiplexing on antenna ports 7 or 8 for UE category 0	13.0.1	13.1.0
2016-03	RAN#71	R5-160853	2394	1	Update to TC 8.9.1.2.1 TDD PDSCH Transmit Diversity for UE category 0	13.0.1	13.1.0
2016-03	RAN#71	R5-160854	2395	1	Update to TC 8.9.1.2.3 TDD PDSCH Single-layer Spatial Multiplexing on antenna ports 7 or 8 for UE category 0	13.0.1	13.1.0
2016-03	RAN#71	R5-160855	2408	1	Update to TC 9.7.2.2 TDD CQI reporting definition under fading conditions for UE category 0	13.0.1	13.1.0

2016-03	RAN#71	R5-160856	2420	1	Update to TC 9.7.2.1 FDD and Half duplex FDD CQI reporting definition under fading conditions for UE category 0	13.0.1	13.1.0
2016-03	RAN#71	R5-160858	2498	1	Additions to test case 6.6.2.2E – Additional Spectrum Emission Mask for UE category 0	13.0.1	13.1.0
2016-03	RAN#71	R5-160859	2500	1	Additions to test case 6.6.3E.3 – Additional spurious emissions for UE category 0	13.0.1	13.1.0
2016-03	RAN#71	R5-160860	2501	1	Additions to test case 6.6.2.3E – Adjacent Channel Leakage power Ratio for UE category 0	13.0.1	13.1.0
2016-03	RAN#71	R5-160861	2504	1	Additions to test case 6.3.4E.2 – PRACH and SRS ON/OFF time mask for UE category 0	13.0.1	13.1.0
2016-03	RAN#71	R5-160862	2506	1	Additions to test case 6.7E – Transmit intermodulation for UE category 0	13.0.1	13.1.0
2016-03	RAN#71	R5-160863	2508	1	Additions to test case 6.5.2.1E.2 – PUSCH-EVM with exclusion period for UE category 0	13.0.1	13.1.0
2016-03	RAN#71	R5-160864	2510	1	Additions of overlying section 6.6.3E-Spurious emission for UE category 0	13.0.1	13.1.0
2016-03	RAN#71	R5-160865	2511	1	Additions of overlying sections 6.3.5C, 6.3.5D and 6.3.5E Power Control for UE category 0	13.0.1	13.1.0
2016-03	RAN#71	R5-160866	2513	1	Additions to test case 6.2.3E - Maximum Power Reduction (MPR) for UE category 0	13.0.1	13.1.0
2016-03	RAN#71	R5-160867	2515	1	Additions of overlying section 6.3.4E-ON/OFF time mask for UE category 0	13.0.1	13.1.0
2016-03	RAN#71	R5-160868	2507	1	Additions to test case 6.6.3E.2 –Spurious emission band UE co-existence for UE category 0	13.0.1	13.1.0
2016-03	RAN#71	R5-160869	2505	1	Additions to test case 6.6.3E.1 – Transmitter Spurious emissions for UE category 0	13.0.1	13.1.0
2016-03	RAN#71	R5-160870	2370	1	Updates and test tolerance to single antenna FDD-TDD CA test cases	13.0.1	13.1.0
2016-03	RAN#71	R5-160877	2384	1	TTs to Annex F for eDL MIMO enhancement	13.0.1	13.1.0
2016-03	RAN#71	R5-160878	2392	1	Update to Annex F for TC 8.9.1.1.3, 8.9.1.2.1, 8.9.1.2.3, 9.7.2.1, 9.7.2.2	13.0.1	13.1.0
2016-03	RAN#71	R5-161001	2495	1	Addition of B66 in Frequency bands and channel arrangement.	13.0.1	13.1.0
2016-03	RAN#71	R5-161004	2427	1	Updates of some Rel-13 defined CA combinations to chapter 5 of TS 36.521-1	13.0.1	13.1.0
2016-03	RAN#71	R5-161005	2449	1	New ProSe test case: Demodulation of PSDCH for ProSe direct discovery	13.0.1	13.1.0
2016-03	RAN#71	R5-161006	2450	1	New ProSe test case: Maximum input level test	13.0.1	13.1.0
2016-03	RAN#71	R5-161008	2398	1	Updates to TC 8.7.1.1_A.2 FDD Sustained data rate performance for CA (3DL CA)	13.0.1	13.1.0
2016-03	RAN#71	R5-161009	2421	1	Updates to TM3 TDD-FDD with TDD Pcell 2DLCA and 3DLCA test cases	13.0.1	13.1.0
2016-03	RAN#71	R5-161010	2491	1	Corrections to TDD FDD CA Open Loop Spatial Multiplexing TCs	13.0.1	13.1.0
2016-03	RAN#71	R5-161012	2502	1	36.521-1 Sensitivity test points revision for 3DL 1A-3A-7A	13.0.1	13.1.0
2016-03	RAN#71	R5-161014	2503	1	36.521-1 Sensitivity test points revision for 3DL 1A-3A-20A	13.0.1	13.1.0
2016-03	RAN#71	R5-161017	2417	1	Update to TC 6.2.4A.2 A-MPR for 2UL inter-band CA	13.0.1	13.1.0
2016-03	RAN#71	R5-161019	2356	1	New CA 2UL Tx test case 6.5.2A.1.3 Error Vector Magnitude (EVM) for CA (intra-band non-contiguous DL CA and UL CA)	13.0.1	13.1.0

2016-03	RAN#71	R5-161022	2359	1	New CA 2UL Tx test case 6.5.2A.3.2 In-band emissions for non allocated RB for CA (inter-band DL CA and UL CA)	13.0.1	13.1.0
2016-03	RAN#71	R5-161023	2360	1	New CA 2UL Tx test case 6.5.2A.3.3 In-band emissions for non allocated RB for CA (intra-band non-contiguous DL CA and UL CA)	13.0.1	13.1.0
2016-03	RAN#71	R5-161024	2361	1	New CA 2UL Tx test case 6.6.3.1A.3 Transmitter Spurious emissions for CA (intra-band non-contiguous DL CA and UL CA)	13.0.1	13.1.0
2016-03	RAN#71	R5-161025	2377	1	Addition of new LTE_CA_Rel12_2UL test case 6.6.3.2A.3	13.0.1	13.1.0
2016-03	RAN#71	R5-161026	2378	1	Completion of new LTE_CA_Rel12_2UL Test Case 6.7A.2	13.0.1	13.1.0
2016-03	RAN#71	R5-161028	2517	1	Introduction of test case 6.6.2A.2 - Additional Spectrum Emission Mask for CA (inter-band DL CA and UL CA)	13.0.1	13.1.0
2016-03	RAN#71	R5-161029	2407	1	Updates to Annex A for 256QAM test	13.0.1	13.1.0
2016-03	RAN#71	R5-161030	2403	1	Addition of new TC 9.2.1.7 FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for 256QAM in DL	13.0.1	13.1.0
2016-03	RAN#71	R5-161031	2404	1	Addition of new TC 9.2.1.8 TDD CQI Reporting under AWGN conditions – PUCCH 1-0 for 256QAM in DL	13.0.1	13.1.0
2016-03	RAN#71	R5-161032	2405	1	Addition of new TC 9.3.1.2.3 FDD CQI Reporting under fading conditions – PUSCH 3-1 for 256QAM in DL	13.0.1	13.1.0
2016-03	RAN#71	R5-161033	2406	1	Addition of new TC 9.3.1.2.4 TDD CQI Reporting under fading conditions – PUSCH 3-1 for 256QAM in DL	13.0.1	13.1.0
2016-03	RAN#71	R5-161034	2399	1	Updates to 7.4A.1_H and 7.4A.2_H Maximum input level for intra-band contiguous CA for 256QAM in DL	13.0.1	13.1.0
2016-03	RAN#71	R5-161035	2402	1	Updates to TC 7.4A.5_H Maximum input level for CA (3DL CA without UL CA) for 256QAM in DL	13.0.1	13.1.0
2016-03	RAN#71	R5-161039	2353	1	LTE Type B performance requirements - Introduction of new test cases 8.2.1.4.4 and 8.2.2.4.5	13.0.1	13.1.0
2016-03	RAN#71	R5-161040	2354	1	LTE Type B performance requirements - Adding test cases 8.2.1.4.4 and 8.2.2.4.5 into Annex F and G	13.0.1	13.1.0
2016-03	RAN#71	R5-161041	2433	1	Test configuration correction for AMPR tests	13.0.1	13.1.0
2016-03	RAN#71	R5-161042	2434	1	Test configuration correction for ASE tests	13.0.1	13.1.0
2016-03	RAN#71	R5-161043	2435	1	Test configuration correction for ASEM tests	13.0.1	13.1.0
2016-03	RAN#71	R5-161044	2438	1	Test configuration correction for UL 64QAM AMPR tests	13.0.1	13.1.0
2016-03	RAN#71	R5-161045	2441	1	Test configuration correction for UL 64QAM ASE tests	13.0.1	13.1.0
2016-03	RAN#71	R5-161046	2442	1	Test configuration correction for UL 64QAM ASEM tests	13.0.1	13.1.0
2016-03	RAN#71	R5-161047	2444	1	Rel-8 Test point reduction for UL 64QAM AMPR, ASEM and ASE tests	13.0.1	13.1.0
2016-03	RAN#71	R5-161056	2410	1	Adding new clause 6.3.5A.1.0 and 6.3.5A.2.0 to define the minimum conformance requirements.	13.0.1	13.1.0
2016-03	RAN#71	R5-161059	2465	1	New CA band combination CA_41A-42C - Updates of 7.3A Refsens	13.0.1	13.1.0
2016-03	RAN#71	R5-161061	2447	1	Rel-10 Test point reduction for UL 64QAM CA AMPR, ASEM and ASE tests	13.0.1	13.1.0
2016-03	RAN#71	R5-161062	2472	1	Correction to the UL CA Frequency Error Testcase	13.0.1	13.1.0
2016-03	RAN#71	R5-161064	2522	1	Correction to A-MPR test with frequency hopping	13.0.1	13.1.0
2016-03	RAN#71	R5-161065	2415	1	Correction of Table number of DeltaRib reference in CA receiver RF tests	13.0.1	13.1.0

2016-03	RAN#71	R5-161073	2367	1	Update of test applicability for eDL MIMO enhancement TCs	13.0.1	13.1.0
2016-03	RAN#71	R5-161085	2514	1	36.521-1 Editorial corrections	13.0.1	13.1.0
2016-03	RAN#71	R5-161086	2524	1	Addition frequency bands and channel arrangement for B67 and CA_20-67	13.0.1	13.1.0
2016-03	RAN#71	R5-161103	2355	2	New CA 2UL Tx test case 6.5.2A.1.2 Error Vector Magnitude (EVM) for CA (inter-band DL CA and UL CA)	13.0.1	13.1.0
2016-03	RAN#71	R5-161104	2357	2	New CA 2UL Tx test case 6.5.2A.2.2 Carrier leakage for CA (inter-band DL CA and UL CA)	13.0.1	13.1.0
2016-03	RAN#71	R5-161105	2358	2	New CA 2UL Tx test case 6.5.2A.2.3 Carrier leakage for CA (intra-band non-contiguous DL CA and UL CA)	13.0.1	13.1.0
2016-03	RAN#71	R5-161107	2389	2	Reference sensitivity level with 4 Rx antenna ports	13.0.1	13.1.0
2016-03	RAN#71	R5-161109	2509	2	36.521-1 Transmitter tests for Band 66	13.0.1	13.1.0
2016-03	RAN#71	R5-161110	2512	1	36.521-1 Receiver tests for Band 66	13.0.1	13.1.0
2016-03	RAN#71	R5-161111	2373	1	Correction to power level for dual layer TM9 demodulation tests	13.0.1	13.1.0
2016-03	RAN#71	R5-161112	2458	2	Correction to TDD CQI Reporting for feICIC	13.0.1	13.1.0
2016-03	RAN#71	R5-161113	2461	2	Correction to UL 64 QAM RMC	13.0.1	13.1.0
2016-03	RAN#71	R5-161114	2475	2	Correction to CQI reports in CoMP fading test	13.0.1	13.1.0
2016-03	RAN#71	R5-161115	2476	2	Correction to test system uncertainties for Rx 7.6.3	13.0.1	13.1.0
2016-06	RAN#72	R5-162088	2527	-	Test Tolerances for FDD PDSCH Closed Loop Single Layer Spatial Multiplexing 2x2 with TM4 Interference Model-Enhanced Performance	13.1.0	13.2.0
2016-06	RAN#72	R5-162090	2528	-	Test Tolerances for TDD PDSCH Closed Loop Single Layer Spatial Multiplexing 2x2 with TM4 Interference Model-Enhanced Performance	13.1.0	13.2.0
2016-06	RAN#72	R5-162169	2533	-	Corrections to Annex F.1.2 and F.3.2 for Pcmx test case	13.1.0	13.2.0
2016-06	RAN#72	R5-162189	2536	-	Additions to test case 6.3.5E.3 – Aggregate power control tolerance for UE category 0	13.1.0	13.2.0
2016-06	RAN#72	R5-162191	2537	-	Additions to test case 6.3.5E.2 – Power Control Relative power tolerance for UE category 0	13.1.0	13.2.0
2016-06	RAN#72	R5-162192	2538	-	Editorial correction in Reference sensitivity QPSK PREFSENS four antenna ports Table number	13.1.0	13.2.0
2016-06	RAN#72	R5-162195	2539	-	Addition In-band blocking with 4 Rx antenna ports test case	13.1.0	13.2.0
2016-06	RAN#72	R5-162210	2542	-	Addition of UL CA capability for CA_4A-5A in Table 5.4.2A.1-2	13.1.0	13.2.0
2016-06	RAN#72	R5-162211	2543	-	New test points for CA_4A-5A (2DL-2UL) in sec. 6.2 and sec. 6.3	13.1.0	13.2.0
2016-06	RAN#72	R5-162212	2544	-	New test points for CA_4A-5A (2DL-2UL) in sec. 6.5 and sec. 6.6	13.1.0	13.2.0
2016-06	RAN#72	R5-162215	2545	-	Update of requirements in TC 6.2.2A.2 for CA_4A-5A (2DL-2UL)	13.1.0	13.2.0
2016-06	RAN#72	R5-162235	2557	-	Introduction of ACLR for intra-band non-contiguous UL CA for UL 64QAM	13.1.0	13.2.0
2016-06	RAN#72	R5-162241	2563	-	New test case: Maximum sidelink processes for ProSe Direct discovery	13.1.0	13.2.0
2016-06	RAN#72	R5-162247	2569	-	Update of TC 7.3A.6 for CA_4A-5A (2DL-2UL)	13.1.0	13.2.0

2016-06	RAN#72	R5-162248	2570	-	New D2D Tx test case 6.5.1D.2 Frequency error for ProSe Direct Communication	13.1.0	13.2.0
2016-06	RAN#72	R5-162249	2571	-	Update of Inter-band E-UTRA ProSe / E-UTRA operating bands to chapter 5 of TS 36.521-1	13.1.0	13.2.0
2016-06	RAN#72	R5-162251	2572	-	Update to CA 2UL Tx test case 6.5.1A.3 Frequency Error for CA (intra-band non-contiguous DL CA and UL CA)	13.1.0	13.2.0
2016-06	RAN#72	R5-162296	2590	-	New TC: FDD PDSCH Closed Loop Single-layer Spatial Multiplexing on antenna ports 7 or 8 with TM9 Interference Model - Enhanced Performance Requirement Type B	13.1.0	13.2.0
2016-06	RAN#72	R5-162303	2593	-	RF: Wrong Number of PDCCH symbols in TC 8.2.1.4.1_H	13.1.0	13.2.0
2016-06	RAN#72	R5-162304	2594	-	RF: Corrections to RMCs in Annex A	13.1.0	13.2.0
2016-06	RAN#72	R5-162306	2595	-	RF: Correction to RMC for UE Category 1 in CSI tests	13.1.0	13.2.0
2016-06	RAN#72	R5-162308	2597	-	RF: Pb setting in power imbalance TCs	13.1.0	13.2.0
2016-06	RAN#72	R5-162309	2598	-	RF: UE Categories in FDD-TDD 2DL joint operation CSI test cases	13.1.0	13.2.0
2016-06	RAN#72	R5-162324	2605	-	Introduction of TDD PCFICH/PDCCH Single-antenna Port Performance 1x4	13.1.0	13.2.0
2016-06	RAN#72	R5-162340	2608	-	Added Channel BW clause for Dual Connectivity	13.1.0	13.2.0
2016-06	RAN#72	R5-162343	2609	-	Introduction of Spurious Response for ProSe	13.1.0	13.2.0
2016-06	RAN#72	R5-162344	2610	-	Introduction of In-band blocking for ProSe	13.1.0	13.2.0
2016-06	RAN#72	R5-162345	2611	-	Introduction of Out-of-band blocking for ProSe	13.1.0	13.2.0
2016-06	RAN#72	R5-162346	2612	-	Annex F: Addition of chapter 7 ProSe TCs	13.1.0	13.2.0
2016-06	RAN#72	R5-162350	2615	-	UL CA: Corrections to 6.5.2A.x inter-band and non-contiguous TCs	13.1.0	13.2.0
2016-06	RAN#72	R5-162354	2618	-	Correction to UL64QAM A-MPR and ASE tests	13.1.0	13.2.0
2016-06	RAN#72	R5-162355	2619	-	Correction to TC 8.2.1.3.1A_A.1	13.1.0	13.2.0
2016-06	RAN#72	R5-162358	2622	-	Annex G: Corrections to test times for joint operation TCs	13.1.0	13.2.0
2016-06	RAN#72	R5-162393	2625	-	Addition CA_66A-66A in test case 7.4A.4_H	13.1.0	13.2.0
2016-06	RAN#72	R5-162420	2628	-	Addition of CA_1A-3A-7A in 36.521-1	13.1.0	13.2.0
2016-06	RAN#72	R5-162421	2629	-	Addition of CA_3A-7A-8A in 36.521-1	13.1.0	13.2.0
2016-06	RAN#72	R5-162463	2633	-	Addition of Band 45 to Section 5 of 36.521-1	13.1.0	13.2.0
2016-06	RAN#72	R5-162464	2634	-	Addition of Band 45 in maximum output power test cases	13.1.0	13.2.0
2016-06	RAN#72	R5-162465	2635	-	Addition of Band 45 in MPR test cases	13.1.0	13.2.0
2016-06	RAN#72	R5-162467	2637	-	Addition of Band 45 in Refsens test cases	13.1.0	13.2.0
2016-06	RAN#72	R5-162468	2638	-	Addition of Band 45 in in-band blocking test cases	13.1.0	13.2.0
2016-06	RAN#72	R5-162469	2639	-	Addition of Band 45 in out-of-band blocking test cases	13.1.0	13.2.0
2016-06	RAN#72	R5-162475	2640	-	Addition of output power configuration for CA_3C-5A to Section 6.2.5	13.1.0	13.2.0
2016-06	RAN#72	R5-162486	2644	-	Updates of test configuration for Additional spurious emissions for 2UL inter-band CA	13.1.0	13.2.0
2016-06	RAN#72	R5-162490	2645	-	New CA band combinations CA_28A-41A and CA_28A-41C - Updates of 5.4.2A Channel bandwidth	13.1.0	13.2.0

2016-06	RAN#72	R5-162491	2646	-	New CA band combinations CA_28A-41A and CA_28A-41C - Updates of 6.2.5.3 Delta TIB	13.1.0	13.2.0
2016-06	RAN#72	R5-162492	2647	-	New CA band combinations CA_28A-41A and CA_28A-41C - Updates of 7.3.3 Delta RIB	13.1.0	13.2.0
2016-06	RAN#72	R5-162495	2649	-	New CA band combinations CA_28A-42A and CA_28A-42C - Updates of 5.4.2A Channel bandwidth	13.1.0	13.2.0
2016-06	RAN#72	R5-162496	2650	-	New CA band combinations CA_28A-42A and CA_28A-42C - Updates of 6.2.5.3 Delta TIB	13.1.0	13.2.0
2016-06	RAN#72	R5-162497	2651	-	New CA band combinations CA_28A-42A and CA_28A-42C - Updates of 7.3.3 Delta RIB	13.1.0	13.2.0
2016-06	RAN#72	R5-162499	2653	-	New CA band combinations CA_41C-42A and CA_41C-42C - Updates of 5.4.2A Channel bandwidth	13.1.0	13.2.0
2016-06	RAN#72	R5-162500	2654	-	New CA band combinations CA_41C-42A and CA_41C-42C - Updates of 6.2.5.3 Delta TIB	13.1.0	13.2.0
2016-06	RAN#72	R5-162501	2655	-	New CA band combinations CA_41C-42A and CA_41C-42C - Updates of 7.3.3 Delta RIB	13.1.0	13.2.0
2016-06	RAN#72	R5-162502	2656	-	New CA band combinations CA_41C-42A - Updates of 7.3A Refsens	13.1.0	13.2.0
2016-06	RAN#72	R5-162527	2661	-	Correction of editor's note for CA_41A-42C	13.1.0	13.2.0
2016-06	RAN#72	R5-162528	2662	-	Minor correction to TC 8.2.1.4.2_A.1	13.1.0	13.2.0
2016-06	RAN#72	R5-162542	2666	-	Updates of delta TIB,c values for some CA configurations	13.1.0	13.2.0
2016-06	RAN#72	R5-162549	2668	-	Correction to test case 9.3.2.2.2_D	13.1.0	13.2.0
2016-06	RAN#72	R5-162550	2669	-	Correction to test applicability in test case 8.7.5.1.1	13.1.0	13.2.0
2016-06	RAN#72	R5-162553	2671	-	Correction to test case 9.3.3.1.1.	13.1.0	13.2.0
2016-06	RAN#72	R5-162563	2676	-	Introduction of new Rx test case Maximum input level with 4 Rx antenna ports	13.1.0	13.2.0
2016-06	RAN#72	R5-162567	2678	-	Addition of 2x1 antenna correlation matrices for UE category 0	13.1.0	13.2.0
2016-06	RAN#72	R5-162568	2679	-	Updates to test case 8.9.1.1.1 - FDD PDSCH Transmit Diversity 2x1 for UE category 0	13.1.0	13.2.0
2016-06	RAN#72	R5-162569	2680	-	Updates to test case 9.7.1.1 - FDD and Half duplex FDD CQI reporting definition under AWGN conditions for UE category 0	13.1.0	13.2.0
2016-06	RAN#72	R5-162593	2688	-	Correction to CQI tests for Enhanced Performance Type A	13.1.0	13.2.0
2016-06	RAN#72	R5-162594	2689	-	Correction to TDD FDD CA CQI Reporting tests	13.1.0	13.2.0
2016-06	RAN#72	R5-162596	2691	-	Correction to demodulation test cases for CoMP in 8.3.1.3.2_F and 8.3.2.4.2_F	13.1.0	13.2.0
2016-06	RAN#72	R5-162597	2692	-	Correction to PDCCH Aggregation Level for SDR test	13.1.0	13.2.0
2016-06	RAN#72	R5-162605	2695	-	Update of refsens test case 7.3A.3 for CA_20A-67A	13.1.0	13.2.0
2016-06	RAN#72	R5-162647	2700	-	Re-Addition of new LTE_CA_Rel12_2UL test case 6.6.3.2A.3	13.1.0	13.2.0
2016-06	RAN#72	R5-162661	2704	-	Band 65 introduction to Chapter 7 in 36.521-1	13.1.0	13.2.0
2016-06	RAN#72	R5-162802	2546	1	Introduction of MPR for inter-band DL CA and UL CA for UL 64QAM	13.1.0	13.2.0
2016-06	RAN#72	R5-162803	2547	1	Introduction of MPR for intra-band non-contiguous CA and UL CA for UL 64QAM	13.1.0	13.2.0
2016-06	RAN#72	R5-162804	2553	1	Rel-11 Test point reduction for intra-band non-contiguous UL CA MPR and ACLR tests	13.1.0	13.2.0

2016-06	RAN#72	R5-162805	2554	1	Rel-11 Test point reduction for inter-band UL CA AMPR, ASEM and ASE tests	13.1.0	13.2.0
2016-06	RAN#72	R5-162806	2555	1	R8 - Modification of test bandwidths in AMPR, ASEM and ASE test	13.1.0	13.2.0
2016-06	RAN#72	R5-162807	2556	1	R13 - Modification of test bandwidths in AMPR and ASE for UL 64QAM test	13.1.0	13.2.0
2016-06	RAN#72	R5-162808	2616	1	UL CA: Corrections to TC 6.5.2A.1.1	13.1.0	13.2.0
2016-06	RAN#72	R5-162810	2685	1	Correction to 6.2.4 A-MPR test for Band 12	13.1.0	13.2.0
2016-06	RAN#72	R5-162811	2535	1	Corrections to CA_41A-41C and CA_41C-41A tables in clauses 7.3A.5, 7.4A.5, 7.5A.5, 7.6.1A.5, 7.6.2A.5, 7.6.3A.5 and 7.8.1A.5	13.1.0	13.2.0
2016-06	RAN#72	R5-162812	2665	1	Correction of refsens test case 7.3A.3 for CA_20A-32A	13.1.0	13.2.0
2016-06	RAN#72	R5-162813	2674	1	New CA band combination CA_8A-40A – Updates of 7.3.3 Delta RIB	13.1.0	13.2.0
2016-06	RAN#72	R5-162814	2684	1	New CA band combination CA_8A-40A – Updates of 7.3A Refsens	13.1.0	13.2.0
2016-06	RAN#72	R5-162815	2686	1	Correction to reference sensitivity test cases	13.1.0	13.2.0
2016-06	RAN#72	R5-162816	2687	1	Clarification of interferer frequencies in ACS	13.1.0	13.2.0
2016-06	RAN#72	R5-162817	2621	1	Corrections to chapter 8 joint operation TCs	13.1.0	13.2.0
2016-06	RAN#72	R5-162818	2670	1	Correction to test case 8.2.3.2.2A	13.1.0	13.2.0
2016-06	RAN#72	R5-162819	2690	1	Additional test point for 3DL CA Performance and CQI test cases	13.1.0	13.2.0
2016-06	RAN#72	R5-162820	2693	1	Correction to TDD FDD CA performance test cases for FDD PCell(2DL and 3DL)	13.1.0	13.2.0
2016-06	RAN#72	R5-162821	2694	1	Correction to TDD FDD CA performance test cases for TDD PCell TCs(2DL)	13.1.0	13.2.0
2016-06	RAN#72	R5-162832	2623	1	Corrections to 256QAM SDR joint operation TCs	13.1.0	13.2.0
2016-06	RAN#72	R5-162837	2559	1	New test case: 2x4 PDSCH TM9 single layer TypeA	13.1.0	13.2.0
2016-06	RAN#72	R5-162838	2530	1	Addition of CA_4A-12A Bandwidth combination set5 information	13.1.0	13.2.0
2016-06	RAN#72	R5-162839	2567	1	Update of TC 6.6.3.1A.2 for CA_4A-5A (2DL-2UL)	13.1.0	13.2.0
2016-06	RAN#72	R5-162840	2584	1	Updates TC7.3 for new Rel-13 defined CA combinations to minimum requirements of Reference sensitivity	13.1.0	13.2.0
2016-06	RAN#72	R5-162841	2585	1	Updates TC7.3A for new Rel-13 defined CA combinations to minimum requirements of Reference sensitivity for CA	13.1.0	13.2.0
2016-06	RAN#72	R5-162842	2586	1	Updates of some Rel-13 defined CA combinations to operating bands of TS 36.521-1	13.1.0	13.2.0
2016-06	RAN#72	R5-162843	2587	1	Updates TC6.2.5 for delta TIB,c values with new Rel-13 CA band combination	13.1.0	13.2.0
2016-06	RAN#72	R5-162844	2627	1	Addition of CA_4A-4A BW set 1	13.1.0	13.2.0
2016-06	RAN#72	R5-162846	2531	1	Addition of Rel-13 CA combination CA_3A-41A to refsens for inter-band 2DL CA	13.1.0	13.2.0
2016-06	RAN#72	R5-162847	2710	1	Introduction of new TC8.2.1.4.2_A.3 4DL CA	13.1.0	13.2.0
2016-06	RAN#72	R5-162848	2719	1	Addition of definition of CA capability with 4DL & 5DL CCs	13.1.0	13.2.0
2016-06	RAN#72	R5-162849	2720	1	Addition of Operating bands for CA in clause 5.2A	13.1.0	13.2.0

2016-06	RAN#72	R5-162851	2560	1	New test case: 4layer PDSCH CLSM	13.1.0	13.2.0
2016-06	RAN#72	R5-162852	2561	1	New test case: 4layer PDSCH TM9 SM	13.1.0	13.2.0
2016-06	RAN#72	R5-162853	2562	1	New test case: 3layer PDSCH OLSM	13.1.0	13.2.0
2016-06	RAN#72	R5-162854	2573	1	New Performance test case 8.10.4.1.1 FDD distributed EPDCCH performance 2x4	13.1.0	13.2.0
2016-06	RAN#72	R5-162855	2574	1	New Performance test case 8.10.4.1.2 TDD distributed EPDCCH performance 2x4	13.1.0	13.2.0
2016-06	RAN#72	R5-162856	2575	1	New Performance test case 8.10.4.2.1 FDD localized EPDCCH performance with TM9 2x4	13.1.0	13.2.0
2016-06	RAN#72	R5-162857	2576	1	New Performance test case 8.10.4.2.2 TDD localized EPDCCH performance with TM9 2x4	13.1.0	13.2.0
2016-06	RAN#72	R5-162858	2602	1	Introduction of FDD PCFICH/PDCCH Single-antenna Port Performance 1x4	13.1.0	13.2.0
2016-06	RAN#72	R5-162859	2603	1	Introduction of FDD PCFICH/PDCCH Transmit Diversity 2x4	13.1.0	13.2.0
2016-06	RAN#72	R5-162860	2606	1	Introduction of TDD PCFICH/PDCCH Transmit Diversity 2x4	13.1.0	13.2.0
2016-06	RAN#72	R5-162861	2607	1	Introduction of TDD PCFICH/PDCCH Transmit Diversity 4x4	13.1.0	13.2.0
2016-06	RAN#72	R5-162862	2675	1	Addition of 4Rx antenna port feature into Annex I	13.1.0	13.2.0
2016-06	RAN#72	R5-162863	2677	1	Introduction of new Rx test case Adjacent Channel Selectivity (ACS) with 4 Rx antenna ports	13.1.0	13.2.0
2016-06	RAN#72	R5-162865	2577	1	Rearrangement of TC 6.6.2.3A.1_1 and TC 6.6.2.3A.2 and corrections to TC 6.6.2.3A.2	13.1.0	13.2.0
2016-06	RAN#72	R5-162866	2614	1	UL CA: Corrections to intra-band non-contiguous test configuration tables	13.1.0	13.2.0
2016-06	RAN#72	R5-162867	2725	1	Updates of test configuration for EVM and Carrier leakage test cases of 2UL CA	13.1.0	13.2.0
2016-06	RAN#72	R5-162868	2643	1	Addition of minimum requirement tables to clause 6.3.5A.1.0 and 6.3.5A.2.0	13.1.0	13.2.0
2016-06	RAN#72	R5-162869	2681	1	Updates to test case 6.6.2.2A.2 - Additional Spectrum Emission Mask for CA (inter-band DL CA and UL CA)	13.1.0	13.2.0
2016-06	RAN#72	R5-162870	2699	1	Re-submission of New CA 2UL Tx test case 6.5.2A.1.3 Error Vector Magnitude (EVM) for CA (intra-band non-contiguous DL CA and UL CA)	13.1.0	13.2.0
2016-06	RAN#72	R5-162872	2724	1	Additions to test case 6.6.3.1A.2 – Transmitter Spurious emissions for CA (inter-band DL CA and UL CA)	13.1.0	13.2.0
2016-06	RAN#72	R5-162875	2696	1	Adding operating band definitions for MTC and eMTC	13.1.0	13.2.0
2016-06	RAN#72	R5-162877	2564	1	New test case: PSSCH performance for ProSe Direct communication	13.1.0	13.2.0
2016-06	RAN#72	R5-162878	2565	1	New test case: Maximum sidelink processes for ProSe Direct communication	13.1.0	13.2.0
2016-06	RAN#72	R5-162879	2722	1	New test Case: ProSe-UE Maximum Output Power	13.1.0	13.2.0
2016-06	RAN#72	R5-162880	2723	1	New test Case: ProSe-UE Maximum Power Reduction test case	13.1.0	13.2.0
2016-06	RAN#72	R5-162884	2599	1	Update to FDD PDSCH Closed Loop Multi-Layer Spatial Multiplexing 4x2 for Dual Connectivity	13.1.0	13.2.0
2016-06	RAN#72	R5-162885	2600	1	Update to TDD PDSCH Closed Loop Multi-Layer Spatial Multiplexing 4x2 for Dual Connectivity	13.1.0	13.2.0

2016-06	RAN#72	R5-162886	2601	1	Update to sustained data rate performance for Dual Connectivity 64QAM	13.1.0	13.2.0
2016-06	RAN#72	R5-162887	2641	1	Addition of test case for FDD sustained data rate performance for Dual Connectivity 256QAM	13.1.0	13.2.0
2016-06	RAN#72	R5-162888	2642	1	Addition of test case for TDD sustained data rate performance for Dual Connectivity 256QAM	13.1.0	13.2.0
2016-06	RAN#72	R5-162890	2728	-	Adding Low Wgap definition to section 3	13.1.0	13.2.0
2016-06	RAN#72	R5-162952	2632	1	Update to TC 6.3.5A.2.3 Power Control Relative power tolerance for CA (intra-band non-contiguous DL CA and UL CA)	13.1.0	13.2.0
2016-06	RAN#72	R5-162953	2525	1	CR for Clause 9.3.8.2 in 36.521-1	13.1.0	13.2.0
2016-06	RAN#72	R5-162954	2591	1	New TC: TDD PDSCH Closed Loop Single-layer Spatial Multiplexing on antenna ports 7 or 8 with TM9 Interference Model - Enhanced Performance Requirement Type B	13.1.0	13.2.0
2016-06	RAN#72	R5-162967	2624	2	Addition CA combinations in intra-band contiguous DL CA and UL CA transmitter test cases	13.1.0	13.2.0
2016-06	RAN#72	R5-162969	2660	1	Update BW definition for band 66 in clause 5	13.1.0	13.2.0
2016-06	RAN#72	R5-162973	2701	1	Band 65 introduction to Chapter 5 in 36.521-1	13.1.0	13.2.0
2016-06	RAN#72	R5-162974	2703	1	Band 65 introduction to Chapter 6.6.3 in 36.521-1	13.1.0	13.2.0
2016-06	RAN#72	R5-162975	2636	1	Addition of Band 45 in Spurious emission test cases	13.1.0	13.2.0
2016-06	RAN#72	R5-162976	2540	2	6.3.4E.1 – General ON/OFF time mask for UE category 0	13.1.0	13.2.0
2016-06	RAN#72	R5-162977	2548	1	Introduction of AMPR for inter-band DL CA and UL CA for UL 64QAM	13.1.0	13.2.0
2016-06	RAN#72	R5-162978	2541	1	6.3.4.1 – General ON/OFF time mask.	13.1.0	13.2.0
2016-06	RAN#72	R5-162979	2549	1	Introduction of EVM for inter-band UL CA for UL 64QAM	13.1.0	13.2.0
2016-06	RAN#72	R5-162980	2550	1	Introduction of ASEM for inter-band DL CA and UL CA for UL 64QAM	13.1.0	13.2.0
2016-06	RAN#72	R5-162981	2551	1	Introduction of ACLR for inter-band DL CA and UL CA for UL 64QAM	13.1.0	13.2.0
2016-06	RAN#72	R5-162982	2552	1	Introduction of ASE for inter-band DL CA and UL CA for UL 64QAM	13.1.0	13.2.0
2016-06	RAN#72	R5-162983	2657	1	Updates of test point for A-Spur for UL 64QAM	13.1.0	13.2.0
2016-06	RAN#72	R5-162985	2673	1	New CA band combination CA_8A-40A – Updates of 5.4.2A Channel Bandwidth	13.1.0	13.2.0
2016-06	RAN#72	R5-162987	2664	1	Change of test case applicability for A-MPR for NS_05	13.1.0	13.2.0
2016-06	RAN#72	R5-162989	2566	1	Update of TC 6.6.2.2A.2 for CA_4A-5A (2DL-2UL)	13.1.0	13.2.0
2016-06	RAN#72	R5-162990	2648	1	New CA band combinations CA_28A-41A and CA_28A-41C - Updates of 7.3A Refsens	13.1.0	13.2.0
2016-06	RAN#72	R5-162991	2716	1	Introduction of new TC7.7A.7 4DL CA	13.1.0	13.2.0
2016-06	RAN#72	R5-162992	2604	1	Introduction of FDD PCFICH/PDCCH Transmit Diversity 4x4	13.1.0	13.2.0
2016-06	RAN#72	R5-162993	2532	1	Update test case 6.2.4A.2:AMPR for 2UL inter-band CA	13.1.0	13.2.0
2016-06	RAN#72	R5-162995	2658	1	Addition of a new TC for Minimum Output Power for CA (inter-band DL CA and UL CA)	13.1.0	13.2.0
2016-06	RAN#72	R5-162996	2659	1	Addition of a new TC for Minimum Output Power for CA (intra-band non-contiguous DL CA and UL CA)	13.1.0	13.2.0

2016-06	RAN#72	R5-162997	2682	1	Introduction of test case 6.6.2.2A.3 - Additional Spectrum Emission Mask for CA (intra-band non-contiguous DL CA and UL CA)	13.1.0	13.2.0
2016-06	RAN#72	R5-163100	2588	1	Introduction of new eMTC RF test case 6.3.5EA.1 for category M1	13.1.0	13.2.0
2016-06	RAN#72	R5-163101	2589	1	Introduction of new eMTC RF test case 6.3.5EA.2 for category M1	13.1.0	13.2.0
2016-06	RAN#72	R5-163102	2705	1	Addition of new test case for aggregate power control tolerance for UE category M1	13.1.0	13.2.0
2016-06	RAN#72	R5-163103	2706	1	Addition of New test case for Maximum input level for UE category M1	13.1.0	13.2.0
2016-06	RAN#72	R5-163104	2707	1	Addition of New test case for Adjacent Channel Selectivity (ACS) for category M1	13.1.0	13.2.0
2016-06	RAN#72	R5-163107	2568	1	New D2D Tx test case 6.5.1D.1 Frequency error for ProSe Direct Discovery	13.1.0	13.2.0
2016-06	RAN#72	R5-163110	2558	1	New 2x4 test case: PDSCH CLSM TypeA	13.1.0	13.2.0
2016-06	RAN#72	R5-163119	2708	1	Introduction of new TC7.3A.9 4DL CA	13.1.0	13.2.0
2016-06	RAN#72	R5-163120	2709	1	Introduction of new TC7.4A.7 4DL CA	13.1.0	13.2.0
2016-06	RAN#72	R5-163121	2711	1	Introduction of new TC7.5A.7 4DL CA	13.1.0	13.2.0
2016-06	RAN#72	R5-163122	2712	1	Introduction of new TC7.6.1A.7 4DL CA	13.1.0	13.2.0
2016-06	RAN#72	R5-163123	2713	1	Introduction of new TC7.6.2A.7 4DL CA	13.1.0	13.2.0
2016-06	RAN#72	R5-163124	2715	1	Introduction of new TC7.6.3A.7 4DL CA	13.1.0	13.2.0
2016-06	RAN#72	R5-163125	2717	1	Introduction of new TC7.8.1A.7 4DL CA	13.1.0	13.2.0
2016-06	RAN#72	R5-163126	2718	1	Updates of delta TIB,c values and table references for delta TIB,c for TC 6.2.5	13.1.0	13.2.0
2016-06	RAN#72	R5-163127	2727	1	Introduction of CA 1A-8A-11A in chapters 5, 6 and 7	13.1.0	13.2.0
2016-06	RAN#72	R5-163129	2529	1	Addition of new test case 7.9_1 Spurious emissions with 4 Rx antenna ports	13.1.0	13.2.0
2016-06	RAN#72	R5-163130	2534	1	Revise Power Control Relative power tolerance for CA (intra-band contiguous DL CA and UL CA) test case 6.3.5A.2.1	13.1.0	13.2.0
2016-06	RAN#72	R5-163132	2652	1	New CA band combinations CA_28A-42A and CA_28A-42C - Updates of 7.3A Refsens	13.1.0	13.2.0
2016-06	RAN#72	R5-163192	2631	2	Update to TC 6.3.5A.2.2 Power Control Relative power tolerance for CA (inter-band DL CA and UL CA)	13.1.0	13.2.0
2016-06	RAN#72	R5-163194	2702	2	Band 65 introduction to Chapter 6.2 in 36.521-1	13.1.0	13.2.0
2016-06	RAN#72	R5-163195	2663	2	Change of test points and requirements for A-MPR for NS_05	13.1.0	13.2.0
2016-06	RAN#72	R5-163196	2726	1	Correction to the UL CA Frequency Error Testcase	13.1.0	13.2.0
2016-09	RAN#73	R5-165046	2742	2	Introduction of new definitions for NB-IoT in Chapter 3	13.2.0	13.3.0
2016-09	RAN#73	R5-165047	2744	2	Introduction of general information for NB-IoT in Chapter 4	13.2.0	13.3.0
2016-09	RAN#73	R5-165048	2745	2	Introduction of operating bands for NB-IoT in Chapter 5	13.2.0	13.3.0
2016-09	RAN#73	R5-165049	2730	2	Introduce Downlink Fixed Reference Channels for UE category NB1 Receiver tests	13.2.0	13.3.0
2016-09	RAN#73	R5-165050	2731	2	Introduce GSM Interferer for UE category NB1 Adjacent channel selectivity tests	13.2.0	13.3.0

2016-09	RAN#73	R5-165051	2736	2	New test case: 6.2.2EA UE Maximum Output Power for UE category M1	13.2.0	13.3.0
2016-09	RAN#73	R5-165057	2759	2	Addition of FDD MPDCCH demod test case for eMTC	13.2.0	13.3.0
2016-09	RAN#73	R5-165058	2760	2	Addition of TDD MPDCCH demod test case for eMTC	13.2.0	13.3.0
2016-09	RAN#73	R5-165062	2757	2	UE Maximum Output Power for UE category NB1	13.2.0	13.3.0
2016-09	RAN#73	R5-165063	2741	2	Addition of test case 6.6.2.3F for ACLR for UE category NB1	13.2.0	13.3.0
2016-09	RAN#73	R5-165067	2749	2	Addition of test case 6.7F for Transmit Intermodulation for UE category NB1	13.2.0	13.3.0
2016-09	RAN#73	R5-165068	2750	2	Addition of Occupied Bandwidth test case 6.6.1F for UE category NB1	13.2.0	13.3.0
2016-09	RAN#73	R5-165069	2751	2	Addition of Spectrum Emission Mask test case 6.6.2.1F for UE category NB1	13.2.0	13.3.0
2016-09	RAN#73	R5-165070	2756	2	Introduction of 6.5.1F Frequency Error for UE category NB1	13.2.0	13.3.0
2016-09	RAN#73	R5-165071	2763	2	Introduction of new NB-IoT RF test case 6.3.4F.1 for category NB1	13.2.0	13.3.0
2016-09	RAN#73	R5-165072	2765	2	Introduction of test case 6.2.3F - Maximum Power Reduction (MPR) for UE category NB1	13.2.0	13.3.0
2016-09	RAN#73	R5-165073	2766	2	Introduction of test case 6.6.3F.1 - Transmitter Spurious emission for UE category NB1	13.2.0	13.3.0
2016-09	RAN#73	R5-165074	2758	2	Maximum input level for UE category NB1	13.2.0	13.3.0
2016-09	RAN#73	R5-165075	2729	2	Introduce Adjacent Channel Selectivity (ACS) for UE category NB1 test case 7.5F	13.2.0	13.3.0
2016-09	RAN#73	R5-165076	2733	2	Introduce Downlink Physical Channels for UE category NB1 Receiver tests	13.2.0	13.3.0
2016-09	RAN#73	R5-165077	2764	2	Addition of the TC 6.6.2.3EA ACLR for UE category M1	13.2.0	13.3.0
2016-09	RAN#73	R5-165094	2776	-	New test case: 6.5.1EA Frequency Error for UE category M1	13.2.0	13.3.0
2016-09	RAN#73	R5-165095	2777	-	New test case: 6.5.2.1EA.1 Error Vector Magnitude for UE category M1	13.2.0	13.3.0
2016-09	RAN#73	R5-165096	2778	-	New test case: 6.5.2.1EA.2 PUSCH-EVM with exclusion period for UE category M1	13.2.0	13.3.0
2016-09	RAN#73	R5-165097	2779	-	New test case: 6.5.2.2EA Carrier leakage for UE category M1	13.2.0	13.3.0
2016-09	RAN#73	R5-165098	2780	-	New test case: 6.5.2.3EA In-band emissions for non allocated RB for UE category M1	13.2.0	13.3.0
2016-09	RAN#73	R5-165099	2781	-	New test case: 6.5.2.4EA EVM equalizer spectrum flatness for UE category M1	13.2.0	13.3.0
2016-09	RAN#73	R5-165100	2782	-	New test case: 6.6.2.1EA Spectrum Emission Mask for UE category M1	13.2.0	13.3.0
2016-09	RAN#73	R5-165101	2783	-	New test case: 6.6.2.2EA Additional Spectrum Emission Mask for UE category M1	13.2.0	13.3.0
2016-09	RAN#73	R5-165117	2797	-	Changes to general clauses for UE category M1	13.2.0	13.3.0
2016-09	RAN#73	R5-165158	2800	-	Introduction of ProSe RF TC 7.5D	13.2.0	13.3.0
2016-09	RAN#73	R5-165159	2801	-	Introduction of ProSe RF TC 7.6.3D	13.2.0	13.3.0
2016-09	RAN#73	R5-165160	2802	-	Introduction of ProSe RF TC 7.8.1D	13.2.0	13.3.0
2016-09	RAN#73	R5-165210	2808	-	New CA band combination CA_1A-40A and CA_3A-40A - Updates of 7.3A Refsens	13.2.0	13.3.0

2016-09	RAN#73	R5-165225	2809	-	Update minimum test time into Annex G for TC 8.9.1.1.3,8.9.1.2.3	13.2.0	13.3.0
2016-09	RAN#73	R5-165228	2810	-	Update to TC 9.7.2.1,9.7.2.2	13.2.0	13.3.0
2016-09	RAN#73	R5-165243	2812	-	Addition of new 4Rx Test Cases - CQI reporting / AWGN / rank 1	13.2.0	13.3.0
2016-09	RAN#73	R5-165244	2813	-	Addition of new 4Rx Test Cases - CQI reporting / AWGN / rank 2	13.2.0	13.3.0
2016-09	RAN#73	R5-165245	2814	-	Addition of new 4Rx Test Cases - CQI reporting / AWGN / rank 4	13.2.0	13.3.0
2016-09	RAN#73	R5-165247	2815	-	Addition of new 4Rx Test Cases - CQI reporting / AWGN / rank 3	13.2.0	13.3.0
2016-09	RAN#73	R5-165248	2816	-	Uncertainties and Test Tolerances for new 4Rx Test Cases - CQI reporting / AWGN	13.2.0	13.3.0
2016-09	RAN#73	R5-165250	2817	-	Addition of channel matrices for 4Rx in Annex B.1	13.2.0	13.3.0
2016-09	RAN#73	R5-165310	2822	-	Update to FDD PCFICH/PDCCH transmit diversity 2x4	13.2.0	13.3.0
2016-09	RAN#73	R5-165311	2823	-	Update to FDD PCFICH/PDCCH transmit diversity 4x4	13.2.0	13.3.0
2016-09	RAN#73	R5-165322	2833	-	Update minimum requirement of Reference sensitivity level for all Rel-13 CA configurations	13.2.0	13.3.0
2016-09	RAN#73	R5-165334	2834	-	Correction of test requirements of In-band emissions for non allocated RB	13.2.0	13.3.0
2016-09	RAN#73	R5-165366	2837	-	Update to test case 8.10.4.1.1 FDD distributed EPDCCH performance 2x4	13.2.0	13.3.0
2016-09	RAN#73	R5-165368	2839	-	Update to test case 8.10.4.1.2 TDD distributed EPDCCH performance 2x4	13.2.0	13.3.0
2016-09	RAN#73	R5-165369	2840	-	Update to test case 8.10.4.2.1 FDD localized EPDCCH performance 2x4	13.2.0	13.3.0
2016-09	RAN#73	R5-165370	2841	-	Introduction of a clause for Demodulation of PBCH (enhanced coverage)	13.2.0	13.3.0
2016-09	RAN#73	R5-165371	2842	-	Update to test case 8.10.4.2.2 TDD localized EPDCCH performance 2x4	13.2.0	13.3.0
2016-09	RAN#73	R5-165395	2851	-	Correction to the test requirement for General ON/OFF time mask for UE category 0	13.2.0	13.3.0
2016-09	RAN#73	R5-165413	2854	-	Correction for UL 64QAM test cases to TS36.521-1	13.2.0	13.3.0
2016-09	RAN#73	R5-165415	2856	-	Update to eMTC RF test case 6.3.5EA.2 for category M1	13.2.0	13.3.0
2016-09	RAN#73	R5-165424	2861	-	Update Reference sensitivity for Band 66	13.2.0	13.3.0
2016-09	RAN#73	R5-165441	2868	-	Introduction of EVM test for UL 64QAM + 2UL CA (intra-band non-contiguous DL CA and UL CA)	13.2.0	13.3.0
2016-09	RAN#73	R5-165443	2870	-	Introduction of test requirements for AMPR inter-band UL CA + UL 64QAM	13.2.0	13.3.0
2016-09	RAN#73	R5-165444	2871	-	Introduction of TT in Annex F for UL 64QAM + 2UL CA	13.2.0	13.3.0
2016-09	RAN#73	R5-165454	2872	-	Correction to test case 7.3E Reference sensitivity level for UE category 0	13.2.0	13.3.0
2016-09	RAN#73	R5-165485	2876	-	Removal of SCC allocation in TCs 6.5.2A.x	13.2.0	13.3.0
2016-09	RAN#73	R5-165487	2878	-	Annex F: Addition of Uncertainties for chapter 7 ProSe TCs	13.2.0	13.3.0
2016-09	RAN#73	R5-165489	2880	-	Minor correction to TC 6.6.3.3A.2	13.2.0	13.3.0
2016-09	RAN#73	R5-165496	2885	-	Update to Annex C for CAT M1 testing	13.2.0	13.3.0

2016-09	RAN#73	R5-165510	2887	-	UE Power Class test requirements in Multi-Cluster PUSCH TCs	13.2.0	13.3.0
2016-09	RAN#73	R5-165512	2889	-	Correction of Reference sensitivity test settings for CA_26A-41C	13.2.0	13.3.0
2016-09	RAN#73	R5-165541	2890	-	Introduction of additional 3DL tolerances in TC 6.2.2A.2	13.2.0	13.3.0
2016-09	RAN#73	R5-165592	2894	-	Adding the Diversity characteristics requirements in chapter 7.2 for category NB1 UE.	13.2.0	13.3.0
2016-09	RAN#73	R5-165624	2909	-	New TC: FDD PDSCH Closed Loop Single-layer Spatial Multiplexing on antenna ports 7 or 8 with TM3 interference model - Enhanced Performance Requirement Type B	13.2.0	13.3.0
2016-09	RAN#73	R5-165625	2910	-	New TC: TDD PDSCH Closed Loop Single-layer Spatial Multiplexing on antenna ports 7 or 8 with TM3 interference model - Enhanced Performance Requirement Type B	13.2.0	13.3.0
2016-09	RAN#73	R5-165673	2924	-	Correction to CA sustained data rate tests for 256QAM	13.2.0	13.3.0
2016-09	RAN#73	R5-165674	2925	-	Clean up on UE DL category for 256QAM DL RMC	13.2.0	13.3.0
2016-09	RAN#73	R5-165675	2926	-	Correction to TDD eDL-MIMO performance test case with 256QAM	13.2.0	13.3.0
2016-09	RAN#73	R5-165676	2927	-	Addition of test points in 6.5.1A.1 Frequency error for CA	13.2.0	13.3.0
2016-09	RAN#73	R5-165680	2931	-	Correction to Annex F.3 for UL64QAM test cases	13.2.0	13.3.0
2016-09	RAN#73	R5-165681	2932	-	Clean up on TM4 CA and TDD FDD CA performance test cases	13.2.0	13.3.0
2016-09	RAN#73	R5-165682	2933	-	Correction to TDD FDD CA sustained data rate performance test cases	13.2.0	13.3.0
2016-09	RAN#73	R5-165683	2934	-	Correction to the minimum test time for TDD FDD CA performance test cases	13.2.0	13.3.0
2016-09	RAN#73	R5-165684	2935	-	Correction to TDD FDD soft buffer for 2DL CA	13.2.0	13.3.0
2016-09	RAN#73	R5-165690	2938	-	Correction of the test requirement for TC 6.6.2.1A.1 SEM for CA (intra-band contiguous DL CA and UL CA)	13.2.0	13.3.0
2016-09	RAN#73	R5-165695	2942	-	Addition of the FDD-FDD-TDD 3DL case into TC 9.6.1.3.2 TDD FDD CQI Reporting under AWGN conditions – PUCCH 1-0 for FDD PCell (3DL CA)	13.2.0	13.3.0
2016-09	RAN#73	R5-165701	2948	-	Change of test points and requirements for NS_05 A-MPR for UL64QAM	13.2.0	13.3.0
2016-09	RAN#73	R5-165702	2949	-	Change of test points and requirements for NS_05 Additional spurious emissions for UL64QAM	13.2.0	13.3.0
2016-09	RAN#73	R5-165732	2951	-	Correction to spurious emission band UE co-existence limits references for Rel-13	13.2.0	13.3.0
2016-09	RAN#73	R5-165734	2952	-	NS_24 and NS_25 A-MPR test configuration and requirements	13.2.0	13.3.0
2016-09	RAN#73	R5-165735	2953	-	NS_24 and NS_25 A-Spurious emission test configuration and requirements	13.2.0	13.3.0
2016-09	RAN#73	R5-165785	2955	-	Addition of CQI report config IE for 4Rx TM9 test cases	13.2.0	13.3.0
2016-09	RAN#73	R5-165787	2956	-	Addition TC 6.3.2F Minimum Output power for UE category NB1	13.2.0	13.3.0
2016-09	RAN#73	R5-165790	2957	-	Addition TC 7.3F.1 Reference sensitivity test for UE category NB1	13.2.0	13.3.0
2016-09	RAN#73	R5-165820	2966	-	36.521-1 UL CA frequency error clarification	13.2.0	13.3.0
2016-09	RAN#73	R5-165837	2970	-	Addition Out of-band blocking with 4 Rx antenna ports TC 7.6.2_1	13.2.0	13.3.0

2016-09	RAN#73	R5-165838	2971	-	Addition Narrow band blocking with 4 Rx antenna ports TC 7.6.3_1	13.2.0	13.3.0
2016-09	RAN#73	R5-165857	2975	-	New test case: FDD Multiple timing reference test for ProSe direct discovery	13.2.0	13.3.0
2016-09	RAN#73	R5-165858	2976	-	New test case: FDD power imbalance performance with two links for ProSe Direct communication	13.2.0	13.3.0
2016-09	RAN#73	R5-166001	2869	1	Introduction of test configurations for ASEM inter-band UL CA + UL 64QAM	13.2.0	13.3.0
2016-09	RAN#73	R5-166002	2930	1	Correction to interferer frequencies in In-band blocking for CA	13.2.0	13.3.0
2016-09	RAN#73	R5-166003	2884	1	Addition of test points to UL 64 QAM TC	13.2.0	13.3.0
2016-09	RAN#73	R5-166004	2905	1	Correction to TC 6.2.4A.1 A-MPR for CA (intra-band contiguous DL CA and UL CA)	13.2.0	13.3.0
2016-09	RAN#73	R5-166005	2929	1	Correction to Max Power for CA	13.2.0	13.3.0
2016-09	RAN#73	R5-166006	2928	1	Clean up on chapter 3, 6 and 7	13.2.0	13.3.0
2016-09	RAN#73	R5-166007	2941	1	Change of test points and requirements for NS_05 A-MPR	13.2.0	13.3.0
2016-09	RAN#73	R5-166008	2943	1	Change of test points and requirements for NS_05 Additional spurious emissions	13.2.0	13.3.0
2016-09	RAN#73	R5-166009	2945	1	Change of test points and requirements for NS_05 A-MPR for UL-MIMO	13.2.0	13.3.0
2016-09	RAN#73	R5-166010	2947	1	Change of test points and requirements for NS_05 Additional spurious emissions for UL-MIMO	13.2.0	13.3.0
2016-09	RAN#73	R5-166011	2818	1	Change of names of 3DL TCs	13.2.0	13.3.0
2016-09	RAN#73	R5-166012	2860	1	Update Reference sensitivity for additional requirement	13.2.0	13.3.0
2016-09	RAN#73	R5-166013	2883	1	Correction to applicability of Power Class 3 only UL TCs	13.2.0	13.3.0
2016-09	RAN#73	R5-166022	2799	1	Correction to Max Input power for 256QAM	13.2.0	13.3.0
2016-09	RAN#73	R5-166023	2939	1	Update of the test points of the TC 8.7.1.1_H.3	13.2.0	13.3.0
2016-09	RAN#73	R5-166027	2771	1	Update of Delta Tib tables in clause 6.2.5.3 for all Rel-13 CA configurations	13.2.0	13.3.0
2016-09	RAN#73	R5-166028	2772	1	Update of Delta Rib tables in clause 7.3.3 for all Rel-13 CA configurations	13.2.0	13.3.0
2016-09	RAN#73	R5-166029	2773	1	Update of CA operating bands and bandwidth for all Rel-13 CA configurations	13.2.0	13.3.0
2016-09	RAN#73	R5-166030	2768	1	Addition of CA_3A-5A BW set 3	13.2.0	13.3.0
2016-09	RAN#73	R5-166031	2819	1	Introduction of CA_8A-42A (2DL) to test case 7.3A.3	13.2.0	13.3.0
2016-09	RAN#73	R5-166033	2820	1	Introduction of CA_8A-42C (3DL) to test case 7.3A.5	13.2.0	13.3.0
