

ARIB STD-T64-C.S0005-F v2.0

**Upper Layer (Layer 3) Signaling
Standard for cdma2000 Spread
Spectrum Systems**

Refer to "Industrial Property Rights (IPR)" in the preface of ARIB STD-T64 for Related Industrial Property Rights. Refer to "Notice" in the preface of ARIB STD-T64 for Copyrights

1 **Original Specification**

2 This standard, ARIB STD-T64-C.S0005-F v2.0, was prepared by 3GPP2-WG of Association of
3 Radio Industries and Businesses (ARIB) based upon the 3GPP2 specification, C.S0005-F v2.0.

4

5 **Modification to the original specification**

6 None.

7

8 **Notes**

9 None.

10

3GPP2 C.S0005-F v2.0

Revision History

Revision	Description of Changes	Date
Rev.0 v1.0	Initial publication	October 1999
Rev.0-2 v1.0	addendum	May 2001
Rev.0 v3.0	Bug fix	July 2001
Rev.A v1.0	Revision	July 2000
Rev.A-1 v1.0	Addendum	October 2000
Rev.A v5.0	Bug fix	July 2001
Rev.A v6.0	Bug fix	February 2002
Rev.B v1.0	Revision	April 2002
Rev.C v1.0	Revision	May 2002
Rev.D v1.0	Revision	March 2004
Rev.C v2.0	Bug fix	August 2004
Rev.D v2.0	Bug fix	October 2005
Rev.E v1.0	Revision	September 2009
Rev.E v2.0	Bug fix	August 2011
Rev.E v3.0	Bug fix	June 2011
Rev.F v1.0	Revision	December 2012
Rev.F v2.0	Bug fix	May 2014

FOREWORD

(This foreword is not part of this specification)

This Specification was prepared by Technical Specification Group C of the Third Generation Partnership Project 2 (3GPP2). This Specification contains the Layer 3 layer of the IMT-2000 CDMA Multi-Carrier Mode, IMT-2000 CDMA MC, also known as cdma2000^{®1}. It provides a specification for land mobile wireless systems based upon cellular principles. This Specification includes the capabilities of Telecommunications Industry Association Standard TIA/EIA-95-B.

1. General. This section defines the terms and numeric indications used in this document. This section also describes the general signaling architecture.

2. Requirements for Mobile Station CDMA Operation. This section describes the requirements for mobile stations operating in the CDMA mode. A mobile station complying with these requirements will be able to operate with CDMA base stations complying with this document.

3. Requirements for Base Station CDMA Operation. This section describes the requirements for CDMA base stations. A base station complying with these requirements will be able to operate in the CDMA mode with mobile stations complying with this document.

Annex A. Reserved.

Annex B. CDMA Call Flow Examples. This informative annex provides examples of simple call flows in the CDMA system.

Annex C. Additional CDMA Call Flows. This informative annex provides examples of additional simple call flows in the CDMA system.

Annex D. CDMA Constants. This normative annex contains tables that give specific values for the constant identifiers found in Section 2 and Section 3.

Annex E. CDMA Retrievable and Settable Parameters. This normative annex describes the mobile station parameters that the base station can set and retrieve.

Annex F. Mobile Station Database. This informative annex describes a database model that can be used for mobile stations complying with this document.

¹cdma2000[®] is the trademark for the technical nomenclature for certain specifications and standards of the Organizational Partners (OPs) of 3GPP2. Geographically (and as of the date of publication), cdma2000[®] is a registered trademark of the Telecommunications Industry Association (TIA-USA) in the United States.

- 1 **Annex G. Encryption Call Flows.** This informative annex provides examples of extended
- 2 encryption call flows in the CDMA system.

1. Compatibility, as used in connection with cdma2000[®], is understood to mean: any cdma2000 mobile station is able to place and receive calls in cdma2000 and IS-95 systems. Conversely, any cdma2000 system is able to place and receive calls for cdma2000 and IS-95 mobile stations.
2. Reserved.
3. This compatibility specification is based upon spectrum allocations that have been defined by various governmental administrations.
4. Each mobile station is assigned either a single unique 32-bit binary serial number (ESN) or a single unique 56-bit binary serial number (MEID) that cannot be changed by the subscriber without rendering the mobile station inoperative (see 2.3.2).
5. “Base station” refers to the functions performed in the fixed network. These functions typically distributed among cells, sectors, and mobile switching centers.
6. Footnotes appear at various points in this specification to elaborate and further clarify items discussed in the body of the specification.
7. Unless indicated otherwise, this document presents numbers in decimal form. Binary numbers are distinguished in the text by the use of single quotation marks.
8. The following operators define mathematical operations:
 - × indicates multiplication.
 - $\lfloor x \rfloor$ indicates the largest integer less than or equal to x : $\lfloor 1.1 \rfloor = 1$, $\lfloor 1.0 \rfloor = 1$.
 - $\lceil x \rceil$ indicates the smallest integer greater or equal to x : $\lceil 1.1 \rceil = 2$, $\lceil 2.0 \rceil = 2$.
 - $|x|$ indicates the absolute value of x : $|-17| = 17$, $|17| = 17$.
 - \oplus indicates exclusive OR (modulo-2 addition).
 - $\min(x, y)$ indicates the minimum of x and y .
 - $\max(x, y)$ indicates the maximum of x and y .
 - $x \bmod y$ indicates the remainder after dividing x by y : $x \bmod y = x - (y \times \lfloor x/y \rfloor)$.
 - $\text{weight}(x)$ indicates the number of ‘1’s in the binary representation of x .
 - \gg indicates binary right shift operation.
 - \ll indicates binary left shift operation.
9. While communication between Layer 3 and Layer 2 is specified, there is no requirement to implement layering.
10. The following indentation is advised :

- 2 + bullet 3.
- 3 ○ bullet 4.
- 4 ◇ bullet 5.
- 5 — bullet 6.

1 GENERAL

This section defines the terms and numeric indications used in this document. This section also describes the general signaling architecture.

1.1 Scope

This Specification provides the Layer 3 Upper Layer signaling protocol architecture and functionality. Other specifications are required to complete the air interface and the rest of the system. Some of these specifications are listed in the References section.

1.2 Requirements Terminology

This standard uses the following verbal forms: “Shall” and “shall not” identify requirements strictly to be followed in order to conform with the standard and from which no deviation is permitted. “Should” and “should not” indicate that one of several possibilities is recommended as particularly suitable, without mentioning or excluding others; that a certain course of action is preferred but not necessarily required; or that (in the negative form) a certain possibility or course of action is discouraged but not prohibited. “May” and “need not” indicate a course of action permissible within the limits of the standard. “Can” and “cannot” are used for statements of possibility and capability, whether material, physical, or causal.

1.3 Terms and Numeric Information

1.3.1 Terms

Abbreviated Alert. An abbreviated alert is used to remind the mobile station user that previously selected alternative routing features are still active.

AC. See Authentication Center.

Access Attempt. The entire process of sending one message and receiving (or failing to receive) an acknowledgment for that message, consisting of one or more access sub-attempts. See also Access Probe, Access Probe Sequence, and Access Sub-attempt.

Access Channel. A Reverse CDMA Channel used by mobile stations for communicating to the base station. The Access Channel is used for short signaling message exchanges such as call originations, responses to pages, and registrations. The Access Channel is a slotted random access channel.

Access Channel Message. The information part of an access probe consisting of the message body, length field, and CRC.

Access Channel Message Capsule. An Access Channel message plus the padding.

Access Channel Preamble. The preamble of an access probe consisting of a sequence of all-zero frames that are sent at the 4800 bps rate.

Access Channel Request Message. An Access Channel message that is autonomously generated by the mobile station. See also Access Channel Response Message.

Access Channel Response Message. A message on the Access Channel generated to reply to a message received from the base station.

- 1 **Access Channel Slot.** The assigned time interval for an access probe. An Access Channel
2 slot consists of an integer number of frames. The transmission of an access probe is
3 performed within the boundaries of an Access Channel slot.
- 4 **Access Entry Handoff.** The act of transferring reception of the Paging Channel from one
5 base station to another, when the mobile station is transitioning from the *Mobile Station*
6 *Idle State* to the *System Access State*.
- 7 **Access Handoff.** The act of transferring reception of the Paging Channel from one base
8 station to another, when the mobile station is in the *System Access State* after an Access
9 Attempt.
- 10 **Access Overload Class.** See Overload Class.
- 11 **Access Probe.** One Access Channel transmission consisting of a preamble and a message.
12 The transmission is an integer number of frames in length and transmits one Access
13 Channel message. See also Access Probe Sequence, Access Sub-attempt, and Access
14 Attempt.
- 15 **Access Probe Handoff.** A handoff that occurs while the mobile station is performing an
16 Access Attempt in the *System Access State*.
- 17 **Access Probe Sequence.** A sequence of one or more access probes on the Access Channel.
18 Other than the reported pilot information, the same Access Channel message content is
19 transmitted in every access probe of an access sub-attempt. See also Access Probe, Access
20 Sub-attempt, and Access Attempt.
- 21 **Access Sub-attempt.** A sequence of one or more access probe sequences on the Access
22 Channel transmitted to one pilot, containing the same message content other than the
23 reported pilot information. See also Access Probe, Access Probe Sequence, and Access
24 Attempt.
- 25 **Acknowledgment.** A Layer 2 response by the mobile station or the base station confirming
26 that a signaling message was received correctly.
- 27 **Action Time.** The time at which the action implied by a message should take effect.
- 28 **Active Set.** The set of pilots associated with the CDMA Channels containing Forward
29 Traffic Channels assigned to a particular mobile station.
- 30 **Active User Zone.** A user zone in which the mobile station makes its presence known via
31 an explicit registration in order to activate tiered service features. See also CDMA Tiered
32 Services, User Zone, and Passive User Zone.
- 33 **Aging.** A mechanism through which the mobile station maintains in its Neighbor Set the
34 pilots that have been recently sent to it from the base station and the pilots whose handoff
35 drop timers have recently expired.
- 36 **AKA.** Authentication and Key Agreement. An authentication procedure that allows mutual
37 authentication of the mobile station and base station.
- 38 **A-key.** A secret, 64-bit pattern stored in the mobile station and HLR/AC. It is used to
39 generate/update the mobile station's Shared Secret Data.

1 **Alternate Interleaver Pattern.** An interleaver pattern used for convolutional coded frames
2 for code combining soft handoff for Radio Configuration 12. The alternate interleaver
3 pattern is used by some base stations in the mobile station active set to increase the
4 probability of frame early termination.**ARQ.** Automatic Repeat Request. The ARQ is an
5 automatic retransmission protocol that ensures the delivery of encoder packets from the
6 sender to the receiver by retransmission of portions of a turbo encoded packet based on the
7 feedback from the receiver that indicates if the encoder packets have been received and
8 decoded successfully (ACK) or not (NAK).

9 **Assured Mode.** Mode of delivery that guarantees that a PDU will be delivered to the peer.
10 A PDU sent in assured mode is retransmitted by the LAC sublayer, up to a maximum
11 number of retransmissions, until the LAC entity at the sender receives an acknowledgment
12 for the PDU. See also Confirmation of Delivery.

13 **Authentication.** A procedure used by a base station to validate a mobile station's identity.

14 **Authentication Center (AC).** An entity that manages the authentication information
15 related to the mobile station.

16 **Authentication Response (AUTHR).** An 18-bit output of the authentication algorithm. It
17 is used, for example, to validate mobile station registrations, originations and terminations.

18 **Autonomous Registration.** A method of registration in which the mobile station registers
19 without an explicit command from the base station.

20 **Auxiliary Pilot Channel.** A non-data-bearing, direct-sequence spread spectrum signal
21 optionally transmitted by a CDMA base station.

22 **Auxiliary Transmit Diversity Pilot Channel.** A pilot channel, counterpart to an Auxiliary
23 Pilot Channel, that is transmitted by a CDMA base station from the non-primary antenna
24 when orthogonal transmit diversity is employed.

25 **AV.** Authentication Vector used by AKA.

26 **Bad Frames.** Frames classified as insufficient frame quality or as 9600 bps primary traffic
27 only, with bit errors. See also Good Frames.

28 **Band Class.** A set of CDMA frequency assignments and a numbering scheme for these
29 channels. See also CDMA Frequency Assignment.

30 **Base Station.** A fixed station used for communicating with mobile stations. Depending
31 upon the context, the term base station may refer to a cell, a sector within a cell, an MSC,
32 or other part of the wireless system. See also MSC.

33 **Base Station Authentication Response (AUTHBS).** An 18-bit pattern generated by the
34 authentication algorithm. AUTHBS is used to confirm the validity of base station orders to
35 update the Shared Secret Data.

36 **Base Station Random Variable (RANDBS).** A 32-bit random number generated by the
37 mobile station for authenticating base station orders to update the Shared Secret Data.

38 **BCMC Service Layer.** The functional components residing above the signaling layer (Layer
39 3) that provide BCMC services.

- 1 **BCMC TDM Mode.** A mode of operation where a time-division multiplexing (TDM)
2 structure is used on a Forward Supplemental Channel (F-SCH) for BCMC content
3 transmission to mobile stations in *Mobile Station Idle State*.
- 4 **Blank-and-Burst.** The preemption of an entire Traffic Channel frame's primary traffic by
5 signaling traffic or secondary traffic. Blank-and-burst is performed on a frame-by-frame
6 basis.
- 7 **BLOB.** Block of Bits.
- 8 **bps.** Bits per second.
- 9 **Boosted Mode.** Mode of operation of Reverse Packet Data Channel where selected data
10 packets are transmitted by the mobile station at a higher power to increase the probability
11 of being received by the base station.
- 12 **Broadcast Control Channel.** A code channel in a Forward CDMA Channel used for
13 transmission of control information or broadcast messages from a base station to a mobile
14 station.
- 15 **Broadcast Control Channel Number (BCN).** A number that identifies the Broadcast
16 Control Channel. BCN number 1 corresponds to the Primary Broadcast Control Channel.
17 BCN numbers 2 through 7 correspond to other Broadcast Control Channels (if any).
- 18 **Broadcast User Zone.** A user zone that is identified to the mobile station by means of
19 broadcast messages. It corresponds to the RF coverage area of a particular set of cells and
20 sectors. See also CDMA Tiered Services and Mobile-Specific User Zone.
- 21 **Call Disconnect.** The process that releases the resources handling a particular call. The
22 disconnect process begins either when the mobile station user indicates the end of the call
23 by generating an on-hook condition or other call-release mechanism, or when the base
24 station initiates a release.
- 25 **Call History Parameter (COUNT).** A modulo-64 event counter maintained by the mobile
26 station and Authentication Center that is used for clone detection.
- 27 **Call Rescue Soft Handoff.** The ability for a mobile station to autonomously add one or
28 more strong pilots to its Active Set in order to minimize the probability of dropped calls.
- 29 **Candidate Frequency.** The frequency, for which the base station specifies a search set,
30 using a *Candidate Frequency Search Request Message*.
- 31 **Candidate Set.** The set of pilots that have been received with sufficient strength by the
32 mobile station to be successfully demodulated, but have not been placed in the Active Set
33 by the base station. See also Active Set, Neighbor Set, and Remaining Set.
- 34 **CCK.** An encryption key derived from the CMEA key. A 128-bit pattern that is the 64-bit
35 CMEA key concatenated with a copy of itself.
- 36 **CCSH.** See Code Combining Soft Handoff.
- 37 **CDMA.** See Code Division Multiple Access.
- 38 **CDMA Candidate Frequency.** The Candidate Frequency specified for a search of CDMA
39 pilots.

- 1 **CDMA Channel.** The set of channels transmitted between the base station and the mobile
2 stations within a given CDMA Frequency Assignment. See also Forward CDMA Channel
3 and Reverse CDMA Channel.
- 4 **CDMA Channel Number.** An 11-bit number that identifies a CDMA Frequency
5 Assignment.
- 6 **CDMA Frequency Assignment.** A 1.23 or 3.69 MHz segment of spectrum. The center of a
7 CDMA frequency assignment is given by a CDMA Channel Number.
- 8 **CDMA Preferred Set.** The set of CDMA channel numbers in a CDMA system
9 corresponding to Frequency Assignments that a mobile station will normally search to
10 acquire a CDMA Pilot Channel. For CDMA cellular systems, the primary and secondary
11 channels comprise the CDMA Preferred Set.
- 12 **CDMA Tiered Services.** System features and services that are based on location,
13 potentially including private networks. User zones establish the availability of services. See
14 also User Zone, Broadcast User Zone, Mobile-Specific User Zone, Active User Zone, and
15 Passive User Zone.
- 16 **Center SR3 Frequency.** The Spreading Rate 3 frequency that has the center frequency
17 assignment.
- 18 **Chip.** See PN Chip.
- 19 **CIK.** An integrity key derived from the CMEA key. A 128-bit pattern that is the 64-bit
20 CMEA key concatenated with a copy of itself.
- 21 **CK.** Cipher Key. A 128-bit pattern produced by AKA that is used for encryption.
- 22 **CMEA.** Cellular Message Encryption Algorithm.
- 23 **Code Channel.** A subchannel of a Forward CDMA Channel or Reverse CDMA Channel.
24 Each subchannel uses an orthogonal Walsh function or quasi-orthogonal function.
- 25 **Code Combining Soft Handoff (CCSH).** A Soft Handoff method for Fundamental
26 Channels on the forward link in Radio Configuration 12 and Supplemental Channels on
27 the forward link in Radio Configurations 4, 5, and 12. For Supplemental Channels using
28 Turbo codes in this mode, certain base stations encode and transmit the data with the
29 default Turbo Encoder, whereas others use the complementary Turbo Encoder. Mobile
30 stations in soft handoff can then combine both codes to achieve lower code rate. For
31 Fundamental Channels and Supplemental Channels using Convolutional codes in this
32 mode certain base stations transmit using the default interleaver pattern, whereas others
33 use an alternate interleaver pattern. Mobile stations in handoff combine transmissions
34 from both base stations to decode the frames earlier.
- 35 **Code Division Multiple Access (CDMA).** A technique for spread-spectrum multiple-
36 access digital communications that creates channels through the use of unique code
37 sequences.
- 38 **Code Symbol.** The output of an error-correcting encoder. Information bits are input to
39 the encoder and code symbols are output from the encoder. See Convolutional Code.

1 **Configuration Change Indicator.** A one-bit datum, sent on the Quick Paging Channel.
2 Appearance of the Configuration Change Indicator in the Quick Paging Channel serves to
3 alert a slotted mode mobile station, operating in the idle state, that, after performing an idle
4 handoff, it should monitor the Paging Channel, the Forward Common Control Channel, or
5 the Primary Broadcast Control Channel in order to determine if it should update its stored
6 parameters.

7 **Confirmation of Delivery.** A notification sent by the LAC sublayer to Layer 3 at the
8 sender, when the LAC entity at the sender receives the acknowledgment for a specific PDU
9 sent in assured mode.

10 **Convolutional Code.** A type of error-correcting code. A code symbol can be considered as
11 modulo 2 the convolution of the input data sequence with the impulse response of a
12 generator function.

13 **CRC.** See Cyclic Redundancy Code.

14 **Cyclic Redundancy Code (CRC).** A class of linear error detecting codes that generate
15 parity check bits by finding the remainder of a polynomial division. See also Frame Quality
16 Indicator.

17 **dBm.** A measure of power expressed in terms of its ratio (in dB) to one milliwatt.

18 **dBm/Hz.** A measure of power spectral density. The ratio, dBm/Hz, is the power in one
19 Hertz of bandwidth, where power is expressed in units of dBm.

20 **dBW.** A measure of power expressed in terms of its ratio (in dB) to one Watt.

21 **Dedicated Control Channel.** A portion of a Traffic Channel (Forward or Reverse) that
22 carries a combination of user data, signaling, and power control information.

23 **Deinterleaving.** The process of unpermuting the symbols that were permuted by the
24 interleaver. Deinterleaving is performed on received symbols prior to decoding.

25 **Device Access Priority (DAP).** An access priority level provisioned in mobile station used
26 to determine when the mobile station may access the system in the event of network
27 overload.

28 **Direct Channel Assignment.** A MS-terminated call set-up procedure where the channel
29 assignment can be sent directly to a mobile station without receiving a page response
30 message from the mobile station.

31 **Discontinuous Transmission (DTX).** A mode of operation in which a base station or a
32 mobile station switches its transmitter on and off on a particular code channel
33 autonomously. For the case of DTX operation on the Forward Dedicated Control Channel,
34 the Forward Power Control Subchannel is still transmitted.

35 **Distance-Based Registration.** An autonomous registration method in which the mobile
36 station registers whenever it enters a cell whose distance from the cell in which the mobile
37 station last registered exceeds a given threshold.

38 **DTMF.** See Dual-Tone Multifrequency.

- 1 **Dual-Tone Multifrequency (DTMF).** Signaling by the simultaneous transmission of two
2 tones, one from a group of low frequencies and another from a group of high frequencies.
3 Each group of frequencies consists of four frequencies.
- 4 **E_b .** A measure of the energy in a signal, at some point in a communication system, per
5 information bit conveyed by that signal, or an average value of such energies. Its relevance
6 to system performance is most often expressed by its ratio to additive noise and
7 interference, such as in E_b/N_0 or E_b/I_0 . Such ratios are dimensionless, and are usually
8 expressed in dB units.
- 9 **E_c/I_0 .** A notation used to represent a dimensionless ratio of the average power of some
10 code-distinguished CDMA signal channel, typically a pilot, to the total power comprised of
11 signal plus interference, within the signal bandwidth. It is usually expressed in dB units.
- 12 **Effective Radiated Power (ERP).** The product of the power supplied to the antenna and
13 its gain relative to a half-wave dipole in a given direction.
- 14 **EIRP.** See Equivalent Isotropic Radiated Power.
- 15 **Electronic Serial Number (ESN).** A 32-bit number assigned by the mobile station
16 manufacturer, uniquely identifying the mobile station equipment.
- 17 **Encoder Tail Bits.** A fixed sequence of bits added to the end of a block of data to reset the
18 convolutional encoder to a known state.
- 19 **Enhanced Access Channel.** A reverse channel used by mobile station for communicating
20 to the base station. The Enhanced Access Channel operates in the Basic Access Mode, and
21 Reservation Access Mode. It is used for transmission of short messages, such as signaling,
22 MAC messages, response to pages, and call originations. It can also be used to transmit
23 moderate-sized data packets.
- 24 **Enhanced Access Channel Preamble.** A non-data bearing portion of the Enhanced
25 Access probe sent by the mobile station to assist the base station in initial acquisition and
26 channel estimation.
- 27 **Enhanced Access Channel Slot.** The assigned time interval for an enhanced access
28 probe. The transmission of an enhanced access probe is performed within the boundaries
29 of an Enhanced Access Channel slot.
- 30 **Enhanced Access Data.** The data transmitted while in the Basic Access Mode on the
31 Enhanced Access Channel or while in the Reservation Access Mode on a Reverse Common
32 Control Channel.
- 33 **Enhanced Access Header.** A frame containing access origination information transmitted
34 immediately after the Enhanced Access Channel Preamble while in the Reservation Access
35 Mode.
- 36 **Enhanced Access Probe.** One Enhanced Access Channel transmission consisting of an
37 Enhanced Access Channel preamble, optionally an Enhanced Access header, and
38 optionally Enhanced Access data. See also Enhanced Access Probe Sequence.
- 39 **Enhanced Access Probe Sequence.** A sequence of one or more Enhanced Access probes
40 on the Enhanced Access Channel. See also Enhanced Access Probe.

- 1 **Enhanced Rate Adaptation Mode (ERAM).** A flexible and variable data rate mode for the
2 Supplemental Channel operation with turbo codes. ERAM is defined on forward link for
3 Radio Configurations 4 and 5, and on the reverse link for Radio Configuration 4. In this
4 mode, lower rate turbo codes are used to match the desired channel interleaver block size
5 instead of pure code symbol repetitions.
- 6 **Equivalent Isotropically Radiated Power (EIRP).** The product of the power supplied to
7 the antenna and the antenna gain in a direction relative to an isotropic antenna.
- 8 **ERAM.** See Enhanced Rate Adaptation Mode.
- 9 **Erasur Indicator Bit.** See [2].
- 10 **ERP.** See Effective Radiated Power.
- 11 **ESN.** See Electronic Serial Number.
- 12 **ESN_ME.** ESN associated with the mobile equipment. See Electronic Serial Number (ESN)
13 and ME.
- 14 **EXT_SSEQ.** Security sequence number. A 32-bit crypto-sync that is used for encryption,
15 message integrity, or both.
- 16 **EXT_REG_PRD.** Extended registration period.
- 17 **EXT_UIM_ID.** An extended (length more than 32-bits) electronic identification (ID) number
18 that is unique to the R-UIM. See [40]. EXT_UIM_ID can be either SF_EUIMID or
19 LF_EUIMID. The mobile station uses SF_EUIMID in place of MEID, with the exception of
20 the MEID_ME information record, when configured with a R-UIM which indicates that
21 SF_EUIMID is to be used in place of MEID (see [40]).
- 22 **F-ACKCH.** Forward Acknowledgment Channel. A channel used by the base station to
23 acknowledge the successful receipt and decoding of the encoder packets (ACK) sent by the
24 mobile station on Reverse Packet Data Channel or the failure to do so (NAK).
- 25 **f-csch.** Forward common signaling logical channel.
- 26 **f-dsch.** Forward dedicated signaling logical channel.
- 27 **F-GCH.** Forward Grant Channel. A channel used by the base station to assign or “grant”
28 the mobile station a certain data rate on the Reverse Packet Data Channel.
- 29 **F-RCCH.** Forward Rate Control Channel. A channel used by the base station to modify the
30 transmission data rate used on the Reverse Packet Data Channel by the mobile station.
31 The data rates possible are allocated in advance.
- 32 **Fade Timer.** A timer kept by the mobile station as a measure of Forward Traffic Channel
33 continuity. If the fade timer expires, the mobile station drops the call.
- 34 **Fast Call Setup Mode.** Any operational mode of a mobile station in the *Mobile Station Idle*
35 *State* that can improve setup time for call originations or terminations. See Radio
36 Environment Reporting Mode, Reduced Slot Cycle Mode, and Tracking Zone Mode.
- 37 **Flash.** An indication sent on the Reverse CDMA Channel indicating that the user directed
38 the mobile station to invoke special processing.

1 **Foreign NID Roamer.** A mobile station operating in the same system (SID) but in a
2 different network (NID) from the one in which service was subscribed. See also Foreign SID
3 Roamer and Roamer.

4 **Foreign SID Roamer.** A mobile station operating in a system (SID) other than the one
5 from which service was subscribed. See also Foreign NID Roamer and Roamer.

6 **Forward CDMA Channel.** A CDMA Channel from a base station to mobile stations. The
7 Forward CDMA Channel contains one or more code channels that are transmitted on a
8 CDMA Frequency Assignment using a particular pilot PN offset. The code channels are
9 associated with the Pilot Channel, Sync Channel, Paging Channels, Broadcast Control
10 Channel, Forward Common Control Channels, and Traffic Channels. The Forward CDMA
11 Channel always carries a Pilot Channel and may also carry up to one Sync Channel, up to
12 seven Paging Channels, up to seven Broadcast Control Channels, up to seven Forward
13 Common Control Channels and up to the maximum number of channels allowed for the
14 assigned Radio Configuration minus one Traffic Channels, as long as the total number of
15 channels, including the Pilot Channel, is no greater than the maximum number of
16 channels allowed for the assigned Radio Configuration (see [2] section 3.1.3.1.13).

17 **Forward Acknowledgment Channel.** A portion of a Forward CDMA Channel used for the
18 transmission of acknowledgments from a base station to multiple mobile stations in
19 response to the data received on the Reverse Packet Data Channel or the Reverse
20 Fundamental Channel.

21 **Forward Common Acknowledgment Channel.** A portion of the Forward CDMA Channel
22 used for the transmission of Acknowledgments from a base station to multiple mobile
23 stations in response to the Reverse Supplemental Channel from mobile stations operating
24 with reverse link Radio Configuration 8. The Forward Common Acknowledgment Channel
25 is used by the base station to early terminate Reverse Supplemental Channel frames.

26 **Forward Common Acknowledgment Subchannel.** A subchannel on the Forward Common
27 Acknowledgment Channel used by the base station to early terminate the Reverse
28 Supplemental Channel from a mobile station operating with Radio Configuration 8.

29 **Forward Common Control Channel.** A control channel used for the transmission of
30 digital control information from a base station to one or more mobile stations.

31 **Forward Dedicated Control Channel.** A Dedicated Control Channel that is transmitted
32 on the Forward CDMA Channel.

33 **Forward Fundamental Channel.** A Fundamental Channel that is transmitted on the
34 Forward CDMA Channel.

35 **Forward Packet Data Channel.** A portion of a Forward Link channel with Spreading Rate
36 1 used for the transmission of higher-level data from a base station to a mobile station.

37 **Forward Packet Data Control Channel.** A portion of a Forward Link channel with
38 Spreading Rate 1 used for the transmission of the control information for the subpacket
39 being transmitted on the Forward Packet Data Channel.

40 **Forward Pilot Channel.** A non-data-bearing direct-sequence spread spectrum signal
41 transmitted continuously by each CDMA base station. The Forward Pilot Channel allows a

1 mobile station to acquire the timing of the Forward CDMA Channel, provides a phase
2 reference for coherent demodulation, and provides a means for signal strength
3 comparisons between base stations for determining when to handoff. Different base
4 stations are identified by different pilot PN sequence time phases. See also Pilot PN
5 Sequence, Pilot PN Sequence Offset.

6 **Forward Supplemental Channel.** A Supplemental Channel that is transmitted on the
7 Forward CDMA Channel.

8 **Forward Supplemental Code Channel.** A Supplemental Code Channel that is transmitted
9 on the Forward CDMA Channel.

10 **Forward Traffic Channel.** One or more code channels used to transport user and
11 signaling traffic from the base station to the mobile station. See Forward Fundamental
12 Channel, Forward Dedicated Control Channel, Forward Packet Data Channel, Forward
13 Supplemental Channel, and Forward Supplemental Code Channel. ²

14 **Forward Transmit Diversity Pilot Channel.** A pilot channel transmitted by a CDMA base
15 station from the non-primary antenna when orthogonal transmit diversity is employed.

16 **Frame.** A basic timing interval in the system. For the Sync Channel, a frame is 26.666...
17 ms long. For the Access Channel, the Paging Channel, the Forward Supplemental Code
18 Channel, and the Reverse Supplemental Code Channel, a frame is 20 ms long. For the
19 Forward Supplemental Channel and the Reverse Supplemental Channel, a frame is 20, 40,
20 or 80 ms long. For the Enhanced Access Channel, the Forward Common Control Channel,
21 and the Reverse Common Control Channel, a frame is 5, 10, or 20 ms long. For the
22 Forward Fundamental Channel, Forward Dedicated Control Channel, Reverse
23 Fundamental Channel, and Reverse Dedicated Control Channel, a frame is 5 or 20 ms
24 long. For the Common Assignment Channel, a frame is 5 ms long. For the Broadcast
25 Control Channel, a frame is 40 ms long; the frame may be transmitted once, twice, or four
26 times. For the Forward Packet Data Control Channel and the Forward Packet Data
27 Channel, a frame could be 1.25, 2.5, or 5 ms long. For the Reverse Acknowledgment
28 Channel and the Reverse Channel Quality Indicator Channel, a frame is 1.25 ms long. For
29 the Reverse Packet Data Channel, the Reverse Packet Data Control Channel, the Reverse
30 Request Channel, the Forward Indicator Control Channel, the Forward Grant Channel, and
31 the Forward Acknowledgment Channel, a frame is 10 ms long.

32 **Frame Category.** A classification of a received Traffic Channel frame based upon
33 transmission data rate, the frame contents (primary traffic, secondary traffic, or signaling
34 traffic), and whether there are detected errors in the frame.

35 **Frame Early Termination.** A method used to terminate transmission of a frame earlier
36 than the nominal length of the frame (20 ms) if the receiver has successfully received the
37 frame. The receiver transmits an acknowledgment to the transmitter following successful
38 reception of the frame.

² The Forward Traffic Channel does not include F-PDCCH, F-CPCCH.

- 1 **Frame Number.** CDMA System Time, in integer multiples of 20 ms.
- 2 **Frame Offset.** A time skewing of Traffic Channel frames from System Time in integer
3 multiples of 1.25 ms. The maximum frame offset is 18.75 ms.
- 4 **Frame Quality Indicator.** See [2].
- 5 **Full TMSI.** The combination of TMSI_ZONE and TMSI_CODE. The full TMSI is a globally
6 unique address for the mobile station.
- 7 **Fundamental Channel.** A portion of a Traffic Channel that can carry a combination of
8 primary data, secondary data, signaling, and power control information.
- 9 **Fundicated Channel.** Fundamental Channel, Dedicated Control Channel, or both.
- 10 **Gating Rate Set.** This specifies the set of supported reverse pilot gating rates. The base
11 station and the mobile station may support one or more gating rates.
- 12 **GHz.** Gigahertz (10^9 Hertz).
- 13 **Global Positioning System (GPS).** A US government satellite system that provides
14 location and time information to users. See Navstar GPS Space Segment / Navigation User
15 Interfaces ICD-GPS-200 for specifications.
- 16 **Good Frames.** Frames not classified as bad frames. See also Bad Frames.
- 17 **GPS.** See Global Positioning System.
- 18 **Handoff.** The act of transferring communication with a mobile station from one base
19 station to another.
- 20 **Hard Handoff.** A handoff characterized by a temporary disconnection of the Traffic
21 Channel. Hard handoffs occur when the mobile station is transferred between disjoint
22 Active Sets, when the CDMA Frequency Assignment changes, or when the frame offset
23 changes. See also Soft Handoff.
- 24 **Hash Function.** A function used by the mobile station to select one out of N available
25 resources. The hash function distributes the available resources uniformly among a
26 random sample of mobile stations.
- 27 **HARQ.** Hybrid ARQ (Automatic Repeat Request). A “hybrid ARQ” is a combination of an
28 ARQ with an error correction mechanism to repair some errors in the encoder packet.
- 29 **Highest SR3 Frequency.** The SR3 frequency that has the highest frequency assignment.
- 30 **HDP.** Highly detectable pilot.
- 31 **HLR.** See Home Location Register.
- 32 **Home Location Register (HLR).** The location register to which a MIN/IMSI is assigned for
33 record purposes such as subscriber information.
- 34 **Home System.** The wireless system in which the mobile station subscribes for service.
- 35 **Hopping Pilot Beacon.** A pilot beacon that changes CDMA Frequency periodically to
36 simulate multiple base stations operating on different frequencies. The transmission of the
37 hopping pilot beacon is discontinuous on any CDMA Channel.

1 **Idle Handoff.** The act of transferring reception of the Paging Channel, Broadcast Control
2 Channel or the Forward Common Control Channel from one base station to another, when
3 the mobile station is in the *Mobile Station Idle State*.

4 **IK.** Integrity Key. A 128-bit pattern produced by AKA that is used for integrity protection.

5 **Implicit Registration.** A registration achieved by a successful transmission of an
6 origination or page response on the r-csch.

7 **IMSI.** See International Mobile Subscriber Identity.

8 **IMSI_M.** MIN-based IMSI using the lower 10 digits to store the MIN.

9 **IMSI_O.** Operational value of IMSI used by the mobile station for operation with the base
10 station.

11 **IMSI_T.** True IMSI not associated with MIN. This could be 15 digits or fewer.

12 **Interleaving.** The process of permuting a sequence of symbols.

13 **International Mobile Subscriber Identity (IMSI).** A method of identifying stations in the
14 land mobile service as specified in [18].

15 **kHz.** Kilohertz (10^3 Hertz).

16 **ksps.** Kilo-symbols per second (10^3 symbols per second).

17 **LAC.** See Link Access Control.

18 **Layering.** A method of organization for communication protocols in which the transmitted
19 or received information is transferred in pipeline fashion, within each station, in well-
20 defined encapsulated data units between otherwise decoupled processing entities (“layers”).
21 A layer is defined in terms of its communication protocol to a peer layer in another entity
22 and the services it offers to the next higher layer in its own entity.

23 **Layer 1.** Layer 1 provides for the transmission and reception of radio signals between the
24 base station and the mobile station. Also see Physical Layer.

25 **Layer 2.** Layer 2 provides for the correct transmission and reception of signaling
26 messages, including partial duplicate detection. Layer 2 makes use of the services
27 provided by Layer 1. See also Layering and Layer 3.

28 **Layer 3.** Layer 3 provides the control messaging for the wireless telephone system. Layer
29 3 originates and terminates signaling messages according to the semantics and timing of
30 the communication protocol between the base station and the mobile station. Layer 3
31 makes use of the services provided by Layer 2. See also Layering and Layer 2.

32 **Link Access Control.** See LAC. The LAC Sublayer is the upper sublayer of Layer 2. It
33 implements a data link protocol that provides for the correct transport and delivery of
34 signaling messages generated by Layer 3. The LAC Sublayer makes use of the services
35 provided by the Lower Layers (Layer 1 and the MAC Sublayer).

36 **Local Control.** An optional mobile station feature used to perform manufacturer-specific
37 functions.

- 1 **Logical Channel.** A communication path between the mobile station and the base station,
2 described in terms of the intended use of, and access to, the transferred data, and direction
3 of transfer. A logical channel can be “mapped” to and from one or more physical channels.
- 4 **Logical-to-physical Mapping.** The technique for forming associations between logical and
5 physical channels.
- 6 **Long Code.** A PN sequence with period $2^{42} - 1$ that is used for scrambling on the Forward
7 CDMA Channel and spreading on the Reverse CDMA Channel. The long code uniquely
8 identifies a mobile station on both the Reverse Traffic Channel and the Forward Traffic
9 Channel. The long code provides limited privacy. The long code also separates multiple
10 Access Channels and Enhanced Access Channels on the same CDMA Channel. See also
11 Public Long Code and Private Long Code.
- 12 **Long Code Mask.** A 42-bit binary number that creates the unique identity of the long
13 code. See also Public Long Code, Private Long Code, Public Long Code Mask, and Private
14 Long Code Mask.
- 15 **Lowest SR3 Frequency.** The SR3 frequency that has the lowest frequency assignment.
- 16 **Low-Rate EACH.** EACH that supports low data rates at 1.5, 2.7 and 4.8 Kbps.
- 17 **LSB.** Least significant bit.
- 18 **LTU.** Logical Transmission Unit. One of more Type 3 MuxPDUs with a 16-bit CRC.
- 19 **MAC.** See Medium Access Control.
- 20 **MAC-I.** Message Authentication Code for message integrity. The 32-bit output of the
21 message integrity algorithm that allows the receiver to authenticate the message.
- 22 **MACI.** A 32-bit LAC Layer field that carries either the MAC-I or the UMAC of a signaling
23 message.
- 24 **Maximal Length Sequence (m-Sequence).** A binary sequence of period $2^n - 1$, n being a
25 positive integer, with no internal periodicities. A maximal length sequence can be
26 generated by a tapped n -bit shift register with linear feedback.
- 27 **MAXIMUM EXTENDED SLOT CYCLE INDEX.** Maximum value of the extended slot cycle
28 index allowed by the base station. This parameter can take values between 0 and 7,
29 inclusive.
- 30 **MC System.** Multi Carrier CDMA System (1x and 3x).
- 31 **MCC.** See Mobile Country Code.
- 32 **Mcps.** Megachips per second (10^6 chips per second).
- 33 **MCSB.** See Message Control and Status Block.
- 34 **ME.** Mobile Equipment. The part of a mobile station that does not include the UIM.
- 35 **Mean Input Power.** The total received calorimetric power measured in a specified
36 bandwidth at the antenna connector, including all internal and external signal and noise
37 sources.

- 1 **Mean Output Power.** The total transmitted calorimetric power measured in a specified
2 bandwidth at the antenna connector when the transmitter is active.
- 3 **Medium Access Control.** See MAC. The MAC Sublayer is the lower sublayer of Layer 2.
4 It implements the medium access protocol and is responsible for transport of LAC protocol
5 data units using the services provided by Layer 1.
- 6 **MEID.** See Mobile Equipment Identifier.
- 7 **MEID_ME.** MEID associated with the mobile equipment. See Mobile Equipment Identifier
8 (MEID) and ME.
- 9 **MEID_SIG.** [An electronic signature using the credentials associated with the MEID_ME,
10 cryptographically computed as described in \[54\]. This signature is used by the network to
11 enforce the binding of a cdma2000 1x subscription to a specific mobile station or to a
12 group of mobile stations.](#)
- 13 **Message.** A data structure that conveys control information or application information. A
14 message consists of a length field (MSG_LENGTH), a message body (the part conveying the
15 information), and a CRC.
- 16 **Message Body.** The part of the message contained between the length field
17 (MSG_LENGTH) and the CRC field.
- 18 **Message Capsule.** A sequence of bits comprising a single message and padding. The
19 padding always follows the message and may be of zero length.
- 20 **Message Control and Status Block.** In this document, a parameter block representing
21 the PCI being transferred between Layer 3 and Layer 2.
- 22 **Message CRC.** The CRC check associated with a message. See also Cyclic Redundancy
23 Code.
- 24 **Message Field.** A basic named element in a message. A message field may consist of zero
25 or more bits.
- 26 **Message Record.** An entry in a message consisting of one or more fields that repeats in
27 the message.
- 28 **MHz.** Megahertz (10^6 Hertz).
- 29 **MIN.** See Mobile Identification Number.
- 30 **MNC.** See Mobile Network Code.
- 31 **Mobile Country Code (MCC).** A part of the E.212 IMSI identifying the home country. See
32 [18].
- 33 **Mobile Directory Number.** A dialable directory number that is not necessarily the same
34 as the mobile station's air interface identification, i.e., MIN, IMSI_M or IMSI_T.
- 35 **Mobile Equipment Identifier (MEID).** A 56-bit number assigned by the mobile station
36 manufacturer, uniquely identifying the mobile station equipment.
- 37 **Mobile Identification Number (MIN).** The 34-bit number that is a digital representation
38 of the 10-digit number assigned to a mobile station.

- 1 **Mobile Network Code (MNC).** A part of the E.212 IMSI identifying the home network
2 within the home country. See [18].
- 3 **Mobile Protocol Capability Indicator (MPCI).** A 2-bit field used to indicate the mobile
4 station's capabilities.
- 5 **Mobile-Specific User Zone.** A user zone that is identified by the mobile station. The
6 mobile station may consider parameters such as the identity of the serving system, cell,
7 and sector, and the geographic location of that station in making the determination. See
8 also CDMA Tiered Services, User Zone, Broadcast User Zone, Active User Zone, and Passive
9 User Zone.
- 10 **Mobile Station.** A station in the Public Wireless Radio Telecommunications Service
11 intended to be used while in motion or during halts at unspecified points. Mobile stations
12 include portable units (e.g., hand-held personal units) and units installed in vehicles. A
13 mobile station consists of two parts – ME and UIM.
- 14 **Mobile Station Class.** A classification of mobile stations based on characteristics such as
15 slotted operation and transmission power. See [12] and Table 2.3.3-1 of this document.
- 16 **Mobile Station Identification Number (MSIN).** A part of the E.212 IMSI identifying the
17 mobile station within its home network. See [18].
- 18 **Mobile Station Originated Call.** A call originating from a mobile station.
- 19 **Mobile Station Terminated Call.** A call received by a mobile station (not to be confused
20 with a disconnect or call release).
- 21 **ms.** Millisecond (10^{-3} second).
- 22 **MSB.** Most significant bit.
- 23 **MSC.** See Mobile Switching Center.
- 24 **MSIN.** See Mobile Subscriber Identification Number.
- 25 **Multiplex Option.** The ability of the multiplex sublayer and lower layers to be tailored to
26 provide special capabilities. A multiplex option defines such characteristics as the frame
27 format, the maximum number of Supplemental Code Channels supported, and the rate
28 decision rules. See also Multiplex Sublayer.
- 29 **Multiplex Sublayer.** One of the conceptual layers of the system that multiplexes and
30 demultiplexes primary traffic, secondary traffic, and signaling traffic.
- 31 **NAM.** See Number Assignment Module.
- 32 **National Mobile Subscriber Identity (NMSI).** A part of the E.212 IMSI identifying the
33 mobile station within its home country. The NMSI consists of the MNC and the MSIN. See
34 [18].
- 35 **NDSS.** See Network Directed System Selection.
- 36 **Neighbor Set.** The set of pilots associated with the CDMA Channels that are probable
37 candidates for handoff. Normally, the Neighbor Set consists of the pilots associated with
38 CDMA Channels that cover geographical areas near the mobile station. See also Active Set,
39 Candidate Set, Remaining Set, and Private Neighbor Set.

- 1 **Network.** A network is a subset of a wireless system, such as an area-wide cellular
2 network, a private group of base stations, or a group of base stations set up to handle a
3 special requirement. A network can be as small or as large as needed, as long as it is fully
4 contained within a system. See also System.
- 5 **NET_OVRLD_INDICATOR.** An indicator set by base station when the access channels
6 become overloaded.
- 7 **Network Access Priority (NAP).** A priority level set and advertised by base station in the
8 event of network overload that determines which set of mobile stations may access.
- 9 **Network Directed System Selection (NDSS).** A feature that allows the mobile station to
10 automatically register with a preferred system while roaming, or to be automatically
11 directed by a service provider, typically the home service provider, to a suggested system,
12 regardless of the frequency band class, cellular band, or PCS frequency block.
- 13 **Network Identification (NID).** A number that uniquely identifies a network within a
14 wireless system. See also System Identification.
- 15 **NEW_KEY_ID.** In *ROP*, this is the index of the pending (CIK, CCK) and NEW_SSEQ_H
16 associated with AUTHR. In *Authentication Response Message*, this is the index of the
17 pending (IK, CK) and NEW_SSEQ_H associated with the (RANDA, AUTHN).
- 18 **NEW_SSEQ_H.** The pending 24-bit security sequence number used for encryption and/or
19 integrity protection.
- 20 **NEW_SSEQ_H_SIG.** An 8-bit digital signature of NEW_SSEQ_H computed by RAND_S,
21 SSD_A, and NEW_SSEQ_H.
- 22 **NID.** See Network Identification.
- 23 **NMSI.** See National Mobile Subscriber Identity.
- 24 **Non-Autonomous Registration.** A registration method in which the base station initiates
25 registration. See also Autonomous Registration.
- 26 **Non-Slotted Mode.** An operation mode of the mobile station in which the mobile station
27 continuously monitors the Paging Channel, or the Forward Common Control Channel/
28 Broadcast Control Channel.
- 29 **ns.** Nanosecond (10^{-9} second).
- 30 **NULL.** Any value that is not in the specified range of a field.
- 31 **Null Traffic Channel Data.** One or more frames of a specified data sequence sent at the
32 lowest agreed-upon rate of the negotiated radio configuration. Null Traffic Channel data
33 may be sent when there is no primary, secondary, or signaling traffic available. Null Traffic
34 Channel data serves to maintain the connectivity between the mobile station and the base
35 station.
- 36 **Number Assignment Module (NAM).** A set of MIN/IMSI-related parameters stored in the
37 mobile station.

- 1 **Numeric Information.** Numeric information consists of parameters that appear as
2 numeric fields in messages exchanged by the base station and the mobile station and
3 information used to describe the operation of the mobile station.
- 4 **Optional Field.** A field defined within a message structure that is optionally transmitted
5 to the message recipient.
- 6 **Order.** A type of message that contains control codes for either the mobile station or the
7 base station.
- 8 **Ordered Registration.** A registration method in which the base station orders the mobile
9 station to send registration related parameters.
- 10 **Orthogonal Transmit Diversity (OTD).** An optional method of transmission of the
11 Forward CDMA Channel that uses two antennas, each transmitting a fraction of the code
12 symbols. It can be used to enhance performance in the presence of multipath fading radio
13 propagation.
- 14 **OTD.** See Orthogonal Transmit Diversity
- 15 **Overhead Message.** A message sent by the base station on the Paging Channel or the
16 Primary Broadcast Control Channel to communicate base-station-specific and system-wide
17 information to mobile stations.
- 18 **Overload Class (OLC).** The means used to control system access by mobile stations,
19 typically in emergency or other overloaded conditions. Mobile stations are assigned one (or
20 more) of sixteen overload classes. Access to the CDMA system can then be controlled on a
21 per class basis by persistence values transmitted by the base station.
- 22 **PACA.** Priority Access and Channel Assignment. See PACA Call.
- 23 **PACA Call.** A priority mobile station originated call for which no traffic channel or voice
24 channel was immediately available, and which has been queued for a priority access
25 channel assignment.
- 26 **Packet.** The unit of information exchanged between the service option applications of the
27 base station and the mobile station.
- 28 **Padding.** A sequence of bits used to fill from the end of a message to the end of a message
29 capsule, typically to the end of the frame or half frame. All bits in the padding are '0'.
- 30 **Paging.** The act of seeking a mobile station when a call has been placed to that mobile
31 station.
- 32 **Paging Channel.** A code channel in a Forward CDMA Channel used for transmission of
33 control information and pages from a base station to a mobile station.
- 34 **Paging Channel Slot.** An 80 ms interval on the Paging Channel. Mobile stations
35 operating in the slotted mode are assigned specific slots in which they monitor messages
36 from the base station.
- 37 **Paging Indicator.** A one-bit datum, sent on the Quick Paging Channel. Quick paging
38 indicators are associated with mobile stations, in pairs, via a hashing algorithm.
39 Appearance of both of its indicators in its assigned Quick Paging Channel slot serves to
40 alert a slotted mode mobile station, operating in the idle state, that it should monitor the

- 1 Paging Channel or the Forward Common Control Channel starting in the next slot. See
2 also Quick Paging Channel.
- 3 **Parameter-Change Registration.** A registration method in which the mobile station
4 registers when certain of its stored parameters change.
- 5 **Parity Check Bits.** Bits added to a sequence of information bits to provide error detection,
6 correction, or both.
- 7 **Passive User Zone.** A user zone in which the implicit registration that takes place at call
8 set-up is sufficient to trigger a change in tiered service features. See also CDMA Tiered
9 Services, User Zone, and Active User Zone.
- 10 **PCI.** See Protocol Control Information.
- 11 **PCS.** See Personal Communications Services.
- 12 **PCSC.** See Personal Communications Switching Center.
- 13 **PCS System.** See Personal Communications Services System.
- 14 **PDU.** See Protocol Data Unit.
- 15 **Personal Communications Services System.** A configuration of equipment that provides
16 PCS radiotelephone services.
- 17 **Personal Communications Services (PCS).** A family of mobile and portable radio
18 communications services for individuals and businesses that may be integrated with a
19 variety of competing networks. Broadcasting is prohibited and fixed operations are to be
20 ancillary to mobile operations.
- 21 **Personal Communications Switching Center (PCSC).** See Mobile Switching Center
22 (MSC).
- 23 **Physical Channel.** A communication path between stations, described in terms of the RF
24 characteristics such as coding, power control policies, etc.
- 25 **Physical Layer.** The part of the communication protocol between the mobile station and
26 the base station that is responsible for the transmission and reception of data. The
27 physical layer in the transmitting station is presented a frame by the multiplex sublayer
28 and transforms it into an over-the-air waveform. The physical layer in the receiving station
29 transforms the waveform back into a frame and presents it to the multiplex sublayer above
30 it.
- 31 **Pilot Beacon.** A transmit-only base station that broadcasts a Pilot Channel, a Sync
32 Channel, optionally a Paging Channel or a Primary Broadcast Control Channel, but no
33 Forward Common Control Channels and Forward Traffic Channels. The mobile station
34 measures the pilot beacon to assist in CDMA hard handoffs and inter-frequency idle-mode
35 handoffs.
- 36 **Pilot Channel.** A non-data-bearing signal transmitted by a CDMA station. See Forward
37 Pilot Channel, Transmit Diversity Pilot Channel, Auxiliary Pilot Channel, Auxiliary
38 Transmit Diversity Pilot Channel, and Reverse Pilot Channel.

- 1 **Pilot PN Chip.** One bit, or bit pair, of a pilot PN sequence, or the time interval
2 corresponding thereto.
- 3 **Pilot PN Sequence.** A pair of modified maximal length PN sequences used to spread the
4 quadrature components of a CDMA Channel.
- 5 **Pilot PN Sequence Offset.** The time offset of a Forward Pilot Channel from CDMA System
6 time, as transmitted by the base station, expressed modulo the pilot period.
- 7 **Pilot PN Sequence Offset Index.** The pilot PN sequence offset in units of 64 PN chips of a
8 Forward Pilot Channel, relative to the zero offset pilot PN sequence.
- 9 **Pilot Strength.** The ratio of pilot power to total power in the signal bandwidth of a CDMA
10 Forward or Reverse Channel. See also E_c/I_0 .
- 11 **Plus Code Dialing.** Plus code dialing relieves the user of the need to dial an international
12 access prefix, which may vary between countries and carriers. This capability allows
13 telephony addresses to be entered, received, displayed, stored and transmitted in an
14 international format (full ITU-T E.164 number, including country code). When addresses
15 are entered by a user, the MS user interface can provide an input aid, such as a key
16 marked with a “+” sign, to indicate that the address is international. When displayed by the
17 MS, they can be identified by a visual device, such as a “+” prefix. When received,
18 transmitted, or stored, an international indicator can be included with the address digits. It
19 will be the responsibility of the network to ignore the international indicator when attached
20 to a national number. This allows users to store and dial all phone numbers in a consistent
21 format, which is particularly useful for international travelers. See [39].
- 22 **PN.** Pseudonoise.
- 23 **PN Chip.** One bit in a PN sequence, or the time duration of such a bit. It corresponds to
24 the smallest modulation interval in a CDMA system.
- 25 **PN Sequence.** Pseudonoise sequence. A deterministic, periodic binary sequence having
26 limited statistical similarity to a Bernoulli (coin-tossing).
- 27 **Power Control Bit.** A bit sent on the Forward Power Control Subchannel or Reverse Power
28 Control Subchannel to signal the mobile station or base station to increase or decrease its
29 transmit power.
- 30 **Power Control Group.** A 1.25 ms interval on the Forward Traffic Channel and the Reverse
31 Traffic Channel. See also Power Control Bit.
- 32 **Power-Down Registration.** An autonomous registration method in which the mobile
33 station registers on power-down.
- 34 **Power Up Function.** A method by which the mobile station increases its output power to
35 support location services.
- 36 **Power-Up Registration.** An autonomous registration method in which the mobile station
37 registers on power-up.
- 38 **PPM.** Parts per million.
- 39 **Preamble.** See Access Channel Preamble and Traffic Channel Preamble.

- 1 **Primary CDMA Channel.** A pre-assigned channel in a CDMA Cellular System used by the
2 mobile station for initial acquisition. See also Secondary CDMA Channel.
- 3 **Primary Paging Channel (CDMA).** The default code channel (code channel 1) assigned for
4 paging on a CDMA Channel.
- 5 **Primary Pilot.** One of the three pilots on the Spreading Rate 3 Forward Channels. The
6 primary pilot may be on any one of the SR3 frequencies and may have a higher
7 transmission power comparing to the pilots on the other two SR3 frequencies.
- 8 **Primary Traffic.** The main traffic stream carried between the mobile station and the base
9 station on the Traffic Channel. See also Secondary Traffic and Signaling Traffic.
- 10 **Primitive.** An atomic, well-defined method of transferring data and control information
11 between two adjacent layers and sublayers. Conventionally represented as a function
12 invocation with the data and/or control information as parameters.
- 13 **Private Long Code.** The long code characterized by the private long code mask. See also
14 Long Code.
- 15 **Private Long Code Mask.** The long code mask used to form the private long code. See
16 also Public Long Code Mask and Long Code.
- 17 **Private Neighbor Set.** The set of pilots associated with the private system base stations
18 that are probable candidates for idle handoff. See also Active Set, Neighbor Set, Remaining
19 Set, and CDMA Tiered Services.
- 20 **Protocol Control Information (PCI).** Data passed between adjacent layers in the protocol
21 stack, together with the SDU, to assist a layer to properly encapsulate/decapsulate the
22 SDU. Examples of PCI in this document are the MCSB and the PCSB.
- 23 **Protocol Data Unit.** Encapsulated data communicated between peer layers on the mobile
24 station and base station. Unless specified otherwise, in this document PDU refers to the
25 Layer 3 protocol data unit transferred at the interface between Layer 3 and Layer 2.
- 26 **Protocol Stack.** Conceptual model of the layered architecture for communication
27 protocols (see Layering) in which layers within a station are represented in the order of
28 their numeric designation and requiring that transferred data be processed sequentially by
29 each layer, in the order of their representation. Graphically, the “stack” is drawn vertically,
30 with the layer having the lowest numeric designation at the base.
- 31 **Pseudo-ESN.** A 32 bit number derived from MEID and used in place of ESN.
- 32 **Public Long Code.** The long code characterized by the public long code mask.
- 33 **Public Long Code Mask.** The long code mask used to form the public long code. The
34 mask can contain a permutation of the mobile station’s ESN, or the particular mask
35 specified by the base station. The mask also includes the channel number when used for a
36 Supplemental Code Channel. See also Private Long Code Mask and Long Code.
- 37 **PUF.** See Power Up Function.
- 38 **PUF Attempt.** A sequence of PUF probes sent by the mobile station in response to a *Power*
39 *Up Function Message*.

- 1 **PUF Probe.** One or more consecutive frames on the Reverse Traffic Channel within which
2 the mobile station transmits the PUF pulse.
- 3 **PUF Pulse.** Portion of PUF probe that may be transmitted at elevated output power.
- 4 **PUF Target Frequency.** The CDMA frequency assignment to which the base station
5 directs a mobile station for transmitting the PUF probe.
- 6 **Punctured Code.** An error-correcting code generated from another error-correcting code
7 by deleting (i.e., puncturing) code symbols from the coder output.
- 8 **QoS.** See Quality of Service.
- 9 **Quality of Service.** Set of parameters and procedures associated with a service and/or
10 user, indicating some of the capabilities and constraints related to the delivery of the
11 service to the user.
- 12 **Quick Paging.** A feature that permits mobile stations to further conserve battery power
13 beyond the savings achieved by slotted mode operation. See also Paging Indicator and
14 Configuration Change Indicator.
- 15 **Quick Paging Channel.** An uncoded, on-off-keyed (OOK) spread spectrum signal sent by
16 base stations to inform slotted mode mobile stations, operating in the idle state, whether to
17 monitor the Paging Channel or the Forward Common Control Channel. See also Quick
18 Paging, Paging Indicator, and Configuration Change Indicator.
- 19 **Quick Paging Channel Slot.** An 80 ms interval on the Quick Paging Channel. See also
20 Paging Indicator and Configuration Change Indicator.
- 21 **Quick Repeats.** Additional transmissions of identical copies of a message within a short
22 interval to increase the probability that the message is received correctly.
- 23 **r-csch.** Reverse common signaling logical channel.
- 24 **r-dsch.** Reverse dedicated signaling logical channel.
- 25 **R-PDCCH.** Reverse Packet Data Control Channel. A control channel used for the
26 transmission of control information for the subpacket being transmitted on the Reverse
27 Packet Data Channel and the Mobile Status Indicator Bit.
- 28 **R-PDCH. Reverse** Packet Data Channel. A portion of a Radio Configuration 7 Reverse
29 Traffic Channel which carries higher-level data and control information from a mobile
30 station to a base station.
- 31 **R-REQCH. Reverse** Request Channel. A control channel used by the mobile station to
32 report available power headroom and buffer status.
- 33 **R-SPICH.** Reverse Secondary Pilot Channel. An unmodulated, direct-sequence spread
34 spectrum signal transmitted by a CDMA mobile station in conjunction with certain
35 transmissions on the Reverse Packet Data Channel. The secondary pilot channel provides
36 additional phase reference for the Reverse Packet Data Channel for coherent demodulation
37 and may provide a means for signal strength measurement.

1 **Radio Configuration.** A set of Forward Traffic Channel and Reverse Traffic Channel
2 transmission formats that are characterized by physical layer parameters such as
3 transmission rates, modulation characteristics and spreading rate. See [2].

4 **Radio Configuration Class.** A group of Radio Configurations. All Radio Configurations,
5 for the Forward Traffic Channel and the Reverse Traffic Channel, are divided into three
6 classes by the types of pre-spreading symbols (BPSK and QPSK) and spreading rates. RC
7 Class 1 consists of RC 1 and RC 2 for the Forward Traffic Channel and the Reverse Traffic
8 Channel. RC Class 2 consists of RC 3, RC 4, and RC 8 of the Reverse Traffic Channel, and
9 RC 3, RC 4, RC 5, RC 11, and RC12 of the Forward Traffic Channel. RC Class 3 consists of
10 RC 5 and RC 6 of the Reverse Traffic Channel, and RC 6, RC 7, RC 8, and RC 9 of the
11 Forward Traffic Channel.

12 **Radio Environment Reporting Mode.** A fast call setup mode of the mobile station in the
13 *Mobile Station Idle State*, in which *Radio Environment Messages* are triggered based on a
14 radio environment report pilot list (RER_PILOT_LIST). This mode may be used to assist the
15 base station with direct channel assignment. See also Direct Channel Assignment.

16 **RANDA.** The random challenge number contained in an AV.

17 **RC.** See Radio Configuration.

18 **Reduced Slot Cycle Mode.** A fast call setup mode of the mobile station in which the
19 mobile station operates in the slotted mode with a shorter slot cycle than the registered slot
20 cycle or in the non-slotted mode for the negotiated duration of time. See also Slotted Mode
21 and Non-Slotted Mode.

22 **RES.** A *Registration Accepted Order*, *Extended Channel Assignment Message*, or *Security*
23 *Mode Command Message*.

24 **Registration.** The process by which a mobile station identifies its location and parameters
25 to a base station.

26 **Registration Zone.** A collection of one or more base stations treated as a unit when
27 determining whether a mobile station should perform zone-based registration. See also
28 User Zone, with which it should not be confused.

29 **Release.** A process that the mobile station and base station use to inform each other of
30 call disconnect.

31 **Remaining Set.** The set of all allowable pilot offsets as determined by PILOT_INC,
32 excluding the pilot offsets of the pilots in the Active Set, Candidate Set, and Neighbor Set.
33 See also Active Set, Candidate Set, and Neighbor Set.

34 **Replay Attack.** An attempt by a third party to record an over-the-air message and send it
35 later in time so as to mislead the receiver.

36 **Request.** A Layer 3 message generated by either the mobile station or the base station to
37 retrieve information, ask for service, or command an action.

38 **Rescue Channel.** A Fundamental Channel used for call rescue soft handoff. The Walsh
39 Code is pre-allocated and advertised to the mobile station. In the event that the mobile

1 station loses the Forward Traffic Channel or declares an acknowledgment failure,
2 communication with a new base station can be established on the Rescue Channel.

3 **Response.** A Layer 3 message generated as a result of another message, typically a
4 request.

5 **Reverse Acknowledgment Channel.** A portion of Reverse CDMA Channel used for the
6 transmission of acknowledgments from the mobile station to the base station in response
7 to the data transmitted on the Forward Packet Data Channel, the Forward Packet Data
8 Control Channel, the Forward Fundamental Channel and the Forward Supplemental
9 Channel.

10 **Reverse Channel Quality Indicator Channel.** A portion of Reverse CDMA Channel used
11 by the mobile station to indicate to the base station the quality of the Forward Link Pilot
12 Channel received at the mobile station.

13 **Reverse CDMA Channel.** The CDMA Channel from the mobile station to the base station.
14 From the base station's perspective, the Reverse CDMA Channel is the sum of all mobile
15 station transmissions on a CDMA Frequency Assignment.

16 **Reverse Dedicated Control Channel.** A Dedicated Control Channel that is transmitted on
17 the Reverse CDMA Channel.

18 **Reverse Fundamental Channel.** A Fundamental Channel that is transmitted on the
19 Reverse CDMA Channel.

20 **Reverse Pilot Channel.** A non-data-bearing direct-sequence spread spectrum signal
21 transmitted by each CDMA mobile station whenever the Enhanced Access Channel,
22 Reverse Common Control Channel, or Reverse Traffic Channel is enabled. The Reverse
23 Pilot Channel allows a base station to acquire the timing of the Reverse CDMA Channel and
24 provides a phase reference for coherent demodulation. The Reverse Pilot Channel may be
25 transmitted either continuously or in gated mode.

26 **Reverse Supplemental Channel.** A Supplemental Channel that is transmitted on the
27 Reverse CDMA Channel.

28 **Reverse Supplemental Code Channel.** A Supplemental Code Channel that is transmitted
29 on the Reverse CDMA Channel.

30 **Reverse Traffic Channel.** A Traffic Channel on which data and signaling are transmitted
31 from a mobile station to a base station. The Reverse Traffic Channel is composed of zero or
32 one Reverse Fundamental Channel, zero to seven Reverse Supplemental Code Channels,
33 zero to two Reverse Supplemental Channels, and zero or one Reverse Dedicated Control
34 Channel.³

35 **ROP.** A *Registration Message, Origination Message, or Page Response Message.*

³ The Reverse Traffic Channel does not include R-CQICH, R-ACKCH.

1 **Roamer.** A mobile station operating in a wireless system (or network) other than the one
2 from which service was subscribed. See also Foreign NID Roamer and Foreign SID
3 Roamer.

4 **R-UIM.** Removable UIM.

5 **SAP.** See Service Access Point.

6 **SCI.** See Synchronized Capsule Indicator Bit.

7 **SDU.** See Service Data Unit.

8 **Search Window.** The range of PN sequence offsets that a mobile station searches for a
9 pilot.

10 **Search Window Offset.** PN sequence offset used by the mobile station to position the
11 search window when searching for a pilot.

12 **Secondary CDMA Channel.** A pre-assigned channel in a CDMA Cellular System used by
13 the mobile station for initial acquisition. See also Primary CDMA Channel.

14 **Secondary Traffic.** An additional traffic stream that can be carried between the mobile
15 station and the base station on the Traffic Channel. See also Primary Traffic and Signaling
16 Traffic.

17 **Selective Retransmission Mode** – A mode of Enhanced Access Channel operation that
18 allows the mobile station to re-transmit only the Enhanced Access Channel data frames
19 not yet received by the base station.**Service Access Point.** Conceptual point at the
20 interface between two adjacent layers where services are provided to the upper layer and
21 data and protocol information is exchanged between layers.

22 **Service Configuration.** The common attributes used by the mobile station and the base
23 station to build and interpret Traffic Channel frames. Service configuration corresponds to
24 the parameters contained in the Service Configuration information record and the Non-
25 negotiable Service Configuration information record. Examples of such parameters include
26 Forward and Reverse Traffic Channel multiplex options, Forward and Reverse Traffic
27 Channel transmission rates, service option connections, and reverse pilot gating rate.

28 **Service Configuration Synchronization Identifier (SYNC_ID).** An identifier assigned by
29 the base station that identifies a specific Service Configuration information record and Non-
30 negotiable Service Configuration information record.

31 **Service Data Unit.** Data transferred between adjacent layers in the protocol stack.
32 Unless specified otherwise in this document SDU refers to the Layer 3 service data unit
33 being transferred to/from Layer 2.

34 **Service Negotiation.** The procedures used by the mobile station and base station to
35 establish a service configuration. See also Service Option Negotiation.

36 **Service Option.** A service capability of the system. Service options may be applications
37 such as voice, data, or facsimile. See ~~30~~[53].

38 **Service Option Connection.** A particular instance or session in which the service defined
39 by a service option is used. Associated with a service option connection are a reference,
40 which is used for uniquely identifying the service option connection, a service option, which

1 specifies the particular type of service in use, a Forward Traffic Channel traffic type, which
2 specifies what type of Forward Traffic Channel traffic is used to support the service option
3 connection, and a Reverse Traffic Channel traffic type, which specifies what type of Reverse
4 Traffic Channel traffic is used by the service option connection.

5 **Service Option Connection Reference.** A designator used by the base station and mobile
6 station to uniquely identify a particular service option connection.

7 **Service Option Negotiation.** The procedures used by the mobile station and base station
8 to establish a service configuration. Service option negotiation is similar to service
9 negotiation, but allows less flexibility for specifying the attributes of the service
10 configuration. See also Service Negotiation.

11 **Service Redirection.** The process by which the base station alters the system selection
12 made by a mobile station. It can be used temporarily during maintenance and testing to
13 divert subscribers to an alternate system.

14 **Serving Frequency.** The CDMA frequency on which a mobile station is currently
15 communicating with one or more base stations.

16 **Shared Secret Data (SSD).** A 128-bit pattern stored in the mobile station (in semi-
17 permanent memory) and known by the base station. SSD is a concatenation of two 64-bit
18 subsets: SSD_A, which is used to support the authentication procedures, and SSD_B,
19 which serves as one of the inputs to the process generating the encryption mask and
20 private long code.

21 **Short Message Services (SMS).** A suite of services such as SMS Text Delivery, Digital
22 Paging (i.e., Call Back Number - CBN), and Voice Mail Notification (VMN).

23 **SID.** See System Identification.

24 **Signaling Traffic.** Control messages that are carried between the mobile station and the
25 base station on the Traffic Channel. See also Primary Traffic and Secondary Traffic.

26 **Silent Re-origination.** An autonomous attempt to re-originate a call after the mobile
27 station Layer 3 receives an access attempt failure indication from Layer 2 following a user-
28 initiated origination or a re-origination. Silent re-origination does not apply to any user-
29 programmable capabilities or services, e.g. user-programmable automatic redial.

30 **Slotted Mode.** An operation mode of the mobile station in which the mobile station
31 monitors only selected slots on the Paging Channel or the Forward Common Control
32 Channel when in the *Mobile Station Idle State*.

33 **Soft Handoff.** A handoff occurring while the mobile station is in the *Mobile Station Control*
34 *on the Traffic Channel State*. This handoff is characterized by commencing communications
35 with a new base station on the same CDMA Frequency Assignment before terminating
36 communications with an old base station. See also Hard Handoff.

37 **SOM.** Start-of-Message bit.

38 **Space Time Spreading (STS).** A forward link transmission method which transmits all
39 forward link channel symbols on multiple antennas and spreads the symbols with
40 complementary Walsh or quasi-orthogonal functions.

- 1 **Spreading Rate.** The PN chip rate of the system, defined as a multiple of 1.2288 Mcps.
- 2 **Spreading Rate 1.** A 1.2288 Mcps chip rate-based system using a direct-spread single
3 carrier.
- 4 **Spreading Rate 3.** A 3.6864 Mcps chip rate-based system using three 1.2288 Mcps
5 carriers on the Forward CDMA Channel. The Reverse CDMA Channel uses a 3.6864 Mcps
6 direct-spread carrier.
- 7 **sps.** Symbols per second.
- 8 **SR.** See Spreading Rate.
- 9 **SR1.** See Spreading Rate 1.
- 10 **SR3.** See Spreading Rate 3.
- 11 **SR3 Frequencies.** CDMA frequencies for the three 1.2288 Mcps carriers on the Forward
12 CDMA Channel. SR3 frequencies include the lowest SR3 frequency, the center SR3
13 frequency, and the highest SR3 frequency.
- 14 **SR3 Primary Pilot.** See Primary Pilot.
- 15 **SSD.** See Shared Secret Data.
- 16 **SSEQ.** Security sequence number. The 8 LSB of the EXT_SSEQ used for an input to
17 encryption functions and as an input to MACI calculations.
- 18 **Station Class Mark (SCM).** An identification of certain characteristics of a mobile station.
19 Classes are defined in [12] and Table 6.3.3-1 of this document.
- 20 **Subscriber Authentication Key.** A secret, 128-bit pattern stored in the mobile station
21 and AC. It is used to generate/update the mobile station's IK, CK and UAK during AKA
22 procedure.
- 23 **Supplemental Channel.** An optional portion of a Traffic Channel (Forward or Reverse
24 Radio Configurations 3 and above) that operates in conjunction with a Fundamental
25 Channel in that Traffic Channel, and (optionally) with other Supplemental Channels to
26 provide higher data rate services.
- 27 **Supplemental Code Channel.** An optional portion of a Traffic Channel (Forward or
28 Reverse Radio Configurations 1 and 2) that operates in conjunction with a Fundamental
29 Channel in that Traffic Channel, and (optionally) with other Supplemental Code Channels
30 to provide higher data rate services. On this channel a combination of primary data,
31 secondary data, or both (but never signaling information) are transmitted.
- 32 **Symbol.** See Code Symbol and Modulation Symbol.
- 33 **Sync Channel.** Code channel 32 in the Forward CDMA Channel which transports the
34 synchronization message to the mobile station.
- 35 **Sync Channel Superframe.** An 80 ms interval consisting of three Sync Channel frames
36 (each 26.666... ms in length).
- 37 **System.** A system is a wireless communications service that covers a geographic area
38 such as a city, metropolitan region, county, or group of counties. See also Network.

- 1 **System Identification (SID).** A number uniquely identifying a wireless system.
- 2 **System Time.** The time reference used by the system. System Time is synchronous to
3 UTC time (except for leap seconds) and uses the same time origin as GPS time. All base
4 stations use the same System Time (within a small error). Mobile stations use the same
5 System Time, offset by the propagation delay from the base station to the mobile station.
6 See also Universal Coordinated Time.
- 7 **Target Frequency.** The CDMA frequency assignment to which the base station directs a
8 mobile station in a handoff using an *Extended Handoff Direction Message*, a *General*
9 *Handoff Direction Message*, or a *Universal Handoff Direction Message*.
- 10 **TD.** See Transmit Diversity.
- 11 **Temporary Mobile Subscriber Identity (TMSI).** A temporary mobile station identification
12 assigned by the base station.
- 13 **Tracking Zone Mode.** A fast call setup mode of the mobile station in the *Mobile Station*
14 *Idle State*, in which *Radio Environment Messages* are triggered based on the tracking zone
15 identifier (TKZ_ID) broadcast by the base station and hysteresis criteria. This mode may be
16 used to assist the base station with direct channel assignment. See also Direct Channel
17 Assignment.
- 18 **Timer-Based Registration.** A registration method in which the mobile station registers
19 whenever a counter reaches a predetermined value. The counter is incremented an
20 average of once per 80 ms period.
- 21 **Time Reference.** A reference established by the mobile station that is synchronous with
22 the earliest arriving multipath component used for demodulation.
- 23 **TMSI.** See Temporary Mobile Subscriber Identity.
- 24 **TMSI Zone.** The administrative zone that allows the TMSI to be reused. The TMSI_CODE
25 has to be unique within a TMSI zone but may be reused in a different TMSI zone. The
26 TMSI zone is identified by the field TMSI_ZONE.
- 27 **Traffic Channel.** A communication path between a mobile station and a base station used
28 for user and signaling traffic. The term Traffic Channel implies a Forward Traffic Channel
29 and Reverse Traffic Channel pair. See also Forward Traffic Channel and Reverse Traffic
30 Channel.
- 31 **Traffic Channel Preamble.** For RC1 and RC2, a sequence of all-zero frames that is sent by
32 the mobile station on the Reverse Traffic Channel as an aid to Traffic Channel acquisition.
33 For RC3 to RC6 inclusive, the traffic preamble is the ungated transmission of the Reverse
34 Pilot.
- 35 **Transmit Diversity.** See Orthogonal Transmit Diversity and Space Time Spreading.
- 36 **UAK.** UIM Authentication Key. A 128-bit pattern produced by AKA that is used for
37 authentication of the R-UIM.
- 38 **UIM.** User Identity Module.

1 **UIM_ID.** A 32-bit electronic identification (ID) number that is unique to the R-UIM. The
2 mobile station uses UIM_ID in place of ESN, with the exception of the ESN_ME information
3 record, when configured with a R-UIM which indicates that UIM ID is to be used (see [40]).

4 **UMAC.** A 32-bit output of the UMAC algorithm computed by UIM based on MAC-I.

5 **Unassured Mode.** Mode of delivery that does not guarantee that a PDU will be delivered to
6 the peer. The LAC entity at the receiver does not acknowledge a PDU sent in unassured
7 mode.

8 **Unique Challenge-Response Procedure.** An exchange of information between a mobile
9 station and a base station for the purpose of confirming the mobile station's identity. The
10 procedure is initiated by the base station and is characterized by the use of a challenge-
11 specific random number (i.e., RANDU) instead of the random variable broadcast globally
12 (RAND).

13 **Unique Random Variable (RANDU).** A 24-bit random number generated by the base
14 station in support of the Unique Challenge-Response procedure.

15 **Universal Coordinated Time (UTC).** An internationally agreed-upon time scale
16 maintained by the Bureau International de l'Heure (BIH) used as the time reference by
17 nearly all commonly available time and frequency distribution systems i.e., WWV, WWVH,
18 LORAN-C, Transit, Omega, and GPS.

19 **User Zone.** An area within which CDMA Tiered Services may be provided. It may
20 correspond to an RF coverage area, or it may be established independent of RF topology.
21 User Zones are classified as broadcast versus mobile-specific, and as active versus passive.
22 See Broadcast User Zone, Mobile-Specific User Zone, Active User Zone, and Passive User
23 Zone. See also Registration Zone, with which it should not be confused.

24 **User Zone Registration.** An autonomous registration method in which the mobile station
25 registers when it selects an active user zone while in the Idle State. See also Zone-Based
26 Registration, with which it should not be confused.

27 **Upper Layers.** General reference to Layer 3 and the layers above it.

28 **User Zone Exit parameter.** A parameter used by the mobile station to determine if it
29 should exit a User Zone.

30 **UTC.** Universal Temps Coordoné. See Universal Coordinated Time.

31 **Voice Privacy.** The process by which user voice transmitted over a CDMA Traffic Channel
32 is afforded a modest degree of protection against eavesdropping over the air.

33 **Walsh Chip.** See [2].

34 **Walsh Function.** One of 2^N time orthogonal binary functions (note that the functions are
35 orthogonal after mapping '0' to 1 and '1' to -1).

36 **Wireless Local Loop.** Wireless alternative access mechanism to provide standard
37 telecommunication services using standard wireline terminal via a radio link between the
38 network and customer premises equipment.

39 **WLL.** See Wireless Local Loop.

1 **Zone-Based Registration.** An autonomous registration method in which the mobile
 2 station registers whenever it enters a zone that is not in the mobile station's zone list. See
 3 also User Zone Registration, with which it should not be confused.

4 **Zone Timer.** A timer used by the mobile station to remove outdated entries from its list of
 5 zones in which it has previously registered.

6 **μs.** Microsecond (10^{-6} second).

7 1.3.2 Numeric Information

8 Numeric information is used to describe the operation of the mobile station. The following
 9 subscripts are used to clarify the use of the numeric information:

- 10 • “s” indicates a value stored in a mobile station's temporary memory.
- 11 • “sv” indicates a stored value that varies as a mobile station processes various tasks.
- 12 • “sl” indicates the stored limits on values that vary.
- 13 • “r” indicates a value received by a mobile station over a CDMA Forward Channel.
- 14 • “p” indicates a value set in a mobile station's permanent security and identification
 15 memory.
- 16 • “s-p” indicates a value stored in a mobile station's semi-permanent security and
 17 identification memory.

18 1.3.2.1 Reserved

19 1.3.2.2 CDMA Numeric Information

20 The following are internal values that are stored by the mobile station in temporary
 21 memory that are not sent over the air. See Annex F for values stored by the mobile station
 22 in permanent and semi-permanent memory.

23 **1XRL_FREQ_OFFSET_s** – Frequency offset of the 1X reverse link.

24 **A41_SYS_PAR_MSG_SEQ_s** – *ANSI-41 System Parameters Message* sequence number.

25 **ACC_CHAN_s** – Number of Access Channels supported by the current Paging Channel.

26 **ACC_ENT_HO_ORDER_s** – Access entry handoff permitted from the *Mobile Station Order and*
 27 *Message Processing Operation* of the *Mobile Station Idle State*.

28 **ACCESS_ENTRY_HO_s** – Idle handoff permitted when entering the *System Access State*.

29 **ACCESS_HO_s** – Handoff permitted after performing an access attempt while the mobile
 30 station is in the *System Access State*.

31 **ACCESS_HO_ALLOWED_s** – Handoff permitted to the corresponding neighbor base station
 32 while in the *System Access State*.

33 **ACCESS_HO_LIST** – List of pilots to which access handoff or access probe handoff is
 34 permitted.

35 **ACC_HO_LIST_UPD_s** – Access handoff list update permitted indicator.

- 1 **ACCESS_HO_MSG_RSP_s** – Access handoff permitted in the *System Access State* between
2 the time that the mobile station receives a message and responds to that message.
- 3 **ACCESS_PROBE_HO_s** – Access probe handoff permitted during an access attempt in the
4 *Mobile Station Origination Attempt Substate* or the *Page Response Substate*.
- 5 **ACC_MSG_SEQ_s** – Last received *Access Parameters Message* or *Enhanced Access*
6 *Parameters Message* sequence number.
- 7 **ACC_PROBE_HO_OTHER_MSG_s** – Access probe handoff permitted for Access Channel
8 messages other than the *Origination Message*, *Reconnect Message*, and the *Page Response*
9 *Message*.
- 10 **ACCT_INCL_EMG_s** – Access Control based on Call Type (ACCT) applies to emergency calls
11 indicator.
- 12 **ACCT_SO_GRP_LIST** – List of service option groups that have Access Control based on Call
13 Type (ACCT) enabled.
- 14 **ACCT_SO_LIST** – List of individual service options that have Access Control based on Call
15 Type (ACCT) enabled.
- 16 **ACH_ACC_TMO_s** – Access Channel acknowledgment timeout, in units of 80 ms.
- 17 **ACK_WAITING_s[i]** – Acknowledgment status indicator for message sequence number i. Set
18 to YES if an acknowledgment is pending for the message; otherwise, set to NO.
- 19 **ADD_INTERCEPT_s** – The intercept in the inequality criterion for adding a pilot to the Active
20 Set.
- 21 **ADD_PLCM_FOR_FCH_39_s** – The 39 least significant bits of the additional Public Long
22 Code Mask for the forward Fundamental Channel.
- 23 **ADD_PLCM_FOR_FCH_TYPE_s** – Additional Public Long Code Mask for forward
24 Fundamental Channel type indicator.
- 25 **AGE_s** – Neighbor list age. For each pilot in the Neighbor Set, the mobile station increments
26 this counter each time a *Neighbor List Update Message* or an *Extended Neighbor List Update*
27 *Message* is received. When AGE_s exceeds NGBHR_MAX_AGE, the pilot is deleted from the
28 Neighbor Set.
- 29 **ALIGN_TIMING_USED_s** – Indicates whether the mobile station aligns the times of visits
30 away from the Serving Frequency, as requested by the base station, in the periodic search
31 procedures.
- 32 **ASSIGNED_QPAGECH_s** – Assigned Quick Paging Channel number.
- 33 **AUTH_s** – Current authentication mode.
- 34 **AUTO_FCSO_ALLOWED_s** – Base station support of autonomous *Fast Call Setup Order*
35 indicator.
- 36 **AUTO_MSG_INTERVAL** – Autonomous message interval.
- 37 **AUTO_MSG_SUPPORTED** – Autonomous message supported indicator.

- 1 **BAD_FRAMES_s** – Forward Fundamental Channel bad frames count. The number of
2 received bad Forward Fundamental Channel frames.
- 3 **BAND_SUBCLASS_IND_REC** – Band subclass indicator record. This record specifies the
4 band subclasses that the base station requires the mobile station to report whether it
5 supports.
- 6 **BASE_CLASS_s** – Base station class of the current base station.
- 7 **BASE_ID_s** – Base station identification of the current base station.
- 8 **BASE_LAT_s** – Latitude of the current base station, in units of 0.25 seconds.
- 9 **BASE_LONG_s** – Longitude of the current base station, in units of 0.25 seconds.
- 10 **BCMC_FLOW_LIST_s[i]** – BCMC Flow Information. This is an array that contains
11 information corresponding to each BCMC flow being transmitted by the base station in this
12 sector:
- 13 • BCMC_FLOW_ID - BCMC flow identifier.
 - 14 • REGISTRATION_REQ_FLAG – Registration required flag.
 - 15 • AUTH_SIGNATURE_REQ_IND – Authorization signature required indication.
 - 16 • BCMC_FLOW_ON_TRAFFIC_IND – BCMC flow on traffic channel supported indicator.
 - 17 • BCMC_FLOW_ON_IND – BCMC flow On indicator.
 - 18 • LPM_INFO[j] - For each BCMC_FLOW_ID, one or more Logical-to-Physical Mapping
19 entries:
 - 20 - FSCH_ID - Forward Broadcast Supplemental Channel identifier.
 - 21 - TDM_USED_IND - TDM used indicator.
 - 22 - TDM_MASK - TDM mask.
 - 23 - TDM_SUPER_PERIOD_MASK - TDM super period mask.
 - 24 - TDM_MEGA_PERIOD_MASK - TDM mega period mask.
 - 25 - BSR_ID - BCMC Service Reference identifier.
 - 26 - NGHBR_INFO[k] - For each Logical-to-Physical Mapping entries, information on one
27 or more neighbor base stations:
 - 28 + NGHBR_PN - Neighbor pilot PN sequence offset index.
 - 29 + NGHBR_BCMC_CONFIG - Neighbor BCMC Configuration.

- 1 + NGHBR_FSCH_BAND_CLASS - Neighbor band class of the Forward Broadcast
2 Supplemental Channel.
- 3 + NGHBR_FSCH_CDMA_FREQ - Neighbor Frequency assignment of the Forward
4 Broadcast Supplemental Channel.
- 5 + NGHBR_FSCH_CODE_CHAN - Neighbor Forward Broadcast Supplemental
6 Channel Code Channel Index.
- 7 + NGHBR_FSCH_PLCM - Neighbor Public Long Code Mask of the Forward
8 Broadcast Supplemental Channel.
- 9 + NGHBR_FSCH_MUX_OPTION - Neighbor Multiplex Option of the Forward
10 Broadcast Supplemental Channel.
- 11 + NGHBR_FSCH_RC - Neighbor Radio configuration of the Forward Broadcast
12 Supplemental Channel.
- 13 + NGHBR_FSCH_CODING - Neighbor Coding Type of the Forward Broadcast
14 Supplemental Channel.
- 15 + NGHBR_FSCH_OUTERCODE_RATE - Neighbor outer code rate of the Forward
16 Broadcast Supplemental Channel.
- 17 + NGHBR_FSCH_OUTERCODE_OFFSET - Neighbor outer coding buffer offset of
18 the Forward Broadcast Supplemental Channel.
- 19 + NGHBR_FSCH_NUM_BITS_IDX - Neighbor number of information bits index of
20 the Forward Broadcast Supplemental Channel.
- 21 + NGHBR_FSCH_FRAME_40_USED - Neighbor Forward Broadcast Supplemental
22 Channel 40ms frame used indicator.
- 23 + NGHBR_FSCH_FRAME_80_USED - Neighbor Forward Broadcast Supplemental
24 Channel 80ms frame used indicator.

25 **BCMC_RETRY_DELAY_LISTs[i]** – BCMC Retry Delay List. This is an array that contains
26 retry time corresponding to each BCMC flow rejected with BCMC Reason indicating
27 RETRY_LATER:

- 28 • BCMC_FLOW_ID - BCMC flow identifier.
- 29 • RETRY_DELAY – Retry time for this BCMC flow.
- 30 **BEGIN_PREAMBLE_s** – A stored variable in the mobile station that contains the size of the
31 preamble that shall be transmitted on a Reverse Supplemental Code Channel at the
32 beginning of a Reverse Supplemental Code Channel transmission.
- 33 **BKOFF_s** – Access Channel probe sequence backoff range.
- 34 **BRAT_s** – Data rate of the Primary Broadcast Control Channel.

- 1 **BSPM_MSG_SEQ_s** – *BCMC Service Parameters Message* sequence number.
- 2 **BSPM_WAIT_TIME** – The maximum duration the mobile station waits to receive a BCMC
3 *Service Parameters Message* after sending a *Registration Message* requesting a BCMC flow.
- 4 **BYPASS_ALERT_ANSWER_s** – Mobile station termination bypass indicator. This is set to ‘1’
5 if the mobile station is to bypass the *Waiting for Order Substate* and the *Waiting for Mobile*
6 *Station Answer Substate*, and proceed directly to the *Conversation Substate* when Layer 3
7 receives a *forward dedicated channel-acquired* indication from Layer 2.
- 8 **CAND_BAND_CLASS_REC** – Candidate band class record. This record specifies the band
9 classes that the base station requires the mobile station to report whether it supports.
- 10 **CCSH_ENCODER_ACTION_TIME_s** - Specifies the time at which Code Combining Soft
11 Handoff Turbo Encoder swapping takes effect.
- 12 **CDMABAND_s**. CDMA band class. The CDMA band class currently used by the mobile
13 station.
- 14 **CDMACH_s** – CDMA Channel number. The CDMA Channel number currently used by the
15 mobile station.
- 16 **CDMA_OFF_TIME_REP_SUP_IND_s** – CDMA off time report supported indicator.
- 17 **CDMA_OFF_TIME_REP_THRESHOLD_s** – CDMA off time report threshold.
- 18 **CF_CDMABAND_s** – Candidate Frequency CDMA band class. The CDMA band class
19 specified in the *Candidate Frequency Search Request Message*.
- 20 **CF_CDMACH_s** – Candidate Frequency CDMA Channel number. The CDMA Channel
21 number specified in the *Candidate Frequency Search Request Message*.
- 22 **CF_PILOT_INC_s** – PILOT_INC to be used by the mobile station after an inter-frequency
23 hard handoff to the CDMA Candidate Frequency is successfully completed.
- 24 **CF_SEARCH_PRIORITY_INCL_s** – Candidate Frequency neighbor pilots’ search priority
25 included indicator.
- 26 **CF_SRCH_OFFSET_INCL_s** – Candidate Frequency neighbor pilot search window offset
27 included indicator.
- 28 **CF_SRCH_WIN_NGHR_INCL_s** – Candidate Frequency neighbor pilots’ search window
29 included indicator.
- 30 **CF_SRCH_WIN_N_s** – Search window size for the Candidate Frequency Search Set.
- 31 **CF_SRCH_WIN_R_s** – Search window size to be used for the Remaining Set after an inter-
32 frequency hard handoff to the CDMA Candidate Frequency is successfully completed.
- 33 **CF_T_ADD_s** – Pilot detection threshold to be used on the CDMA Candidate Frequency. The
34 stored value is a positive value in units of 0.5 dB.
- 35 **CH_IND_s** – A two-bit physical channel indicator, based on the currently established
36 physical channels. The least significant bit denotes the Fundamental Channel, and the
37 most significant bit denotes the Dedicated Control Channel.
- 38 **CHAN_LST_MSG_SEQ_s** – *CDMA Channel List Message* sequence number.

- 1 **CHM_SUPPORTED_s** – Indicates whether the base station supports Control Hold Mode
2 operation.
- 3 **CODE_CHAN_LIST** – Code Channel List. A descriptive structure used to manage the
4 Forward Fundamental Channel, and Forward Supplemental Code Channels, if any,
5 associated with the mobile station's Active Set.
- 6 **COMPLETE_PUF_FRAME_s** – Number of power control groups required to make the PUF
7 probe an integer number of frames.
- 8 **COMPLETE_SEARCH_s** – Flag to indicate if the mobile station is to complete the search of
9 the Candidate Frequency Search Set after it has determined that the inter-frequency
10 handoff attempt to the CDMA Candidate Frequency is unsuccessful.
- 11 **CONFIG_MSG_SEQ_s** – Current message sequence number for the *System Parameters*
12 *Message, Neighbor List Message, Extended Neighbor List Message, General Neighbor List*
13 *Message, CDMA Channel List Message, Extended System Parameters Message, Global*
14 *Service Redirection Message, Private Neighbor List Message, User Zone Identification*
15 *Message, Extended CDMA Channel List Message, Extended Global Service Redirection*
16 *Message, MC-RR Parameters Message, ANSI-41 System Parameters Message.*
- 17 **COUNTER_ENABLED_s** – Timer-based registration indicator. Set to YES if timer-based
18 registration is enabled; otherwise, set to NO.
- 19 **C_SIG_ENCRYPT_MODE_s** – Common Channel signaling message encryption mode.
- 20 **CS_SUPPORTED_s** – Base station Concurrent Services supported indicator. This 1-bit field
21 is set to '1' if the base station supports concurrent connection of at least two services that
22 use either Primary or Secondary traffic type.
- 23 **CURR_ACC_MSG_SEQ** – Current *Access Parameters Message* or *Enhanced Access*
24 *Parameters Message* sequence number.
- 25 **CURRENT_ACTIVE_PILOT_s** – Identifies the current pilot in the Active Set during an access
26 attempt.
- 27 **CURRENT_PUF_PROBE_s** – Number of the next PUF probe to be transmitted within the PUF
28 attempt.
- 29 **DAYLT_s** – Daylight Savings Time indicator.
- 30 **DCCH_BAD_FRAMES_s** – Forward Dedicated Control Channel bad frames count. The
31 number of received bad Forward Dedicated Control Channel frames.
- 32 **DCCH_TOT_FRAMES_s** – Total Forward Dedicated Control Channel frames received. The
33 total number of received Forward Dedicated Control Channel frames, counted for Forward
34 Traffic Channel power control.
- 35 **DECORR** – Hashing function input used to decorrelate hashing function applications for
36 the same mobile station.
- 37 **DEFAULT_CONFIG_s** – Mobile station current default configuration.

- 1 **DELETE_FOR_TMSI_s** – A storage variable in the mobile station that indicates whether the
 2 mobile station should delete its current TMSI if the TMSI was assigned in a different TMSI
 3 zone.
- 4 **DIFF_RX_PWR_THRESH_s** – Threshold for the difference between the received power on the
 5 Serving Frequency and the received power on the CDMA Candidate Frequency for the
 6 mobile station to search for pilots on the CDMA Candidate Frequency.
- 7 **DIRECT_CH_ASSIGN_RECOVER_IND_s** – Direct Channel Assignment Recover Indicator.
- 8 **DISTANCE** – Distance from registered base station to current base station, used for
 9 distance-based registration.
- 10 **DROP_INTERCEPT_s** – The intercept in the inequality criterion for dropping a pilot from the
 11 Active Set.
- 12 **D_SIG_ENCRYPT_MODE_s** – Dedicated Channel signaling message encryption mode.
- 13 **EACH_ACC_TMO_s** – Enhanced Access Channel acknowledgment timeout, in units of 20
 14 ms.
- 15 **EACH_SLOT_s** – See [2].
- 16 **EACH_SLOT_OFFSET1_s** – See [2].
- 17 **EACH_SLOT_OFFSET2_s** – See [2].
- 18 **EARLY_RL_TRANSMIT_IND_s** – The early reverse link transmission flag indicates whether,
 19 upon channel assignment, the mobile station is allowed to enable its transmitter and
 20 transmit the preamble prior to receiving sufficient energy on the forward link.
- 21 **EC_IO_THRESH_s** – Pilot E_c/I_0 threshold used for system reselection.
- 22 **EC_THRESH_s** – Pilot power threshold used for system reselection.
- 23 **ENC_KEY_SIZE_s** – The key size used for signaling and user information encryption on
 24 common channel and dedicated channel.
- 25 **ENC_KEY[j]** – An array of encryption keys for signaling and user information encryption on
 26 common channel and dedicated channel, where j is the key identifier that ranges from ‘00’
 27 to ‘11’.
- 28 **SSEQ⁴** – An 8-bit temporary variable for encryption/decryption and message integrity.
- 29 **ENCRYPT_MODE_s** – Current message encryption mode.
- 30 **EXCL_P_REV_MS** – Exclude from redirection by MOB_P_REV indicator.
- 31 **EXT_CHAN_LST_s** – *Extended CDMA Channel List Message* sent indicator.
- 32 **EXT_CHAN_LST_MSG_SEQ_s** – *Extended CDMA Channel List Message* sequence number.
- 33 **EXT_NGHR_LST_MSG_SEQ_s** – *Extended Neighbor List Message* sequence number.

⁴ Formerly called ENC_SEQ.

- 1 **EXT_PREF_MSID_TYPE_s** – Extended preferred mobile station identifier field type.
- 2 **RX_EXT_SSEQ[i][j]⁵** – An array of 32-bit crypto-sync counters used for encryption and
 3 message integrity, where $i = 0$ is for unassured messages and $i = 1$ is for assured messages,
 4 where j is the key identifier that ranges from ‘00’ to ‘11’.
- 5 **TX_EXT_SSEQ[i][j]⁶** – An array of 32-bit crypto-sync counters used for encryption and
 6 message integrity, where $i = 0$ is for unassured messages and $i = 1$ is for assured messages,
 7 where j is the key identifier that ranges from ‘00’ to ‘11’.
- 8 **EXT_SSEQ⁷** – A 32-bit temporary variable for encryption and message integrity.
- 9 **INT_KEY[j]** – An array of 128-bit integrity keys for message integrity, where j is the key
 10 identifier that ranges from ‘00’ to ‘11’.
- 11 **KEY_ID** – A 2-bit index of INT_KEY[.], ENC_KEY[.], TX_EXT_SSEQ[.][.], and
 12 RX_EXT_SSEQ[.][.] that are “in use”. The values ‘00’ to ‘01’ are used to index 2G keys and
 13 security sequence numbers. The values ‘10’ to ‘11’ are used to index 3G keys and security
 14 sequence numbers.
- 15 **EXT_GLOBAL_REDIRECT_s** – *Extended Global Service Redirection Message* sent indicator.
- 16 **EXT_GLOB_SERV_REDIR_MSG_SEQ_s** – *Extended Global Service Redirection Message*
 17 sequence number.
- 18 **EXT_SYS_PARAMETER_s** – *Extended System Parameters Message* sent indicator.
- 19 **EXT_SYS_PAR_MSG_SEQ_s** – *Extended System Parameters Message* sequence number.
- 20 **FBSCH_LIST_s[i]** – Forward Broadcast Supplemental Channel information. This is an array
 21 that contains information corresponding to each Forward Supplemental Channel
 22 transmitted by the base station:
- 23 • FSCH_ID - Forward Broadcast Supplemental Channel identifier.
 - 24 • FSCH_BAND_CLASS - Band class of the Forward Broadcast Supplemental Channel.
 - 25 • FSCH_FREQ - Frequency assignment of the Forward Broadcast Supplemental Channel.
 - 26 • FSCH_CODE_CHAN - Code Channel index of the Forward Broadcast Supplemental
 27 Channel.
 - 28 • FSCH_PLCM – Public Long Code Mask of the Forward Broadcast Supplemental Channel

⁵ Formerly called EXT_DECRYPT_SEQ[i].

⁶ Formerly called EXT_ENCRYPT_SEQ[i].

⁷ Formerly called EXT_ENC_SEQ[i].

- 1 • FSCH_MUX_OPTION - Multiplex Option of the Forward Broadcast Supplemental
2 Channel
- 3 • FSCH_RC - Radio configuration of the Forward Broadcast Supplemental Channel.
- 4 • FSCH_CODING - Coding Type of the Forward Broadcast Supplemental Channel.
- 5 • FSCH_OUTERCODE_RATE - Outer code rate of the Forward Broadcast Supplemental
6 Channel.
- 7 • FSCH_OUTERCODE_OFFSET - Outer coding buffer offset of the Forward Broadcast
8 Supplemental Channel.
- 9 • FSCH_NUM_BITS_IDX - Number of information bits index of the Forward Broadcast
10 Supplemental Channel.
- 11 • FSCH_FRAME_40_USED - Forward Broadcast Supplemental Channel 40ms frame used
12 indicator.
- 13 • FSCH_FRAME_80_USED - Forward Broadcast Supplemental Channel 80ms frame used
14 indicator.
- 15 • TDM_STRUCTURE_IND - Forward Broadcast Supplemental Channel TDM structure
16 used indicator.
- 17 • TDM_SLOT_LENGTH - Forward Broadcast Supplemental Channel TDM slot length
- 18 • TDM_SUPER_PERIOD_MASK_LEN - TDM super period mask length indicator.
- 19 • TDM_MEGA_PERIOD_MASK_LEN - TDM mega period mask length indicator.
- 20 **FCCCH_s** – Current Forward Common Control Channel number.
- 21 **FIRST_ACTIVE_PILOT_s** – While the mobile station is in the *System Access State*, identifies
22 the pilot to which the first access probe was transmitted, upon entering the *System Access*
23 *State*.
- 24 **FIXED_NUM_PREAMBLE_s** – Traffic Channel preamble length for fixed preamble
25 transmission.
- 26 **FIXED_PREAMBLE_TRANSMIT_IND_s** – The fixed preamble transmission flag indicates
27 whether the mobile station is allowed to enter the *Traffic Channel Substate* of the *Mobile*
28 *Station Control on the Traffic Channel State*, after sending the number of preambles specified
29 in *Extended Channel Assignment Message*.
- 30 **FOR_ACKCH_ASSIGNED_s** – Forward Acknowledgment Channel assignment
31 indicator.
- 32 **FOR_ACKCH_COMB_SEL_s** – Forward Acknowledgment Channel combining method
33 selector.
- 34 **FOR_ACKCH_MODE_s** – Forward Acknowledgment Channel Mode.

- 1 **FOR_ACKCH_WALSH_INDEX_s** – Forward Acknowledgment Channel Walsh Code index.
- 2 **FOR_ACKSCH_INDEX_s** – Forward Acknowledgment Channel subchannel index.
- 3 **FOR_CPCCH_RATE_s** – Forward Common Power Control Channel Rate.
- 4 **FOR_DCCH_MUX_OPTION_s** – Forward Dedicated Control Channel Multiplex Option.
- 5 **FOR_DURATION_s** – A stored variable in the mobile station that contains the duration (in
6 units of 80 ms) of a forward Supplemental Code Channel transmission that begins at time
7 FOR_START_TIME_s.
- 8 **FOR_FCH_MUX_OPTION_s** – Forward Fundamental Channel Multiplex Option.
- 9 **FOR_FCH_RC_s** – Forward Fundamental Channel Radio Configuration.
- 10 **FOR_FRAME_40_MAX_RATE_s** – The maximum data rate for the mobile station's
11 transmission at 40 ms frame length on the Forward Supplemental Channel.
- 12 **FOR_FRAME_80_MAX_RATE_s** – The maximum data rate for the mobile station's
13 transmission at 80 ms frame length on the Forward Supplemental Channel.
- 14 **FOR_GCH_ASSIGNED_s** – Forward Grant Channel assigned indicator.
- 15 **FOR_GCH_WALSH_INDEX_s** – Forward Grant Channel Walsh Index. The Walsh index of
16 the Forward Grant Channel assigned to a mobile station.
- 17 **FOR_LINKED_HDM_SEQ_s** – Storage variable containing the most recent forward sequence
18 number of the *General Handoff Direction Message* to which a *Supplemental Channel*
19 *Assignment Message* forward assignment was linked.
- 20 **FOR_NID_REG_s** – Foreign NID roamer autonomous registration enable.
- 21 **FOR_RCCH_ASSIGNED_s** – Assigned Forward Rate Control Channel. An on or off indicator
22 used to determine if Forward Rate Control Channel is assigned or not.
- 23 **FOR_RCCH_MODE_s** – Forward Rate Control Channel mode.
- 24 **FOR_RCCH_REPETITION_s** – Forward Rate Control Channel Subchannel repetition factor.
- 25 **FOR_RCCH_WALSH_INDEX_s** – Forward Rate Control Channel Walsh code.
- 26 **FOR_RCSCH_INDEX_s** – Forward Rate Control Channel subchannel index.
- 27 **FOR_PDCH_SUPPORTED_s** – Forward Packet Data Channel supported indicator.
- 28 **FOR_PDCH_INCL_s** – Forward Packet Data Channel assigned indicator for each pilot in the
29 active set.
- 30 **FOR_RC_s** – Forward Channel Radio Configuration.
- 31 **FOR_SCH_CC_INDEX_s** – Supplemental code channel index used on the Supplemental
32 Channel.
- 33 **FOR_SCH_DURATION_s** – A stored variable in the mobile station, which contains the
34 duration of a forward Supplemental Channel transmission, which begins at time
35 FOR_SCH_START_TIME_s.
- 36 **FOR_SCH_FRAME_LENGTH_s** – The Forward Supplemental Channel frame length.

- 1 **FOR_SCH_RATE_s** – The rate of the Forward Supplemental Channel.
- 2 **FOR_SCH_START_TIME_s** – A stored variable in the mobile station which contains the
3 System Time, in units of time specified by START_TIME_UNIT_s, (modulo 32) at which the
4 mobile station shall start (or resume) processing Forward Supplemental Channels.
- 5 **FOR_SID_REG_s** – Foreign SID roamer autonomous registration enable.
- 6 **FOR_START_TIME_s** – A stored variable in the mobile station that contains the System
7 Time, in units of 80 ms, (modulo 64) at which the mobile station shall start (or resume)
8 processing Forward Supplemental Code Channels.
- 9 **FPC_DCCH_CURR_SETPT_s** – Current power control subchannel outer loop setpoint for the
10 Forward Dedicated Control Channel.
- 11 **FPC_DCCH_FER_s** – Target frame error rate for the Forward Dedicated Control Channel.
- 12 **FPC_DCCH_MAX_SETPT_s** – Maximum value of the power control subchannel outer loop
13 setpoint for the Forward Dedicated Control Channel.
- 14 **FPC_DCCH_MIN_SETPT_s** – Minimum value of the power control subchannel outer loop
15 setpoint for the Forward Dedicated Control Channel.
- 16 **FPC_DELTA_SCH_SETPT_s** – The difference between the Fundamental Channel current
17 power control subchannel outer loop setpoint and the Supplemental Channel current
18 power control subchannel outer loop setpoint.
- 19 **FPC_DELTA_SETPT_s** – The difference between the Fundamental Channel current power
20 control subchannel outer loop setpoint and the Dedicated Control Channel current power
21 control subchannel outer loop setpoint.
- 22 **FPC_FCH_CURR_SETPT_s** – Current power control subchannel outer loop setpoint for the
23 Forward Fundamental Channel.
- 24 **FPC_FCH_FER_s** – Target frame error rate for the Forward Fundamental Channel.
- 25 **FPC_FCH_MAX_SETPT_s** – Maximum value of the power control subchannel outer loop
26 setpoint for the Forward Fundamental Channel.
- 27 **FPC_FCH_MIN_SETPT_s** – Minimum value of the power control subchannel outer loop
28 setpoint for the Forward Fundamental Channel.
- 29 **FPC_MODE_s** – Forward power control operating mode.
- 30 **FPC_MODE_NO_SCH_s** – Forward power control operating mode except during the forward
31 Supplemental Channel assignment interval.
- 32 **FPC_MODE_SCH_s** – Forward power control operating mode during the forward
33 Supplemental Channel assignment interval.
- 34 **FPC_PRI_CHAN_s** – Primary power control subchannel measured channel.
- 35 **FPC_SEC_CHAN_s** – Index of Forward Supplemental Channel to be measured by the
36 secondary power control subchannel.
- 37 **FPC_SCH_CURR_SETPT_s[i]** – Current power control subchannel outer loop setpoint for
38 Forward Supplemental Channel i.

- 1 **FPC_SCH_FER_s[i]** – Target frame error rate for Forward Supplemental Channel i.
- 2 **FPC_SCH_MAX_SETPT_s[i]** – Maximum value of the power control subchannel outer loop
3 setpoint for Forward Supplemental Channel i.
- 4 **FPC_SCH_MIN_SETPT_s[i]** – Minimum value of the power control subchannel outer loop
5 setpoint for Forward Supplemental Channel i.
- 6 **FPC_SETPT_THRESH_s** – Power control subchannel outer loop setpoint report threshold for
7 the Dedicated Control Channel.
- 8 **FPC_SETPT_THRESH_SCH_s** – Power control subchannel outer loop setpoint report
9 threshold for the Supplemental Channel.
- 10 **FRAME_OFFSET_s** – Current Traffic Channel frame offset, in units of 1.25 ms.
- 11 **FULL_BSPM_IND** – Indicates whether mobile station had the complete BSPM information
12 at the time it received the last Full or Differential *BCMC Service Parameters Message*.
- 13 **FUNDICATED_BCMC_IND_s** – Broadcast-Multicast services on Fundicated Channel
14 Indicator.
- 15 **GAPM_SEQ_s** – Last received *Generic Access Parameters Message* sequence number if the
16 mobile supports GAPM.
- 17 **GEN_NGHR_LST_MSG_SEQ_s** – General Neighbor List Message sequence number.
- 18 **GLOBAL_REDIRECT_s** – *Global Service Redirection Message* sent indicator.
- 19 **GLOB_SERV_REDIR_MSG_SEQ_s** – Global Service Redirection Message sequence number.
- 20 **GRANTED_MODE_s** – Mobile station current granted mode.
- 21 **HASH_KEY** – Hashing function input that determines the return value. Derived from
22 IMSI_O.
- 23 **HDM_SEQ_s** – Last received *Extended Handoff Direction Message*, *General Handoff Direction*
24 *Message*, or *Universal Handoff Direction Message* sequence number.
- 25 **HOME_REG_s** – Home (non-roaming) autonomous registration enable.
- 26 **IGNORE_ESCAM_s** – Identifies whether a mobile station will process the reverse
27 supplemental channel assignment portion of the subsequent *Supplemental Channel*
28 *Assignment Message* or *Reverse Supplemental Channel Assignment Mini Message*.
- 29 **IGNORE_QPCH_s** – Ignore QPCH indicators flag. Indicates whether the mobile station is to
30 ignore its assigned paging indicators on the QPCH while operating in the reduced slot cycle
31 mode if the reduced slot cycle index is -3 or -4.
- 32 **IGNORE_SCAM_s** – Identifies whether a mobile station will process the reverse
33 supplemental code channel assignment portion of the subsequent *Supplemental Channel*
34 *Assignment Message*.
- 35 **IMSI_10_s** – The least significant digit of MNC when the MNC is 3-digit.
- 36 **IMSI_11_12_s** – The 11th and 12th digits of the IMSI used for address matching.

- 1 **IMSI_O_ADDR_NUM_s** – The number of digits in the NMSI of the Operational IMSI (IMSI_O)
 2 minus four.
- 3 **IMSI_O_S_s** – The last 10-digits of Operational IMSI (IMSI_O).
- 4 **IMSI_O_11_12_s** – The 11th and 12th digits of the Operational IMSI (IMSI_O).
- 5 **INIT_PWR_s** – Initial power offset for Access Channel probes.
- 6 **LC_STATE_s** – Long code state obtained from the *Sync Channel Message*.
- 7 **LOGICAL_TO_PHYSICAL_MAPPING_TABLE** – This table contains the logical to physical
 8 mapping for signaling and user traffic.
- 9 **LP_SEC_s** – Leap seconds count (offset of CDMA system time from UTC).
- 10 **LTM_OFF_s** – Local time offset from UTC, in units of 30 minutes.
- 11 **MAX_ADD_SERV_INSTANCE_s** – Maximum number of additional service reference
 12 identifiers allowed in origination.
- 13 **MAX_CAP_SZ_s** – Maximum number of Access Channel frames in an Access Channel
 14 message capsule, less 3.
- 15 **MAX_NUM_ALT_SO_s** – The maximum number of alternative service option numbers that
 16 the mobile station is allowed to include in the *Origination Message* or in the *Page Response*
 17 *Message*.
- 18 **MAX_NUM_PROBE_HO_s** – The maximum number of times that a mobile station is
 19 permitted to perform an access probe handoff.
- 20 **MAX_PWR_PUF_s** – Maximum number of PUF probes to be transmitted at maximum mobile
 21 station output power during a PUF attempt.
- 22 **MAX_REQ_SEQ_s** – Maximum number of access probe sequences for an Access Channel or
 23 Enhanced Access Channel request.
- 24 **MAX_RER_PILOT_LIST_SIZE_s** – Maximum number of pilots to be maintained in the radio
 25 environment report pilot list while in the radio environment reporting mode.
- 26 **MAX_RSP_SEQ_s** – Maximum number of access probe sequences for an Access Channel or
 27 Enhanced Access Channel response.
- 28 **MAX_SLOT_CYCLE_INDEX_s** – Maximum value of the slot cycle index allowed by the
 29 current base station. This parameter can take values between 0 and 7, inclusive.
- 30 **MCC_s** – The Mobile Country Code used for address matching.
- 31 **MCC_O_s** – The Mobile Country Code of IMSI_O.
- 32 **MC_RR_PAR_MSG_SEQ_s** – *MC-RR Parameters Message* sequence number.
- 33 **MIN_PILOT_EC_IO_THRESH_s** – Threshold for total E_c/I_o of pilots in the Serving Frequency
 34 Active Set used in the Periodic Serving Frequency Pilot Report Procedure.
- 35 **MIN_PILOT_PWR_THRESH_s** – Threshold for total E_c of pilots in the Serving Frequency
 36 Active Set used in the Periodic Serving Frequency Pilot Report Procedure.

- 1 **MIN_P_REV_s** – Minimum mobile station protocol revision level required for access to the
2 CDMA system.
- 3 **MIN_SLOT_CYCLE_INDEX** – Minimum value of the slot cycle index allowed by the current
4 base station. This parameter can take the values -4 or 0.
- 5 **MIN_TOTAL_PILOT_EC_IO_s** – Total pilot strength threshold for the mobile station to
6 attempt to demodulate the Forward Traffic Channel on the CDMA Candidate Frequency.
- 7 **MOB_QOS_s** – Indicator of whether the mobile station is allowed to request QoS settings in
8 the *Origination Message*, *Origination Continuation Message*, or *Enhanced Origination*
9 *Message*.
- 10 **MOB_TERM_s** – Mobile station termination indicator. Set to ‘1’ if the mobile station will
11 accept mobile station terminated calls in its current roaming status.
- 12 **MSG_PERSIST_s** – Persistence modifier for Access Channel message and Enhanced Access
13 data transmissions.
- 14 **MS_LAT_s** – The latitude of the mobile station as estimated by the base station.
- 15 **MS_LOC_TSTAMP_s** – The time corresponding to the estimate of mobile station’s latitude
16 and longitude.
- 17 **MS_LONG_s** – The longitude of the mobile station as estimated by the base station.
- 18 **MS_INIT_POS_LOC_SUP_IND_s** – Mobile station initiated position location determination
19 supported indicator.
- 20 **MULT_NIDS_s** – Multiple NID storage indicator. Set to ‘1’ if the mobile station may store
21 more than one entry in SID_NID_LIST_s for each SID.
- 22 **MULT_SIDS_s** – Multiple SID storage indicator. Set to ‘1’ if the mobile station may store
23 entries in SID_NID_LIST_s having different SIDs.
- 24 **NDSS_ORIG_s** – NDSS Origination Indicator. Indicator used when the mobile station is
25 NDSS-redirected while originating a call.
- 26 **NEW_BAND_RECORD** – Record carrying information pertaining to a channel on a new
27 band to which the mobile station has hashed. The record includes the following fields:
- 28 • **NEW_BAND_CLASS** – The new band class.
 - 29 • **NEW_FREQ** – The new frequency in the new band class.
- 30 **NGHBR_BAND_s** – Neighbor band class.
- 31 **NGHBR_CONFIG_s** – Neighbor base station channel allocation configuration.
- 32 **NGHBR_FREQ_s** – Neighbor CDMA channel number.
- 33 **NGHBR_LST_MSG_SEQ_s** – *Neighbor List Message* sequence number.
- 34 **NGHBR_MAX_AGE_s** – Neighbor set maximum age for retention in the set.
- 35 **NGHBR_PN_s** – Neighbor base station Pilot Channel PN sequence offset in units of 64 PN
36 chips.

- 1 **NGHBR_REC** – Record containing information about a neighbor base station (see also
2 NGHBR_REC_LIST).
- 3 **NGHBR_REC_LIST** – Neighbor base station record list. A descriptive structure used to
4 manage the base station’s information records about neighbor base stations (see also
5 NGHBR_REC).
- 6 **NGHBR_SET_ACCESS_INFO_s** – Neighbor Set access handoff or access probe handoff
7 information included indicator.
- 8 **NGHBR_SET_ENTRY_INFO_s** – Neighbor Set access entry handoff information included
9 indicator.
- 10 **NGHBR_SET_SIZE_s** – Size of the Neighbor Set.
- 11 **NGHBR_TIMING_INCL_s** – Indicates that hopping pilot beacon timing information is
12 included.
- 13 **NGHBR_TX_DURATION_s** – Hopping pilot beacon transmit time duration.
- 14 **NGHBR_TX_OFFSET_s** – Hopping pilot beacon transmit time offset.
- 15 **NGHBR_TX_PERIOD_s** – Hopping pilot beacon transmit time period.
- 16 **NID_s** – Network identification. A network is a subset of the base stations within a wireless
17 system.
- 18 **NOM_PWR_s** – Nominal transmit power offset. A correction factor to be used by mobile
19 stations in the open loop power estimate.
- 20 **NUM_FCCCH_s** – Number of Forward Common Control Channels supported on the current
21 CDMA channel.
- 22 **NUM_PREAMBLE_s** –Traffic Channel preamble length for hard handoff.
- 23 **NUM_QPCH_s** – Number of Quick Paging Channels supported on the current CDMA
24 channel.
- 25 **NUM_REV_CODES_s** – A storage variable in the mobile station that contains the number of
26 Reverse Supplemental Code Channels that will be utilized in the next Reverse
27 Supplemental Code Channel transmission beginning at time REV_START_TIME_s. A value
28 of 0 indicates no Reverse Supplemental Code Channel transmission will be permitted (i.e.,
29 there is no pending Reverse Supplemental Code Channel transmission).
- 30 **NUM_SOFT_SWITCHING_FRAMES_s** – Number of frames for R-CQICH soft switching. The
31 duration of the cell switching period, during which the mobile station is to transmit the cell
32 switch sequence on the R-CQICH channel when it switches between two pilots which are in
33 different groups.
- 34 **NUM_SOFT_SWITCHING_FRAMES_CHM_s** – Number of frames for R-CQICH soft switching
35 while in Control Hold. The duration of the cell switching period, during which the mobile
36 station, while in Control Hold, is to transmit the cell switch sequence on the R-CQICH
37 channel when it switches between two pilots which are in different groups.
- 38 **NUM_SOFT_SWITCHING_SLOTS_s** – Number of slots per frame for R-CQICH soft switching.
39 The duration of the cell switching slots within a switching frame, during which the mobile

- 1 station is to transmit the cell switch indication by using Walsh cover of target on the R-
2 CQICH channel when it switches between two pilots which are in different groups.
- 3 **NUM_SOFT_SWITCHING_SLOTS_CHM_s** – Number of slots per frame for R-CQICH soft
4 switching while in Control Hold. The duration of the cell switching slots within a switching
5 frame, during which the mobile station, while in Control Hold, is to transmit the cell switch
6 indication by using Walsh cover of target on the R-CQICH channel when it switches
7 between two pilots which are in different groups.
- 8 **NUM_SOFTER_SWITCHING_FRAMES_s** – Number of frames for R-CQICH softer switching.
9 The duration of the cell switching period, during which the mobile station is to transmit the
10 cell switch sequence on the R-CQICH channel when it switches between two pilots which
11 are in the same group.
- 12 **NUM_SOFTER_SWITCHING_FRAMES_CHM_s** – Number of frames for R-CQICH softer
13 switching while in Control Hold. The duration of the cell switching period, during which the
14 mobile station, while in Control Hold, is to transmit the cell switch sequence on the R-
15 CQICH channel when it switches between two pilots which are in the same group.
- 16 **NUM_SOFTER_SWITCHING_SLOTS_s** – Number of slots per frame for R-CQICH softer
17 switching. The duration of the cell switching slots within a switching frame. During this
18 time the mobile station is to transmit the cell switch indication by using the Walsh cover of
19 the target sector in the cell switch sequence on the R-CQICH channel when it switches
20 between two pilots which are in the same group.
- 21 **NUM_SOFTER_SWITCHING_SLOTS_CHM_s** – Number of slots per frame for R-CQICH softer
22 switching while in Control Hold. The duration of the cell switching slots within a switching
23 frame. During this time the mobile station, while in Control Hold, is to transmit the cell
24 switch indication by using the Walsh cover of the target sector in the cell switch sequence
25 on the R-CQICH channel when it switches between two pilots which are in the same group.
- 26 **NUM_STEP_s** – Number of access probes or enhanced access probes in a single access
27 probe sequence or enhanced access probe sequence.
- 28 **NUM_SYNC_ID_SUPPORTED** – Number of SYNC_IDs supported by the mobile station.
- 29 **OTHER_REPORTED_LIST** – List of other pilots that have pilot strengths exceeding T_ADD
30 and that are not included in ACCESS_HO_LIST.
- 31 **PACA_s** – PACA call indicator. Set to enabled to indicate that the mobile station is waiting
32 for a priority access channel assignment; otherwise, set to disabled. In Sections 2 and 3,
33 PACA_s = 0 is equivalent to setting PACA_s to disabled and PACA_s = 1 is equivalent to setting
34 PACA_s to enabled.
- 35 **PACA_CANCEL** – PACA call cancel indicator. Set to ‘1’ when the mobile station is directed
36 by the user to cancel the PACA call; otherwise, set to ‘0’.
- 37 **PACA_SID_s** – PACA system identifier. Equal to the SID of the system on which the mobile
38 station originated a PACA call.
- 39 **PACA_TIMEOUT_s** – PACA state timer duration. Specifies how long the mobile station
40 should wait for a *PACA Message* from the base station.

- 1 **PACKET_ZONE_ID_s** – Packet data services zone identifier of the base station.
- 2 **PAGECH_s** – Current CDMA Paging Channel number.
- 3 **PAGED** – Indicator for a page match detected while the mobile station is in the *System*
- 4 *Access State*.
- 5 **PAGE_CHAN_s** – Number of Paging Channels supported on the current CDMA channel.
- 6 **PAM_SZ_s** – Number of frames in the Access Channel or Enhanced Access Channel
- 7 preamble, less 1.
- 8 **PARAMETER_REG_s** – Parameter-change registration enable.
- 9 **PDCH_CHM_SUPPORTED_s** – Indicates whether the base station supports PDCH Control
- 10 Hold Mode operation.
- 11 **PDCH_GROUP_IDENTIFIER_s** – A three-bit Packet Data Channel group identifier. It is used
- 12 to determine whether the mobile station should use the softer or soft reselection
- 13 parameters when repointing between pilots in its Active Set (See [3]).
- 14 **PDCH_SOFT_SWITCHING_DELAY_s** – PDCH soft switching delay. The minimum
- 15 interruption seen by the mobile station when the mobile station is to transmit the cell
- 16 switch sequence on the R-CQICH channel when it switches between two pilots which are in
- 17 different groups.
- 18 **PDCH_SOFTENED_SWITCHING_DELAY_s** – PDCH softer switching delay. The minimum
- 19 interruption seen by the mobile station when the mobile station is to transmit the cell
- 20 switch sequence on the R-CQICH channel when it switches between two pilots which are in
- 21 the same group.
- 22 **PERIODIC_SEARCH_s** – Flag to indicate if the mobile station is to perform a periodic search
- 23 on the Candidate Frequency.
- 24 **PGSLOT** – Value obtained from the hashing function, used to determine the mobile
- 25 station's assigned Paging Channel slots.
- 26 **PILOT_ARRIVAL** – Time of occurrence, as measured at the mobile station antenna
- 27 connector, of the earliest arriving usable multipath component of the pilot. The arrival time
- 28 is measured relative to the mobile station's time reference.
- 29 **PILOT_INFO_REQ_SUPPORTED_s** – Pilot information request supported indicator.
- 30 **PILOT_GATING_RATE_s** – Reverse pilot gating rate on the Reverse Pilot Channel.
- 31 **PILOT_GATING_USE_RATE** – Reverse pilot gating rate enable indicator. It indicates
- 32 whether or not the Reverse Pilot Channel is gated.
- 33 **PILOT_INC_s** – Pilot PN sequence offset index increment. The interval between pilots, in
- 34 units of 64 PN chips, for base stations in a system.
- 35 **PILOT_PN_s** – Pilot Channel PN sequence offset, in units of 64 PN chips, for a base station.
- 36 **PILOT_PN_PHASE** – Calculated Pilot Channel PN phase, in chips, including the PN
- 37 sequence offset and the arrival time relative to the mobile station's time reference.
- 38 **PILOT_REPORT_s** – Pilot reporting indicator.

- 1 **PLCM_TYPE_s** – Public long code mask type. Indicates the long code mask generation
2 algorithm when Public Long Code Mask is in use. See 2.3.6.
- 3 **POTENTIAL_CDMACH_s** – The CDMA Channel number that could potentially be used by
4 the mobile station.
- 5 **POWER_DOWN_REG_s** – Power down registration enable indicator.
- 6 **POWER_UP_REG_s** – Power up registration enable indicator.
- 7 **PPSMM_PERIOD_s** – The period used in the Periodic Serving Frequency Pilot Report
8 Procedure.
- 9 **PRAT_s** – Data rate of the Paging Channels.
- 10 **P_REV_s** – Protocol revision level supported by a base station.
- 11 **P_REV_IN_USE_s** – Protocol revision level currently in use by a mobile station.
- 12 **PREF_MSID_TYPE_s** – Preferred mobile station identifier field type.
- 13 **PREVIOUS_ACTIVE_PILOT_s** – Identifies the pilot, if any, which was in the Active Set
14 immediately prior to the current pilot in the Active Set, during the current access attempt.
- 15 **PRI_NGHBR_LST_s** – *Private Neighbor List Message* sent indicator.
- 16 **PRI_NGHBR_PN** – Private Neighbor base station Pilot Channel PN sequence offset in units
17 of 64 PN chips.
- 18 **PRI_NGHBR_REC** – Record containing information about a private neighbor base station
19 (see also PRI_NGHBR_REC_LIST).
- 20 **PRI_NGHBR_REC_LIST** – Private neighbor base station record list. A descriptive structure
21 used to manage the base station’s information records about private neighbor base stations
22 (see also PRI_NGHBR_REC).
- 23 **PRI_NGHBR_LST_MSG_SEQ_s** – Private Neighbor List Message sequence number.
- 24 **PROBE_BKOFF_s** – Access Channel probe backoff range, in slots.
- 25 **PROBE_PN_RAN_s** – Range for hashing function selection of the delay prior to transmission
26 of Access Channel probes. Value is $\log_2(\text{range} + 1)$.
- 27 **PSIST_s** – Persistence value for the mobile station’s overload class.
- 28 **PSIST_M_s** – Persistence value used by the mobile station with overload class 14 when
29 sending delay-sensitive data or network overload control is not enabled.
- 30 **PUF_FREQ_INCL_s** – Flag to indicate whether the mobile station is to transmit a PUF probe
31 on the serving frequency or on a target frequency.
- 32 **PUF_INIT_PWR_s** – Power increase (in dB) of the first PUF pulse in a PUF attempt.
- 33 **PUF_INTERVAL_s** – Number of frames between the start of each PUF probe.
- 34 **PUF_PULSE_SIZE_s** – Duration of a PUF pulse in power control groups.
- 35 **PUF_PWR_STEP_s** – Amount (in dB) by which the mobile station is to increment the power
36 of a PUF pulse above nominal power from one PUF pulse to the next.

- 1 **PUF_SETUP_SIZE_s** – Number of power control groups within a PUF probe before the
2 transmission of the PUF pulse.
- 3 **PUF_SF_CDMABAND_s** – Serving Frequency CDMA band class.
- 4 **PUF_SF_CDMACH_s** – Serving Frequency CDMA Channel number.
- 5 **PUF_TF_CDMABAND_s** – Target Frequency CDMA band class.
- 6 **PUF_TF_CDMACH_s** – Target Frequency CDMA Channel number.
- 7 **PUF_TX_PWR_s** – Mobile station’s output power for the PUF pulse.
- 8 **PWR_CNTL_STEP_s** – Power control step size assigned by the base station that the mobile
9 station is to use for closed loop power control.
- 10 **PWR_PERIOD_ENABLE_s** – Forward power control periodic reporting enabled indicator.
- 11 **PWR_REP_DELAY_s** – Power report delay. The period that the mobile station waits following
12 an autonomous *Power Measurement Report* before restarting frame counting for power
13 control purposes.
- 14 **PWR_REP_FRAMES_s** – Power control reporting frame count. The number of frames over
15 which the mobile station is to count frame errors. Value is $2 \times \log_2(\text{frames} / 5)$.
- 16 **PWR_REP_THRESH_s** – Power control reporting threshold. The number of bad frames to be
17 received in a measurement period before the mobile station is to generate a *Power*
18 *Measurement Report Message*.
- 19 **PWR_STEP_s** – Power increment for successive access probes, in units of 1.0 dB.
- 20 **PWR_THRESH_ENABLE_s** – Forward power control threshold reporting enabled indicator.
- 21 **QOF_ID_s** – Quasi-orthogonal function index on the Supplemental Channel.
- 22 **QoF Set** – QoF Set is a set of Quasi-orthogonal functions generated by applying the same
23 quasi-orthogonal masking function to the set of all Walsh functions.
- 24 **QPAGECH_s** – Current Quick Paging Channel number.
- 25 **QPCH_CCI_SUPPORTED_s** – Flag to indicate if configuration change indicators are
26 supported on the Quick Paging Channel.
- 27 **QPCH_POWER_LEVEL_PAGE_s** – Relative power level of the transmitted Quick Paging
28 Channel Paging Indicator modulation symbols, relative to the Forward Pilot Channel.
- 29 **QPCH_POWER_LEVEL_CONFIG_s** – Relative power level of the transmitted Quick Paging
30 Channel Configuration Change Indicator modulation symbols, relative to the Forward Pilot
31 Channel.
- 32 **QPCH_RATE_s** – Indicator rate of the current Quick Paging Channel(s).
- 33 **QPCH_SUPPORTED_s** – Flag to indicate if the Quick Paging Channel is supported by the
34 base station.
- 35 **RA** – Random access channel number. The Access Channel number generated (pseudo-
36 randomly) by the mobile station.

- 1 **RAND_s** – Authentication random challenge value.
- 2 **RANDC** – The eight most-significant bits of the random challenge value used by the mobile
3 station.
- 4 **RANDOM_TIME** – Random time. A portion of SYS_TIME used to seed the random number
5 generator.
- 6 **RC_CAP_REQUESTED_s** – Radio Configuration Capability indicator. When set to “1” the
7 mobile station shall include the Radio Configuration capabilities that it supports in the
8 *Origination Message and Page Response Message*.
- 9 **RCCCH_SLOT_s** – See [2].
- 10 **RCCCH_SLOT_OFFSET1_s** – See [2].
- 11 **RCCCH_SLOT_OFFSET2_s** – See [2].
- 12 **REDIRECTION_s** – Service redirection indicator. Set to enabled to indicate that service
13 redirection is currently in effect; otherwise, set to disabled.
- 14 **REDIRECT_REC_s** – Holds the service redirection criteria specified in the redirection record
15 of the most recently received *Extended Global Service Redirection Message, Global Service*
16 *Redirection Message or Service Redirection Message*.
- 17 **REDIRECT_REC_LIST** – An array of redirection records selected from the most recently
18 received *Extended Global Service Redirection Message*. Each redirection record in this array
19 specifies a redirection criteria. See REDIRECT_REC_s.
- 20 **REG_COUNT_s** – The timer-based registration counter.
- 21 **REG_COUNT_MAX_s** – Timer-based registration count limit. The timer-based registration
22 counter expiration value computed from REG_PRD_T.
- 23 **REG_DIST_s** – Registration distance. Distance from last registration that causes a distance-
24 based registration to occur.
- 25 **REG_ENABLED_s** – Autonomous registrations enabled indicator.
- 26 **REG_NID_s** – Network identification corresponding to the base station where the mobile
27 station is considered registered upon receiving confirmation of delivery of *Registration*
28 *Message, Origination Message, Page Response Message, or Reconnect Message*.
- 29 **REG_REG_ZONE_s** – Registration zone number corresponding to the base station where the
30 mobile station is considered registered upon receiving confirmation of delivery of
31 *Registration Message, Origination Message, Page Response Message, or Reconnect Message*.
- 32 **REG_SECURITY_RESYNC** – Security re-sync required registration indicator.
- 33 **REG_SID_s** – System identification corresponding to the base station where the mobile
34 station is considered registered upon receiving confirmation of delivery of *Registration*
35 *Message, Origination Message, Page Response Message, or Reconnect Message*.
- 36 **REGISTERED_s** – Mobile station registered indicator.
- 37 **REG_PRD_s** – Registration period. The time interval between timer-based registrations.
38 Value is $4 \times \log_2(\text{time} / 0.08 \text{ s})$.

- 1 **REG_PERSIST_s** – Persistence modifier for registration accesses (except ordered registrations).
- 2 **REG_ZONE_s** – Registration zone number of the base station.
- 3 **REG_ZONE_TIMER_s** – Zone timer length corresponding to the base station where the
 4 mobile station is considered registered upon receiving confirmation of delivery of
 5 *Registration Message, Origination Message, Page Response Message, or Reconnect Message.*
- 6 **REJECT_UZID_s** – User Zone identifier of the User Zone rejected by the base station.
- 7 **RELEASE_TO_IDLE_IND_s** – Indicator of whether the mobile station is allowed to transition
 8 directly to the *Mobile Station Idle State* upon releasing all the dedicated channels.
- 9 **RER_MAX_NUM_MSG_s** – The maximum number of Radio Environment Messages that the
 10 mobile station is permitted to transmit while in the radio environment reporting mode.
- 11 **RER_MODE_ENABLED** – Flag that indicates whether the radio environment reporting
 12 mode is currently enabled at the mobile station.
- 13 **RER_PILOT_LIST** – Radio environment report pilot list used while in the radio environment
 14 reporting mode.
- 15 **RER_MODE_SUPPORTED_s** – Base station support of radio environment reporting mode
 16 indicator.
- 17 **RESELECT_INCLUDED_s** – System reselection information included indicator. When this is
 18 set to ‘1’, the system reselection procedure is enabled.
- 19 **RESPOND_IND_s** – Respond Requested Indicator. Indicates if the mobile station is to
 20 acknowledge direct channel assignment by sending a page response message or a
 21 reconnect message in unassured mode.
- 22 **RESQ_ENABLED_s** – Call rescue feature enabled indicator. Flag to indicate if the call
 23 rescue feature is enabled in the network.
- 24 **RESQ_ALLOWED_TIME_s** – Call rescue allowed timer. Specifies the maximum interval that
 25 the mobile station has to begin a call rescue soft handoff attempt, after the call rescue
 26 delay timer expires.
- 27 **RESQ_ATTEMPT_TIME_s** – Call rescue attempt timer. Specifies the maximum time a
 28 mobile station is allowed to keep its transmitter re-enabled while waiting to receive N_{3m}
 29 consecutive good frames during a call rescue soft handoff attempt.
- 30 **RESQ_CODE_CHAN_s** – The code channel index of the Rescue Channel for neighbor base
 31 stations that are configured with a Rescue Channel.
- 32 **RESQ_DELAY_TIME_s** – Call rescue delay timer. Specifies the minimum delay before the
 33 mobile station can attempt call rescue soft handoff, after the mobile station disables its
 34 transmitter due to receiving N_{2m} consecutive bad frames or declaring an acknowledgment
 35 failure.
- 36 **RESQ_MIN_PERIOD_s** – Minimum time between consecutive call rescues. Specifies the
 37 minimum time after a successful call rescue (i.e. receipt of N_{3m} consecutive good frames
 38 by the mobile station after the rescue attempt timer is enabled) before any subsequent call
 39 rescue attempts can be initiated.

- 1 **RESQ_NUM_PREAMBLE_RC1_RC2_s** – The Traffic Channel preamble length for Call Rescue
2 Soft Handoff when operating in Radio Configuration 1 or 2.
- 3 **RESQ_NUM_PREAMBLE_s** – The Traffic Channel preamble length for Call Rescue Soft
4 Handoff when operating in Radio Configuration greater than 2.
- 5 **RESQ_NUM_TOT_TRANS_20MS_s** – The required number of transmissions of a regular
6 PDU before declaring a L2 Acknowledgment Failure when Call Rescue is enabled.
- 7 **RESQ_NUM_TOT_TRANS_5MS_s** – The required number of transmissions of a mini PDU
8 before declaring a L2 Acknowledgment Failure when Call Rescue is enabled.
- 9 **RESQ_POWER_DELTA_s** – The power level adjustment to be applied to the last closed-loop
10 power level when re-enabling the transmitter for call rescue soft handoff.
- 11 **RESQ_QOF_s** – The Quasi-Orthogonal Function mask identifier of the Rescue Channel for
12 neighbor base stations that are configured with a Rescue Channel.
- 13 **RESUME_PREAMBLE_s** – A storage variable in the mobile station that contains the size of
14 the preamble that shall be transmitted on a Reverse Supplemental Code Channel at the
15 beginning of transmission on a Reverse Supplemental Code Channel when resuming
16 transmission following an interruption when discontinuous transmission is occurring.
- 17 **RETRY_DELAY_s[i]** – A storage variable in the mobile station that contains the system time
18 before which the mobile station may not transmit a specific message. The type of message
19 that cannot be transmitted is specified by RETRY_TYPE, represented here by i. A
20 RETRY_DELAY_s[i] value of 0 indicates no retry delay is in effect, and a value of ‘11111111’
21 indicates an infinite retry delay.
- 22 **RETRY_DELAY_UNIT_s** – The units for the value of RETRY_DELAY_s. Possible values are
23 1000ms and 60000ms.
- 24 **RETRY_DELAY_VALUE_s** – The unitless value of the retry delay.
- 25 **RETRY_TYPE_s** – The retry delay type. It specifies the type of message to which the retry
26 delay value applies. If set to a value of 0, it indicates that all retry delay values should be
27 cleared.
- 28 **RETURN_CAUSE_s** – Reason for the mobile station registering or accessing the system.
- 29 **RETURN_IF_FAIL_s** – Return if fail indicator. Set to ‘1’ to indicate that mobile station is to
30 return to the system from which it was redirected if it fails to acquire service on a system
31 using specified redirection criteria. Otherwise, set to ‘0’.
- 32 **RETURN_IF_HANDOFF_FAIL_s** – Return if handoff fail indicator. Indicates if the mobile
33 station is to resume using the Active Set on the Serving Frequency following an
34 unsuccessful hard handoff attempt.
- 35 **REV_DCCH_MUX_OPTION_s** – Reverse Dedicated Control Channel Multiplex Option.
- 36 **REV_DTX_DURATION_s** – Maximum duration of time in units of 20 ms that the mobile
37 station is allowed to stop transmitting on a Reverse Supplemental Code Channel within the
38 reverse assignment duration.

- 1 **REV_DURATION_s** – A stored variable in the mobile station that contains the duration (in
2 units of 80 ms) of the Reverse Supplemental Code Channel transmission that will begin at
3 time REV_START_TIME_s.
- 4 **REV_FCH_GATING_MODE_s** – The reverse Fundamental Traffic Channel gating mode in
5 Radio Configurations 3, 4, 5, and 6 where 50% of the PCGs in the 1500 bps and 1800 bps
6 frames are gated off (see [2]). Set to '1' if the mobile station is operating in the reverse
7 fundamental channel gating mode.
- 8 **REV_FCH_MUX_OPTION_s** – Reverse Fundamental Channel Multiplex Option.
- 9 **REV_FCH_RC_s** – Reverse Fundamental Channel Radio Configuration.
- 10 **REV_FRAME_40_MAX_RATE_s** – The maximum data rate for the mobile station's
11 transmission at 40 ms frame length on the Reverse Supplemental Channel.
- 12 **REV_FRAME_80_MAX_RATE_s** – The maximum data rate for the mobile station's
13 transmission at 80 ms frame length on the Reverse Supplemental Channel.
- 14 **REV_LINKED_HDM_SEQ_s** – Storage variable containing the most recent reverse sequence
15 number of the *General Handoff Direction Message* to which a *Supplemental Channel*
16 *Assignment Message* reverse assignment was linked.
- 17 **REV_PDCH_AUTO_ALLOWED_s[i]** – Reverse Packet Data Channel Autonomous
18 Transmission allowed indicator. An on or off indicator used to identify whether
19 autonomous transmission is allowed or not allowed for each SR_ID.
- 20 **REV_PDCH_BOOST_ALLOWED_s[i]** – Reverse Packet Data Channel boost allowed indicator.
21 An on or off indicator that identifies whether traffic to pilot ratio boosting is allowed or not
22 allowed for each SR_ID.
- 23 **REV_PDCH_BOOST_OVERSHOOT_s** – Reverse Packet Data Channel Boost Overshoot.
- 24 **REV_PDCH_BUFFER_SIZE_s[i]** – Reverse Packet Data Buffer size. An array of buffer sizes
25 that correspond to the buffer status.
- 26 **REV_PDCH_DEFAULT_PERSISTENCE_s** – Reverse Packet Data Default Persistence. The
27 initial default persistence value.
- 28 **REV_PDCH_GRANT_PRECEDENCE_s** – Reverse Packet Data Channel Grant
29 Precedence Indicator.
- 30 **REV_PDCH_INIT_TARGET_TPR_s** – Reverse Packet Data Channel Initial Target for Traffic
31 to pilot ratio. The initial target traffic to pilot ratio.
- 32 **REV_PDCH_MAX_AUTO_TPR_s** – The maximum traffic to pilot ratio for autonomous
33 transmission.
- 34 **REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_s** – Maximum Allowed Reverse
35 Packet Data Channel encoder packet size.
- 36 **REV_PDCH_MAX_SIZE_SUPPORTED_ENCODER_PACKET** – Maximum supported
37 Reverse Packet Data Channel encoder packet size by the mobile station.
- 38 **REV_PDCH_MAX_TARGET_TPR_s** – Reverse Packet Data Maximum Target Traffic to Pilot
39 Ratio. The maximum target traffic to pilot ratio that is allowed.

- 1 **REV_PDCH_MSIB_SUPPORTED_s** – Reverse Packet Data Channel Mobile Station Indicator
2 Supported Bit.
- 3 **REV_PDCH_MUX_OPTION_HIGH_RATE_s** – Reverse Packet Data Channel Multiplex
4 Option for higher data rates indicator.
- 5 **REV_PDCH_MUX_OPTION_LOW_RATE_s** – Reverse Packet Data Channel Multiplex Option
6 for lower data rates indicator.
- 7 **REV_PDCH_NUM_ARQ_ROUNDS_BOOST_s** – The maximum number of ARQ rounds for
8 boosted transmission that can be performed on the Reverse Packet Data Channel.
- 9 **REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_s** – The maximum number of ARQ rounds for
10 non-boosted transmission that can be performed on the Reverse Packet Data Channel.
- 11 **REV_PDCH_QUICK_START_THRESH_s** – Reverse Packet Data Quick Start Threshold. The
12 Quick start threshold for the Reverse Packet Data Control Channel.
- 13 **REV_PDCH_RC** – Reverse Packet Data Channel radio configuration.
- 14 **REV_PDCH_RESET_PERSISTENCE_s** – Reverse Packet Data Channel Reset Persistence.
15 Determines the value of current persistence [3] at the end of a non-persistent grant for the
16 Reverse Packet Data Channel.
- 17 **REV_PDCH_REQCH_TRIGGER_s[i]** – Reverse Packet Data Request Channel Trigger. The
18 following parameters are contained in this array and will be triggered for the REQCH.
- 19 • REV_REQCH_MIN_DURATION – Minimum duration between REQCH messages for this
20 SR_ID.
 - 21 • REV_REQCH_USE_BUFFER_REPORTS – An on or off indicator used to allow buffer
22 reports.
 - 23 • REV_REQCH_USE_POWER_REPORTS – An on or off indicator used to allow power
24 status reports.
 - 25 • REV_REQCH_USE_WATERMARKS – An on or off indicator used to allow watermark
26 reports.
 - 27 • REV_REQCH_HIGH_WATERMARK – The high watermark level, in octets.
 - 28 • REV_REQCH_LOW_WATERMARK – The low watermark level, in octets.
 - 29 • REV_REQCH_CEILING – The high ceiling level, in octets, used for high priority
30 reporting.
 - 31 • REV_REQCH_FLOOR – The low floor level, in octets, used for high priority reporting.
- 32 **REV_PDCH_SOFT_HANDOFF_RESET_IND_s** – Reverse Packet Data Channel Soft Handoff
33 Reset Indicator. An indicator used to determine whether the Reverse Packet Data Channel
34 control function must be initialized when soft selection is to occur or not.

- 1 **REV_PDCH_STEP_DOWN_s[i]** – Reverse Packet Data Channel Step “down” for rate
2 control.
- 3 **REV_PDCH_STEP_UP_s[i]** – Reverse Packet Data Channel Step “up” for rate
4 control.
- 5 **REV_PDCH_TABLE_SEL_s** – Reverse Packet Data Channel Table selector.
- 6 **REV_PDCH_TPR_BOOSTED_s[i]** – Reverse Packet Data Traffic to Pilot Ratio Boosted. An
7 array indicating the traffic to pilot ratio for boosted traffic.
- 8 **REV_PDCH_TPR_NORMAL_s[i]** – Reverse Packet Data Channel Traffic to Pilot Normal. An
9 array indicating the traffic to pilot ratio for non-boosted traffic.
- 10 **REV_PWR_CNTL_DELAY_s** – The reverse link power control delay for the reverse
11 fundamental channel gating mode in Radio Configurations 3, 4, 5, and 6 and the gated
12 preamble transmission on the Enhanced Access Channel or the Reverse Common Control
13 Channel. The delay is the time between the end of the reverse link PCG and the beginning
14 of the forward link PCG minus one, when the round trip delay is zero.
- 15 **REV_RC_s** – Reverse Channel Radio Configuration.
- 16 **REV_REQCH_ADJ_GAIN_s** – Reverse Request Channel Adjustment Gain.
- 17 **REV_REQCH_HEADROOM_DURATION_s** – Reverse Request Channel minimum power
18 headroom update trigger interval.
- 19 **REV_REQCH_MAX_POWER_UPDATE_DURATION_s** – Reverse Request Channel
20 maximum power headroom update trigger interval.
- 21 **REV_REQCH_POWER_HEADROOM_DECREASE_s** – Reverse Request Channel Power
22 headroom decrease delta to trigger power report.
- 23 **REV_REQCH_POWER_HEADROOM_INCREASE_s** – Reverse Request Channel Power
24 headroom increase delta to trigger power report.
- 25 **REV_REQCH_QUICK_REPEAT_ALLOWED_s** – Reverse Request Channel Quick Repeat
26 Allowed indicator.
- 27 **REV_SCH_DTX_DURATION_s** – Maximum duration of time in units of 20 ms that the
28 mobile station is allowed to stop transmitting on a Reverse Supplemental Channel within
29 the reverse assignment duration.
- 30 **REV_SCH_DURATION_s** – A stored variable in the mobile station which contains the
31 duration of the Reverse Supplemental Channel transmission which will begin at time
32 REV_SCH_START_TIME_s.
- 33 **REV_SCH_FRAME_LENGTH_s** – The Reverse Supplemental Channel frame length.
- 34 **REV_SCH_RATE_s** – The rate of the Reverse Supplemental Channel.
- 35 **REV_SCH_START_TIME_s** – A stored variable in the mobile station which contains the
36 System Time, in units of time specified by START_TIME_UNIT_s, (modulo 32) at which the
37 mobile station shall start (or resume) processing Reverse Supplemental Channels.
- 38 **REV_SPICH_ADJ_GAIN_s** – Reverse Secondary Pilot Channel Adjustment Gain.

- 1 **REV_SPICH_EP_SIZE_s** – Minimum Encoder Packet Size for which the Reverse
2 Secondary Pilot Channel is used.
- 3 **REV_START_TIME_s** – A stored variable in the mobile station that contains the next 80 ms
4 frame boundary (modulo 64) on which the mobile station is assigned to start Reverse
5 Supplemental Code Channel transmission.
- 6 **REV_WALSH_ID_s** – Reverse Supplemental Channel Walsh cover Identifier.
- 7 **RL_UNDERLOAD_INDICATOR_s** – An indication from the base station that the reverse link
8 rise-over-thermal level is low..
- 9 **RLGAIN_ACKCH_PILOT_s** – Reverse Acknowledgment Channel to pilot adjustment
10 gain.
- 11 **RLGAIN_CQICH_PILOT_s** – Reverse Channel Quality Indicator Channel to pilot
12 adjustment gain.
- 13 **RLGAIN_PDCCH_PILOT_s** – Reverse Packet Data Channel to pilot adjustment gain.
- 14 **RLGAIN_REQCH_PILOT_s** – Reverse Request Channel to pilot adjustment gain.
- 15 **RLGAIN_SPICH_PILOT_s** – Reverse Secondary Pilot Channel to pilot adjustment
16 gain.
- 17 **RN_HASH_KEY_s** – Name of an internal variable having the same value as the mobile
18 station's ESN. This variable is used by procedures defined in [3].
- 19 **ROAM_INDI_s** – Enhanced roaming indicator used for mobile station roaming condition
20 display.
- 21 **RS** – Inter-probe sequence backoff. The delay in slots generated (pseudorandomly) by the
22 mobile station following an unsuccessful access probe sequence or prior to the first access
23 probe in a response attempt.
- 24 **RSC_END_TIME** – Reduced slot cycle mode end time. The system time at which a mobile
25 station operating in the reduced slot cycle mode will exit the mode.
- 26 **RSC_MODE_ENABLED** – Mobile Station flag that indicates whether reduced slot cycle
27 mode is enabled.
- 28 **RSCI_s** – Reduced slot cycle index.
- 29 **RT** – Inter-probe backoff. The delay in slots generated (pseudorandomly) by the mobile
30 station following an unacknowledged access probe.
- 31 **RTC_NOM_PWR_s** – Reverse Traffic Channel Nominal Power. The nominal power to be used
32 by the mobile station for its initial transmission on the Reverse Traffic Channel when Direct
33 Channel Assignment is used.
- 34 **RTC_NOM_PWR_USE_IND** – Reverse Traffic Channel Nominal Power Used Indicator.
35 Indicates if the mobile station uses RTC_NOM_PWR_s. See RTC_NOM_PWR_s.
- 36 **SCAM_FOR_DURATION_MODE_s** – Indicator for a specific or an indefinite Forward
37 Supplemental Code Channel assignment duration.

- 1 **SCAM_FOR_ORDER_s** – The stop or start command set by a *Supplemental Channel*
2 *Assignment Message* that is linked to a *General Handoff Direction Message*.
- 3 **SCAM_REV_DURATION_MODE_s** – Indicator for a specific or an indefinite Reverse
4 Supplemental Code Channel assignment duration.
- 5 **SCH_BAD_FRAMES_s** – Forward Supplemental Channel bad frames count. The number of
6 received bad Forward Supplemental Channel frames.
- 7 **SCH_TOT_FRAMES_s** – Total Forward Supplemental Channel frames received. The total
8 number of received Forward Supplemental Channel frames, counted for Forward Traffic
9 Channel power control.
- 10 **SCRM_SEQ_NUM_s** – Storage variable containing the most recently transmitted
11 *Supplemental Channel Request Message* sequence number.
- 12 **SEARCH_MODE_s** – Search mode to be used in a search on the Candidate Frequency.
- 13 **SEARCH_OFFSET_s** – Time offset of the start of the first search from the action time of the
14 *Candidate Frequency Search Request Message* or the *Candidate Frequency Search Control*
15 *Message* that starts a search.
- 16 **SEARCH_PERIOD_s** – Period for search on the Candidate Frequency.
- 17 **SEARCH_PRIORITY_s** – Neighbor Pilot Channel search priority.
- 18 **SEARCH_PRIORITY_INCL_s** – Search priorities included indicator.
- 19 **SEARCH_TIME_RESOLUTION_s** – Unit of delay used in the *Candidate Frequency Search*
20 *Report Message* to report the total and maximum times away from the Serving Frequency.
- 21 **SENDING_BSPM_s** – *BCMC Service Parameters Message* is being transmitted indicator.
- 22 **SENDING_RAND_s** – *ANSI-41 RAND Message* sent indicator.
- 23 **SERV_NEG_s** – Service negotiation indicator. Indicates whether the mobile station is to use
24 service negotiation or service option negotiation.
- 25 **SERV_REQ_NUM_s** – Service request sequence number. Sequence number to use when
26 requesting a new service configuration.
- 27 **SERVSYS_s** – Selected serving system indicator for Band Class 0. Set to SYS_A if the mobile
28 station operates in system A; otherwise, set to SYS_B.
- 29 **SETTING_SEARCH_WIN** – SRCH_WIN_NGHBR Setting flag. Set to ‘1’ if the mobile station
30 shall set the SRCH_WIN_NGHBR field of each NGHBR_REC to SEARCH_WIN_N_s for all
31 NGHBR_SET_SIZE_s entries upon receiving the *System Parameters Message*.
- 32 **SF_ADD_INTERCEPT_s** – Intercept of the handoff add criterion for the Serving Frequency,
33 stored during hard handoff.
- 34 **SF_CDMABAND_s** – Serving Frequency CDMA band class, stored during hard handoff.
- 35 **SF_CDMACH_s** – Serving Frequency CDMA Channel number, stored during hard handoff.
- 36 **SF_CODE_CHAN_LIST_s** – Serving Frequency Code Channel List, stored during hard
37 handoff.

- 1 **SF_DROP_INTERCEPT_s** – Intercept of the handoff drop criterion for the Serving Frequency,
2 stored during hard handoff.
- 3 **SF_ENCRYPT_MODE_s** – Message encryption indicator for the Serving Frequency, stored
4 during hard handoff.
- 5 **SF_FRAME_OFFSET_s** – Traffic Channel frame offset used on the Serving Frequency, stored
6 during hard handoff.
- 7 **SF_NOM_PWR_s** – Nominal transmit power offset used on the Serving Frequency, stored
8 during hard handoff.
- 9 **SF_NOM_PWR_EXT_s** – Extended nominal transmit power offset indicator for the Serving
10 Frequency, stored during hard handoff.
- 11 **SF_P_REV_s** – Protocol revision level supported by the base station on the Serving
12 Frequency.
- 13 **SF_P_REV_IN_USE_s** – Protocol revision level currently used by the mobile station on the
14 Serving Frequency.
- 15 **SF_PLCM_TYPE_s** – Public long code mask type for the Serving Frequency, stored during
16 hard handoff.
- 17 **SF_PLCM_39_s** – 39-bit public long code mask specified by the base station for the Serving
18 Frequency, stored during hard handoff.
- 19 **SF_PRIVATE_LCM_s** – Private long code mask indicator for the Serving Frequency, stored
20 during hard handoff.
- 21 **SF_PVTLCM_42_s** – Private long code mask for the Serving Frequency, stored during hard
22 handoff.
- 23 **SF_SERV_NEG_s** – Service negotiation indicator for the Serving Frequency, stored during
24 hard handoff.
- 25 **SF_SERVICE_CONFIG_s** – Service configuration (service configuration record and non-
26 negotiable service configuration record) for the Serving Frequency.
- 27 **SF_SOFT_SLOPE_s** – Slope of the handoff add/drop criterion for the Serving Frequency,
28 stored during hard handoff.
- 29 **SF_SRCH_WIN_A_s** – Search window size for the Active Set and Candidate Set used on the
30 Serving Frequency, stored during hard handoff.
- 31 **SF_SRCH_WIN_N_s** – Search window size for the Neighbor Set used on the Serving
32 Frequency, stored during hard handoff.
- 33 **SF_SRCH_WIN_R_s** – Search window size for the Remaining Set used on the Serving
34 Frequency, stored during hard handoff.
- 35 **SF_T_ADD_s** – Pilot detection threshold used on the Serving Frequency, stored during hard
36 handoff.
- 37 **SF_T_COMP_s** – Active Set versus Candidate Set comparison threshold used on the Serving
38 Frequency, stored during hard handoff.

- 1 **SF_T_DROP_s** – Pilot drop threshold used on the Serving Frequency, stored during hard
2 handoff.
- 3 **SF_T_TDROPS** – Pilot drop timer value used on the Serving Frequency, stored during hard
4 handoff.
- 5 **SF_T_TDROPRANGE_s** – Pilot drop timer range value used on the Serving Frequency,
6 stored during hard handoff.
- 7 **SF_TOTAL_EC_THRESH_s** – Threshold for total E_C of pilots in the Serving Frequency Active
8 Set used in the Candidate Frequency periodic search procedures.
- 9 **SF_TOTAL_EC_IO_THRESH_s** – Threshold for total E_C/I_O of pilots in the Serving Frequency
10 Active Set used in the Candidate Frequency periodic search procedures.
- 11 **SID_s** – System identifier.
- 12 **SID_NID_LIST_s** – Registration SID, NID list. The SID, NID pairs in which the mobile
13 station has registered.
- 14 **SLOT_CYCLE_INDEX_s** – Slot cycle index. This is a signed parameter that can take values
15 between -4 and +7, inclusive. It is computed from the SLOT_CYCLE_INDEX_REG, and
16 bounded by the minimum and maximum slot cycle indices allowed by the current base
17 station.
- 18 **SLOT_CYCLE_INDEX_REG** – Slot cycle index registered. This is a signed parameter that
19 can take values between -4 and +7, inclusive. It is computed based on the slot cycle index
20 value included in the last registration attempt.
- 21 **SLOT_NUM** – Paging Channel or Forward Common Control Channel slot number.
- 22 **SOFT_SLOPE_s** – The slope in the inequality criterion for adding a pilot to the Active Set, or
23 dropping a pilot from the Active Set.
- 24 **SO_REQ_s** – Service option request number. The number of the service option requested by
25 the mobile station during service option negotiation.
- 26 **SR1_BRAT_NON_TD_s** – Spreading Rate 1 Primary Broadcast Control Channel data rate
27 with no transmit diversity.
- 28 **SR1_BRAT_TD_s** – Spreading Rate 1 Primary Broadcast Control Channel data rate with
29 transmit diversity.
- 30 **SR1_CRAT_NON_TD_s** – Spreading Rate 1 coding rate with no transmit diversity.
- 31 **SR1_CRAT_TD_s** – Spreading Rate 1 coding rate with transmit diversity.
- 32 **SR1_TD_MODE_s** – Spreading Rate 1 transmit diversity mode in support of OTD or STS.
- 33 **SR1_TD_LEVEL_s** – Spreading Rate 1 transmit diversity power level.
- 34 **SR3_BRAT_s** – Data rate of the Broadcast Control Channel on SR3 frequencies.
- 35 **SR3_PRIMARY_PILOT_s** – Frequency offset of the primary SR3 pilot.
- 36 **SR3_PILOT_POWER1_s** – The power level of the primary pilot with respect to the pilot on
37 the lower frequency of the two remaining SR3 frequencies.

- 1 **SR3_PILOT_POWER2_s** – The power level of the primary pilot with respect to the pilot on
2 the higher frequency of the two remaining SR3 frequencies.
- 3 **SRCH_OFFSET_INCL_s** – Neighbor pilot search window offset included indicator.
- 4 **SRCH_OFFSET_NGHR_s** – Neighbor pilot search window offset.
- 5 **SRCH_WIN_A_s** – Search window size for the Active Set and Candidate Set.
- 6 **SRCH_WIN_NGHR_s** – Neighbor Pilot Channel search window size.
- 7 **SRCH_WIN_NGHR_INCL_s** – Neighbor Pilot Channel search window size included
8 indicator.
- 9 **SRCH_WIN_N_s** – Search window size for the Neighbor Set.
- 10 **SRCH_WIN_R_s** – Search window size for the Remaining Set.
- 11 **START_TIME_UNIT_s** – A stored variable in the mobile station which contains the time unit
12 used for determining FOR_SCH_START_TIME and REV_SCH_START_TIME on
13 Supplemental Channels.
- 14 **SYNC_ID_s** – Service Configuration Synchronization Identifier identifying the service
15 configuration currently in use (i.e. Service Configuration information record and Non-
16 negotiable Service Configuration information record).
- 17 **SYS_PAR_MSG_SEQ_s** – *System Parameters Message* sequence number.
- 18 **SYS_TIME_s** – Current value of CDMA system time as received in the *Sync Channel*
19 *Message*.
- 20 **TA** – Acknowledgment response timeout.
- 21 **T_ADD_s** – Pilot detection threshold. The stored value is a positive value in units of 0.5 dB.
- 22 **T_COMP_s** – Active Set versus Candidate Set comparison threshold. The stored value is a
23 positive value in units of 0.5 dB.
- 24 **T_DROP_s** – Pilot drop threshold. The stored value is a positive value in units of 0.5 dB.
- 25 **T_TDROPRANGE_s** – Pilot drop timer range value.
- 26 **T_SLOTTED_s** – Slotted timer, used for the slotted timer feature.
- 27 **TAG_s** – Transaction identifier. This is a 4-bit parameter maintained by the mobile station
28 which is used to uniquely identify a new call origination (via an *Enhanced Origination*
29 *Message*) by the mobile station. When the mobile station is to send an *Enhanced*
30 *Origination Message*, the mobile station increments the stored value of TAG and includes it
31 in the message.
- 32 **TAG_OUTSTANDING_LIST** – List of outstanding TAG values. This corresponds to those
33 values of TAG sent in the *Enhanced Origination Message* which have neither been accepted
34 by the base station (by assigning the requested call) nor rejected by the base station.
- 35 **TBR_RAND_SUPPR_ENABLE_s** – Flag to indicate if suppression of timer-based registration
36 randomization based upon frequent implicit registrations is enabled.

- 1 **TBR_RAND_WINDOW_s** – Indicates the window over which the next timer-based registration
2 following call release is randomized.
- 3 **TEMP_SUB_s** – User Zone temporary subscription flag.
- 4 **TF_CDMABAND_s** – Target Frequency CDMA band class. The CDMA band class specified in
5 the *Extended Handoff Direction Message* or the *General Handoff Direction Message*.
- 6 **TF_CDMACH_s** – Target Frequency CDMA Channel number. The CDMA Channel number
7 specified in the *Extended Handoff Direction Message* or the *General Handoff Direction*
8 *Message*.
- 9 **TF_RESET_FPC_s** – Flag to initialize the Forward Traffic Channel power control counters on
10 the Target Frequency.
- 11 **TF_RESET_L2_s** – Flag to reset acknowledgment procedures on the Target Frequency.
- 12 **TF_T_ADD_s** – Pilot detection threshold to be used on the Target Frequency. The stored
13 value is a positive value in units of 0.5 dB.
- 14 **TF_WAIT_TIME_s** – Maximum time that the mobile station may wait to receive a period of
15 $(N_{11m} \times 20)$ ms with sufficient signal quality on the CDMA Target Frequency.
- 16 **TKZ_ID_s** – Tracking zone identifier used while in tracking zone mode.
- 17 **TKZ_LIST_LEN_s** – Number of tracking zone identifiers to be maintained in the tracking
18 zone list while in tracking zone mode.
- 19 **TKZ_MAX_NUM_MSG_s** – The maximum number of *Radio Environment Messages* that the
20 mobile station is permitted to transmit while in the tracking zone mode.
- 21 **TKZ_MODE_ENABLED** – Flag that indicates whether the tracking zone mode is currently
22 enabled at the mobile station.
- 23 **TKZ_MODE_PENDING** – Flag that indicates whether the tracking zone mode is currently
24 pending at the mobile station. If the tracking zone mode is pending, then it becomes
25 enabled when the radio environment reporting mode is disabled.
- 26 **TKZ_MODE_SUPPORTED_s** – Base station support of tracking zone mode indicator.
- 27 **TKZ_LIST** – Tracking zone list. A list of most recent TKZ_IDs that the mobile station has
28 received while in the tracking zone mode.
- 29 **TMSI_ZONE_s** – TMSI zone number of the base station.
- 30 **TMSI_ZONE_LEN_s** – The number of octets in TMSI zone.
- 31 **T_MULCHAN_s** – The threshold offset that the mobile station is to use when reporting
32 neighbor pilot strength measurements in a *Supplemental Channel Request Message*. The
33 stored value is a positive value in units of 0.5 dB.
- 34 **TOTAL_PUF_PROBES_s** – Maximum number of PUF probes transmitted in a PUF attempt.
- 35 **TOTAL_ZONES_s** – Number of registration zones to be retained in ZONE_LIST_s.

- 1 **TOT_FRAMES_s** – Total Forward Fundamental Channel frames received. The total number
2 of received Forward Fundamental Channel frames, counted for Forward Traffic Channel
3 power control.
- 4 **TX_PWR_LIMIT_s** – Transmit Power Limit. If the mobile station is operating in the 1915MHz
5 – 1920MHz block of the PCS band, the mobile station is to limit its transmission power to
6 no more than the value indicated by this field.
- 7 **T_TDROPS** – Pilot drop timer value.
- 8 **USE_ERAM_s** – Use ERAM indicator. Indicates whether ERAM is to be used on the flexible
9 and variable data rate Supplemental Channel with turbo codes in RC4 and RC5 Forward
10 Link and RC4 Reverse Link.
- 11 **USE_FOR_HDM_SEQ_s** – Storage variable containing a flag indicating a pending
12 *Supplemental Channel Assignment Message* forward assignment that is linked to a *General*
13 *Handoff Direction Message*.
- 14 **USE_REV_HDM_SEQ_s** – Storage variable containing a flag indicating a pending
15 *Supplemental Channel Assignment Message* reverse assignment that is linked to a *General*
16 *Handoff Direction Message*.
- 17 **USE_T_ADD_ABORT_s** – A storage variable in the mobile station that contains the Reverse
18 Supplement Code Channel assignment T_ADD abort indicator.
- 19 **USE_TMSI_s** – Base station’s preference of the use of TMSI.
- 20 **USER_ZONE_ID_s** – *User Zone Identification Message* sent indicator.
- 21 **USER_ZONE_ID_MSG_SEQ_s** – *User Zone Identification Message* sequence number.
- 22 **UZ_EXIT_IN_USE_s** – The User Zone Exit parameter that the mobile station received from
23 the *User Zone Identification Message* broadcast by the last base station of the old user zone.
- 24 **UZ_EXIT_RCVD_s** – The User Zone Exit parameter that the mobile station just received from
25 the *User Zone Identification Message* broadcast by the currently serving base station.
- 26 **UZID_s** – User Zone identifier.
- 27 **UZ_REC** – Record containing information about a User Zone broadcast by the base station
28 (see also UZ_REC_LIST).
- 29 **UZ_REC_LIST** – Broadcast User Zone record list. A descriptive structure used to manage
30 the base station’s information records about broadcast User Zones (see also UZ_REC).
- 31 **UZ_REV_s** – User Zone update revision number.
- 32 **ZONE_LIST_s** – Registration zone list. List of zones in which the mobile station has
33 registered.
- 34 **ZONE_TIMER_s** – Zone timer length.

1.6 Signaling Architecture

Layer 3 signaling for cdma2000 is modeled as follows:

- Protocol Layer.** Layer 3 generates Layer 3 PDUs and passes these PDUs to Lower Layers, where proper encapsulation into Lower Layer PDUs is performed. On the receiving end, Lower Layer PDUs are decapsulated and the resulting SDUs are sent from Lower Layers to Layer 3 for processing.
- Service Access Points.** SAPs and corresponding communication primitives are defined between the Layer 3 and Lower Layers over the data plane. No SAPs are defined for communications through the control plane.

1.7 Signaling and Functionality

1.7.1 General Architecture

The general architecture is presented in Figure 1.3.1-1.

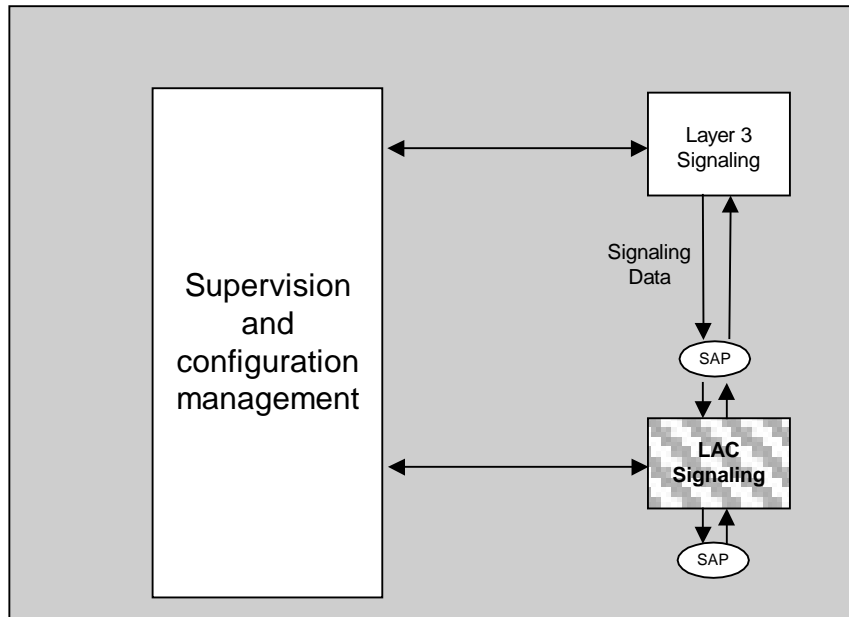

Figure 1.3.1-1. cdma2000 Signaling – General Architecture

1.7.2 Interface to Layer 2

The interface between Layer 3 and Layer 2 is a Service Access Point (SAP). At the SAP, Layer 3 and Layer 2 exchange Service Data Units (SDU) and interface control information in the form of Message Control and Status Blocks (MCSB) using a set of primitives.

1.7.2.1 Message Control and Status Block (MCSB)

The MCSB is a parameter block for the defined primitives, containing relevant information about an individual Layer 3 message (PDU), as well as instructions on how the message may be handled or how it is to be (for transmission), or was (for reception), processed by Layer 2. The MCSB is a conceptual construct and is not subject to detailed specification in this document; see [4] for more information on the content of the MCSB.

1 1.7.2.2 Interface Primitives

2 The following primitives are defined for communication between the Layer 3 and Layer 2:

3

4 Name: **L2-Data.Request**

5 Type: Request

6 Direction: Layer 3 to Layer 2

7 Parameters: PDU, MCSB

8 Action: The PDU is handed to Layer 2 for delivery across the radio interface.

9

10 Name: **L2-Data.Confirm**

11 Type: Confirm

12 Direction: Layer 2 to Layer 3

13 Parameters: MCSB

14 Action: Reception of the specified (in the MCSB) transmitted PDU was acknowledged at
15 Layer 2 by the addressee.

16

17 Name: **L2-Data.Indication**

18 Type: Indication

19 Direction: Layer 2 to Layer 3

20 Parameters: PDU, MCSB

21 Action: The received PDU is handed to Layer 3.

22

23 Name: **L2-Condition.Notification**

24 Type: Indication

25 Direction: Layer 2 to Layer 3

26 Parameters: MCSB

27 Action: Layer 3 is notified of a relevant event (e.g. abnormal condition) detected at Layer
28 2. Details are indicated via the MCSB.

29

30 Name: **L2-Supervision.Request**

31 Type: Request

32 Direction: Layer 3 to Layer 2

33 Parameters: MCSB

1 Action: Layer 2 executes a control command as directed by Layer 3. This could be, for
2 example, an order to abandon retransmission of a message or an order for local
3 reset for the message sequence number, acknowledgment sequence number and
4 duplicate detection.

5 1.7.3 Reserved

7 1.7.4 Functional Description

8 In the Data Plane, Layer 3 originates and terminates signaling data units according to the
9 semantic and timing of the communication protocol between the base station and the
10 mobile station. From a semantic point of view the signaling data units are referred to as
11 “messages” (or “orders”). From a protocol point of view, the signaling data units are PDUs.
12 In general, the language of this specification does not explicitly distinguish between the
13 terms “PDU” and “Message”. It is considered that the context provides enough information
14 to allow the reader to make the appropriate distinctions.

15 1.7.5 PDU Transmission and Reception

16 Layer 3 employs the services offered at the interface with Layer 2 to transfer PDUs to and
17 from the Layer 3 entity.

18 When requesting the transmission of a PDU, Layer 3 will typically specify whether the
19 transfer will be performed in *assured mode* or in *unassured mode* (for example, by setting
20 the proper parameters in the MCSB argument of the L2-Data.Request primitive). For
21 transmission in assured mode, Layer 3 may specify if *confirmation of delivery* of the PDU is
22 required.

23 Layer 2 guarantees that an assured mode PDU received from the transmitting Layer 3
24 entity is delivered to the receiving Layer 3 entity. Each assured mode PDU is delivered to
25 the receiving Layer 3 entity only once and without errors. Additionally, if the transmitting
26 Layer 3 entity requests confirmation of delivery of an assured mode PDU, Layer 2 will send
27 an indication to the transmitting Layer 3 entity (for example by using the L2-Data.Confirm
28 primitive) when Layer 2 receives an acknowledgment for that PDU. If Layer 2 is not able to
29 deliver an assured mode PDU, it sends an indication of the failure to Layer 3 which can
30 then take corrective action.

31 Layer 2 does not guarantee that an unassured mode PDU received from the transmitting
32 Layer 3 entity is delivered to the receiving Layer 3 entity. Thus, Layer 2 acknowledgments
33 may not be required for unassured mode PDUs. To increase the probability of delivery of
34 unassured mode PDUs, Layer 3 may request Layer 2 to send those PDUs multiple times in
35 quick repeat sequence and rely on the duplicate detection capabilities of the receiver to
36 achieve uniqueness of delivery.

37 Layer 3 can also request Layer 2 to perform a reset of the Layer 2 ARQ procedures (for
38 example, by using the L2-Supervision.Request primitive).

2 REQUIREMENTS FOR MOBILE STATION CDMA OPERATION

This section defines requirements that are specific to CDMA mobile station equipment and operation. A CDMA mobile station may support operation in one or more band classes.

2.1 Reserved

2.2 Reserved

2.3 Security and Identification

2.3.1 Mobile Station Identification Number

Mobile stations operating in the CDMA mode are identified by the International Mobile Subscriber Identity (IMSI).⁸ Mobile Stations shall have two different identifiers, IMSI_T and IMSI_M. The IMSI consists of up to 15 numerical characters (0-9). The first three digits of the IMSI are the Mobile Country Code (MCC), and the remaining digits are the National Mobile Subscriber Identity (NMSI). The NMSI consists of the Mobile Network Code (MNC) and the Mobile Station Identification Number (MSIN). The IMSI structure is shown in Figure 2.3.1-1.

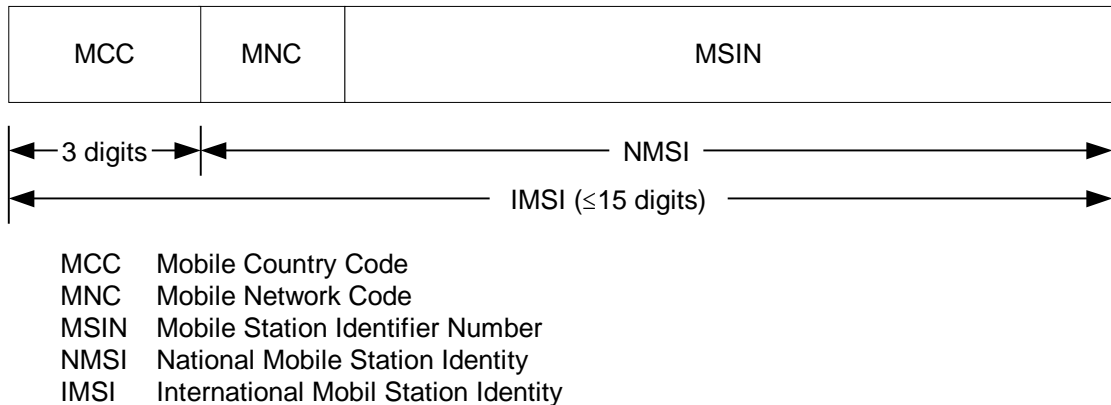

Figure 2.3.1-1. IMSI Structure

An IMSI that is 15 digits in length is called a class 0 IMSI (the NMSI is 12 digits in length); an IMSI that is less than 15 digits in length is called a class 1 IMSI (the NMSI is less than 12 digits in length).

IMSI_M is an IMSI that contains a MIN in the lower ten digits of the NMSI. An IMSI_M is always a class 0 IMSI. If the IMSI_M is not programmed, the mobile station shall set the

⁸ See [18].

1 four least-significant digits of the IMSI_M to the value of the ESN_p, converted directly from
 2 binary to decimal, modulo 10000, and the mobile station shall set the other digits to 0.

3 IMSI_T is an IMSI that is not associated with the MIN assigned to the mobile station. An
 4 IMSI_T can be a class 0 or class 1 IMSI. If the IMSI_T is not programmed, the mobile
 5 station shall set the four least-significant digits of the IMSI_T to the value of the ESN_p,
 6 converted directly from binary to decimal, modulo 10000, and the mobile station shall set
 7 the other digits to 0.

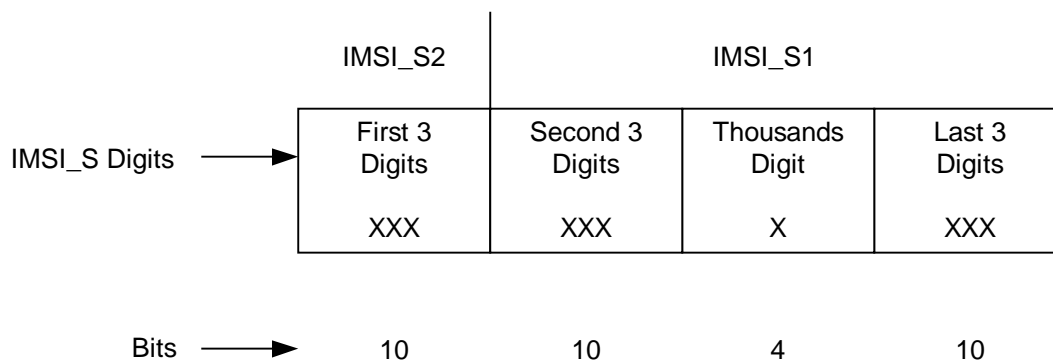

8 When operating in the CDMA mode the mobile station shall set its operational IMSI value,
 9 IMSI_O, to either the IMSI_M or the IMSI_T depending on the capabilities of the base
 10 station (See 2.6.2.2.5).

11 An IMSI_S is a 10-digit (34-bit) number derived from the IMSI. When an IMSI has 15
 12 digits, IMSI_S is equal to the least significant ten digits of the IMSI. When an IMSI has
 13 fewer than fifteen digits, zeros are added to the most significant side of MSIN to obtain a
 14 15-digit padded IMSI; IMSI_S is equal to the last 10-digit of the padded IMSI.

15 A 10-digit IMSI_S consists of 3- and 7-digit parts, called IMSI_S2 and IMSI_S1,
 16 respectively, as illustrated in Figure 2.3.1-2. IMSI_S is mapped into a 34-bit number (see
 17 2.3.1.1). The IMSI_S derived from IMSI_M is designated IMSI_M_S. The IMSI_S derived
 18 from IMSI_T is designated IMSI_T_S. The IMSI_S derived from IMSI_O is designated
 19 IMSI_O_S.

20 The mobile station shall have memory to store the 34-bit IMSI_M_S_p and the 34-bit
 21 IMSI_T_S_p. IMSI_M_S_p is represented by the 10-bit IMSI_M_S2_p and the 24 bit
 22 IMSI_M_S1_p. IMSI_T_S_p is represented by the 10-bit IMSI_T_S2_p and the 24 bit
 23 IMSI_T_S1_p.

24

25

26

27 **Figure 2.3.1-2. IMSI_S Binary Mapping**

28

29 When an IMSI has 15 digits, IMSI_{11_12} is equal to the 11th and 12th digits of the IMSI.
 30 When an IMSI has fewer than 15 digits, zeros are added to the most significant side of
 31 MSIN to obtain a 15-digit padded IMSI; the IMSI_{11_12} is equal to the 11th and 12th digits
 32 of the resulting number.

1 IMSI_11_12 is encoded as described in 2.3.1.2. The mobile station shall have memory to
2 store the 7-bit IMSI_M_11_12_p and the 7-bit IMSI_T_11_12_p.

3 The 3-digit MCC is encoded as described in 2.3.1.3. The mobile station shall have memory
4 to store the 10-bit MCC_M_p and the 10-bit MCC_T_p.

5 If the mobile station has a class 1 IMSI_T, it shall have memory to store
6 IMSI_T_ADDR_NUM_p. IMSI_T_ADDR_NUM_p is equal to the number of digits in the NMSI⁹
7 minus four.

8 2.3.1.1 Encoding of IMSI_M_S and IMSI_T_S

9 The IMSI_M_S and IMSI_T_S binary mapping is defined as follows:

10 1. The first three digits of the IMSI_M_S and the first three digits of the IMSI_T_S are
11 mapped into ten bits (corresponding to IMSI_M_S2_p and IMSI_T_S2_p, respectively) by
12 the following coding algorithm:

- 13 a. Represent these three digits as D₁ D₂ D₃ with the digit equal to zero being given the
14 value of ten.
15 b. Compute $100 \times D_1 + 10 \times D_2 + D_3 - 111$.
16 c. Convert the result in step b to binary by the standard decimal-to-binary conversion
17 as shown in Table 2.3.1.1-1.

18

19

Table 2.3.1.1-1. Decimal to Binary Conversion Table

Decimal Number	Binary Number

•	•
998	1111100110
999	1111100111

20

⁹ It is assumed that the number of digits in NMSI is greater than three.

- 1 2. The second three digits of IMSI_M_S and the second three digits of IMSI_T_S are
 2 mapped into the ten most significant bits of IMSI_M_S1_p and IMSI_T_S1_p, respectively,
 3 by the coding algorithm indicated in 1.
- 4 3. The last four digits of IMSI_M_S and the last four digits of IMSI_T_S are mapped
 5 into the 14 least significant bits of IMSI_M_S1_p and IMSI_T_S1_p, respectively, as
 6 follows:
- 7 a. The thousands digit is mapped into four bits by a Binary-Coded-Decimal (BCD)
 8 conversion, as shown in Table 2.3.1.1-2.
- 9 b. The last three digits are mapped into ten bits by the coding algorithm indicated in 1.

10
 11 **Table 2.3.1.1-2. BCD Mapping**

Decimal Digit	Binary Number
1	0001
2	0010
3	0011
4	0100
5	0101
6	0110
7	0111
8	1000
9	1001
0	1010

12
 13 The following example illustrates the IMSI_T_S2_p and IMSI_T_S1_p calculation procedure.
 14 Let the IMSI_T be the 9-digit number 123456789. Since the IMSI_T has fewer than ten
 15 digits, the nine least significant digits of the IMSI_T_S are equal to the IMSI_T digits and
 16 the most significant IMSI_T_S digit is set to zero. So the 10-digit IMSI_T_S is 012 345 6
 17 789. IMSI_T_S2_p and IMSI_T_S1_p are calculated as follows:

- 18 • IMSI_T_S2_p. The ten-bit IMSI_T_S2_p is derived from the first three digits of the
 19 IMSI_T_S (i.e., 012):
- 20 a. $D1 = 10$; $D2 = 1$; $D3 = 2$.
- 21 b. $100 \times D1 + 10 \times D2 + D3 - 111 = 100 \times 10 + 10 \times 1 + 2 - 111 = 901$.
- 22 c. 901 in binary is '11 1000 0101'.
- 23 Therefore, IMSI_T_S2_p is '11 1000 0101'.
- 24 • IMSI_T_S1_p. The ten most significant bits of IMSI_T_S1_p are derived from the second
 25 three digits of the IMSI_T_S (i.e., 345):

- 1 a. $D_1 = 3; D_2 = 4; D_3 = 5$.
- 2 b. $100 \times D_1 + 10 \times D_2 + D_3 - 111 = 100 \times 3 + 10 \times 4 + 5 - 111 = 234$.
- 3 c. 234 in binary is '0011 1010 10'.

4 The next four most significant bits of IMSI_T_S1_p are derived from the thousands digit of
5 the IMSI_T_S (i.e., 6) by BCD conversion: 6 in BCD is '0110'.

6 The ten least significant bits of IMSI_T_S1_p are derived from the last three digits of the
7 IMSI_T_S (i.e., 789):

- 8 a. $D_1 = 7; D_2 = 8; D_3 = 9$.
- 9 b. $100 \times D_1 + 10 \times D_2 + D_3 - 111 = 100 \times 7 + 10 \times 8 + 9 - 111 = 678$.
- 10 c. 678 in binary is '10 1010 0110'.

11 Therefore, IMSI_T_S1_p is '0011 1010 1001 1010 1010 0110'.

12 2.3.1.2 Encoding of IMSI_M_11_12 and IMSI_T_11_12

13 The IMSI_M_11_12 and IMSI_T_11_12 binary mapping is defined as follows:

- 14 1. Represent the 11th digit as D_{11} and the 12th digit as D_{12} with the digit equal to
15 zero being given the value of ten.
- 16 2. Compute $10 \times D_{12} + D_{11} - 11$.
- 17 3. Convert the result in step 2 to binary by a standard decimal-to-binary conversion as
18 described in Table 2.3.1.1-1 and limit the resulting number to the 7 least significant
19 bits.

20 2.3.1.3 Encoding of the MCC_M and MCC_T

21 The MCC_M and MCC_T binary mapping is defined as follows:

- 22 1. Represent the 3-digit Mobile Country Code as $D_1 D_2 D_3$ with the digit equal to zero
23 being given the value of ten.
- 24 2. Compute $100 \times D_1 + 10 \times D_2 + D_3 - 111$.
- 25 3. Convert the result in step (2) to binary by a standard decimal-to-binary conversion
26 as described in Table 2.3.1.1-1.

27 2.3.1.4 Mobile Directory Number

28 A Mobile Directory Number (MDN) is a dialable number associated with the mobile station
29 through a service subscription. A Mobile Directory Number is not necessarily the same as
30 the mobile station identification on the air interface, i.e., MIN, IMSI_M or IMSI_T. An MDN
31 consists of up to 15 digits. The mobile station should have memory to store at least one
32 Mobile Directory Number (see Table F.3-1).

33 2.3.2 Electronic Serial Number (ESN), R-UIM Identifier (UIM_ID), and Mobile Equipment 34 Identifier (MEID)

35 The mobile station shall be configured with 32-bit ESN or 56-bit MEID, but not both. All
36 mobile stations with MOB_P_REV_p less than 11 shall be configured with ESN. All mobile

1 stations with MOB_P_REV_p greater than or equal to 11 shall be configured with MEID. The
2 ESN or MEID is used to uniquely identify a mobile station in a wireless system.

3 2.3.2.1 Electronic Serial Number (ESN)

4 The ESN value is available to procedures in the mobile station as the value of the variable
5 ESN_p. The value of the variable RN_HASH_KEY_s is the same as the value of the variable
6 ESN_p, and need not be stored separately.

7 2.3.2.2 Mobile Equipment Identifier (MEID)

8 The MEID value is available to procedures in the mobile station as the value of the variable
9 MEID_p. If the mobile station is configured with MEID, ESN_p stores 32-bit pseudo-ESN
10 value derived from MEID as defined in 2.3.2.2.1.

11 2.3.2.2.1 Pseudo-ESN

12 Pseudo-ESN is a 32-bit identifier derived from MEID.

13 Mobile station shall use the following procedure to derive pseudo-ESN from MEID¹⁰:

- 14 1. The upper 8 bits of pseudo-ESN shall be set to 0x80.
- 15 2. The lower 24 bits of pseudo-ESN shall be the 24 least significant bits of the SHA-1
16 digest of the MEID. See [41] for the specification of the SHA-1 algorithm.

17 2.3.2.3 R-UIM Identifier (UIM_ID, EXT_UIM_ID)

18 If the mobile station has a R-UIM which indicates that UIM ID is to be used, then the mobile
19 station shall use UIM_ID instead of ESN in every place where ESN is used in this document
20 with the exception of the ESN_ME information record (see [40]).

21 If the mobile station has a R-UIM which indicates that SF_EUIMID is to be used in place of
22 MEID, then the mobile station shall use SF_EUIMID instead of MEID in every place where
23 MEID is used in this document with the exception of the MEID_ME information record (see
24 [40]).

25 2.3.3 Station Class Mark

26 Class-of-station information referred to as the station class mark (SCM_p) must be stored in
27 a mobile station. The digital representation of this class mark is specified in Table 2.3.3-1.

28

¹⁰ Example: if the 56-bit MEID is (hexadecimal) FF 00 00 01 12 34 56, the pseudo-ESN is
(hexadecimal) 80 07 37 E1.

Table 2.3.3-1. Station Class Mark

Function	Bit(s)	Setting
Extended SCM Indicator	7	Band Classes 1,4,14 1XXXXXXX Other bands 0XXXXXXX
Dual Mode	6	Always 0 ¹¹ (CDMA Only) X0XXXXXX
Slotted Class	5	Non-Slotted XX0XXXXX Slotted XX1XXXXX
MEID support indicator ¹²	4	MEID not configured XXX0XXXX MEID configured XXX1XXXX
25 MHz Bandwidth	3	Always 1 XXXX1XXX
Transmission	2	Continuous XXXXX0XX Discontinuous XXXXX1XX
Power Class for Band Class 0 Analog Operation	1 - 0	Always 00 ¹³ XXXXXX00

The mobile station shall set the Power Class function bits to '00'.

The mobile station shall set bit 4 (MEID support indicator) of the Station Class Mark field to '1' in the *Registration Message*, *Origination Message*, *Page Response Message*, *Terminal Information* and *Extended Terminal Information* information record.

2.3.4 Registration Memory

The mobile station shall have memory to store one element in the zone-based registration list ZONE_LIST_{s-p} (see 2.6.5.1.5 and 2.6.5.5). This stored element shall include both REG_ZONE and the corresponding (SID, NID) pair. The data retention time under power-off conditions shall be at least 48 hours. If, after 48 hours, the data integrity cannot be guaranteed, then the entry in ZONE_LIST_{s-p} shall be deleted upon power-on.

The mobile station shall have memory to store one element in the system/network registration list SID_NID_LIST_{s-p} (see 2.6.5.1.5 and 2.6.5.5). The data retention time under

¹¹ 'Dual Mode' bit is always set to '0' to indicate 'CDMA only' mode.

¹² The corresponding bit '4' was previously defined as the IS-54 Power Class which was always set to '0'. The base station uses this field to identify mobile stations that comply with [47].

¹³ 'Power Class for Band Class 0 Analog Operation' bits are always set to '00' to indicate mobile station does not support analog mode operation.

1 power-off conditions shall be at least 48 hours. If, after 48 hours, the data integrity cannot
2 be guaranteed, then the entry in SID_NID_LIST_{s-p} shall be deleted upon power-on.

3 The mobile station shall have memory to store the distance-based registration variables
4 BASE_LAT_REG_{s-p}, BASE_LONG_REG_{s-p}, and REG_DIST_REG_{s-p} (see 2.6.5.1.4 and
5 2.6.5.5). The data retention time under power-off conditions shall be at least 48 hours. If,
6 after 48 hours, the data integrity cannot be guaranteed, then REG_DIST_REG_{s-p} shall be
7 set to zero upon power-on.

8 2.3.5 Access Overload Class

9 The 4-bit access overload class indicator (ACCOLC_p) is used to identify which overload
10 class controls access attempts by the mobile station and is used to identify redirected
11 overload classes in global service redirection.

12 The mobile station shall store 4-bit access overload class (ACCOLC_p). Mobile stations that
13 are not for test or emergency use should be assigned to overload classes ACCOLC 0
14 through ACCOLC 9. For mobile stations that are classified as overload classes ACCOLC 0
15 through ACCOLC 9, the mobile station's 4-bit access overload class indicator (ACCOLC_p)
16 shall be automatically derived from the last digit of the associated decimal representation of
17 the IMSI_M by a decimal to binary conversion as specified in Table 2.3.5-1. When a mobile
18 station's IMSI_M is updated, the mobile station shall re-calculate the ACCOLC_p as
19 indicated above. Mobile stations designated for test use should be assigned to ACCOLC
20 10; mobile stations designated for emergency use should be assigned to ACCOLC 11.
21 Mobile stations designated for National Security/Emergency Preparedness should be
22 assigned to ACCOLC 12. ACCOLC 13 and ACCOLC 15 are reserved.¹⁴ Mobile Stations
23 designated for best effort service from the network shall be assigned to ACCOLC 14.
24 Programming the 4-bit ACCOLC_p for overload classes ACCOLC 10 through ACCOLC 15 as
25 specified in Table 2.3.5-2 shall require a special facility only available to equipment
26 manufacturers and system operators.

27 For a mobile station assigned to ACCOLC 14, it shall also store a 3-bit device access
28 priority (DAP_p).

29 The content of ACCOLC_p and DAP_p, if configured, shall not be visible through the mobile
30 station's display.

31
¹⁴ For more information, refer to [28].

2.3.6 Public Long Code Mask and Private Long Code Mask

The Public Long Code Mask and the Private Long Code Mask consist of 42 bits (see [2]).

When using a Public Long Code Mask, the long code mask is generated based on the value of PLCM_TYPE_S. When using the Private Long Code Mask, the value of PLCM_TYPE_S is maintained unless updated by the base station.

2.3.6.1 Public Long Code Mask Formats

The 42 bit Public Long Code Mask PLCM₄₂ is generated using PLCM₃₇ or PLCM₄₀ as defined in section 2.3.6.1.1, where the least significant bits PLCM₃₇ or PLCM₄₀ are set as defined in this section below.

1 The 42 bit Public Long Code Mask ADD_PLCM_FOR_FCH_42 is generated using
 2 ADD_PLCM_FOR_FCH_40 as defined in section 2.3.6.1.1, where the least significant bits
 3 ADD_PLCM_FOR_FCH_40 are set as defined in this section below.

4 The 42 bit Public Long Code Mask ADD_PLCM_FOR_SCH_42 is generated using
 5 ADD_PLCM_FOR_SCH_35 as defined in section 2.3.6.1.1, where the least significant bits
 6 ADD_PLCM_FOR_SCH_35 are set as defined in this section below.

7 If $PLCM_TYPE_S$ is equal to '0000', the 37 least significant bits (PLCM_37) are set as follows:

- 8 • Bits M_{36} through M_{32} shall be set to '11000';
- 9 • Bits M_{31} through M_0 shall be set to a permutation of the mobile station's ESN as
 10 follows:

$$11 \quad ESN = (E_{31}, E_{30}, E_{29}, E_{28}, E_{27}, E_{26}, E_{25}, \dots E_2, E_1, E_0)$$

$$12 \quad \text{Permuted ESN} = (E_0, E_{31}, E_{22}, E_{13}, E_4, E_{26}, E_{17}, E_8, E_{30}, E_{21}, E_{12}, E_3, E_{25}, E_{16}, E_7, \\ 13 \quad E_{29}, E_{20}, E_{11}, E_2, E_{24}, E_{15}, E_6, E_{28}, E_{19}, E_{10}, E_1, E_{23}, E_{14}, E_5, E_{27}, \\ 14 \quad E_{18}, E_9).$$

15 If $PLCM_TYPE_S$ is equal to '0001', the 40 least significant bits (PLCM_40) are set as follows:

- 16 • Bit M_{39} shall be set to '1';
- 17 • Bits M_{38} through M_0 of the public long code mask shall be specified by $PLCM_{39}_S$ and
 18 shall be set as follows:

$$19 \quad PLCM_{39}_S = (P_{38}, P_{37}, P_{36}, P_{35}, P_{34}, P_{33}, P_{32}, \dots P_2, P_1, P_0)$$

20 If $ADD_PLCM_FOR_FCH_TYPE_S$ is equal to '1', the 40 least significant bits
 21 ($ADD_PLCM_FOR_FCH_{40}$) are set as follows:

- 22 • Bit M_{39} shall be set to '1';
- 23 • Bits M_{38} through M_0 of the public long code mask shall be specified by
 24 $ADD_PLCM_FOR_FCH_{39}_S$ and shall be set as follows:
 25 $ADD_PLCM_FOR_FCH_{39}_S = (P_{38}, P_{37}, P_{36}, P_{35}, P_{34}, P_{33}, P_{32}, \dots P_2, P_1, P_0)$

26 If $ADD_PLCM_FOR_SCH_TYPE_S$ is equal to '1', the 35 least significant bits
 27 ($ADD_PLCM_FOR_SCH_{35}$) are set as follows:

- 28 • Bits M_{34} through M_0 of the public long code mask shall be specified by
 29 $ADD_PLCM_FOR_SCH_{35}_S$ and shall be set as follows:
 30 $ADD_PLCM_FOR_SCH_{35}_S = (P_{34}, P_{33}, P_{32}, P_{31}, P_{30}, P_{29}, P_{28}, \dots P_2, P_1, P_0)$

31 If $PLCM_TYPE_S$ is equal to '0010', the 37 least significant bits (PLCM_37) are set as follows:

- 32 • Bits M_{36} through M_{34} shall be set to '001';
- 33 • Bits M_{33} through M_0 shall be set to IMSI_O_S.

34 If $PLCM_TYPE_S$ is equal to '0011', the 37 least significant bits (PLCM_37) are set as follows:

- 35 • Bits M_{36} through M_{34} shall be set to '000';
- 36 • Bits M_{33} through M_0 shall be set to IMSI_O_S.

1 If PLCM_TYPE_s is equal to '0100', the 40 least significant bits (PLCM_40) are set as follows:

- 2 • Bit M₃₉ shall be set to '0';
- 3 • Bits M₃₈ through M₀ shall be set as follows:
 - 4 • The 39 least significant bits of the SHA-1 digest of the MEID¹⁵. See [41] for the
 - 5 specification of the SHA-1 algorithm.

6 2.3.6.1.1 Public Long Code Mask PLCM_42, ADD_PLCM_FOR_FCH_42 and
7 ADD_PLCM_FOR_SCH_42

8 If PLCM_37 is defined, the public long code mask PLCM_42 shall be as follows: bits M₃₆
9 through M₀ of the public long code mask shall be specified by PLCM_37 (see 2.3.6). Bits
10 M₄₁ through M₃₇ shall be set to '11000'. The resulting public long code mask PLCM_42 is
11 shown in Figure 2.3.6.1-1 (a).

12 If PLCM_40 is defined, the public long code mask PLCM_42 shall be as follows: bits M₃₉
13 through M₀ of the public long code mask shall be specified by PLCM_40 (see 2.3.6.1). Bits
14 M₄₁ through M₄₀ shall be set to '10'. The resulting public long code mask PLCM_42 is
15 shown in Figure 2.3.6.1-1 (b).

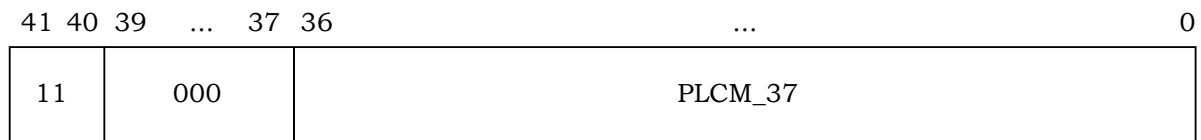

16 If ADD_PLCM_FOR_FCH_40 is defined, the public long code mask
17 ADD_PLCM_FOR_FCH_42 shall be as follows: bits M₃₉ through M₀ of the public long code
18 mask shall be specified by ADD_PLCM_FOR_FCH_40 (see 2.3.6.1). Bits M₄₁ through M₄₀
19 shall be set to '10'. The resulting public long code mask ADD_PLCM_FOR_FCH_42 is
20 shown in Figure 2.3.6.1-1 (c).

21 If ADD_PLCM_FOR_SCH_35 is defined, the public long code mask
22 ADD_PLCM_FOR_SCH_42 shall be as follows: bits M₃₄ through M₀ of the public long code
23 mask shall be specified by ADD_PLCM_FOR_SCH_35 (see 2.3.6.1). Bits M₄₁ through M₃₅
24 shall be set to '1100111'. The resulting public long code mask ADD_PLCM_FOR_SCH_42 is
25 shown in Figure 2.3.6.1-1 (d).

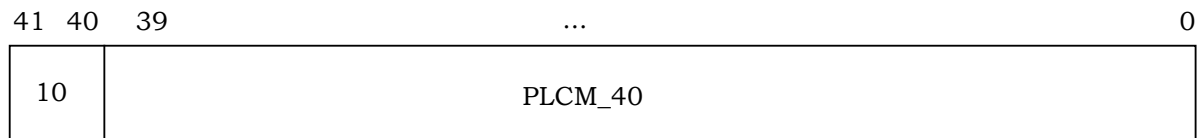

26

¹⁵ Example: if the 56-bit MEID is (hexadecimal) FF 00 00 01 12 34 56, the bits M₃₈ through M₀ of PLCM are (hexadecimal) 1A 0E 07 37 E1, and (binary) '001 1010 0000 1110 0000 0111 0011 0111 1110 0001'.

11
12
13

The 42 bit private long code mask PVTLCM_42 shall be as follows: Bits M₄₁ through M₄₀ shall be set to '01'. Bits M₃₉ through M₀ shall be the 40 least significant bits of the Voice Privacy Mask (VPM) generated by the Key_VPM_Generation procedure or CDMA_3G_2G_Conversion procedure. M₀ of the private long code mask shall be the least significant bit of the VPM. See [15] for details of the Key_VPM_Generation procedure and see [44] for details of the CDMA_3G_2G_Conversion procedure. The resulting private long code mask PVTLCM_42 is shown in Figure 2.3.6.2-1.

2.3.7 Reserved

2.3.8 Home System and Network Identification

The mobile station shall provide memory to store at least one home (SID_p, NID_p) pair. The mobile station shall also provide memory to store the 1-bit parameters MOB_TERM_HOME_p, MOB_TERM_FOR_SID_p, and MOB_TERM_FOR_NID_p (see 2.6.5.3).

2.3.9 Local Control Option

If the mobile station supports the local control option, a means shall be provided within the mobile station to enable or disable the local control option.

2.3.10 Preferred Operation Selection

2.3.10.1 Preferred System

If the mobile station supports operation in Band Class 0 or Band Class 3 (see [2]), a means shall be provided within the mobile station to identify the preferred system. In addition, the mobile station may provide a means for allowing operation only with System A or only with System B.

2.3.10.2 Reserved

2.3.11 Discontinuous Reception

The mobile station shall provide memory to store the preferred slot cycle index, SLOT_CYCLE_INDEX_p (see 2.6.2.1.1.3.2).

2.3.12 Authentication, Encryption of Signaling Information/User Data and Voice Privacy

2.3.12.1 Authentication

Authentication is the process by which information is exchanged between a mobile station and base station for the purpose of confirming the identity of the mobile station. A successful outcome of the authentication process occurs only when it can be demonstrated that the mobile station and base station possess identical sets of shared secret data.

The authentication algorithms are described in [15]. The interface (input and output parameters) for the algorithms is described in [23], Table 2.3.12.1-1 summarizes the setting of the input parameters of the Auth_Signature procedure for each of its uses in this standard.

For authentication purposes, the mobile station shall use IMSI_M if it is programmed; otherwise, the mobile station shall use IMSI_T. The base station uses the IMSI selected according to the same criteria.

Table 2.3.12.1-1. Auth_Signature Input Parameters

Procedure	RAND_CHALLENGE	ESN	AUTH_DATA	SSD_AUTH	SAVE_REGISTERS
Unique Challenge (2.3.12.1.4)	RANDU and 8 LSBs of IMSI_S2	ESN_p	IMSI_S1	SSD_A	TRUE if GEN_CMEKEY is set to 1 in the AUCM; otherwise FALSE

2.3.12.1.1 Shared Secret Data (SSD)

SSD is a 128-bit quantity that is stored in semi-permanent memory in the mobile station and is readily available to the base station. As depicted in Figure 2.3.12.1.1-1, SSD is partitioned into two distinct subsets. Each subset is used to support a different process.

Contents	SSD_A	SSD_B
Length (bits)	64	64

Figure 2.3.12.1.1-1. Partitioning of SSD

SSD_A is used to support the authentication procedures and SSD_B is used to support voice privacy (see 2.3.12.3) and message encryption (see 2.3.12.2). SSD is generated according to the procedure specified in 2.3.12.1.5. The SSD shall not be accessible to the user.

2.3.12.1.2 Random Challenge Memory (RAND)

RAND is a 32-bit value held in the mobile station. When operating in CDMA mode, it is equal to the RAND value received in the last *Access Parameters Message* (see 3.7.2.3.2.2) or the *ANSI-41 RAND Message* (see 3.7.2.3.2.31) of the CDMA f-csch.

$RAND_s$ is used in conjunction with SSD_A and other parameters, as appropriate, to authenticate mobile station originations, terminations and registrations.

2.3.12.1.3 Call History Parameter ($COUNT_{s-p}$)

$COUNT_{s-p}$ is a modulo-64 count held in the mobile station. $COUNT_{s-p}$ is updated by the mobile station when a *Parameter Update Order* is received on the f-dsch (see 3.7.4).

2.3.12.1.4 Unique Challenge-Response Procedure

The Unique Challenge-Response Procedure is initiated by the base station and can be carried out either on the f-csch and r-csch, or on the f-dsch and r-dsch. The procedure is as follows:

The base station generates the 24-bit quantity RANDU and sends it to the mobile station in the *Authentication Challenge Message* on either the f-csch or f-dsch. Upon receipt of the *Authentication Challenge Message*, the mobile station shall set the input parameters of the

1 Auth_Signature procedure (see [23] section 2.3) as illustrated in Figure 2.3.12.1.5-3. The
 2 24 most significant bits of the RAND_CHALLENGE input parameter shall be filled with
 3 RANDU, and the 8 least significant bits of RAND_CHALLENGE shall be filled with the 8
 4 least significant bits of IMSI_S2.

5 The mobile station shall set the SAVE_REGISTERS input parameter to TRUE if the
 6 GEN_CMEAKEKEY field is set to '1' and FALSE if the GEN_CMEAKEKEY is set to '0'.

7 The mobile station shall then execute the Auth_Signature procedure. The 18-bit output
 8 AUTH_SIGNATURE shall be used to fill the AUTHU field of the *Authentication Challenge*
 9 *Response Message*, which shall be sent to the base station.

10 The base station computes the value of AUTHU in the same manner as the mobile station,
 11 but using its internally stored value of SSD_A. The base station compares its computed
 12 value of AUTHU to the value received from the mobile station. If the comparison fails, the
 13 base station may deny further access attempts by the mobile station, drop the call in
 14 progress, or initiate the process of updating SSD (see 2.3.12.1.5).

15 Upon receiving delivery confirmation for the *Authentication Challenge Response Message*
 16 from the LAC layer indicating a successful Unique Challenge, MS may perform the
 17 following procedure: If GEN_CMEAKEKEY was set to '1' in the *Authentication Challenge*
 18 *Message* and either of the following conditions is met:

- 19 • If neither encryption nor integrity protection is turned on and mobile station wants to
 20 turn on encryption or integrity protection or both.
- 21 • If the encryption or integrity protection is turned on and mobile station wants to switch
 22 to new keys based on new SSD.

23 the mobile station shall perform the following procedures:

- 24 • If MSG_INTEGRITY_SUPs is equal to '1', the mobile station then associates a pending
 25 key id NEW_KEY_ID with the pending CMEAKEKEY.
- 26 • The mobile station shall send a *Security Mode Request Message*. If
 27 MSG_INTEGRITY_SUPs is equal to '0', the mobile station shall select a 24-bit number
 28 and include this number in the NEW_SSEQ_H field in the *Security Mode Request*
 29 *Message*; otherwise, the mobile station shall select a 24-bit number and deliver this
 30 number to the LAC Layer along with the *Security Mode Request Message*.
- 31 • Upon reception of the *Security Mode Request Message*, the base station validates the
 32 NEW_SSEQ_H_SIG field in the message. If validation returns success, then the
 33 CMEAKEKEY associated with the AUTHU generated during Unique Challenge-Response
 34 procedure and the pending NEW_SSEQ_H can become "in use" in the base station. If
 35 Voice Privacy was enabled during this procedure, the base station shall indicate to the
 36 mobile station to disable Voice Privacy. The base station then confirms the key set-up
 37 by sending the *Security Mode Command Message* to the mobile station. Upon reception
 38 of *Security Mode Command Message*, the CMEAKEKEY associated with the AUTHU
 39 generated during Unique Challenge-Response procedure, the pending NEW_SSEQ_H
 40 and key id become "in use" for the mobile station.

2.3.12.1.5 Updating the Shared Secret Data (SSD)

SSD is updated using the *SSD_Generation* procedure (see [23], section 2.2.1), initialized with mobile station specific information, random data, and the mobile station's A-key. The A-key is 64 bits long. It is assigned to the mobile station and is stored in the mobile station's permanent security and identification memory. The A-key is known only to the mobile station and to its associated Home Location Register/Authentication Center (HLR/AC) (see [13]). Non-manual methods, such as described in [26], are preferred for entry of the A-key into the mobile station. A manual method of entry that may be used when automated methods are not available is described in [29].

The SSD update procedure is performed as follows (see Figure 2.3.12.1.5-1):

The base station sends an *SSD Update Message* on either the f-csch or the f-dsch. The RANDSSD field of the *SSD Update Message* contains the same value used for the HLR/AC computation of SSD.

Upon receipt of the *SSD Update Message* the mobile station shall set the input parameters of the *SSD_Generation* procedure (see [23], section 2.2.1) as illustrated in Figure 2.3.12.1.5-2. The mobile station shall then execute the *SSD_Generation* procedure. The mobile station shall set *SSD_A_NEW* and *SSD_B_NEW* to the outputs of the *SSD_Generation* procedure.

The mobile station shall then select a 32-bit random number, *RANDBS*, and shall send it to the base station in a *Base Station Challenge Order* on the r-csch or r-dsch.

Both the mobile station and the base station shall then set the input parameters of the *Auth_Signature* procedure (see [23], section 2.3) as illustrated in Figure 2.3.12.1.5-3 and shall execute the *Auth_Signature* procedure.

The mobile station and base station shall set the *SAVE_REGISTERS* input parameter to FALSE.

The mobile station and base station shall execute the *Auth_Signature* procedure. *AUTHBS* is set to the 18-bit result *AUTH_SIGNATURE*. The base station sends its computed value of *AUTHBS* to the mobile station in a *Base Station Challenge Confirmation Order* on the f-csch or the f-dsch.

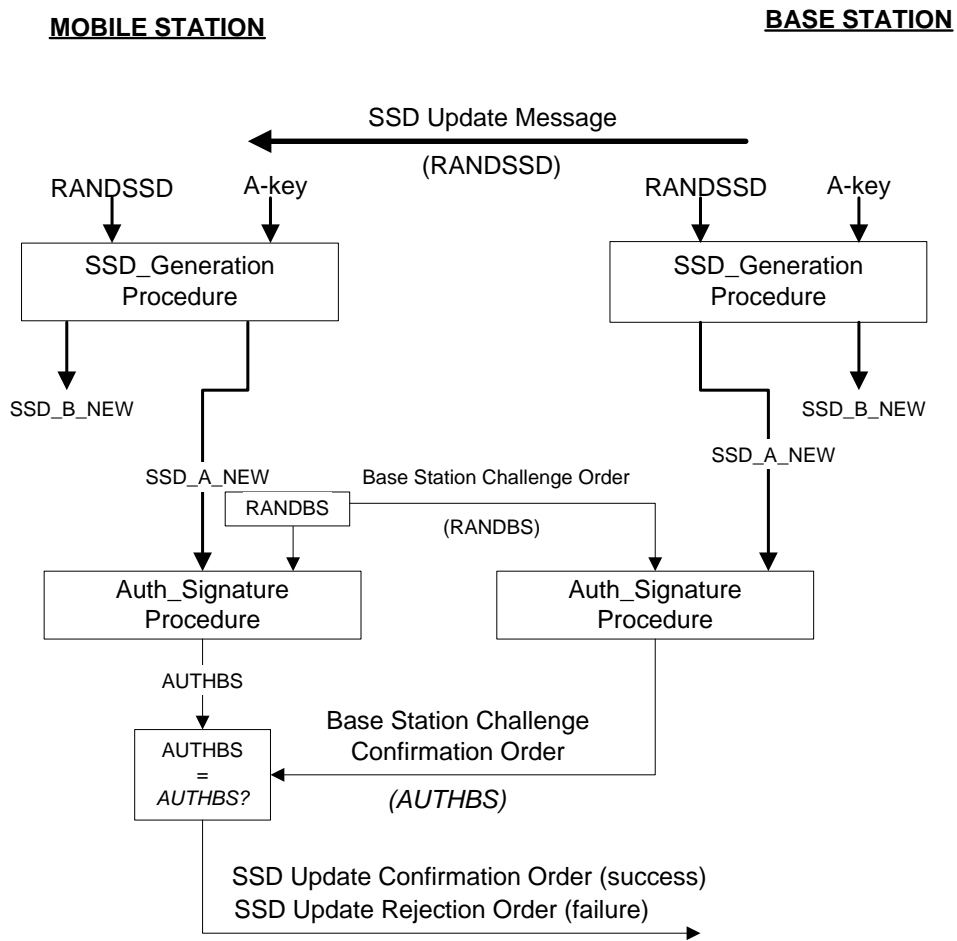

Upon receipt of the *Base Station Challenge Confirmation Order* the mobile station shall compare the received value of *AUTHBS* to its internally computed value. (If the mobile station receives a *Base Station Challenge Confirmation Order* when an SSD update is not in progress, the mobile station shall respond with an *SSD Update Rejection Order*.)

If the comparison is successful, the mobile station shall execute the *SSD_Update* procedure (see [23], section 2.2.2) to set *SSD_A* and *SSD_B* to *SSD_A_NEW* and *SSD_B_NEW*, respectively. The mobile station shall then send an *SSD Update Confirmation Order* to the base station, indicating successful completion of the SSD update.

If the comparison is not successful, the mobile station shall discard *SSD_A_NEW* and *SSD_B_NEW*. The mobile station shall then send an *SSD Update Rejection Order* to the base station, indicating unsuccessful completion of the SSD update.

1 Upon receipt of the *SSD Update Confirmation Order*, the base station sets SSD_A and
 2 SSD_B to the values received from the HLR/AC (see [13]).
 3 If the mobile station fails to receive the *Base Station Challenge Confirmation Order* within
 4 T_{64m} seconds of when the acknowledgment to the *Base Station Challenge Order* was
 5 received, the mobile station shall discard SSD_A_NEW and SSD_B_NEW. The mobile
 6 station shall then terminate the SSD update process.

2.3.12.2 Signaling Message Encryption

In an effort to enhance the authentication process and to protect sensitive subscriber information (such as PINs), a method is provided to encrypt certain fields of selected f-dsch or r-dsch signaling messages.

The following is a description of the messages on f-dsch (see 2.3.12.2.1) and r-dsch (see 2.3.12.2.2) that are enciphered using the Cellular Message Encryption Algorithm (see section 2.5.1, [15]) or the Enhanced Cellular Message Encryption Algorithm (see section 2.5.2, [15]), and when ENCRYPT_MODE_s is set to '01' or '10'. The availability of encryption algorithm information is under government control.

For each message, the enciphered fields are identified. The messages are grouped by channel designation.

Messages shall not be encrypted if authentication is not performed (AUTH_s is set to '00'). See [23] for details of the initialization and use of the encryption procedure.

Signaling message encryption is controlled for each call individually. If P_REV_IN_USE_s is less than or equal to six, the mobile station identifies its encryption capability in the ENCRYPTION_SUPPORTED field in the *Origination Message* and the *Page Response Message* as shown in Table 2.7.1.3.2.4-5. If P_REV_IN_USE_s is greater than or equal to seven, the mobile station identifies its encryption capability in the SIG_ENCRYPT_SUP field in *Registration Message*, *Origination Message*, *Page Response Message*, *Security Mode Request Message*, and the encryption capability information record in *Status Response Message* and *Extended Status Response Message*, as shown in Table 2.7.1.3.2.1-5. The initial encryption mode for the call is established by setting the ENCRYPT_MODE field to '00', '01', or '10' in the *Channel Assignment Message* or in the *Extended Channel Assignment Message*. If ENCRYPT_MODE is set to '00', message encryption is off. To turn encryption on after channel assignment, the base station sends one of the following f-dsch messages to the mobile station:

- *Extended Handoff Direction Message* with the ENCRYPT_MODE field set to '01' or '10'
- *General Handoff Direction Message* with the ENCRYPT_MODE field set to '01' or '10'
- *Universal Handoff Direction Message* with the ENCRYPT_MODE field set to '01' or '10'
- *Message Encryption Mode Order* with the ENCRYPT_MODE field set to '01' or '10'

To turn signaling message encryption off, the base station sends one of the following f-dsch messages to the mobile station:

- *Extended Handoff Direction Message* with the ENCRYPT_MODE field set to '00'
- *General Handoff Direction Message* with the ENCRYPT_MODE field set to '00'
- *Universal Handoff Direction Message* with the ENCRYPT_MODE field set to '00'
- *Message Encryption Mode Order* with the ENCRYPT_MODE field set to '00'

Encryption shall apply only to the part of the Layer 3 message specified below.

When encryption is off, all fields of all Layer 3 messages sent by the mobile station and base station are unencrypted.

1 When additional octets are inserted, the overall Lower Layers message length is updated to
 2 reflect the addition. Specific Layer 3 record length fields (e.g., RECORD_LEN,
 3 NUM_FIELDS, or NUM_DIGITS) shall not be affected by the insertion of additional bits.

4 If the Enhanced Cellular Message Encryption Algorithm is used, the following requirements
 5 apply:

- 6 • The mobile station and base station shall each maintain an 8-bit encryption sequence
 7 counter. The encryption sequence counter shall be incremented modulo 256 for each
 8 new encryption. The counter value, hereafter called ES_COUNT, shall be used to form
 9 the SYNC parameter of the Enhanced Cellular Message Encryption Algorithm as
 10 described below.
- 11 • As part of each encryption, an additional octet of value ES_COUNT shall be inserted
 12 immediately following the encrypted part of the message. This additional octet shall not
 13 be encrypted. The additional octet shall be removed from the message after decryption.

14 2.3.12.2.1 Encrypted Messages on the f-dsch

15 When encryption is on (ENCRYPT_MODE_s equal to binary '01' or '10'), the encryptable
 16 fields of the following messages sent on f-dsch, as listed below, shall be encrypted. All other
 17 messages sent on f-dsch shall be unencrypted.

18 1. Alert With Information Message (see 3.7.3.3.2.3) and Extended Alert With Information
 19 Message (see 3.7.3.3.2.42) are encrypted.

20 The type-specific fields of all information records (see 3.7.5) shall be encrypted. For each
 21 information record, the type-specific fields shall be treated by the encryption procedure as
 22 a new single message. If the type-specific fields of an information record consist of a single
 23 octet (RECORD_LEN field equal to 1), an additional octet of value '00000000' shall be
 24 inserted following the information record and shall be encrypted as if part of the record. (If
 25 the RECORD_LEN field is 0, the information record contains no type-specific fields, and the
 26 record contains no encrypted data.)

27 No other fields in the *Alert With Information Message* and *Extended Alert With Information*
 28 *Message* are encrypted.

29 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s equal
 30 to binary '10'), the following requirements apply for each information record:

- 31 • The DATA_TYPE parameter shall be set to '0'.
- 32 • The SYNC parameter shall be set as follows:
 - 33 - SYNC[0] = ES_COUNT
 - 34 - SYNC[1] = RECORD_TYPE

35 2. Flash With Information Message (see 3.7.3.3.2.14) and Extended Flash With
 36 Information Message (see 3.7.3.3.2.43) are encrypted.

37 The type-specific fields of all information records (see 3.7.5) shall be encrypted. For each
 38 information record, the type-specific fields shall be treated by the encryption procedure as
 39 a new single message. If the type-specific fields of an information record consist of a single
 40 octet (RECORD_LEN field equal to 1), an additional octet of value '00000000' shall be

1 inserted following the information record and shall be encrypted as if part of the record. (If
2 the RECORD_LEN field is 0, the information record contains no type-specific fields, and the
3 record contains no encrypted data.)

4 No other fields in the *Flash With Information Message* and *Extended Flash With Information*
5 *Message* are encrypted.

6 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s equal to
7 binary '10'), the following requirements apply for each information record:

- 8 • The DATA_TYPE parameter shall be set to '0'.
- 9 • The SYNC parameter shall be set as follows:
 - 10 - SYNC[0] = ES_COUNT
 - 11 - SYNC[1] = RECORD_TYPE

12 3. *Send Burst DTMF Message* (see 3.7.3.3.2.9) is encrypted.

13 The DIGIT_i fields of the *Send Burst DTMF Message* shall be encrypted. These fields are
14 treated by the encryption procedure as a new single message, with the 4-bit digit codes
15 packed into consecutive octets. If the NUM_DIGITS field contains an odd number, four bits
16 of value '0000' shall follow the last digit and shall be included in the encrypted message. If
17 NUM_DIGITS is less than 3, an additional eight bits of value '00000000' shall follow the
18 DIGIT_i fields and shall be included in the encrypted part of the message.

19 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s equal
20 to binary '10'), the following requirements apply:

- 21 • The DATA_TYPE parameter shall be set to '0'.
- 22 • The SYNC parameter shall be set as follows:
 - 23 - SYNC[0] = ES_COUNT
 - 24 - SYNC[1] = MSG_TYPE = '00001001'

25 4. *Continuous DTMF Tone Order* (see 3.7.3.3.2.1) is encrypted.

26 The 16 bits comprised of ADD_RECORD_LEN, the order-specific fields and the first five (5)
27 bits of the RESERVED field shall be encrypted. These fields shall be treated by the
28 encryption procedure as a new single message.

29 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s equal
30 to binary '10'), the following requirements apply:

- 31 • The DATA_TYPE parameter shall be set to '0'.
- 32 • The SYNC parameter shall be set as follows:
 - 33 - SYNC[0] = ES_COUNT
 - 34 - SYNC[1] = MSG_TYPE = '00000001'

35 5. *Data Burst Message* (see 3.7.3.3.2.4) is encrypted.

36 If BURST_TYPE is equal to '111110' or '111111', all CHAR_i fields after the first two shall be
37 encrypted; otherwise, all CHAR_i fields shall be encrypted.

1 If the CHARi field consists of a single octet (NUM_FIELDS field equal to 1), an additional
 2 octet of value '00000000' shall be inserted following the information record and shall be
 3 encrypted as if part of the record. (If the NUM_FIELDS field is 0, the information record
 4 contains no type-specific fields, and the record contains no encrypted data).

5 If the Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_S equal to binary
 6 '01'), the following requirements apply:

- 7 • If BURST_TYPE is equal to '000011' (SMS) or '000100' (OTASP), the message shall be
 8 encrypted.
- 9 • For all other values of BURST_TYPE, the message shall be encrypted only if encryption
 10 is required by the service option standard governing use of the *Data Burst Message*;
 11 otherwise, the message shall not be encrypted.

12 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_S equal
 13 to binary '10'), the following requirements apply:

- 14 • If BURST_TYPE is equal to '000100' (OTASP), the DATA_TYPE parameter shall be set to
 15 '0'. Otherwise, the DATA_TYPE parameter shall be set to '1'.
- 16 • The SYNC parameter shall be set as follows:
 17 - SYNC[0] = ES_COUNT
 18 - SYNC[1] = MSG_TYPE = '00000100'

19 6. Power Up Function Completion Message (see 3.7.3.3.2.30) is encrypted.

20 If the LOC_IND field is set to '1', the fields RESERVED (3 bits), MS_LAT (22 bits), MS_LONG
 21 (23 bits), and MS_LOC_TSTAMP (24 bits) are encrypted. These fields shall be treated by the
 22 encryption procedure as a new single message.

23 Otherwise, if the LOC_IND field is set to '0', no fields in this message are encrypted.

24 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_S equal to
 25 binary '10'), the following requirements apply:

- 26 • The DATA_TYPE parameter shall be set to '1'.
- 27 • The SYNC parameter shall be set as follows:
 28 - SYNC[0] = ES_COUNT
 29 - SYNC[1] = MSG_TYPE = '00011110'

30 2.3.12.2.2 Encrypted Messages on the r-dsch

31 When encryption is on (ENCRYPT_MODE_S equal to binary '01' or '10') the encryptable fields
 32 of the following r-dsch Layer 3 messages, as listed below, shall be encrypted. All other r-
 33 dsch messages shall be unencrypted.

34 1. Origination Continuation Message (see 2.7.2.3.2.9) and Enhanced Origination Message
 35 are encrypted.

36 The CHARi fields of the *Origination Continuation Message* and *Enhanced Origination*
 37 *Message* shall be encrypted. These fields shall be treated by the encryption procedure as a

1 new single message, with the character codes packed into consecutive octets. If
 2 DIGIT_MODE is '0' and the NUM_FIELDS field contains an odd number, four bits of value
 3 '0000' shall follow the last digit and shall be included in the encrypted part of the message.
 4 In addition, if ENCRYPT_MODE_s is equal to '01', the following requirement applies

- 5 • If DIGIT_MODE is '0' and NUM_FIELDS is less than 3, or if DIGIT_MODE is '1' and
 6 NUM_FIELDS is less than 2, an additional eight bits of value '00000000' shall follow the
 7 CHAR_i fields and shall be included in the encrypted part of the message.

8 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s equal
 9 to binary '10'), the following requirements apply:

- 10 • The DATA_TYPE parameter shall be set to '0'.
- 11 • The SYNC parameter shall be set as follows:
 - 12 - SYNC[0] = ES_COUNT
 - 13 - SYNC[1] = MSG_TYPE = '00001001' for *Origination Continuation Message*
 - 14 - SYNC[1] = MSG_TYPE = '00011010' for *Enhanced Origination Message*

15 The type-specific fields of all information records (see 2.7.4) in the *Origination Continuation*
 16 *Message* and *Enhanced Origination Message* shall be encrypted. For each information
 17 record, the type-specific fields shall be treated by the encryption procedure as a new single
 18 message. If the type-specific fields of an information record consist of a single octet
 19 (RECORD_LEN field equal to 1), an additional octet of value '00000000' shall be inserted
 20 following the information record and shall be encrypted as if part of the record. (If the
 21 RECORD_LEN field is 0, the information record contains no type-specific fields, and the
 22 record contains no encrypted data.)

23 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s equal
 24 to binary '10'), the following requirements apply for each information record:

- 25 • The DATA_TYPE parameter shall be set to '0'.
- 26 • The SYNC parameter shall be set as follows:
 - 27 - SYNC[0] = ES_COUNT
 - 28 - SYNC[1] = RECORD_TYPE

29 2. Flash With Information Message (see 2.7.2.3.2.3) and Extended Flash With Information
 30 Message (see 2.7.2.3.2.32) are encrypted.

31 The type-specific fields of all information records (see 2.7.4) shall be encrypted. For each
 32 information record, the type-specific fields shall be treated by the encryption procedure as
 33 a new single message. If the type-specific fields of an information record consist of a single
 34 octet (RECORD_LEN field equal to 1), an additional octet of value '00000000' shall be
 35 inserted following the information record and shall be encrypted as if part of the record. (If
 36 the RECORD_LEN field is 0, the information record contains no type-specific fields, and the
 37 record contains no encrypted data.)

38 No other fields in the *Flash With Information Message* and *Extended Flash With Information*
 39 *Message* are encrypted.

1 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s equal
2 to binary '10'), the following requirements apply for each information record:

- 3 • The DATA_TYPE parameter shall be set to '0'.
- 4 • The SYNC parameter shall be set as follows:
 - 5 - SYNC[0] = ES_COUNT
 - 6 - SYNC[1] = RECORD_TYPE

7 3. *Send Burst DTMF Message* (see 2.7.2.3.2.7) is encrypted.

8 The DIGIT_i fields of the *Send Burst DTMF Message* shall be encrypted. These fields shall be
9 treated by the encryption procedure as a new single message, with the 4-bit digit codes
10 packed into consecutive octets. If the NUM_DIGITS field contains an odd number, four bits
11 of value '0000' shall follow the last digit and shall be included in the encrypted message. If
12 NUM_DIGITS is less than 3, an additional eight bits of value '00000000' shall follow the
13 DIGIT_i fields and shall be included in the encrypted part of the message.

14 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s equal
15 to binary '10'), the following requirements apply:

- 16 • The DATA_TYPE parameter shall be set to '0'.
- 17 • The SYNC parameter shall be set as follows:
 - 18 - SYNC[0] = ES_COUNT
 - 19 - SYNC[1] = MSG_TYPE = '00000111'

20 4. *Continuous DTMF Tone Order* (see 2.7.2.3.2.1) is encrypted.

21 The 16 bits comprised of ADD_RECORD_LEN, the order-specific fields and the first five (5)
22 bits of the RESERVED field shall be encrypted. These fields shall be treated by the
23 encryption procedure as a new single message.

24 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s equal
25 to binary '10'), the following requirements apply:

- 26 • The DATA_TYPE parameter shall be set to '0'.
- 27 • The SYNC parameter shall be set as follows:
 - 28 - SYNC[0] = ES_COUNT
 - 29 - SYNC[1] = MSG_TYPE = '00000001'

30 5. *Data Burst Message* (see 2.7.2.3.2.4) is encrypted.

31 If BURST_TYPE is equal to '111110' or '111111', all CHAR_i fields after the first two shall be
32 encrypted; otherwise, all CHAR_i fields shall be encrypted.

33 If the CHAR_i field consists of a single octet (NUM_FIELDS field equal to 1), an additional
34 octet of value '00000000' shall be inserted following the information record and shall be
35 encrypted as if part of the record. (If the NUM_FIELDS field is 0, the information record
36 contains no type-specific fields, and the record contains no encrypted data).

1 If the Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_S equal to binary
2 '01'), the following requirements apply:

- 3 • If BURST_TYPE is equal to '000011' (SMS) or '000100' (OTASP), the message shall be
4 encrypted.
- 5 • For all other values of BURST_TYPE, the message shall be encrypted only if encryption
6 is required by the service option standard governing use of the *Data Burst Message*;
7 otherwise, the message shall not be encrypted.

8 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_S equal
9 to binary '10'), the following requirements apply:

- 10 • If BURST_TYPE is equal to '000100' (OTASP), the DATA_TYPE parameter shall be set to
11 '0'. Otherwise, the DATA_TYPE parameter shall be set to '1'.
- 12 • The SYNC parameter shall be set as follows:
 - 13 - SYNC[0] = ES_COUNT
 - 14 - SYNC[1] = MSG_TYPE = '00000100'

15 2.3.12.3 Voice Privacy

16 Also see [2].

17 Voice privacy is provided in the CDMA system by means of the private long code mask used
18 for PN spreading.

19 Voice privacy is provided on the Traffic Channels only. All calls are initiated using the
20 public long code mask for PN spreading. The mobile station user may request voice privacy
21 during call set-up using the *Origination Message* or *Page Response Message*, and during
22 Traffic Channel operation using the *Long Code Transition Request Order*.

23 The transition to private long code mask shall not be performed if authentication is not
24 performed (AUTH_S is set to '00' or mobile station unable to perform authentication).

25 To initiate a transition to the private or public long code mask, either the base station or
26 the mobile station sends a *Long Code Transition Request Order* on the f-dsch or r-dsch. The
27 mobile station actions in response to receipt of this order are specified in 2.6.4, and the
28 base station actions in response to receipt of this order are specified in 3.6.4.

29 The base station can also cause a transition to the private or public long code mask by
30 sending the *Extended Handoff Direction Message*, the *General Handoff Direction Message*, or
31 the *Universal Handoff Direction Message* with the PRIVATE_LCM bit set appropriately.

32 2.3.12.4 Extended Encryption for Signaling Message and User Information

33 Extended encryption is an encryption framework used for encrypting/decrypting both
34 signaling messages and user information on f/r-dsch, f/r-csch, or f/r-dtch. Signaling
35 message and user information encryption algorithms can be negotiated independently.
36 Signaling message and user information encryption can be turned on or off independently.

37 Signaling messages or user information shall not be encrypted if authentication is not
38 performed (i.e., when MSG_INTEGRITY_SUP_S is equal to '0' and AUTH_S is set to '00' (see

1 2.3.12.1)) or authentication has not been performed (i.e., when MSG_INTEGRITY_SUP_s
2 is equal to '1' and the INT_KEY[KEY_ID] is equal to NULL (see 2.3.12.5)).

3 2.3.12.4.1 Extended Encryption for Signaling Messages

4 Signaling messages with zero length shall be sent un-encrypted, in which case Layer 3
5 shall indicate to LAC layer that the messages are sent un-encrypted.

6 All mini messages shall be sent un-encrypted.

7 When sending a Registration Accepted Order, Security Mode Command Message, or Base
8 Station Reject Order, the base station should use assured mode.

9 2.3.12.4.1.1 Extended Encryption for Signaling on f/r-csch

10 To turn f/r-csch signaling encryption on or off, the base station sends a *Registration*
11 *Accepted Order* or *Security Mode Command Message* on f-csch, with the
12 C_SIG_ENCRYPT_MODE field set to one of the values specified in Table 3.7.4.5-1. The
13 value of C_SIG_ENCRYPT_MODE_r is then stored in C_SIG_ENCRYPT_MODE_s.

14 If C_SIG_ENCRYPT_MODE_s is not equal to '000' and ENC_KEY[KEY_ID] is not equal to
15 NULL, all f/r-csch signaling messages shall be encrypted based on the value of
16 C_SIG_ENCRYPT_MODE_s using the procedures specified in 2.3.12.4.1.3; except for the
17 exceptions listed below in the rest of this section.

18 On the f-csch, *General Page Message*, *Universal Page Message*, *Registration Request Order*,
19 *Authentication Challenge Message*, *Registration Accepted Order*, *Base Station Reject Order*,
20 and *Authentication Request Message* shall be sent un-encrypted. *Channel Assignment*
21 *Message*, *Extended Channel Assignment Message*, and *Security Mode Command Message*
22 may be sent un-encrypted. All overhead messages and all signaling messages with a
23 broadcast address type shall be sent un-encrypted.

24 On the r-csch, *Registration Message*, *Page Response Message*, *Reconnect Message* (if sent
25 in response to a *General Page Message* or a *Universal Page Message*), *Authentication*
26 *Challenge Response Message*, *Security Mode Request Message*, *Authentication Response*
27 *Message*, *Mobile Station Reject Order* (ORDQ = '00010110', '00011000', '00011001' or
28 '00011010') and *Authentication Resynchronization Message* shall be sent un-encrypted.
29 When sending an *Origination Message*, if all of the following conditions are true, the mobile
30 station shall not include the dialed digits in the *Origination Message*, and the mobile station
31 shall include the dialed digits in the *Origination Continuation Message*:

- 32 • The base station supports extended encryption;
- 33 • C_SIG_ENCRYPT_MODE_s is equal to '000' or ENC_KEY[KEY_ID] is equal to NULL;
- 34 • C_SIG_ENCRYPT_REQ is set to '1' or D_SIG_ENCRYPT_REQ is set to '1' in the
35 *Origination Message*;
- 36 • The mobile station does not recognize that this is an emergency call.

37 2.3.12.4.1.2 Extended Encryption for Signaling on f/r-dsch

38 The initial mode of extended encryption for f/r-dsch signaling messages is established by
39 sending a *Channel Assignment Message* or *Extended Channel Assignment Message* with the

1 ENCRYPT_MODE field set to '11'¹⁶ and the D_SIG_ENCRYPT_MODE field set to one of the
 2 values specified in Table 3.7.4.5-1. The value of D_SIG_ENCRYPT_MODE_r is then stored in
 3 D_SIG_ENCRYPT_MODE_s.

4 To turn f/r-dsch signaling encryption on or off after channel assignment, the base station
 5 sends a *General Handoff Direction Message* or *Universal Handoff Direction Message* with the
 6 ENCRYPT_MODE field and the D_SIG_ENCRYPT_MODE field set accordingly. Alternatively,
 7 the base station may send a *Security Mode Command Message* on f-dsch with the
 8 D_SIG_ENCRYPT_MODE field set accordingly.

9 If D_SIG_ENCRYPT_MODE_s is not equal to '000' and ENC_KEY[KEY_ID] is not equal to
 10 NULL, all f/r-dsch signaling messages shall be encrypted based on the value of
 11 D_SIG_ENCRYPT_MODE_s using the procedures specified in 2.3.12.4.1.3, except for the
 12 exceptions listed below in the rest of this section.

13 On the f-dsch, the *Security Mode Command Message* may be sent un-encrypted. The *Base*
 14 *Station Reject Order*, *Authentication Challenge Message* and *Authentication Request Message*
 15 shall be sent un-encrypted.

16 On the r-dsch, the *Security Mode Request Message*, *Authentication Challenge Response*
 17 *Message*, *Authentication Response Message*, *Mobile Station Reject Order* (ORDQ =
 18 '00010110', '00011000', '00011001' or '00011010') and *Authentication Resynchronization*
 19 *Message* shall be sent un-encrypted.

20 2.3.12.4.1.3 Signaling Encryption/Decryption Procedures

21 In order to perform signaling encryption, message integrity, or both, on f/r-csch or f/r-
 22 dsch, both the mobile station and the base station shall each maintain the following 32-bit
 23 counters:

- 24 • TX_EXT_SSEQ[i][j] (the 32-bit crypto-sync for encryption and message integrity. $i = 0$
 25 and 1 , $j = '00'$ to $'11'$)
- 26 • RX_EXT_SEQ[i][j] (the 32-bit crypto-sync for decryption and message integrity. $i = 0$
 27 and 1 , $j = '00'$ to $'11'$)

28 The above counters in the base station and the mobile station shall only be initialized by a
 29 *Registration Accepted Order*, *Channel Assignment Message*, *Extended Channel Assignment*
 30 *Message*, or *Security Mode Command Message* in response to a *Registration Message*,
 31 *Origination Message*, *Page Response Message*, or *Security Mode Request Message* that
 32 carries a NEW_SSEQ_H field with a valid NEW_SSEQ_H_SIG field.¹⁷ The response to a
 33 *Registration Message* is a *Registration Accepted Order*. The response to an *Origination*
 34 *Message* or *Page Response Message* is a *Channel Assignment Message* or *Extended Channel*

¹⁶ If ENCRYPT_MODE is set to a value other than '11', see section 2.3.12.2.1.

¹⁷ The mobile station should select a different value of NEW_SSEQ_H every time NEW_SSEQ_H is included in a message. This is to prevent the re-use of the same 24 most significant bits of the 32-bit crypto-sync.

1 *Assignment Message*. The response to a *Security Mode Request Message* is a *Security Mode*
2 *Command Message*.

3 Upon initialization of the crypto-sync counters, the following initialization shall be
4 performed at the mobile station: the 24 most significant bits of TX_EXT_SSEQ[i][KEY_ID]
5 and RX_EXT_SSEQ[i][KEY_ID] shall be initialized by the value of the NEW_SSEQ_H field
6 included in the message for $i = 0$ and 1.

7 The sender shall perform the following procedures for each Layer 3 PDU (including all
8 Layer 3 PDU retransmitted by Layer 3) that is to be encrypted:

- 9 1. Append between 0 and 7 inclusive padding bits (set to any random combination of '0's
10 and '1's) to the Layer 3 PDU such that the padded Layer 3 PDU in bits is an integer
11 multiple of eight (the padding bits become part of the L3 PDU).
- 12 2. Compute an 8-bit Layer 3 PDU CRC as specified in 2.3.12.1.4 over the un-encrypted
13 Layer 3 PDU (including the padding bits, if any).
- 14 3. Append the 8-bit CRC to the end of the Layer 3 PDU.
- 15 4. If the PDU is to be transmitted on f/r-csch, let SDU_ENCRYPT_MODE equal
16 C_SIG_ENCRYPT_MODE_S. If the PDU is to be transmitted on f/r-dsch, let
17 SDU_ENCRYPT_MODE equal D_SIG_ENCRYPT_MODE_S. If the Layer 3 PDU uses
18 unassured mode, let $i = 0$; otherwise, let $i = 1$.
- 19 5. Let EXT_SSEQ equal TX_EXT_SSEQ[i][KEY_ID]. Encrypt the concatenated Layer 3 PDU
20 and the 8-bit CRC by using EXT_SSEQ and the encryption algorithm specified by
21 SDU_ENCRYPT_MODE, in accordance with 2.3.12.4.3.
- 22 6. The sender shall pass the encrypted concatenated Layer 3 PDU, the 8-bit Layer 3 CRC,
23 the 32-bit EXT_SSEQ, SDU_ENCRYPT_MODE, and an indication whether the Layer 3
24 PDU shall be integrity-protected to the LAC layer.
- 25 7. Set TX_EXT_SSEQ[i][KEY_ID] to $(TX_EXT_SSEQ[i][KEY_ID] + 1) \bmod 2^{32}$.

26 The receiver shall perform the following procedures upon reception of an encrypted
27 signaling message with an 8-bit SDU_SSEQ field or a 32-bit EXT_SSEQ passed by the LAC
28 Layer (e.g., if SDU_ENCRYPT_MODE indicated by LAC Layer is not equal to '000'):

- 29 1. If the Layer 3 PDU uses unassured mode, let $i = 0$ and $N = 8$; otherwise, let $i = 1$ and N
30 $= 4$. Let V be the 8 least significant bits of RX_EXT_SSEQ[i][SDU_KEY_ID]. Perform the
31 duplicate detection procedures in accordance with 2.3.12.4.1.5 using N and V , before
32 proceeding further.
- 33 2. If SDU_SSEQ is supplied by the LAC Layer, the mobile station shall construct
34 EXT_SSEQ as follows:
35 If $(SDU_SSEQ - V) \bmod 256 < 128$:
36 $EXT_SSEQ = (RX_EXT_SSEQ[i][SDU_KEY_ID] + (SDU_SSEQ - V) \bmod 256) \bmod 2^{32}$
37 Else:
38 $EXT_SSEQ = (RX_EXT_SSEQ[i][SDU_KEY_ID] - (V - SDU_SSEQ) \bmod 256) \bmod 2^{32}$

- 1 3. Remove the LAC Layer padding, at the end of the Layer 3 PDU, if any, such that the
2 Layer 3 PDU is octet aligned.
- 3 4. Decrypt the concatenated Layer 3 PDU and the 8-bit Layer 3 CRC using EXT_SSEQ and
4 the encryption algorithm specified by SDU_ENCRYPT_MODE, in accordance with
5 2.3.12.4.3.
- 6 5. Compute an 8-bit CRC as specified in 2.3.12.4.1.4 over the un-encrypted Layer 3 PDU
7 (excluding the received 8-bit CRC).
- 8 6. Compare the value of the computed CRC with the decrypted 8-bit CRC. If the two
9 CRCs are equal, the decryption is defined to be successful; otherwise the decryption is
10 defined to be unsuccessful.
- 11 7. If the decryption was unsuccessful, the message shall be discarded; otherwise, if
12 SDU_SSEQ is supplied by the LAC Layer and $((\text{SDU_SSEQ} - V) \bmod 256) < 128$, the
13 receiver shall set $\text{RX_EXT_SEQ}[i]$ to EXT_SSEQ constructed in step 2 above.
- 14 8. If the base station can not decrypt an *Origination Message* or the LAC Layer
15 indicates that the MACI is not valid in an *Origination Message*, the base station should
16 send a *Base Station Reject Order* (ORDQ = '00000000'). If the base station can not
17 decrypt any other message or the LAC Layer indicates that the MACI is not valid for
18 other message, the base station should send a *Base Station Reject Order* (ORDQ =
19 '00000001').

20 2.3.12.4.1.4 Computation of the 8-bit Layer 3 PDU CRC Field

21 The generator polynomials for the 8-bit Layer 3 PDU CRC field shall be as follows:

$$22 \quad g(x) = x^8 + x^7 + x^4 + x^3 + x + 1$$

23 The Layer 3 PDU CRC field shall be computed according to the following procedure using
24 the logic shown in Figures 2.3.12.4.5-1:

- 25 • Initially, all shift register elements shall be set to logical one and the switches shall be
26 set in the up position.
- 27 • The register shall be clocked a number of times equal to the number bits in the Layer 3
28 PDU with those bits as input.
- 29 • The switches shall be set in the down position so that the output is a modulo-2
30 addition with a '0' and the successive shift register inputs are '0'.
- 31 • The register shall be clocked an additional 8 number of times.
- 32 • These additional bits shall be the Layer 3 PDU CRC field indicator bits.
- 33 • The bits shall be transmitted in the order calculated.

34

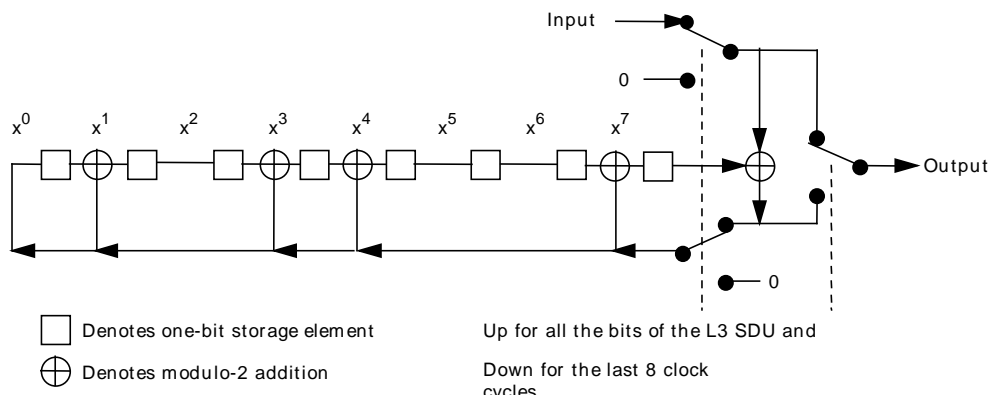

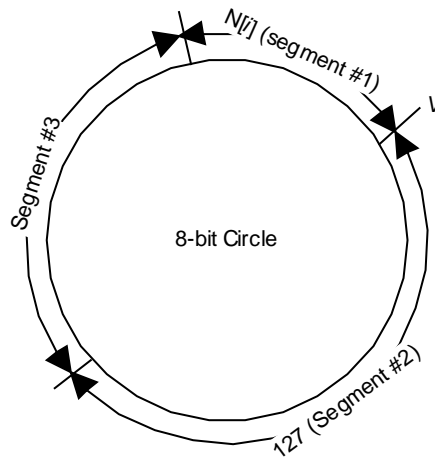

Figure 2.3.12.4.1.4-1. 8-Bit Layer 3 SDU CRC Field Calculation

2.3.12.4.1.5 Duplicate Detection of Security Sequence Number

This section describes the duplicate detection of encrypted signaling messages (see the decryption procedures at the receiver described in 2.3.12.4.1.3).

Given the value of the latest sequence number received, V , and the window size, N (see the decryption procedures at the receiver described in 2.3.12.4.1.3), the 8-bit encryption sequence number space at the receiver can be divided into the following three segments as shown in Figure 2.3.12.4.1.5-1:

- Segment #1 - sequence numbers from $((V - N + 1) \bmod 256)$ to V inclusive (the anti-replay window)
- Segment #2 - sequence numbers from $((V + 1) \bmod 256)$ to $((V + 127) \bmod 256)$ inclusive (future sequence numbers)
- Segment #3 - sequence numbers from $((V + 128) \bmod 256)$ to $((V - N) \bmod 256)$ inclusive (past sequence numbers)

1
2 **Figure 2.3.12.4.1.5-1 An 8-bit Encryption Sequence Number Space Divided into 3**
3 **Segments**
4

5 If the received sequence number, SDU_SSEQ, belongs to segment #1, the receiver shall
6 check whether SDU_SSEQ has already been received.¹⁸ If SDU_SSEQ has been received
7 already, the receiver shall discard the message and shall not perform the remaining steps
8 of the decryption procedures described in 2.3.12.4.1.3; otherwise, the receiver shall
9 continue the decryption procedures described in 2.3.12.4.1.3.

10 If the received sequence number, SDU_SSEQ, belongs to segment #2, the receiver shall
11 continue the decryption procedures described in 2.3.12.4.1.3.

12 If the received sequence number, SDU_SSEQ, belongs to segment #3, the receiver shall
13 discard the message and shall not perform the remaining steps of the decryption
14 procedures described in 2.3.12.4.1.3.

15 2.3.12.4.2 Extended Encryption for User Information

16 Extended encryption can be turned on or off independently for each individual service on
17 f/r-dtch.

¹⁸ The actual means of checking is left to implementation. One simple implementation is for the receiver to maintain an N -bit bitmap, w , to represent the sequence numbers in segment #1. The order of w is most significant bit first (i.e., $w[N-1]$, $w[N-2]$, ..., $w[1]$, $w[0]$). Let $w[0]$ represent V , $w[1]$ represent $((V - 1) \bmod 256)$, etc. $w[i] = '1'$ means sequence number i has already been received. When a message with sequence number i has been decrypted successfully, $w[i]$ is set to '1'. Whenever V moves from V_1 to V_2 , left-shift w $((V_2 - V_1) \bmod 256)$ times. Each time w is left-shifted, stuff a '0' at the eight end of w . After all the shifting, set $w[0]$ to '1'.

1 The initial encryption mode of user information of a service is established by sending a
 2 *Security Mode Command Message* on f-csch or by setting the UI_ENCRYPT_MODE field in
 3 the Service Configuration information record, with the UI_ENCRYPT_MODE field set to one
 4 of the values specified in 3.7.5.7-3. The value of the UI_ENCRYPT_MODE field is then
 5 stored in SO_CON_REC_s[j].UI_ENCRYPT_MODE, where SO_CON_REC_s[j] is the service
 6 option connection record (see 2.6.4.1.12) corresponding to the service.

7 To turn user information encryption for a service on or off after channel assignment,
 8 the base station sends a *Security Mode Command Message* on f-dsch with the
 9 UI_ENCRYPT_MODE field set accordingly. Explicit action time should be used when
 10 sending the *Security Mode Command Message*.

11 User information shall be encrypted based on the value of
 12 SO_CON_REC_s[j].UI_ENCRYPT_MODE, where SO_CON_REC_s[j] is the service option
 13 connection record (see 2.6.4.1.12) corresponding to the service.

14 2.3.12.4.2.1 User Information Encryption/Decryption Procedures

15 If P_REV_IN_USE_s is less than nine and extended encryption for user information is turned
 16 on for a service, the sender shall encrypt each data block (see [3]) from that service, in
 17 accordance with 2.3.12.4.3, before passing the data blocks to MAC Layer. On the receiver
 18 side, the receiver shall decrypt each data block for that service from MAC Layer, in
 19 accordance with 2.3.12.4.3, before passing them to that service.

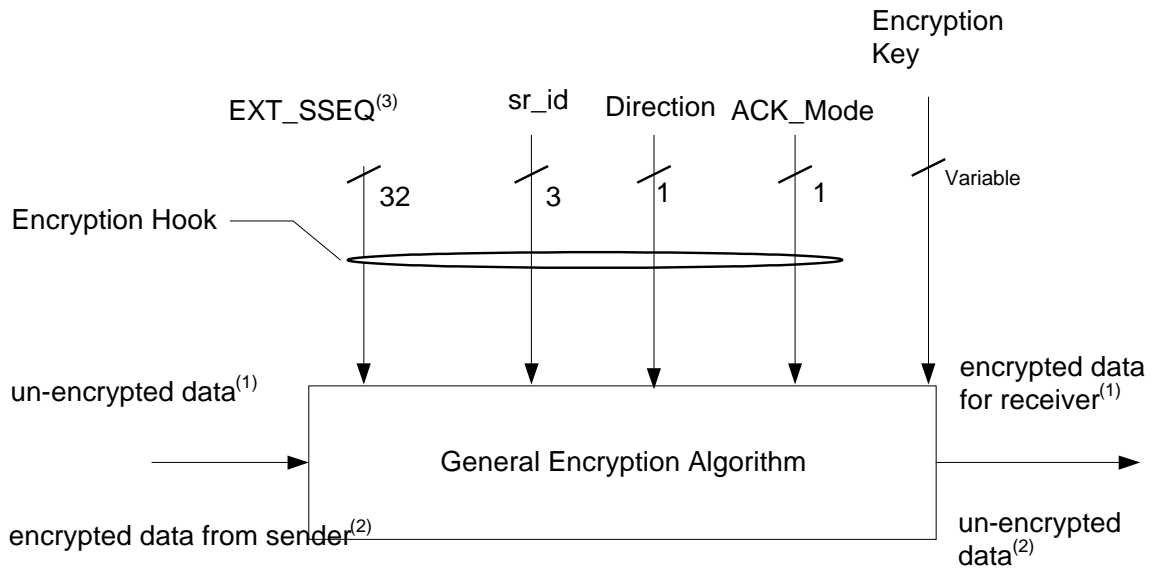

20 If P_REV_IN_USE_s is greater than or equal to nine and extended encryption for user
 21 information is turned on for a service, the sender shall encrypt the user data in the service
 22 layer before passing it to the MAC Layer. On the receiver side, the receiver shall pass each
 23 data block from MAC Layer to that service. Details of encryption are specified in the
 24 corresponding service option specification (see ~~[30]~~[53]).

25 If P_REV_IN_USE_s is greater than or equal to nine and extended encryption for user
 26 information is turned on for a voice service option¹⁹, the sender shall encrypt each data
 27 block from the voice service, in accordance with 2.3.12.4.3, before passing the data blocks
 28 to MAC Layer. On the receiver side, the receiver shall decrypt each data block for the voice
 29 service from MAC Layer, in accordance with 2.3.12.4.3, before passing them to that service.

30 2.3.12.4.3 Interface to the Encryption Algorithms

31 Figure 2.3.12.4.3-1 shows the structure for encrypting/decrypting both signaling messages
 32 and user information. Various encryption algorithms can be used with this structure. The
 33 encryption algorithm takes all or part of the following parameters as inputs, as illustrated
 34 in Figure 2.3.12.4.3-1. The actual inputs to the algorithm are specified in the rest of this
 35 section.

19 Voice service option refers to SO 60, SO 61 or any service option in Service Option Group 0 in
~~[30]~~[53].

Notes:
 (1) For encryption only
 (2) For decryption only
 (3) The following value shall be used instead of EXT_SSEQ for user information: $\lfloor \text{sys_time}/20 \rfloor \bmod 2^{32}$, where sys_time is the system time, in units of ms, corresponding to the start of the frame that carries the user information bits.

Figure 2.3.12.4.3-1. Encryption Input Parameters

The inputs to the encryption algorithm are described as follows:

- EXT_SSEQ - A 32-bit Security Encryption Sequence Number for encryption/decryption.
- sr_id - Service Reference Identifier (see [3]), which identifies the associated service option instance.
- Direction - The direction of the data being encrypted/decrypted. This shall be set to '0' if the data is transmitted on or received on a forward link. Otherwise, it shall be set to '1'.
- Encryption Key – Session Key for Encryption. This shall be a result of successful Session Key Agreement between the base station and the mobile station. The Encryption Key shall be stored by the mobile station in ENC_KEY[KEY_ID].
- Channel_id – Channel identifier, which identifies the physical channel that carries the data to be encrypted or decrypted. This is applicable only to user information encryption on f/r-dtch. Channel_id shall be set to, '000' for Fundamental Channel, '001' for Dedicated Control Channel, '010' for Supplemental Code Channel, '011' for Supplemental Channel 0, and '101' for Supplemental Channel 1.

- 1 • ACK_Mode – The delivery mode (unassured or assured) of the signaling message. This
 2 shall be set to ‘0’ if the message is delivered using unassured mode; otherwise, this
 3 shall be set to ‘1’.

4 If the Enhanced Cellular Message Encryption Algorithm is used for encrypting/decrypting
 5 signaling messages, the input parameters of the Enhanced Cellular Message Encryption
 6 Algorithm (see [23]) shall be set as follows:

- 7 • The DATA_TYPE parameter shall be set to ‘0’.
- 8 • The SYNC parameter shall be set as follows:
- 9 - SYNC[0] = EXT_SSEQ [7:0]²⁰.
- 10 - SYNC[1] = (ACK_Mode | Direction | EXT_SSEQ [13:8]), where “|” denotes
 11 concatenation and EXT_SSEQ_s [13:8] is bits 8 through 13 of EXT_SSEQ (with the
 12 LSB being bit 0).
- 13 • The CMEKEY[0-7] parameter shall be set to the first 64 bits of ENC_KEY[KEY_ID].

14 If the Rijndael Encryption Algorithm is used for encrypting/decrypting signaling messages,
 15 the input parameters of ESP_AES (see [44]) shall be set as follows:

- 16 • The encryption key parameter shall be set to ENC_KEY[KEY_ID].
- 17 • The FRESH parameter shall be set to (ACK_Mode | sr_id [2:0] | Direction | EXT_SSEQ
 18 [31:0] | ‘000’).
- 19 • The FRESHSIZE parameter shall be set to 5.
- 20 • The BUF parameter shall be set to the pointer of the most significant bit of the buffer²¹
 21 that contains the data to be encrypted or decrypted.
- 22 • The BIT_OFFSET parameter shall be set to the offset between the bit position of the
 23 most significant bit of the data to be encrypted/decrypted and the bit position of the
 24 most significant bit of the buffer (e.g., if the bit position of the most significant bit of the
 25 data to be encrypted/decrypted and the bit position of the most significant bit of the
 26 buffer are equal, BIT_OFFSET = 0).
- 27 • The BIT_COUNT parameter shall be set to the number of bits of the data to be
 28 encrypted/decrypted.
- 29 • The full 128 bits of ENC_KEY[KEY_ID] shall be used.

30 If the Rijndael Encryption Algorithm is used for encrypting/decrypting user information,
 31 the input parameters of ESP_AES (see [44]) shall be set as follows:

²⁰ $Z [y:x]$ denotes bit x to bit y of the binary value Z with bit 0 the least significant bit of Z .

²¹ “Buffer” refers to the physical memory that stores the data to be encrypted or decrypted. The octets in the buffer are assumed to be most-significant first, and the first bit of the buffer is the most significant bit of the first octet.

- 1 • The encryption key parameter shall be set to ENC_KEY[KEY_ID].
- 2 • The FRESH parameter shall be set to $(sr_id [2:0] \mid Direction \mid \lfloor sys_time/20 \rfloor \bmod 2^{32})$
- 3 $[31:0] \mid Channel_id [2:0] \mid '0')$, where sys_time is the system time, in units of ms,
- 4 corresponding to the start of the physical layer frame that carries the data block(s).
- 5 • The FRESHSIZE parameter shall be set to 5.
- 6 • The BUF parameter shall be set to the pointer of the most significant bit of the buffer²²
- 7 that contains the data to be encrypted or decrypted.
- 8 • The BIT_OFFSET parameter shall be set to the offset between the bit position of the
- 9 most significant bit of the data to be encrypted/decrypted and the bit position of the
- 10 most significant bit of the buffer (e.g., if the bit position of the most significant bit of the
- 11 data to be encrypted/decrypted and the bit position of the most significant bit of the
- 12 buffer are equal, BIT_OFFSET = 0).
- 13 • The BIT_COUNT parameter shall be set to the number of bits of the data to be
- 14 encrypted/decrypted.
- 15 • The full 128 bits of ENC_KEY[KEY_ID] shall be used.

16 2.3.12.4.4 Encryption Negotiation

17 The mobile station shall indicate to the base station the encryption algorithms supported
18 by using SIG_ENCRYPT_SUP and UI_ENCRYPT_SUP in one of the following messages:

- 19 • *Registration Message*
- 20 • *Origination Message*
- 21 • *Page Response Message*
- 22 • *Security Mode Request Message*
- 23 • *Status Response Message* (in Encryption Capability information record)
- 24 • *Extended Status Response Message* (in Encryption Capability information record)

25 The base station may turn on or turn off the encryption of the voice, data services, or
26 signaling encryption with a *Security Mode Command Message*, *Universal Handoff Direction*
27 *Message*, or *General Handoff Direction Message* sent on f-dsch or *Security Mode Command*
28 *Message* sent on f-csch. Similarly, the mobile station may propose to turn on or turn off
29 the user information encryption or signaling encryption with a *Security Mode Request*
30 *Message* sent on r-dsch or r-csch.

31

²² “Buffer” refers to the implementation-dependent physical memory that stores the data to be encrypted or decrypted. The octets in the buffer are assumed to be most-significant first, and the first bit of the buffer is the most significant bit of the first octet.

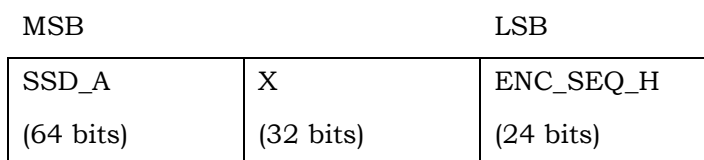

1

2 2.3.12.4.5 Computation of NEW_SSEQ_H_SIG

3 The NEW_SSEQ_H_SIG field (included in the *Registration Message*, *Origination Message*,
4 *Page Response Message*, and *Security Mode Request Message*) is a signature of the 24 most
5 significant bits of the crypto-sync (NEW_SSEQ_H). The mobile station shall compute this
6 8-bit field as follows:

71. The mobile station shall construct the *message bits* as shown in Figure 2.3.12.4.5-1.
8 For messages that are sent on the r-csch, X is set to $RAND_s$. For messages that are sent on
9 the r-dsch, X is set to $(\lfloor \text{sys_time}/20000 \rfloor) \bmod 2^{32}$, where *sys_time* is the system time in
10 ms at which the message is assembled.

11

12

Figure 2.3.12.4.5-1. Message Bits

13

142. The mobile station shall pad the *message bits* constructed in the previous step, as
15 specified in [38], and compute the 160-bit *message digest* as specified in [38].

163. The mobile station shall store the 8 rightmost (least significant) bits of the *message
17 digest* in NEW_SSEQ_H_SIG.

18 2.3.12.5 Authentication and Key Set-up Procedures when $P_REV_IN_USE_s \geq 10$

19 If $P_REV_IN_USE_s$ is equal to or greater than ten and $MSG_INTEGRITY_SUP_s$ is equal to
20 '1', then message integrity is performed (see [4]). The mobile station performs
21 authentication in accordance with the procedures in this section. Before any message
22 integrity or extended encryption (see 2.3.12.4) can be performed, the mobile station and
23 base station need to set up the same set of integrity key, encryption key, and security
24 sequence number in a secured manner.

25 There are two types of keys that the base station could obtain from the network – the
26 CMEA key or the (IK, CK) pair. Each requires a different method to be established. CMEA
27 key is the key generated using CAVE during 2G authentication as described in 2.3.12.1.
28 The (IK, CK) pair is a result of AKA (3G authentication. See [44]).

29 All base stations with P_REV greater than or equal to ten shall be able to execute 2G
30 authentication or AKA. Whether the AKA procedures are actually performed on a mobile
31 station depends on various factors such as whether the HLR/AC has enabled AKA, whether
32 the ANSI-41 interfaces between the MSC/VLR and AC supports AKA, etc.

33 All mobile stations with MOB_P_REV greater than or equal to ten shall support 2G
34 authentication, AKA, and message integrity.

1 In general, when an idle mobile station does not have any integrity key and encryption key
2 to use, it starts the 2G authentication and key set-up procedures by registering via a
3 *Registration Message, Origination Message, or Page Response Message*.

4 Details of Authentication and Key Set-Up Procedures are described in the rest of this
5 section.

6 The mobile station requests (IK, CK) from the UIM. If (IK, CK) are available, the mobile
7 station has already performed the 3G authentication and the (IK, CK) may still be valid, in
8 which case, the mobile station needs to perform the (IK, CK) restoration procedures in
9 2.3.12.5.3 to restore the (IK, CK).

10 If (IK, CK) in the UIM are not available, the mobile station sets KEY_ID to NULL to indicate
11 that the mobile station does not have any integrity key and encryption key and thus not
12 authenticated. The mobile station then registers and sends an *ROP*. The *ROP* contains a
13 new key id (NEW_KEY_ID) and a new security sequence number (NEW_SSEQ_H) associated
14 with the AUTHR (see [4]) of the message. The mobile station also starts a Key Set-Up timer.
15 23

16 Since the mobile station does not know beforehand whether the serving base station it
17 roams to supports 2G authentication, 3G authentication, or both, the mobile station
18 always starts with 2G authentication. When a mobile station sends an *ROP*, it always starts
19 with performing the 2G authentication by including an AUTHR (see [4]) in the message. If
20 an AKA is performed during a 2G authentication, the mobile station will abort the 2G
21 authentication.

22 The types of authentication are distinguished according to what the network provides the
23 base station with during the authentication process. If the base station receives a CMEA
24 key, 2G authentication is performed (see 2.3.12.5.1). If the base station receives
25 Authentication Vectors (AV's), 3G authentication is performed (see 2.3.12.5.2).

26 In the 2G authentication, the mobile station concatenates the CMEA key with a copy of
27 itself to form a 128-bit key to be used as both the integrity key, CIK, and the encryption
28 key, CCK. The CIK and CCK will be referred to as the (CIK, CCK) pair.

29 In the 3G authentication, the mobile station uses IK as the integrity key and CK as the
30 encryption key – referred to as the (IK, CK) pair.

31 The key strength of CCK or CK may be reduced by the “Key Strength Reduction Algorithm”
32 (see 2.3.12.5.4), which takes the key and converts it into another key of the same length
33 but with the entropy reduced. For simplicity, all the procedures hereafter only mention
34 CCK and CK.

²³ If the base station knows it is not going to get any keys from the network for whatever reason, the base station should indicate so in the *Registration Accepted Order*, so that the mobile station could stop waiting. However, if there is no current CIK “in use”, the *Registration Accepted Order* could not be MAC'ed, in which case, it is up to the mobile station whether or not to trust the *Registration Accepted Order*.

1 Whenever the key set-up is complete, all the messages shall include a MACI with the
2 following exceptions:

- 3 • On the f-csch, the *General Page Message*, *Universal Page Message*, *Registration Request*
4 *Order*, *Authentication Request Message* and *Authentication Challenge Message* shall not
5 include a MACI. The *Extended Channel Assignment Message* may not include a MACI.
6 All overhead messages and all signaling messages with a broadcast address type shall
7 not include a MACI.
- 8 • On the f-dsch, the *Authentication Challenge Message* shall not include a MACI.
- 9 • On the r-csch or r-dsch, the *Authentication Response Message*, *Authentication*
10 *Resynchronization Message* and *Mobile Station Reject Order* (ORDQ = '00010110',
11 '00011000', '00011001' or '00011010') shall not include a MACI.
- 12 • All mini messages shall not include a MACI.

13 When the mobile station sends a *Registration Message*, *Origination Message*, or *Page*
14 *Response Message* when RESTORE_KEYS is equal to '1', Layer 3 shall deliver the message
15 with a 24-bit number (selected by Layer 3) to LAC. The 24-bit number is used to perform
16 the MAC-I computation and to initialize TX_EXT_SSEQ[i][j] and RX_EXT_SSEQ[i][j], where *i*
17 = '0' or '1', *j* = '00' to '11'.

18 2.3.12.5.12G Authentication when P_REV_IN_USE_s >= 10

19 This section applies to a base station that performs 2G authentication with the mobile
20 station.

21 If KEY_ID is equal to NULL and mobile station wants to set up encryption and integrity
22 keys, it shall start Key Set-Up timer with expiration time of T75m seconds and execute the
23 key set-up procedure described in this section by sending an *ROP*.

24 If an *ROP* does not include a MACI, it implies that the mobile station does not have an
25 integrity key, in which case, the base station gets a CMEA key from the network and
26 authenticates the mobile station's AUTHR (which is always included, see [4]). If the
27 authentication is successful, when the CMEA key is available at the base station, the base
28 station uses assured mode to send a *RES* that includes a Message Authentication Code
29 generated using the pending CIK, and the pending NEW_SSEQ_H (proposed by the mobile
30 station). Upon reception of the *RES*, the mobile station validates the MACI. If the validation
31 is successful, the pending (CIK, CCK) and NEW_SSEQ_H can become "in use" in the mobile
32 station. The mobile station stores the NEW_KEY_ID in KEY_ID, the CIK in
33 INT_KEY[KEY_ID], and the CCK in ENC_KEY[KEY_ID].

34 The mobile station then stops the Key Set-Up timer and sends a *Security Mode Completion*
35 *Order* using assured mode to the base station that includes a Message Authentication
36 Code. At this point, if the base station successfully validates the *Security Mode Completion*
37 *Order* that the mobile station sends, the pending (CIK, CCK) and NEW_SSEQ_H can
38 become "in use" in the base station; otherwise, the base station resends the *RES* until it
39 receives a valid *Security Mode Completion Order* from the mobile station. If the mobile
40 station receives a *RES* with an invalid MACI, the mobile station shall enter the *System*
41 *Determination Substate* with an encryption/message integrity failure indication.

1 Once (CIK, CCK) has been established, the mobile station can perform integrity protection
2 and encryption.

3 If the Key Set-Up timer expires and the mobile station determines that it is not attempting
4 to originate an emergency call, the mobile station may go to the *System Determination*
5 *Substate* with an encryption/message integrity failure indication, which will trigger re-
6 registrations or the mobile station may continue with normal Layer 3 Signaling procedures,
7 not to retry key set-up, and not to perform message integrity in both directions²⁴. If the
8 mobile station retries key set-up but still cannot establish the keys after an implementation
9 dependent number of retries, the mobile station may reject the serving base station.

10 If the *ROP* includes a MACI in addition to AUTHR, this implies the mobile station has an
11 integrity key, in which case, the base station has two options. It can either continue using
12 the current (CIK, CCK) or change to a new pair.

13 If the base station decides to change to a new pair of (CIK, CCK), the base station will
14 perform the key set-up procedures described above.

15 If the base station decides not to change to any new keys, the base station sends to the
16 mobile station an *RES* that includes a Message Authentication Code. Upon reception of the
17 *RES*, the mobile station validates the MACI and if the MAC-I checks, the mobile station
18 sends a *Security Mode Completion Order* that includes a Message Authentication Code using
19 assured mode and removes the pending keys, the associated key id, and the associated
20 NEW_SSEQ_H.

21 To minimize race conditions, on the base station side, the base station does not send any
22 messages that are encrypted or include a Message Authentication Code, and are non-
23 essential to the key set-up between the time it receives an *ROP* and the time it receives the
24 *Security Mode Completion Order* of an *RES*, which is always sent using the assured mode.
25 On the mobile station side, to the same purpose, the mobile station does not send any
26 messages that are encrypted or include a Message Authentication Code, and are non-
27 essential to the key set-up between the time it sends an *ROP* and the time it receives an
28 *RES*. Also, the mobile station does not send another *ROP* between the time it sends an *ROP*
29 and the time it receives a *RES*.

30 2.3.12.5.23G Authentication (AKA) when $P_REV_IN_USE_s \geq 10$

31 This section applies to a base station that performs 3G authentication (AKA) with the
32 mobile station. The AKA procedure and related algorithms take mobile station specific
33 information, data received from base station and the mobile station's subscriber
34 authentication key as inputs. The subscriber authentication key is 128-bits long. It is
35 assigned to the mobile station and is stored in the mobile station's permanent security and
36 identification memory. The subscriber authentication key is known only to the mobile
37 station and to its associated Authentication Center (AC) (see [13]). Refer to Figures

²⁴ This is to allow the mobile station to operate and accept services from the base station without message integrity protection in case the keys cannot be established for whatever reason (e.g., shared secret root keys in the mobile station and base station do not match).

1 2.3.12.5.2-1, 2.3.12.5.2-2, 2.3.12.5.2-3, and 2.3.12.5.2-4. In these figures, the input K is
2 the mobile station's subscriber authentication key.

3 The purposes of AKA are to mutually authenticate the mobile station and the serving base
4 station, and to establish a new set of (IK, CK) and UAK, if supported. Upon completion of
5 AKA, CK and IK are stored in the mobile station while UAK, if supported, is stored in the
6 UIM. Mentioning of (IK, CK) hereafter already implicitly implies that UAK is also included, if
7 supported. When extended encryption is turned on, CK is used as the encryption key in the
8 extended encryption described in 2.3.12.4. IK is used as the integrity key to provide
9 message integrity check in the base station. UAK is used to convert the result of message
10 integrity check, MAC-I, into UMAC.

11 AKA can be initiated by the base station at any time for any reason. For example, when (IK,
12 CK) expires in the mobile station. Also, when the base station receives an *ROP*, the base
13 station checks if the *ROP* contains a MACI or not. If there is no MACI, or the MACI does not
14 check, or can not be checked, the base station may initiate AKA. Regardless of the reasons,
15 if the base station initiates AKA, the following events occur.

16 The base station invokes the procedure by selecting the next unused AV from the ordered
17 array of AV's stored in the VLR. If an AV is not available in the serving node, one (or more)
18 AV's are requested from the subscriber's home system. The base station sends the mobile
19 station an *Authentication Request Message* which contains the random challenge RANDA
20 and the authentication token for network authentication, AUTN, associated with the
21 selected AV.

22 Each AV contains the following information (see figure 2.3.12.5.2-1):

- 23 • Authentication Random Challenge Number (RANDA)
- 24 • Expected Result (XRES)
- 25 • Encryption Key (CK)
- 26 • Integrity Key (IK)
- 27 • UIM Authentication Key (UAK) (support of this field is optional)
- 28 • Authentication Token (AUTN), which consists of the Concealed Sequence Number
29 (CON_SQN), the Authentication Management Function (AMF), and the Message
30 Authentication Code (MAC-A).

31 Upon reception of the *Authentication Request Message*, the mobile station aborts any
32 pending 2G key set-up, starts the Key Set-Up timer with expiration time of T75m seconds
33 and the UIM computes the expected message authentication code (XMAC). If this is not
34 equal to the MAC-A received in the AUTN, the mobile station shall enter the *System*
35 *Determination Substate* with an encryption/message integrity failure indication; otherwise,
36 the UIM verifies that the sequence number SQN (see [46]) received in the AUTN is in the
37 correct range (a test of freshness).

38 If the UIM determines that the received SQN is not in the correct range (see [46]), the
39 mobile station sends an *Authentication Resync Message* to the base station that includes
40 the concealed value of the sequence number stored in the UIM (CON_MS_SQN). If the SQN
41 is in the correct range, the UIM computes the (IK, CK) pair and the RES and passes the (IK,

1 CK) pair and RES to the mobile station. The mobile station then associates a pending key
2 id NEW_KEY_ID and a pending NEW_SSEQ_H with the pending (IK, CK) pair and sends an
3 *Authentication Response Message* containing RES to the base station. The *Authentication*
4 *Response Message* shall contain a Message Authentication Code that is computed based on
5 the pending NEW_SSEQ_H and the pending IK.

6 The mobile station also stores (RANDA, RES, IK, CK, key id, NEW_SSEQ_H) in case it
7 receives, in the near future, the same retransmitted *Authentication Request Message* that
8 requires the mobile station to resend the same *Authentication Response Message*. The UIM
9 stores (IK, CK) until the next successful execution of AKA.

10 Upon reception of the *Authentication Response Message*, the base station compares RES
11 with the expected response XRES from the selected AV. If XRES equals RES, then the
12 authentication of the user has passed and the pending (IK, CK) and the pending
13 NEW_SSEQ_H can become “in use” in the base station. The base station then confirms the
14 AKA completion by sending an *RES* that includes a Message Authentication Code generated
15 using the pending IK to confirm the use of the pending (IK, CK). Upon reception of this
16 confirmation, the mobile station stops the Key Set-Up timer and the pending (IK, CK),
17 NEW_SSEQ_H, and key id become “in use” for the mobile station. The mobile station stores
18 the NEW_KEY_ID in KEY_ID, the IK in INT_KEY[KEY_ID], and the CK in ENC_KEY[KEY_ID].

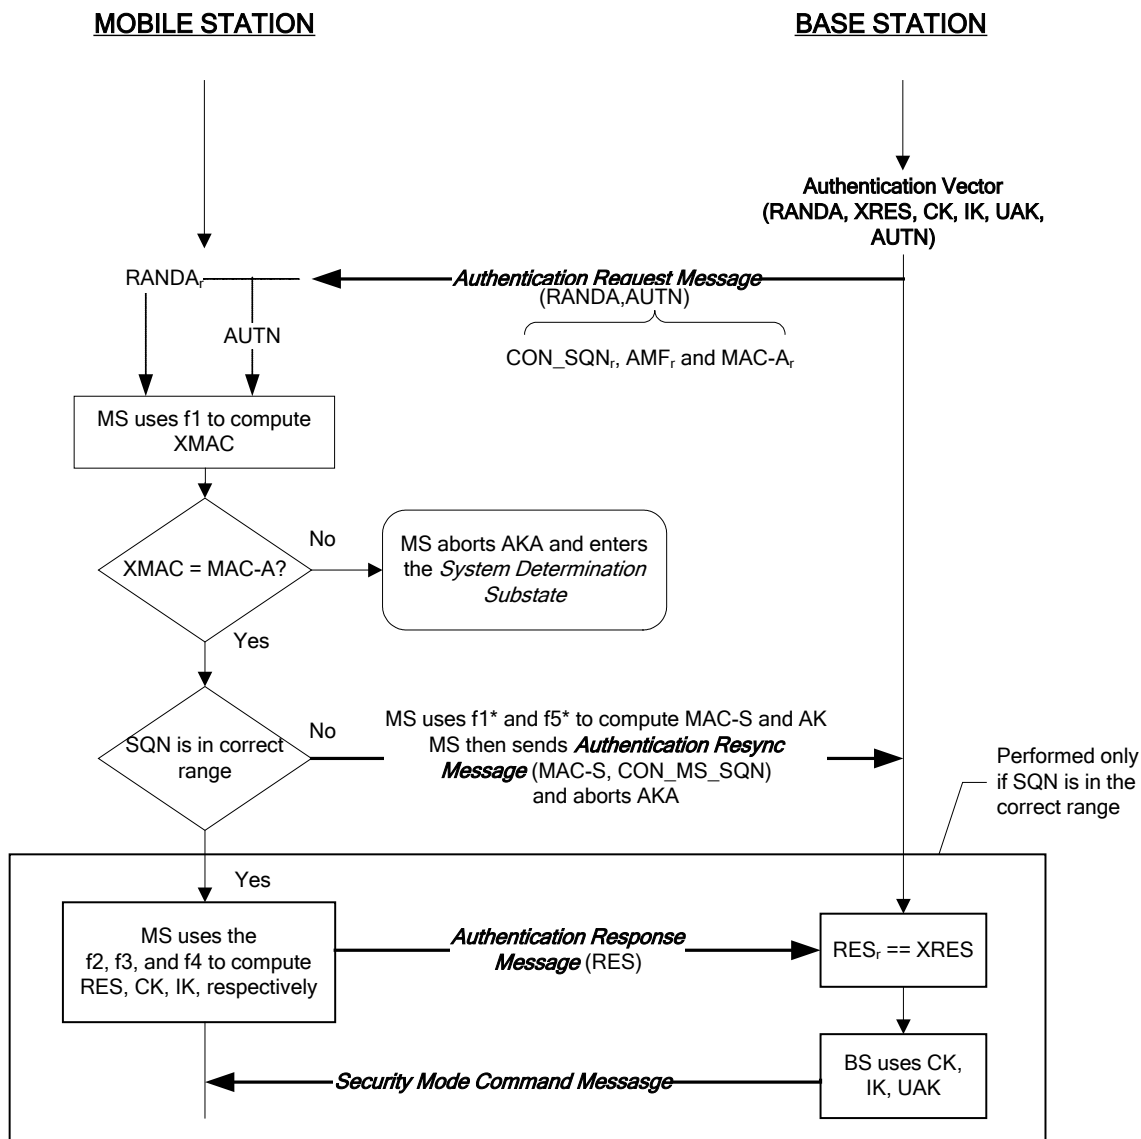

19 Once (IK, CK) has been established, the mobile station may start integrity protection and
20 encryption.

21 If the Key Set-Up timer expires and the mobile station determines that it is not attempting
22 to originate an emergency call, the mobile station shall go to the *System Determination*
23 *Substate* with an encryption/message integrity failure indication, which will trigger re-
24 registrations. If the mobile station retries key set-up but still cannot establish the keys
25 after an implementation dependent number of retries, the mobile station may reject the
26 serving base station.

27 To ensure the base station has agreed to switch to the pending (IK, CK), the mobile station
28 keeps sending the *Authentication Response Message* until it gets the *RES* that includes a
29 Message Authentication Code generated using the pending IK (or until the Key Set-Up
30 timer expires, whichever comes first). Also, if the ME receives the (RANDA, AUTN) that are
31 the same as the last received, the ME does not pass the (RANDA, AUTN) to the UIM but
32 responds with an *Authentication Response Message* including the corresponding RES.

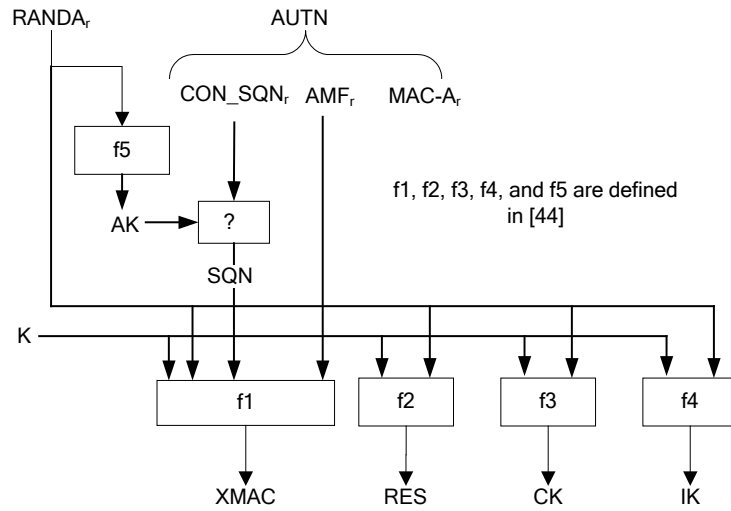

33 To minimize race conditions, on the base station side, the base station does not send any
34 messages that are encrypted or include a Message Authentication Code, and are non-
35 essential to the key set-up between the time it sends the *Authentication Request Message*
36 and the time it receives the *Authentication Response Message*. On the mobile station side,
37 the mobile station does not send any messages that are encrypted or include a Message
38 Authentication Code, and are non-essential to the key set-up between the time it receives
39 the *Authentication Request Message* and the time it receives the *Security Mode Command*
40 *Message* that includes a Message Authentication Code generated using the pending IK.

Figure 2.3.12.5.2-4. Function used for Calculation of UAK

2.3.12.5.3 Restoring (IK, CK) upon power on

Since (IK, CK) is stored in UIM even when the mobile station is powered off, it is possible for the mobile station, when the mobile station powers on again, to try to restore and use the stored (IK, CK) in order to avoid unnecessary AKA. However, the mobile station will need to re-establish the crypto-sync and key id, which are not stored when the mobile station is powered off.

If the base station no longer has the (IK, CK) available, the base station initiates an AKA and establishes a new (IK, CK) anyway, thus it will not need the following procedures.

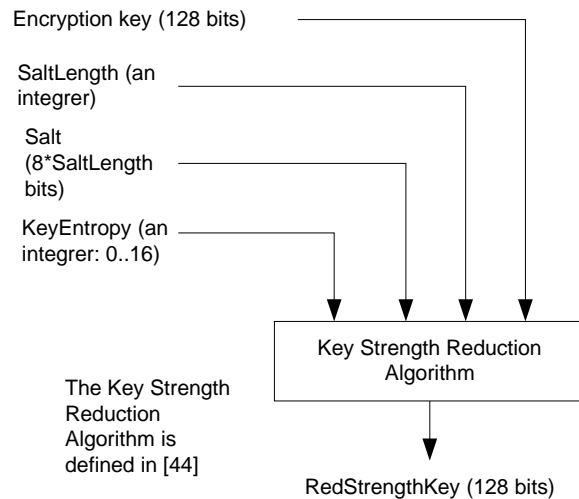

The mobile station could try to restore the key id association with its (IK, CK) via an *ROP* and a subsequent response from the base station. The mobile station sends an *ROP* that includes a Message Authentication Code generated using the stored IK and a pending *NEW_SSEQ_H*. The mobile station includes the *NEW_SSEQ_H* in the LAC Layer in the *ROP* and sets the *SDU_KEY_ID* to a value selected by the mobile station to associate with this (IK, CK). When the base station receives the *ROP*, it validates the MACI using its own IK stored for this mobile station and with the pending *NEW_SSEQ_H* provided in the message. If the MACI is valid, the base station sends a *Security Mode Command Message* that includes a Message Authentication Code generated using the stored IK and *NEW_SSEQ_H*.

When the mobile station receives the *RES*, the mobile station validates the MACI. If the MACI checks, the mobile station then starts using the key id for the stored (IK, CK) and the (IK, CK) and *NEW_SSEQ_H* can become “in use” in the mobile station. The mobile station then sends a *Security Mode Completion Order* that includes a Message Authentication Code using assured mode.

Upon reception of the *Security Mode Completion Order*, base station validates the MACI and if the MACI is valid, the base station starts to set the key id for the (IK, CK) to the value selected by the mobile station (in *NEW_KEY_ID* and *SDU_KEY_ID*), regardless of the current key id being used at the base station. The (IK, CK) pair and *NEW_SSEQ_H* can become in “in use” in the base station. The (IK, CK) pair is now successfully restored. The base station resends the *RES* until it gets the expected *Security Mode Completion Order*.

2.3.12.5.4 Key Strength Reduction Algorithm

Due to local security regulations, the base station may ask the mobile station to perform the Key Strength Reduction Algorithm (by setting *ENC_KEY_SIZE_r*) and use the resultant key from the algorithm. The Key Strength Reduction Algorithm uses the encryption key, *RAND*, and *ENC_KEY_SIZE_r* to determine the values of the inputs to the algorithm. The key strength reduction procedure is shown in Figure 2.3.12.5.4-1. The algorithm is defined in [44].

1

2

Figure 2.3.12.5.4-1. Key Strength Reduction

3

The input parameters of KeyStrengthRedAlg (see [44]) shall be set as follows:

4

- KeyLength shall be set to 16.

5

- OriginalKey shall be set to ENC_KEY[KEY_ID].

6

- SaltLength shall be set to 4.

7

- Salt shall be set to RAND_S.

8

- KeyEntropy shall be set to ENC_KEY_SIZE_r.

9

The mobile station shall set the ENC_KEY[KEY_ID] to RedStrengthKey.

10

2.3.12.5.5 Message Integrity Check Negotiation and Other Requirements

11

The base station shall indicate the supported user integrity algorithms in the SIG_INTEGRITY_SUP field in the *Extended System Parameters Message* and *ANSI-41 System Parameters Message*.

12

13

The mobile station shall indicate to the base station the message integrity algorithms supported and preferred by using SIG_INTEGRITY_SUP and SIG_INTEGRITY_REQ in one of the following messages:

14

- *Registration Message*

15

- *Origination Message*

16

- *Page Response Message*

17

- *Security Mode Request Message*

18

- *Status Response Message* (in Encryption Capability information record)

19

- *Extended Status Response Message* (in Encryption Capability information record)

20

21

22

1 In response, the base station shall select the integrity algorithm to be used among the
 2 integrity algorithms that are supported by both the mobile station and the base station,
 3 and then compute the MAC-I of a *Registration Accepted Order*, *Extended Channel*
 4 *Assignment Message*, or *Security Mode Command Message* based on the selected algorithm.

5 If and only if the base station sends a *Registration Accepted Order*, *Extended Channel*
 6 *Assignment Message*, or *Security Mode Command Message* with the CHANGE_KEYS field²⁵
 7 set to '1', the base station shall supply the base station LAC layer with the 24-bit value
 8 carried in NEW_SSEQ_H field and the 2-bit value in the NEW_KEY_ID field in the
 9 *Registration Message*, *Origination Message*, *Page Response Message*, *Authentication*
 10 *Response Message*, or the *Security Mode Request Message* that the base station is
 11 responding to.

12 2.3.13 Lock and Maintenance Required Orders

13 The mobile station shall have memory to store the lock reason code (LCKRSN_{P_{s-p}}) received
 14 in the *Lock Until Power-Cycled Order*. The data retention time under power-off conditions
 15 shall be at least 48 hours.

16 The mobile station shall have memory to store the maintenance reason code
 17 (MAINTRSN_{S-p}) received in the *Maintenance Required Order*. The data retention time under
 18 power-off conditions shall be at least 48 hours.

19 There are no requirements on the use of the lock and maintenance reason codes, and
 20 interpretation and use are implementation dependent.

21 2.3.14 Mobile Station Revision Identification

22 The mobile station shall provide memory to store the following parameters sent in the
 23 *Status Message*, the *Status Response Message*, or the *Extended Status Response Message*
 24 (*Terminal Information* record or *Extended Terminal information* record):

- 25 • Mobile manufacturer code (MOB_MFG_CODE_p)
- 26 • Manufacturer's model number (MOB_MODEL_p)
- 27 • Firmware revision number (MOB_FIRM_REV_p)

28 In addition, the mobile station shall provide memory to store the following parameter for
 29 each supported band class:

- 30 • Protocol revision number (MOB_P_REV_p)

31 2.3.15 Temporary Mobile Subscriber Identity

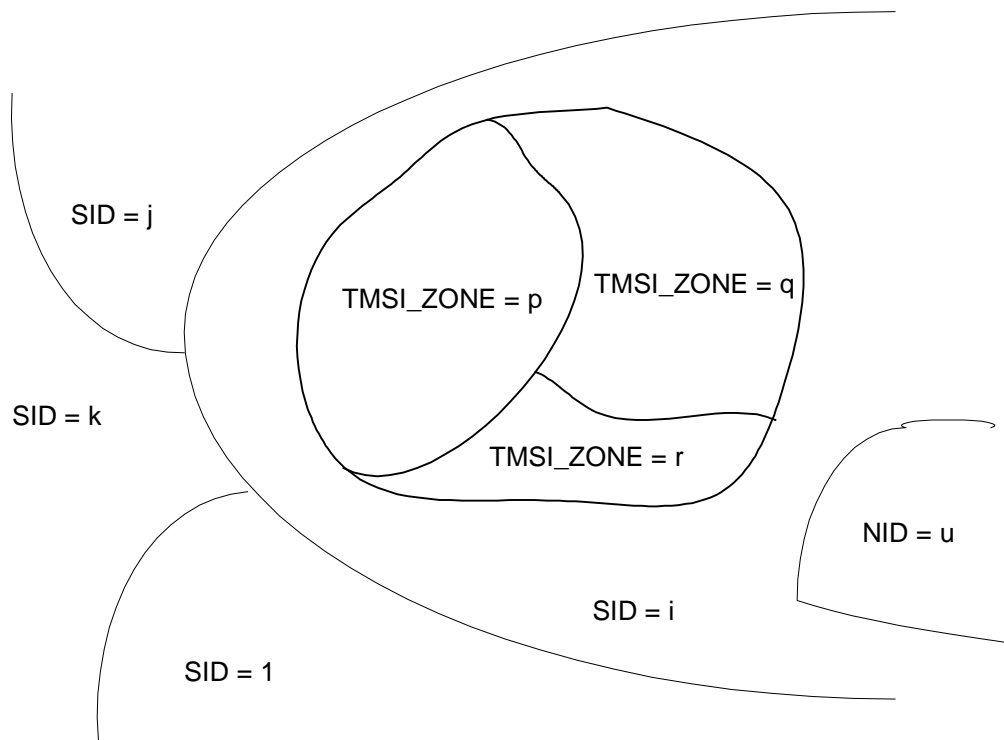

32 2.3.15.1 Overview

33 The Temporary Mobile Subscriber Identity (TMSI) is a temporary locally assigned number
 34 used for addressing the mobile station. The mobile station obtains a TMSI when assigned

²⁵ The base station sets the CHANGE_KEYS field to '1' to trigger the mobile station to reinitialize the crypto-sync and the keys or to reinitialize just the crypto-sync alone depending on different cases.

1 by the base station. The TMSI as a number does not have any association with the mobile
 2 station's IMSI, ESN, or directory number all of which are permanent identifications.

3 A TMSI zone is an arbitrary set of base stations for the administrative assignment of TMSIs.
 4 A TMSI_CODE is uniquely assigned to a mobile station inside a TMSI zone. A TMSI zone is
 5 identified by the TMSI_ZONE field. The same TMSI_CODE may be reused to identify a
 6 different mobile station in a different TMSI zone. The pair (TMSI_ZONE, TMSI_CODE) is a
 7 globally unique identity for the mobile station. This pair is called the full TMSI. The
 8 TMSI_CODE can be two, three, or four octets in length. The TMSI_ZONE can range from 1
 9 to 8 octets in length. Figure 2.3.15-1 shows an example of a TMSI_ZONE where the
 10 TMSI_ZONE is a subset of the NID (see 2.6.5.2).

11
 12 **Figure 2.3.15-1. TMSI Zone Example**

13

14 The base station sends a *TMSI Assignment Message* to assign a TMSI. In response, the
 15 mobile station sends a *TMSI Assignment Completion Message*. The base station instructs
 16 the mobile station to delete the TMSI by sending a *TMSI Assignment Message* with all the
 17 bits in the TMSI_CODE field set equal to '1'.

18 The TMSI expiration time is used to automatically delete the assigned TMSI. The mobile
 19 station obtains the expiration time when the TMSI is assigned in the *TMSI Assignment*
 20 *Message*. The mobile station compares the expiration time to the current System Time
 21 when it powers up and periodically during operation.

22 Whenever the mobile station sends its full TMSI, the mobile station sets a timer, called the
 23 full-TMSI timer. If the full-TMSI timer expires, the mobile station deletes the TMSI by
 24 setting all bits in the TMSI_CODE field to '1'.

2.3.15.2 TMSI Assignment Memory

The mobile station shall provide memory to store the following parameters:

- 4-bit assigning TMSI zone length (ASSIGNING_TMSI_ZONE_LEN_{s-p})
- 8-octet assigning TMSI zone (ASSIGNING_TMSI_ZONE_{s-p})
- 4-octet TMSI code (TMSI_CODE_{s-p})
- 3-octet TMSI expiration time (TMSI_EXP_TIME_{s-p})

2.4 Accumulated Statistics

2.4.1 Monitored Quantities and Statistics

The mobile station shall store the value described in Table 2.4.1-1.

Table 2.4.1-1. Monitored Quantities and Statistics

Quantity Identifier	Length (bits)	Description
OTHER_SYS_TIME	36	The SYS_TIME field from the most recently received <i>Sync Channel Message</i>

2.4.2 Accumulated Paging, Broadcast, and Forward Common Control Channel Statistics

The mobile station shall maintain the counters shown in Table 2.4.2-1. The counters shall have the length as specified in Table 2.4.2-1. The mobile station shall initialize each counter described herein to zero upon power-on; the mobile station shall not re-initialize any counter described herein at any other time except upon command from the base station. Each counter shall be maintained modulo 2^{Length} , where Length is specified in Table 2.4.2-1.

The mobile station shall increment the counter PAG_6 each time that it declares a loss of the Paging Channel (see 2.6.2.1.1.4). The mobile station shall increment the counter PAG_7 for each idle handoff it performs. The mobile station shall increment the counter FCCCH_4 each time that it declares a loss of the Forward Common Control Channel (see 2.6.2.1.1.4). The mobile station shall increment the counter BCCH_5 each time that it declares a loss of the Broadcast Control Channel (see 2.6.2.1.1.4).

1

Table 2.4.2-1. Accumulated PCH/BCCH/F-CCCH Channel Statistics

Counter Identifier	Length (bits)	Description
PAG_6	16	Number of times that the mobile station declared a loss of the Paging Channel
PAG_7	16	Number of mobile station idle handoffs
FCCCH_4	16	Number of times that the mobile station declared a loss of the Forward Common Control Channel
BCCH_5	16	Number of times that the mobile station declared a loss of the Broadcast Control Channel

2.5 Reserved

2.6 Layer 3 Processing

This section describes mobile station Layer 3 processing. It contains frequent references to the messages that flow between the mobile station and base station. While reading this section, it may be helpful to refer to the PDU formats (see 2.7 and 3.7), and to the message flow examples (see Annex B and Annex C).

The mobile station shall ignore fields at the end of messages that do not exist in the protocol revision supported by the mobile station.

The values for the time and numerical constants used in this section (e.g., T_{20m} , N_{4m}) are specified in Annex D.

As illustrated in Figure 2.6-1, mobile station Layer 3 processing consists of the following states:

- *Mobile Station Initialization State* - In this state, the mobile station selects and acquires a system.
- *Mobile Station Idle State* - In this state, the mobile station monitors messages on the f-csch.
- *System Access State* - In this state, the mobile station sends messages to the base station on the r-csch and receives messages from the base station on the f-csch.
- *Mobile Station Control on the Traffic Channel State* - In this state, the mobile station communicates with the base station using the f/r-dsch and f/r-dtch.

After power is applied to the mobile station, it shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a power-up indication (see 2.6.1.1).

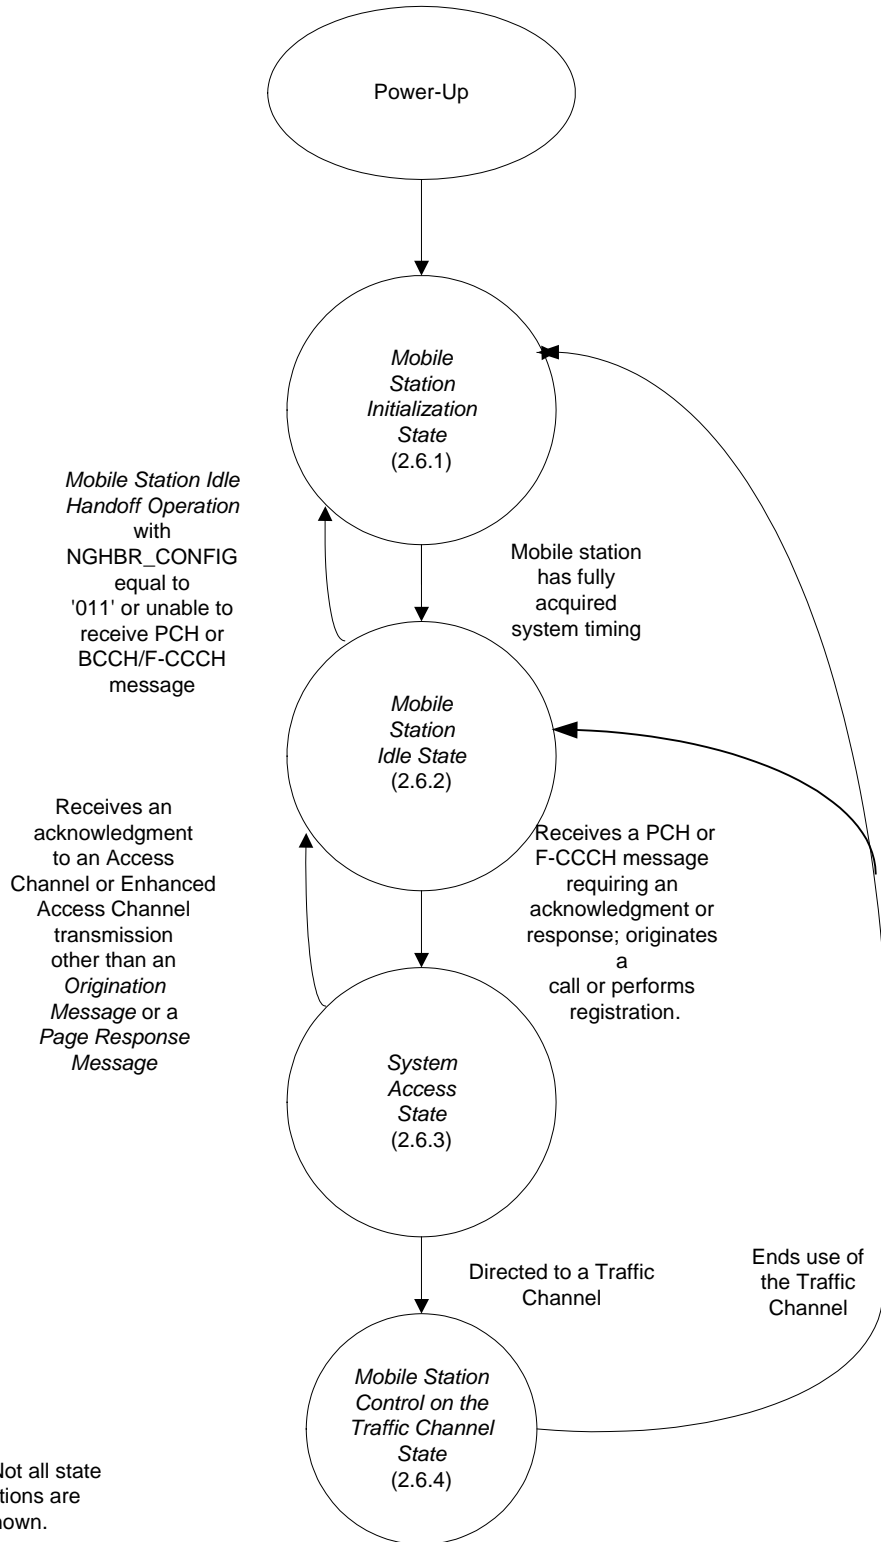

Figure 2.6-1. Mobile Station Layer 3 Processing States

1
2
3

1 2.6.1 Mobile Station Initialization State

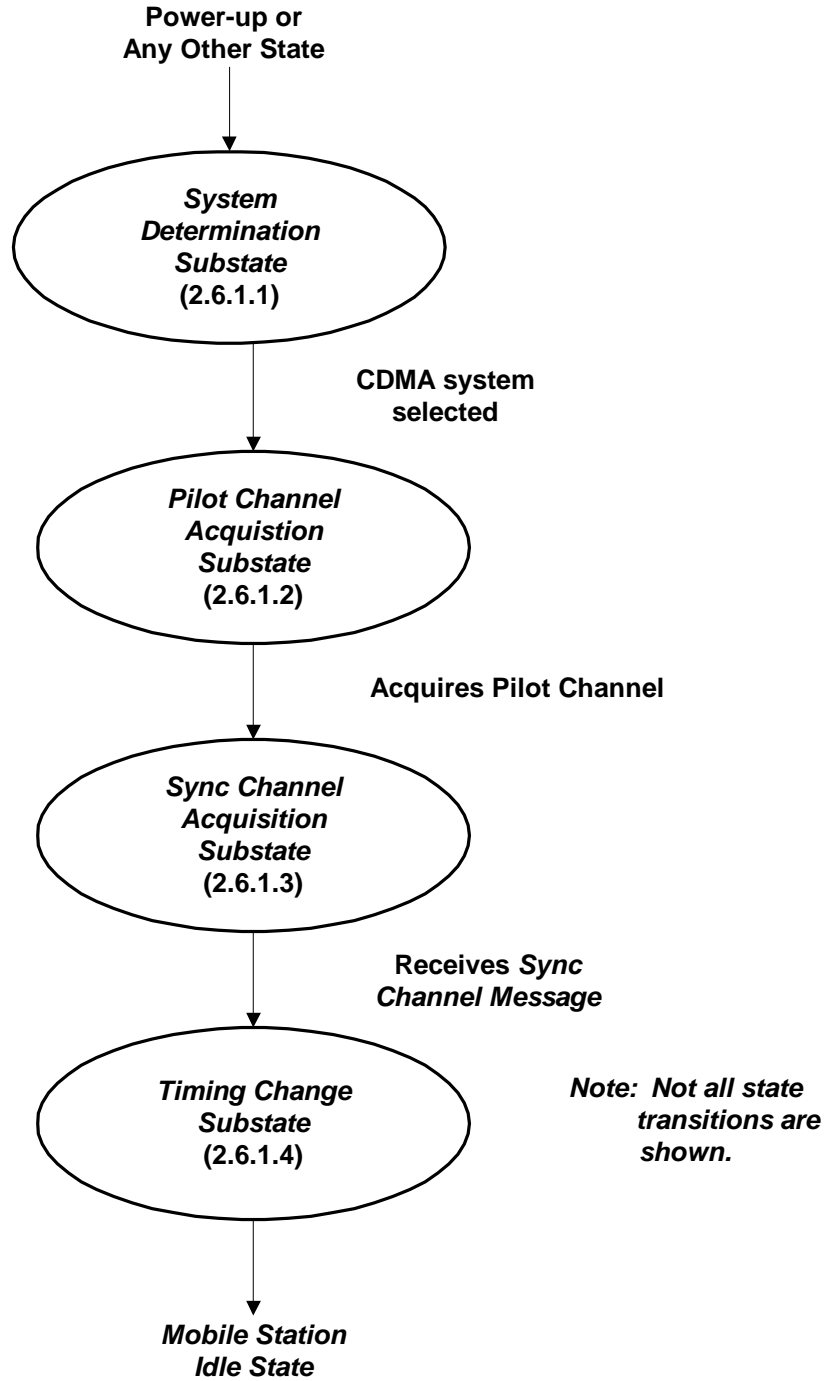

2 In this state, the mobile station first selects a system to use. If the selected system is a
3 CDMA system, the mobile station proceeds to acquire and then synchronize to the CDMA
4 system.

5 As illustrated in Figure 2.6.1-1, the *Mobile Station Initialization State* consists of the
6 following substates:

- 7 • *System Determination Substate* - In this substate, the mobile station selects which
8 system to use.
- 9 • *Pilot Channel Acquisition Substate* - In this substate, the mobile station acquires the
10 Pilot Channel of a CDMA system.
- 11 • *Sync Channel Acquisition Substate* - In this substate, the mobile station obtains system
12 configuration and timing information for a CDMA system.
- 13 • *Timing Change Substate* - In this substate, the mobile station synchronizes its timing to
14 that of a CDMA system.

15 While in the *Mobile Station Initialization State*, the mobile station shall update all active
16 registration timers as specified in 2.6.5.5.1.2.

17

1
2
3

Figure 2.6.1-1. Mobile Station Initialization State

1 2.6.1.1 System Determination Substate

2 In this substate, the mobile station selects the system to use.

3 Upon entering the *System Determination Substate*, the mobile station shall initialize the
4 registration parameters as specified in 2.6.5.5.1.1.

5 If the mobile station enters the *System Determination Substate* with a power-up indication,
6 the mobile station shall set $RAND_S$ to 0 (see 2.3.12.1.2), $PACA_S$ to disabled, $PACA_CANCEL$
7 to '0', the PACA state timer to disabled, $NDSS_ORIG_S$ to disabled, $MAX_REDIRECT_DELAY_S$
8 to 31, $REDIRECTION_S$ to disabled, all entries of $SDB_SO_OMIT_S$ to '0',

9 $RER_MODE_ENABLED$ to NO, $TKZ_MODE_ENABLED$ to NO, $TKZ_MODE_PENDING$ to NO,
10 $RSC_MODE_ENABLED$ to NO, and $T_SLOTTED_S$ to T_{74m} . The mobile station shall select a
11 system in accordance with the custom system selection process (see 2.6.1.1.1) and shall
12 attempt to acquire the selected system (see 2.6.1.1.4).

13 If the mobile station enters the *System Determination Substate* with any indication other
14 than a power-up indication, and if $PACA_S$ is equal to enabled, the mobile station shall also
15 set $PACA_S$ to disabled, $PACA_CANCEL$ to '0', the PACA state timer to disabled, and should
16 indicate to the user that the PACA call has been canceled.

17 If the mobile station enters the *System Determination Substate* with an acquisition failure
18 indication, the mobile station shall perform the following:

- 19 • If $REDIRECTION_S$ is equal to enabled, the mobile station shall attempt to select another
20 system in accordance with the current redirection criteria (see 2.6.1.1.2). If the mobile
21 station is able to select another system, the mobile station shall attempt to acquire the
22 selected system (see 2.6.1.1.4). Otherwise, if the mobile station has exhausted all
23 possible selections using the current redirection criteria, the mobile station shall
24 perform the following:
 - 25 - The mobile station shall set $REDIRECTION_S$ to disabled.
 - 26 - The mobile station shall set $RETURN_CAUSE_S$ to '0001'.
 - 27 - If $RETURN_IF_FAIL_S$ is equal to '1', the mobile station shall attempt to select the
28 system from which it was redirected and shall attempt to acquire the selected
29 system (see 2.6.1.1.4). The precise process for determining how to select the system
30 from which the mobile station was redirected is left to the mobile station
31 manufacturer.
 - 32 - If $RETURN_IF_FAIL_S$ is equal to '0', the mobile station shall select a system other
33 than the system from which it was redirected in accordance with the custom system
34 selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system
35 (see 2.6.1.1.4). The precise process that the mobile station uses to avoid selecting
36 the system from which it was redirected is left to the mobile station manufacturer.
- 37 • If $REDIRECTION_S$ is equal to disabled, the mobile station shall select a system in
38 accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt
39 to acquire the selected system (see 2.6.1.1.4).

40 If the mobile station enters the *System Determination Substate* with a new system
41 indication, the mobile station shall set $REDIRECTION_S$ to disabled. If $NDSS_ORIG_S$ is

1 enabled, the mobile station shall set NDSS_ORIG_s to disabled and should indicate to the
 2 user that the call origination has been canceled. The mobile station shall select a system
 3 in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to
 4 acquire the selected system (see 2.6.1.1.4).

5 If the mobile station enters the *System Determination Substate* with a new band indication,
 6 the mobile station shall set REDIRECTION_s to disabled. If NDSS_ORIG_s is enabled, the
 7 mobile station shall set NDSS_ORIG_s to disabled and should indicate to the user that the
 8 call origination has been canceled. The mobile station shall attempt to acquire the system
 9 found on the frequency and band defined in NEW_BAND_RECORD (see 2.6.1.1.4).

10 If the mobile station enters the *System Determination Substate* with a CDMA available
 11 indication, the mobile station shall set REDIRECTION_s to disabled. If NDSS_ORIG_s is
 12 enabled, the mobile station shall set NDSS_ORIG_s to disabled and should indicate to the
 13 user that the call origination is canceled. The mobile station should set CDMACH_s to the
 14 CDMA Channel (CDMA_FREQ) specified in the *CDMA Capability Global Action Message* and
 15 should attempt to acquire a CDMA system on the specified CDMA channel (see 2.6.1.1.4).
 16 If the mobile station does not attempt to acquire a CDMA system on the specified CDMA
 17 Channel, the mobile station shall select a system in accordance with the custom system
 18 selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see
 19 2.6.1.1.4).

20 If the mobile station enters the *System Determination Substate* with an additional CDMA
 21 available indication, the mobile station shall set REDIRECTION_s to disabled. If
 22 NDSS_ORIG_s is enabled, the mobile station shall set NDSS_ORIG_s to disabled and should
 23 indicate to the user that the call origination is canceled. The mobile station should set
 24 CDMACH_s to the CDMA Channel (CDMA_FREQ) specified in the *CDMA Info Order* and
 25 should attempt to acquire a CDMA system on the specified CDMA channel (see 2.6.1.1.4).
 26 If the mobile station does not attempt to acquire a CDMA system on the specified CDMA
 27 Channel, the mobile station shall select a system in accordance with the custom system
 28 selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see
 29 2.6.1.1.4).

30 If the mobile station enters the *System Determination Substate* with a reselection indication,
 31 the mobile station shall set REDIRECTION_s to disabled. If NDSS_ORIG_s is enabled, the
 32 mobile station shall set NDSS_ORIG_s to disabled and should indicate to the user that the
 33 call origination is canceled. The mobile station shall select a system in accordance with the
 34 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected
 35 system (see 2.6.1.1.4).

36 If the mobile station enters the *System Determination Substate* with an encryption/message
 37 integrity failure indication, the mobile station shall set REDIRECTION_s to disabled, KEY_ID
 38 to '00', D_SIG_ENCRYPT_MODE_s to '000', C_SIG_ENCRYPT_MODE_s to '000',
 39 LAST_2G_KEY_ID_s to '00', LAST_3G_KEY_ID_s to '10', ENC_KEY[j] to NULL, INT_KEY[j] to
 40 NULL, TX_EXT_SSEQ[i][j] to 0, RX_EXT_SSEQ[i][j] to 0, where i ranges from '0' to '1' and j
 41 ranges from '00' to '11'. If NDSS_ORIG_s is enabled, the mobile station shall set
 42 NDSS_ORIG_s to disabled and should indicate to the user that the call origination is
 43 canceled. The mobile station shall select a system in accordance with the custom system

1 selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see
2 2.6.1.1.4).

3 If the mobile station enters the *System Determination Substate* with a system reselection
4 indication, the mobile station shall set REDIRECTION_s to disabled. If NDSS_ORIG_s is
5 enabled, the mobile station shall set NDSS_ORIG_s to disabled and should indicate to the
6 user that the call origination is canceled. The mobile station should attempt to select a
7 system available for system reselection as specified in 2.6.1.1.3, and should attempt to
8 acquire the selected system (see 2.6.1.1.4). The precise process for determining how to
9 select such a system is left to the mobile station manufacturer. If the mobile station does
10 not attempt to select such a system, the mobile station shall select a system in accordance
11 with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the
12 selected system (see 2.6.1.1.4).

13 If the mobile station enters the *System Determination Substate* with a rescan indication, the
14 mobile station shall set REDIRECTION_s to disabled. If NDSS_ORIG_s is enabled, the mobile
15 station shall set NDSS_ORIG_s to disabled and should indicate to the user that the call
16 origination is canceled. The mobile station shall select a system in accordance with the
17 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected
18 system (see 2.6.1.1.4).

19 If the mobile station enters the *System Determination Substate* with a protocol mismatch
20 indication, the mobile station shall perform the following:

- 21 • If REDIRECTION_s is equal to enabled, the mobile station shall attempt to select another
22 system in accordance with the current redirection criteria (see 2.6.1.1.2). If the mobile
23 station is able to select another system, the mobile station shall attempt to acquire the
24 selected system (see 2.6.1.1.4). Otherwise, if the mobile station has exhausted all
25 possible selections using the current redirection criteria, the mobile station shall
26 perform the following:
 - 27 - The mobile station shall set REDIRECTION_s to disabled.
 - 28 - The mobile station shall set RETURN_CAUSE_s to '0010'.
 - 29 - If RETURN_IF_FAIL_s is equal to '1', the mobile station shall attempt to select the
30 system from which it was redirected and shall attempt to acquire the selected
31 system (see 2.6.1.1.4). The precise process for determining how to select the system
32 from which the mobile station was redirected is left to the mobile station
33 manufacturer.
 - 34 - If RETURN_IF_FAIL_s is equal to '0', the mobile station shall select a system other
35 than the system from which it was redirected in accordance with the custom system
36 selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system
37 (see 2.6.1.1.4). The precise process for determining how to avoid the system from
38 which the mobile station was redirected is left to the mobile station manufacturer.
- 39 • If REDIRECTION_s is equal to disabled, the mobile station shall select a system in
40 accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt
41 to acquire the selected system (see 2.6.1.1.4).

1 If the mobile station enters the *System Determination Substate* with a system lost indication,
2 the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the
3 mobile station shall set NDSS_ORIG_S to disabled and should indicate to the user that the
4 call origination is canceled. The mobile station should attempt to select the same system
5 that was lost, and should attempt to acquire the selected system (see 2.6.1.1.4). The
6 precise process for determining how to select the same system is left to the mobile station
7 manufacturer. If the mobile station does not attempt to select the same system, the mobile
8 station shall select a system in accordance with the custom system selection process (see
9 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

10 If the mobile station enters the *System Determination Substate* with a lock indication, the
11 mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the mobile
12 station shall set NDSS_ORIG_S to disabled and should indicate to the user that the call
13 origination is canceled. The mobile station shall select a system in accordance with the
14 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected
15 system (see 2.6.1.1.4).

16 If the mobile station enters the *System Determination Substate* with an unlock indication,
17 the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the
18 mobile station shall set NDSS_ORIG_S to disabled and should indicate to the user that the
19 call origination is canceled. The mobile station shall select a system in accordance with the
20 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected
21 system (see 2.6.1.1.4).

22 If the mobile station enters the *System Determination Substate* with an access denied
23 indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is
24 enabled, the mobile station shall set NDSS_ORIG_S to disabled and should indicate to the
25 user that the call origination is canceled. The mobile station shall select a system in
26 accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to
27 acquire the selected system (see 2.6.1.1.4).

28 If the mobile station enters the *System Determination Substate* with an ACCT blocked
29 indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is
30 enabled, the mobile station shall set NDSS_ORIG_S to disabled. The mobile station shall
31 select a system in accordance with the custom system selection process (see 2.6.1.1.1) and
32 shall attempt to acquire the selected system (see 2.6.1.1.4).

33 If the mobile station enters the *System Determination Substate* with an NDSS off indication,
34 the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the
35 mobile station shall set NDSS_ORIG_S to disabled and should indicate to the user that the
36 call origination is canceled. The mobile station shall select a system in accordance with the
37 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected
38 system (see 2.6.1.1.4).

39 If the mobile station enters the *System Determination Substate* with a release indication and
40 REDIRECTION_S is equal to enabled, the mobile station shall attempt to select the same
41 system on which the release occurred and shall attempt to acquire the selected system (see
42 2.6.1.1.4). The precise process for determining how to select the same system is left to the
43 mobile station manufacturer. If REDIRECTION_S is equal to disabled, the mobile station

1 shall select a system in accordance with the custom system selection process (see
2 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4). If NDSS_ORIG_S
3 is enabled, the mobile station shall set NDSS_ORIG_S to disabled.

4 If the mobile station enters the *System Determination Substate* with an error indication, the
5 mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the mobile
6 station shall set NDSS_ORIG_S to disabled and should indicate to the user that the call
7 origination is canceled. The mobile station shall select a system in accordance with the
8 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected
9 system (see 2.6.1.1.4).

10 If the mobile station enters the *System Determination Substate* with a redirection indication,
11 the mobile station shall set REDIRECTION_S to enabled. The mobile station shall delete all
12 entries from the ZONE_LIST_S and SID_NID_LIST_S. The mobile station shall select a system
13 in accordance with the current redirection criteria (see 2.6.1.1.2) and shall attempt to
14 acquire the selected system (see 2.6.1.1.4).

15 If the mobile station enters the *System Determination Substate* with a registration rejected
16 indication, the mobile station shall perform the following:

- 17 • The mobile station shall delete the newly generated encryption key (if any).
- 18 • If REDIRECTION_S is equal to enabled, the mobile station shall perform the following:
 - 19 - The mobile station shall set REDIRECTION_S to disabled.
 - 20 - The mobile station shall set RETURN_CAUSE_S to '0011'.
 - 21 - If RETURN_IF_FAIL_S is equal to '1', the mobile station shall attempt to select the
22 system from which it was redirected and shall attempt to acquire the selected
23 system (see 2.6.1.1.4). The precise process for determining how to select the system
24 from which the mobile station was redirected is left to the mobile station
25 manufacturer.
 - 26 - If RETURN_IF_FAIL_S is equal to '0', the mobile station shall select a system other
27 than the system from which it was redirected in accordance with the custom system
28 selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system
29 (see 2.6.1.1.4). The precise process for determining how to avoid the system from
30 which the mobile station was redirected is left to the mobile station manufacturer.
- 31 • If REDIRECTION_S is equal to disabled, the mobile station shall select a system in
32 accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt
33 to acquire the selected system (see 2.6.1.1.4).

34 If the mobile station enters the *System Determination Substate* with a wrong system
35 indication, the mobile station shall perform the following:

- 36 • If REDIRECTION_S is equal to enabled, the mobile station shall attempt to select another
37 system in accordance with the current redirection criteria (see 2.6.1.1.2). If the mobile
38 station is able to select another system, the mobile station shall attempt to acquire the
39 selected system (see 2.6.1.1.4). Otherwise, if the mobile station has exhausted all
40 possible selections using the current redirection criteria, the mobile station shall
41 perform the following:

- 1 - The mobile station shall set REDIRECTIONS to disabled.
- 2 - The mobile station shall set RETURN_CAUSES to '0100'.
- 3 - If RETURN_IF_FAIL_S is equal to '1', the mobile station shall attempt to select the
- 4 system from which it was redirected and shall attempt to acquire the selected
- 5 system (see 2.6.1.1.4). The precise process for determining how to select the system
- 6 from which the mobile station was redirected is left to the mobile station
- 7 manufacturer.
- 8 - If RETURN_IF_FAIL_S is equal to '0', the mobile station shall select a system other
- 9 than the system from which it was redirected in accordance with the custom system
- 10 selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system
- 11 (see 2.6.1.1.4). The precise process for determining how to avoid the system from
- 12 which the mobile station was redirected is left to the mobile station manufacturer.
- 13 • If REDIRECTION_S is equal to disabled, the mobile station shall select a system in
- 14 accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt
- 15 to acquire the selected system (see 2.6.1.1.4).

16 If the mobile station enters the *System Determination Substate* with a wrong network
17 indication, the mobile station shall perform the following:

- 18 • If REDIRECTION_S is equal to enabled, the mobile station shall attempt to select another
- 19 system in accordance with the current redirection criteria (see 2.6.1.1.2). If the mobile
- 20 station is able to select another system, the mobile station shall attempt to acquire the
- 21 selected system (see 2.6.1.1.4). Otherwise, if the mobile station has exhausted all
- 22 possible selections using the current redirection criteria, the mobile station shall
- 23 perform the following:
 - 24 - The mobile station shall set REDIRECTION_S to disabled.
 - 25 - The mobile station shall set RETURN_CAUSE_S to '0101'.
 - 26 - If RETURN_IF_FAIL_S is equal to '1', the mobile station shall attempt to select the
 - 27 system from which it was redirected and shall attempt to acquire the selected
 - 28 system (see 2.6.1.1.4). The precise process for determining how to select the system
 - 29 from which the mobile station was redirected is left to the mobile station
 - 30 manufacturer.
 - 31 - If RETURN_IF_FAIL_S is equal to '0', the mobile station shall select a system other
 - 32 than the system from which it was redirected in accordance with the custom system
 - 33 selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system
 - 34 (see 2.6.1.1.4). The precise process for determining how to avoid the system from
 - 35 which the mobile station was redirected is left to the mobile station manufacturer.
 - 36 • If REDIRECTION_S is equal to disabled, the mobile station shall select a system in
 - 37 accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt
 - 38 to acquire the selected system (see 2.6.1.1.4).

39 2.6.1.1.1 Custom System Selection Process

40 The precise process for custom system selection is left to the mobile station manufacturer.

1 The mobile station shall perform the custom system selection process as follows:

- 2 • The mobile station shall determine which system to use.
- 3 • If the mobile station is to use a CDMA system, it shall set CDMABAND_s to the band
- 4 class (see ~~30~~[53]) for the selected system.
- 5 • If the mobile station is to use a CDMA system with CDMABAND_s = '00000' or
- 6 CDMABAND_s = '00011', it shall perform the following:
 - 7 - If the mobile station is to use System A, it shall set SERVSYS_s to SYS_A. If the
 - 8 mobile station is to use System B, it shall set SERVSYS_s to SYS_B.
 - 9 - The mobile station shall set CDMACH_s either to the Primary or Secondary CDMA
 - 10 Channel number (see [2]) for the selected serving system (SERVSYS_s). If the mobile
 - 11 station fails to acquire a CDMA system on the first CDMA Channel it tries, the
 - 12 mobile station should attempt to acquire on the alternate CDMA Channel (Primary
 - 13 or Secondary) before attempting other alternatives.
 - 14 • If the mobile station is to use a CDMA system with CDMABAND_s other than '00000' or
 - 15 '00011', it shall set CDMACH_s to the CDMA Channel number (see [2]) for the selected
 - 16 system.

17 2.6.1.1.2 System Selection Using Current Redirection Criteria

18 To perform system selection using current redirection criteria:

- 19 • When a single redirection record is received in a *Service Redirection Message*, a *Global*
- 20 *Service Redirection Message*, or an *Extended Global Service Redirection Message*, the
- 21 mobile station shall use the information received and stored in the variable
- 22 REDIRECT_REC_s to perform current system selection as specified in 2.6.1.1.2.1.
- 23 • If multiple redirection records are received in an *Extended Global Service Redirection*
- 24 *Message*, the mobile station shall process at most j sequential redirection records,
- 25 where j is equal to the number of redirection records in REDIRECT_REC_LIST as
- 26 follows:
 - 27 - If the DELETE_TMSI field of REDIRECT_REC_LIST[k] is equal to '1', the mobile
 - 28 station shall set all the bits of TMSI_CODE_{s-p} to '1'; otherwise the mobile station
 - 29 shall set TMSI_CODE_{s-p} to TEMP_TMSI_CODE.
 - 30 - Store the redirection record (REDIRECT_REC_s = REDIRECT_REC_LIST[k]).
 - 31 - If the RECORD_TYPE field of REDIRECT_REC_LIST[k] is equal to '00000001' the
 - 32 mobile station shall:
 - 33 + Set CDMA_MODE_s to '1'.
 - 34 + Set DIGITAL_REG_{s-p} to '00000000'.
 - 35 + Set the maximum delay upon redirection (MAX_REDIRECT_DELAY_s =
 - 36 MAX_REDIRECT_DELAY field of REDIRECT_REC_LIST[k]).
 - 37 - If the mobile station has not exhausted all possible selections using the
 - 38 REDIRECT_REC_LIST[k], the mobile station shall attempt to select a system

1 according to 2.6.1.1.2.1; otherwise, if k is not the last record in
 2 REDIRECT_REC_LIST, the mobile station shall continue the system selection with
 3 REDIRECT_REC_LIST[k+1].

4 2.6.1.1.2.1 System Selection Using Current Redirection Record

5 If the RECORD_TYPE field of REDIRECT_REC_s is equal to '0000001' and the mobile
 6 station supports Band Class 0, the mobile station shall perform system selection as
 7 follows:

- 8 • If the SYS_ORDERING field is equal to '000', the mobile station shall make sequential
 9 system selections as follows:
 - 10 - The mobile station shall set SERVSYS_s either to SYS_A or SYS_B. The precise
 11 process for determining how many system selections to make and for determining
 12 whether to use SYS_A or SYS_B is left to the mobile station manufacturer.
- 13 • If the SYS_ORDERING field is equal to '001', the mobile station shall select no more
 14 than one system selection as follows:
 - 15 - The mobile station shall set SERVSYS_s to SYS_A.
- 16 • If the SYS_ORDERING field is equal to '010', the mobile station shall select no more
 17 than one system selection as follows:
 - 18 - The mobile station shall set SERVSYS_s to SYS_B.
- 19 • If the SYS_ORDERING field is equal to '011', the mobile station shall make at most two
 20 sequential system selections as follows:
 - 21 - For the first system selection, the mobile station shall set SERVSYS_s to SYS_A.
 - 22 - For the second system selection, the mobile station shall set SERVSYS_s to SYS_B.
- 23 • If the SYS_ORDERING field is equal to '100', the mobile station shall make at most 2
 24 sequential system selections as follows:
 - 25 - For the first system selection, the mobile station shall set SERVSYS_s to SYS_B.
 - 26 - For the second system selection, the mobile station shall set SERVSYS_s to SYS_A.
- 27 • If the SYS_ORDERING field is equal to '101', the mobile station shall make at most 2
 28 sequential system selections as follows:
 - 29 - For the first system selection, the mobile station shall set SERVSYS_s either to
 30 SYS_A or SYS_B. The precise process for determining whether to use SYS_A or
 31 SYS_B first is left to the mobile station manufacturer.
 - 32 - For the second system selection, the mobile station shall set SERVSYS_s to SYS_B if
 33 SYS_A was used for the first selection, or to SYS_A if SYS_B was used for the first
 34 selection.

35 If the RECORD_TYPE field of REDIRECT_REC_s is equal to '00000010', the mobile station
 36 shall perform system selection as follows:

- 1 • If the mobile station supports CDMA mode operation in the band class identified by the
2 BAND_CLASS field, the mobile station shall make at most n sequential system
3 selections, where n is equal to the value of the NUM_CHANS field, as follows:

- 4 - For the i^{th} system selection, where i ranges from 1 to n :

- 5 + If the mobile station supports operation on the CDMA channel associated with
6 the value of the i^{th} occurrence of the CDMA_CHAN field and the CDMA channel
7 is supported for at least one band subclass listed in the record (when included),
8 the mobile station shall set CDMACH_s to the value of the i^{th} occurrence of the
9 CDMA_CHAN field and shall set CDMABAND_s to the value specified in the
10 BAND_CLASS field.

- 11 + Otherwise, the mobile station shall not make the i^{th} system selection.

12 2.6.1.1.3 System Selection Using System Reselection Criteria

13 The precise process for selecting a system using system reselection criteria is left to the
14 mobile station manufacturer. The mobile station should use information received in the
15 *Neighbor List Message*, *Extended Neighbor List Message*, *General Neighbor List Message*, or
16 the *Universal Neighbor List Message* to perform the system reselection process as follows:

- 17 • If there are pilots in the Neighbor List on a different Frequency Assignment than that of
18 the mobile station, the mobile station may select the CDMA system consisting of these
19 neighbor pilots. If the mobile station is to use a CDMA system, it shall set
20 CDMABAND_s to the band class (see ~~30~~[53]) for the selected system and shall set
21 CDMACH_s to the CDMA Channel number (see [2]) for the selected system.

22 2.6.1.1.4 Acquiring the Selected System

23 The mobile station shall attempt to acquire the selected system as follows:

- 24 • If the selected system is a CDMA system, the mobile station shall enter the *Pilot*
25 *Channel Acquisition Substate*.

26 2.6.1.2 Pilot Channel Acquisition Substate

27 In this substate, the mobile station acquires the Pilot Channel of the selected CDMA
28 system.

29 Upon entering the *Pilot Channel Acquisition Substate*, the mobile station shall tune to the
30 CDMA Channel number equal to CDMACH_s, shall set its code channel for the Pilot
31 Channel (see [2]) and shall search for the Pilot Channel for no longer than T_{20m} seconds
32 (see Annex D). If the mobile station acquires the Pilot Channel, the mobile station shall
33 enter the *Sync Channel Acquisition Substate*.

34 If the mobile station determines that it is unlikely to acquire the Pilot Channel within T_{20m}
35 seconds, the mobile station may enter the *System Determination Substate* with an
36 acquisition failure indication (see 2.6.1.1). The time, to either acquire the Pilot Channel or
37 determine that Pilot Channel acquisition is unlikely, shall not exceed T_{20m} seconds (see
38 Annex D), after which the mobile station shall enter the *System Determination Substate* with
39 an acquisition failure indication (see 2.6.1.1).

2.6.1.3 Sync Channel Acquisition Substate

In this substate, the mobile station receives and processes the *Sync Channel Message* to obtain system configuration and timing information. A valid *Sync Channel Message* is one that passes the CRC check and is in the appropriate format according to the protocol revision of the base station.

Upon entering the *Sync Channel Acquisition Substate*, the mobile station shall set its code channel for the Sync Channel (see [2]).

If the mobile station does not receive a valid *Sync Channel Message* within T_{21m} seconds, the mobile station shall enter the *System Determination Substate* with an acquisition failure indication.

If the mobile station receives a valid *Sync Channel Message* within T_{21m} seconds, but the protocol revision level supported by the mobile station ($MOB_P_REV_p$ of the current band class) is less than the minimum protocol revision level supported by the base station ($MIN_P_REV_r$), the mobile station shall enter the *System Determination Substate* with a protocol mismatch indication (see 2.6.1.1).

If the mobile station receives a valid *Sync Channel Message* within T_{21m} seconds, but the values of the $PRAT_r$, the $SR1_BRAT_NON_TD_r$, the $SR1_BRAT_TD_r$, or the $SR3_BRAT_r$ fields are designated as reserved by the protocol revision level supported by the mobile station ($MOB_P_REV_p$ of the current band class), the mobile station shall enter the *System Determination Substate* with a protocol mismatch indication (see 2.6.1.1).

If the mobile station receives a valid *Sync Channel Message* within T_{21m} seconds and the protocol revision level supported by the mobile station ($MOB_P_REV_p$ of the current band class) is greater than or equal to the minimum protocol revision level supported by the base station ($MIN_P_REV_r$), the mobile station shall store the following information from the message:

- Protocol revision level ($P_REV_s = P_REV_r$)
- Minimum protocol revision level ($MIN_P_REV_s = MIN_P_REV_r$)
- System identification ($SID_s = SID_r$)
- Network identification ($NID_s = NID_r$)
- Pilot PN sequence offset index ($PILOT_PN_s = PILOT_PN_r$)
- Long code state ($LC_STATE_s = LC_STATE_r$)
- System Time ($SYS_TIME_s = SYS_TIME_r$)
- Paging Channel data rate ($PRAT_s = PRAT_r$)
- Protocol revision level currently in use ($P_REV_IN_USE_s =$ the lesser value of P_REV_s and $MOB_P_REV_p$ of the current band class)
- SR1 Non-TD BCCH support indicator ($SR1_BCCH_NON_TD_INCL_s = SR1_BCCH_NON_TD_INCL_r$)
- SR1 TD BCCH support indicator ($SR1_TD_INCL_s = SR1_TD_INCL_r$)

- 1 • If $SR1_BCCH_NON_TD_INCL_r$ is equal to '1':
- 2 - $SR1_BRAT_NON_TD_s = SR1_BRAT_NON_TD_r$;
- 3 - $SR1_CRAT_NON_TD_s = SR1_CRAT_NON_TD_r$;
- 4 - $BCCH_CODE_CHAN_NON_TD_s = SR1_BCCH_CODE_CHAN_NON_TD_r$.
- 5 • If $SR1_TD_INCL_r$ is included and is equal to '1', and the mobile station supports the
- 6 Transmit Diversity indicated by $SR1_TD_MODE_r$:
- 7 - $SR1_BRAT_TD_s = SR1_BRAT_TD_r$;
- 8 - $SR1_CRAT_TD_s = SR1_CRAT_TD_r$;
- 9 - $BCCH_CODE_CHAN_TD_s = SR1_BCCH_CODE_CHAN_TD_r$.
- 10 • If the mobile station supports the Transmit Diversity, $SR1_BCCH_NON_TD_INCL_r$ is
- 11 equal to '1', and $SR1_TD_INCL_r$ is equal to '0':
- 12 - $SR1_BRAT_TD_s = SR1_BRAT_NON_TD_r$;
- 13 - $SR1_CRAT_TD_s = SR1_CRAT_NON_TD_r$;
- 14 - $BCCH_CODE_CHAN_TD_s = SR1_BCCH_CODE_CHAN_NON_TD_r$.
- 15 • SR3 support indicator ($SR3_INCL_s = SR3_INCL_r$)

16 The mobile station shall ignore any fields at the end of the *Sync Channel Message* that are

17 not defined according to the protocol revision level ($MOB_P_REV_p$ of the current band class)

18 being used by the mobile station.

19 The mobile station may store the following information from the message:

- 20 • Number of leap seconds that have occurred since the start of System Time
- 21 ($LP_SEC_s = LP_SEC_r$)
- 22 • Offset of local time from System Time ($LTM_OFF_s = LTM_OFF_r$)
- 23 • Daylight savings time indicator ($DAYLT_s = DAYLT_r$)

24 If $REDIRECTION_s$ and $NDSS_ORIG_s$ are equal to disabled, the mobile station may enter the

25 *System Determination Substate* with a reselection indication (see 2.6.1.1).

26 If $REDIRECTION_s$ is equal to enabled, the $EXPECTED_SID$ field of $REDIRECT_REC_s$ is not

27 equal to 0, and SID_r is not equal to $EXPECTED_SID$, the mobile station shall enter the

28 *System Determination Substate* with a wrong system indication (see 2.6.1.1). If

29 $REDIRECTION_s$ is equal to enabled, the $EXPECTED_NID$ field of $REDIRECT_REC_s$ is not

30 equal to 65535, and NID_r is not equal to $EXPECTED_NID$, the mobile station shall enter

31 the *System Determination Substate* with a wrong network indication.

32 If $P_REV_IN_USE_s$ is less than 6, the mobile station shall set $POTENTIAL_CDMACH_s$ to

33 $CDMA_FREQ_r$.

34 If $P_REV_IN_USE_s$ is equal to six, the mobile station shall perform the following:

- 35 • If the mobile station supports the Quick Paging Channel or any radio configuration in
- 36 the Radio Configuration Class 2 or 3 (see 1.1.1), the mobile station shall set

1 POTENTIAL_CDMACH_s equal to EXT_CDMA_FREQ_r; otherwise, the mobile station shall
 2 set POTENTIAL_CDMACH_s equal to CDMA_FREQ_r.

3 If P_REV_IN_USE_s is greater than six, the mobile station shall perform the following:

4 • If the mobile station supports Spreading Rate 3 on the common channels and
 5 SR3_INCL_s is equal to '1', the mobile station shall set:

6 - BRAT_s = SR3_BRAT_r;

7 + BCCH_CODE_RATE_s = 1/3;

8 - BCCH_s = SR3_BCCH_CODE_CHAN_r;

9 - SR3_PRIMARY_PILOT_s = SR3_PRIMARY_PILOT_r;

10 - SR3_PILOT_POWER1_s = SR3_PILOT_POWER1_r;

11 - SR3_PILOT_POWER2_s = SR3_PILOT_POWER2_r;

12 - If SR3_CENTER_FREQ_INCL_r is equal to '1', POTENTIAL_CDMACH_s =
 13 SR3_CENTER_FREQ_r; otherwise, POTENTIAL_CDMACH_s = EXT_CDMA_FREQ_r.

14 • If the mobile station does not support Spreading Rate 3 on the common channel or if
 15 SR3_INCL_s is equal to '0', the mobile station shall perform the following:

16 - If SR1_TD_INCL_r is equal to '1' and the mobile station supports the Transmit
 17 Diversity mode specified by SR1_TD_MODE_r, the mobile station shall set:

18 + SR1_TD_MODE_s = SR1_TD_MODE_r

19 + SR1_TD_POWER_LEVEL_s = SR1_TD_POWER_LEVEL_r

20 + BRAT_s = SR1_BRAT_TDr

21 + BCCH_CODE_RATE_s = SR1_CRAT_TDr,

22 + BCCH_s = SR1_BCCH_CODE_CHAN_TDr,

23 + POTENTIAL_CDMACH_s = SR1_CDMA_FREQ_TDr

24 - Otherwise, if SR1_BCCH_NON_TD_INCL_r is equal to '1', the mobile station shall set:

25 + BRAT_s = SR1_BRAT_NON_TDr

26 + BCCH_CODE_RATE_s = SR1_CRAT_NON_TDr,

27 + BCCH_s = SR1_BCCH_CODE_CHAN_NON_TDr,

28 + If SR1_NON_TD_FREQ_INCL_r is equal to '1', POTENTIAL_CDMACH_s =
 29 SR1_CDMA_FREQ_NON_TDr; otherwise, POTENTIAL_CDMACH_s =
 30 EXT_CDMA_FREQ_r

31 - Otherwise, the mobile station shall perform the following:

32 + If the mobile station supports the Quick Paging Channel or any radio
 33 configuration in the Radio Configuration Class 2 or 3 (see 1.1.1), the mobile
 34 station shall set POTENTIAL_CDMACH_s = EXT_CDMA_FREQ_r; otherwise, the
 35 mobile station shall set POTENTIAL_CDMACH_s = CDMA_FREQ_r.

1 If POTENTIAL_CDMACH_s is different from CDMACH_s, the mobile station shall set
 2 CDMACH_s = POTENTIAL_CDMACH_s and then tune to the CDMA Channel (CDMACH_s).

3 The mobile station shall enter the *Timing Change Substate*.

4 2.6.1.4 Timing Change Substate

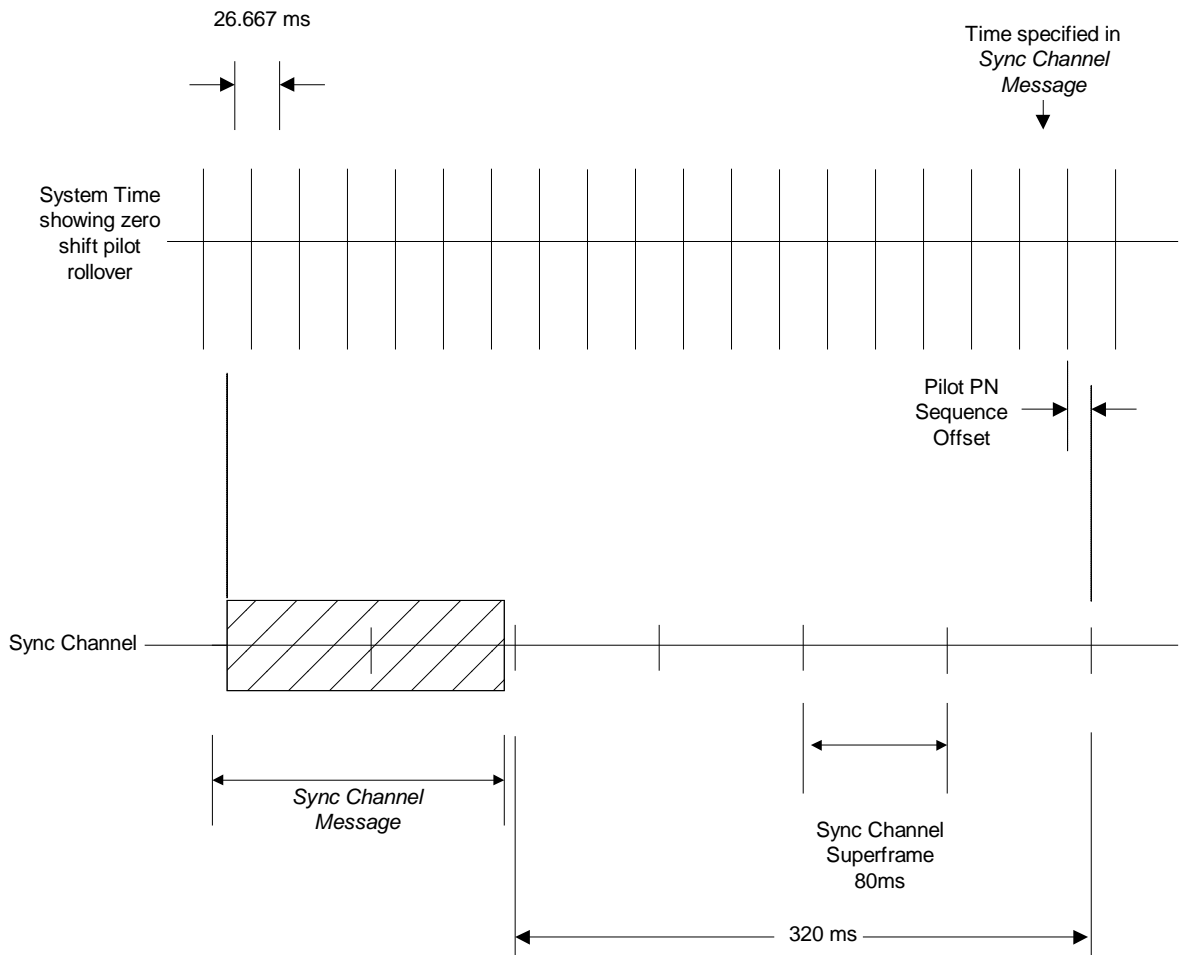

5 Figure 2.6.1.4-1 illustrates the mobile station timing changes that occur in this substate.
 6 The mobile station synchronizes its long code timing and system timing to those of the
 7 CDMA system, using the PILOT_PN_s, LC_STATE_s, and SYS_TIME_s values obtained from the
 8 received *Sync Channel Message*. SYS_TIME_s is equal to the System Time (see [2])
 9 corresponding to 320 ms past the end of the last 80 ms superframe (see [2]) of the received
 10 *Sync Channel Message* minus the pilot PN sequence offset. LC_STATE_s is equal to the
 11 system long code state (see [2]) corresponding to SYS_TIME_s.

12 In the *Timing Change Substate*, the mobile station shall synchronize its long code timing to
 13 the CDMA system long code timing derived from LC_STATE_s, and synchronize its system
 14 timing to the CDMA system timing derived from SYS_TIME_s.

15 The mobile station shall perform the following:

- 16 • If SR1_BCCH_NON_TD_INCL_s is equal to '1', or if SR1_TD_INCL_s is equal to '1' and the
 17 mobile supports the transmit diversity mode specified by SR1_TD_MODE_s, or if the
 18 mobile station supports Spreading Rate 3 on the common channel and SR3_INCL_s is
 19 equal to '1', the mobile station shall:
 - 20 - Set the stored message sequence numbers CONFIG_MSG_SEQ_s,
 21 A41_SYS_PAR_MSG_SEQ_s, ACC_MSG_SEQ_s, GAPM_SEQ_s,
 22 MC_RR_PAR_MSG_SEQ_s, UNI_NGHBR_LST_MSG_SEQ_s,
 23 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
 24 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
 25 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
 26 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s
 27 and PRI_NGHBR_LST_MSG_SEQ_s variables to NULL (see 2.6.2.2);
 - 28 - Set the index number of the Primary Broadcast Control Channel (BCN) to 1;
 - 29 - Set IMSI_11_12_s, IMSI_10_s and MCC_s to NULL;
 - 30 - Perform registration initialization as specified in 2.6.5.5.1.3; and
 - 31 - If the bits of TMSI_CODE_{s-p} are not all equal to '1' and if SYS_TIME_s exceeds
 32 TMSI_EXP_TIME_{s-p} × 2¹², the mobile station shall set all the bits of TMSI_CODE_{s-p}
 33 to '1'.
- 34 • Otherwise, the mobile station shall:
 - 35 - Set PAGECH_s to the Primary Paging Channel (see [2]);
 - 36 - Set PAGE_CHAN_s to '1';
 - 37 - Set the stored message sequence numbers CONFIG_MSG_SEQ_s,
 38 SYS_PAR_MSG_SEQ_s, ACC_MSG_SEQ_s, GAPM_SEQ_s, NGHBR_LST_MSG_SEQ_s,
 39 GEN_NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,

- 1 CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
 2 GLOB_SERV_REDIR_MSG_SEQ_s, EXT_GLOB_SERV_REDIR_MSG_SEQ_s,
 3 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
 4 USER_ZONE_ID_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
 5 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
 6 ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s and PRI_NGHRBR_LST_MSG_SEQ_s variables
 7 to NULL (see 2.6.2.2);
 8 - Set IMSI_11_12_s, IMSI_10_s and MCC_s to NULL;
 9 - Perform registration initialization as specified in 2.6.5.5.1.3; and
 10 - If the bits of TMSI_CODE_{s-p} are not all equal to '1' and if SYS_TIME_s exceeds
 11 TMSI_EXP_TIME_{s-p} × 2¹², the mobile station shall set all the bits of TMSI_CODE_{s-p}
 12 to '1'.
 13 The mobile station shall enter the *Mobile Station Idle State*.

14
 15
 16
 17
 18

Figure 2.6.1.4-1. Mobile Station Internal Timing

2.6.2 Mobile Station Idle State

In this state, the mobile station monitors the Paging Channel or the Quick Paging Channel or Forward Common Control Channel/Primary Broadcast Control Channel. The mobile station can receive messages, receive an incoming call (mobile station terminated call), initiate a call (mobile station originated call), cancel a PACA call, initiate a registration, or initiate a message transmission.

The mobile station may monitor the Quick Paging Channel to determine if it should receive messages from the Paging Channel or Forward Common Control Channel.

Upon entering the *Mobile Station Idle State*, the mobile station shall perform the following if RSC_MODE_ENABLED is equal to NO:

- Set SLOTTED_s to YES if T_SLOTTED_s is equal to 0 or if the mobile station does not support the slotted timer; otherwise, enable the T_{MS_Slotted} timer with the duration specified by T_SLOTTED_s if it is not already enabled, and set SLOTTED_s to NO.

Upon entering the *Mobile Station Idle State* from the *Mobile Station Initialization State*, the mobile station shall perform the following:

- If SR1_BCCH_NON_TD_INCL_s is equal to '1', or if SR1_TD_INCL_s is equal to '1' and the mobile station supports the transmit diversity mode specified by SR1_TD_MODE_s, or if the mobile station supports Spreading Rate 3 on the common channel and SR3_INCL_s is equal to '1', the mobile station shall perform the following:
 - Set its Primary Broadcast Control Channel code channel to BCCH_s,
 - Set the Primary Broadcast Control Channel data rate as determined by BRAT_s,
 - Set the Primary Broadcast Control Channel code rate as determined by BCCH_CODE_RATE_s, and
 - Perform common channel supervision as specified in 2.6.2.1.1.4.
- Otherwise, the mobile station shall perform the following:
 - Set its code channel to PAGECH_s,
 - Set the Paging Channel data rate as determined by PRAT_s, and
 - Perform Paging Channel supervision as specified in 2.6.2.1.1.4.

Upon entering the *Mobile Station Idle State* from the *Mobile Station Control on the Traffic Channel State*, the mobile station shall perform all of the following:

- Perform common channel supervision as specified in 2.6.2.1.1.4.

If REDIRECTION_s, PACA_s, and NDSS_ORIG_s are equal to disabled, the mobile station may exit the *Mobile Station Idle State* at any time and enter the *System Determination Substate* of the *Mobile Station Initialization State* with a reselection indication (see 2.6.1.1).

While in the *Mobile Station Idle State*, the mobile station shall perform the following procedures:

- The mobile station shall perform Paging Channel or Forward Common Control Channel monitoring procedures as specified in 2.6.2.1.1.

- 1 • The mobile station shall perform message acknowledgment procedures as specified in
2 [4].
- 3 • The mobile station shall perform registration procedures as specified in 2.6.2.1.3.
- 4 • The mobile station shall perform idle handoff procedures as specified in 2.6.2.1.4.
- 5 • The mobile station shall perform system reselection procedures as specified in
6 2.6.2.1.6.
- 7 • The mobile station shall perform the *Response to Overhead Information Operation* as
8 specified in 2.6.2.2 whenever the mobile station receives a system overhead message
9 (*ANSI-41 System Parameters Message, Enhanced Access Parameters Message, Extended*
10 *CDMA Channel List Message, MC-RR Parameters Message, Universal Neighbor List*
11 *Message, ANSI-41 RAND Message, System Parameters Message, Access Point*
12 *Identification Message, Access Point Identification Text Message, CDMA Channel List*
13 *Message, Extended System Parameters Message, Neighbor List Message, Extended*
14 *Neighbor List Message, General Neighbor List Message, Access Point Pilot Information*
15 *Message, Global Service Redirection Message, Extended Global Service Redirection*
16 *Message, User Zone Identification Message, Private Neighbor List Message, Access*
17 *Parameters Message, General Overhead Information Message, Frequent General*
18 *Overhead Information Message, Flex Duplex CDMA Channel List Message, Alternative*
19 *Technologies Information Message, Generic Access Parameters Message or HDP*
20 *Parameters Message*).
- 21 • The mobile station shall perform the *Mobile Station Page Match Operation* as specified in
22 2.6.2.3 whenever it receives a mobile station-directed page.
- 23 • The mobile station shall perform the *Mobile Station Order and Message Processing*
24 *Operation* as specified in 2.6.2.4 whenever a message or order directed to the mobile
25 station is received other than a mobile station-directed page.
- 26 • The mobile station shall set NDSS_ORIG_s to disabled if directed by the user to cancel
27 the call origination.
- 28 • The mobile station shall perform the *Mobile Station Origination Operation* as specified in
29 2.6.2.5 if directed by the user to initiate a call, or if NDSS_ORIG_s is equal to enabled.
- 30 • If RETRY_DELAY_s[001] or RETRY_DELAY_s[101] is not set to 0:
- 31 - The mobile station shall not send any *Origination Message* containing a packet data
32 service option²⁶ or *Reconnect Message* (with ORIG_IND set to '1') for connecting a
33 packet data service option until the maximum of the system time stored in
34 RETRY_DELAY_s[001] and RETRY_DELAY_s[101].
- 35 - At the system time stored in RETRY_DELAY_s[001], the mobile station shall reset
36 RETRY_DELAY_s[001] to 0.

²⁶ Packet data service option refers to SO 60, SO 61 or any service option in Service Option Group 4 and 5 in ~~39~~[53]

- 1 - At the system time stored in `RETRY_DELAYs[101]`, the mobile station shall reset
2 `RETRY_DELAYs[101]` to 0.
- 3 • The mobile station shall perform the *Mobile Station PACA Cancel Operation* as specified
4 in 2.6.2.8, if `PACAs` is equal to enabled and any one of the following conditions is met:
- 5 - `PACA_CANCEL` is equal to '1'; or
6 - The mobile station is directed by the user to cancel the PACA call.
- 7 • If the PACA state timer expires, the mobile station shall perform the following:
- 8 - The mobile station should enter the *Update Overhead Information Substate* of the
9 *System Access State* (see 2.6.3) with an origination indication within T_{33m} seconds
10 to re-originate the PACA call.
- 11 - Otherwise, the mobile station shall perform the *Mobile Station PACA Cancel*
12 *Operation* as specified in 2.6.2.8.
- 13 • If the mobile station supports *Data Burst Message* transmission, it shall perform the
14 *Mobile Station Message Transmission Operation* as specified in 2.6.2.6 if directed by the
15 user to transmit a message.
- 16 • If the mobile station supports BCMC operation, it shall perform the procedures as
17 specified in 2.6.13.
- 18 • If `RETRY_DELAYs[100]` or `RETRY_DELAYs[101]` is not set to 0:
- 19 - The mobile station shall not send any Short Data Burst (see ~~30~~[53], [42]) until the
20 maximum of the system time stored in `RETRY_DELAYs[100]` and
21 `RETRY_DELAYs[101]`.
- 22 - At the system time stored in `RETRY_DELAYs[100]`, the mobile station shall reset
23 `RETRY_DELAYs[100]` to 0.
- 24 - At the system time stored in `RETRY_DELAYs[101]`, the mobile station shall reset
25 `RETRY_DELAYs[101]` to 0.
- 26 • If the mobile station supports the *Device Information Message* on the r-csch,
27 `AUTO_MSG_SUPPORTEDs` is equal to '1', and the mobile station has detected a change
28 in hook status since the last time when the mobile station sent hook status
29 information, the mobile station shall perform the following:
- 30 - If the autonomous message timer has expired or is disabled, the mobile station
31 shall perform the *Mobile Station Message Transmission Operation* as specified in
32 2.6.2.6.
- 33 - If the autonomous message timer has not expired, the mobile station shall set the
34 autonomous message timer equal to `AUTO_MSG_INTERVALs` and shall restart the
35 timer.
- 36 • If the mobile station supports the *Fast Call Setup Order* with `ORDQ` equal to '00000000'
37 on the r-csch, `AUTO_FCISO_ALLOWEDs` is equal to '1', `RSC_MODE_ENABLED` is equal
38 to NO, `SLOTTEDs` is equal to YES, and the mobile station would like to request

- 1 operation in reduced slot cycle mode, it shall perform the *Mobile Station Message*
 2 *Transmission Operation* as specified in 2.6.2.6.
- 3 • The mobile station shall perform the *Mobile Station Power-Down Operation* as specified
 4 in 2.6.2.7 if directed by the user to power down.
 - 5 • If the bits of TMSI_CODE_{S-P} are not all equal to '1' and if System Time (in 80 ms units)
 6 exceeds TMSI_EXP_TIME_{S-P} × 2¹², the mobile station shall set all the bits of
 7 TMSI_CODE_{S-P} to '1' within T_{66m} seconds.
 - 8 • If the full-TMSI timer expires or has expired, the mobile station shall set all the bits of
 9 TMSI_CODE_{S-P} to '1'. The mobile station shall update the registration variables as
 10 described in 2.6.5.5.2.5.
 - 11 • If the key setup timer expires or has expired and mobile station determines that it is
 12 not originating an emergency call, the mobile station may set
 13 REG_SECURITY_RESYNC²⁷ to YES and go to the *System Determination Substate* with
 14 an encryption/message integrity failure indication (see 2.3.12.5 for details).
 - 15 • If TKZ_MODE_ENABLED is set to YES, the mobile station shall perform the following:
 16 - If TKZ_ID_S is not equal to any entry in TKZ_LIST, TKZ_SID_S is equal to SID_S,
 17 TKZ_NID_S is equal to NID_S, and TKZ_MODE_SUPPORTED_S is equal to '1', the mobile
 18 station shall send a *Radio Environment Message* by performing the *Mobile Station*
 19 *Message Transmission Operation* as specified in 2.6.2.6.
 - 20 - If the TKZ timer of any entry in TKZ_LIST has expired, the mobile station shall
 21 delete that entry.
 - 22 - If the tracking zone update timer expires, the mobile station shall disable the
 23 tracking zone update timer and set TKZ_MODE_ENABLED to NO.
 - 24 • If P_REV_IN_USE_S is less than 11 after the mobile station performs an idle handoff, the
 25 mobile station shall set TBR_RAND_SUPPR_ENABLE_S to '0', and shall set
 26 TBR_RAND_WINDOW_S to '11'.

27 2.6.2.1 Idle Procedures

28 2.6.2.1.1 Forward Channel Monitoring Procedures

29 2.6.2.1.1.1 General Overview

30 The Paging Channel is divided into 80 ms slots called Paging Channel slots. Paging and
 31 control messages for a mobile station operating in the non-slotted mode can be received in
 32 any of the Paging Channel slots; therefore, the non-slotted mode of operation requires the
 33 mobile station to monitor all slots.

34 The Forward Common Control Channel is divided into 80 ms slots called Forward Common
 35 Control Channel slots. Paging and mobile directed messages for a mobile station operating

²⁷ REG_SECURITY_RESYNC was formerly called REG_ENCRYPT_RESYNC.

1 in the non-slotted mode can be received in any of the Forward Common Control Channel
 2 slots. The overhead messages can be received on the Primary Broadcast Control Channel.
 3 Therefore, the non-slotted mode of operation requires the mobile station to continuously
 4 monitor the Forward Common Control Channel/Primary Broadcast Control Channel.

5 2.6.2.1.1.1.1 General Overview for Individually Addressed Messages

6 The Paging Channel or the Forward Common Control Channel protocol provides for
 7 scheduling the transmission of messages for a specific mobile station in certain assigned
 8 slots. Support of this feature is optional and may be enabled by each mobile station. A
 9 mobile station that monitors the Paging Channel or the Forward Common Control Channel
 10 only during certain assigned slots is referred to as operating in the slotted mode. During
 11 the slots in which the Paging Channel or the Forward Common Control Channel is not
 12 being monitored, the mobile station can stop or reduce its processing for power
 13 conservation. A mobile station may not operate in the slotted mode in any state except the
 14 *Mobile Station Idle State*.

15 A mobile station operating in the slotted mode generally monitors the Paging Channel or
 16 the Forward Common Control Channel for one or two slots per slot cycle. The mobile
 17 station can specify its preferred slot cycle using the SLOT_CYCLE_INDEX and
 18 SIGN_SLOT_CYCLE_INDEX fields in the *Registration Message*, *Origination Message*, or *Page*
 19 *Response Message*. The mobile station can also specify a reduced slot cycle using the RSCI
 20 field of the *Fast Call Setup Order*, *Release Order* (ORDQ = '00000011') or *Extended Release*
 21 *Response Message*, which enables the mobile station to operate in the reduced slot cycle
 22 mode. The length of the slot cycle, T, in units of 1.28 seconds,²⁸ is given by

$$23 \quad T = 2^i,$$

24 where i is the selected slot cycle index (see 2.6.2.1.1.3) which can take the values -4, -3, -2,
 25 -1, 0, 1, 2, 3, 4, 5, 6, and 7.

26 Using the Terminal Information record of the *Status Response Message* or the *Extended*
 27 *Status Response Message*,

- 28 • if P_REV_IN_USE_s is less than eleven, the mobile station reports max (0,
 29 SLOT_CYCLE_INDEX_REG) with the SLOT_CYCLE_INDEX field.
- 30 • if P_REV_IN_USE_s is greater than or equal to eleven, the mobile station reports its last
 31 registered slot cycle, SLOT_CYCLE_INDEX_REG with the SLOT_CYCLE_INDEX and
 32 SIGN_SLOT_CYCLE_INDEX fields.

²⁸ When SIGN_SLOT_CYCLE_INDEX is equal to '1', the minimum length slot cycle consists of 16 slots of 80 ms each, hence 1.28 seconds. When SIGN_SLOT_CYCLE_INDEX is equal to '0', the minimum length slot cycle consists of one slot of 80 ms, hence 80 ms. When operating in the reduced slot cycle mode, the minimum length slot cycle is also 80 ms.

1 Using the Extended Terminal Information record of the *Extended Status Response Message*
 2 the mobile station reports its last registered slot cycle, SLOT_CYCLE_INDEX_REG with the
 3 SLOT_CYCLE_INDEX and SIGN_SLOT_CYCLE_INDEX fields.

4 When in the *Mobile Station Control on the Traffic Channel State*, using the Terminal
 5 Information record of the *Status Response Message* or the *Status Message*,

- 6 • if $P_REV_IN_USE_s$ is less than eleven, the mobile station reports max (0,
 7 SLOT_CYCLE_INDEX_REG) with the SLOT_CYCLE_INDEX field.
- 8 • if $P_REV_IN_USE_s$ is greater than or equal to eleven, the mobile station reports its last
 9 registered slot cycle, SLOT_CYCLE_INDEX_REG with the SLOT_CYCLE_INDEX and
 10 SIGN_SLOT_CYCLE_INDEX fields.

11 When in the *Mobile Station Control on the Traffic Channel State*, using the Extended
 12 Terminal Information record of the *Status Response Message*, the mobile station reports its
 13 last registered slot cycle, SLOT_CYCLE_INDEX_REG with the SLOT_CYCLE_INDEX and
 14 SIGN_SLOT_CYCLE_INDEX fields.

15 A mobile station operating in the slotted mode may optionally monitor additional slots to
 16 receive broadcast messages and/or broadcast pages (see 2.6.2.1.1.3.3 and 2.6.2.1.1.3.4).

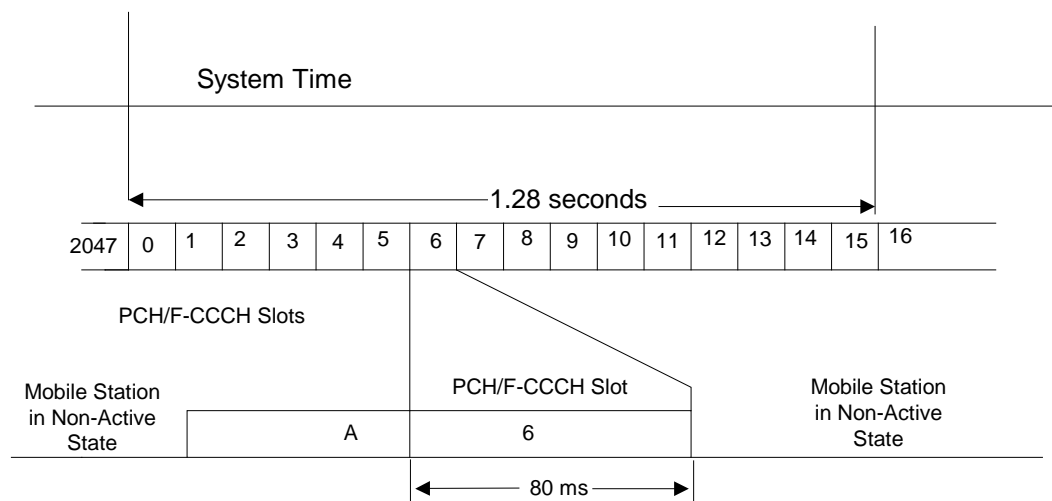

17 There are $16 \times T$ slots in a slot cycle.

18 SLOT_NUM is the Paging Channel or the Forward Common Control Channel slot number,
 19 modulo the maximum length slot cycle (2048 slots). That is, the value of SLOT_NUM is

$$20 \quad \text{SLOT_NUM} = \lfloor t/4 \rfloor \bmod 2048,$$

21 where t is the System Time in 20ms frames. For each mobile station, the starting times of
 22 its slot cycles are offset from the slot in which SLOT_NUM equals zero by a fixed, randomly
 23 selected number of slots as specified in 2.6.2.1.1.3.

24 Figure 2.6.2.1.1.1-1 shows an example for a slot cycle length of 1.28 seconds, in which the
 25 computed value of PGSLOT (see 2.6.2.1.1.3) is equal to 6, so that one of the mobile
 26 station's slot cycles begins when SLOT_NUM equals 6. The mobile station begins
 27 monitoring the Paging Channel or the Forward Common Control Channel at the start of the
 28 slot in which SLOT_NUM equals 6. The next slot in which the mobile station must begin
 29 monitoring the Paging Channel or the Forward Common Control Channel is 16 slots later,
 30 i.e., the slot in which SLOT_NUM is 22.

A - Reacquisition of CDMA System

6 - Mobile Station's Assigned PCH/F-CCCH Slot

Figure 2.6.2.1.1.1-1. Mobile Station Idle Slotted Mode Structure Example

2.6.2.1.1.1.1.1 Overview of Stopping Monitoring via the General Page Message

Layer 3 determines when a mobile station operating in the slotted mode may stop monitoring the Paging Channel or the Forward Common Control Channel based upon indications received from Layer 2 (see [4]). When the *General Page Message* is used, Layer 2 determines whether there is an address mismatch or a broadcast address mismatch, based upon the address information received in the *General Page Message*. Based upon the address mismatch and broadcast address mismatch indications received from Layer 2, Layer 3 can determine when no further messages or records addressed to an individual mobile station will be present in the slot.

A *General Page Message* contains four fields: CLASS_0_DONE, CLASS_1_DONE, TMSI_DONE, and ORDERED_TMSIS, which indicate when a mobile station operating in the slotted mode may stop monitoring the Paging Channel or the Forward Common Control Channel.

When CLASS_0_DONE is set to '1' during a mobile station's assigned slot and the mobile station is operating in the slotted mode, no further messages or records addressed by a class 0 IMSI will be directed to the mobile station during the current slot. When CLASS_1_DONE is set to '1' during a mobile station's assigned slot and the mobile station is operating in the slotted mode, no further messages or records addressed by a class 1 IMSI will be directed to the mobile station during the current slot. Similarly, when TMSI_DONE is set to '1' during a mobile station's assigned slot and the mobile station is operating in the slotted mode, no further messages or records addressed by a TMSI will be directed to the mobile station during the current slot.

1 The field ORDERED_TMSIS, when set to '1' during a mobile station's assigned slot,
2 indicates that the base station has ordered TMSI page records directed to mobile stations
3 operating in the slotted mode so that the resulting TMSI_CODE values are in ascending
4 order in the *General Page Messages* in the slot.

5 A mobile station which is operating in the slotted mode, has a class 0 IMSI assigned, and
6 does not have a TMSI assigned (all the bits of TMSI_CODE_{s-p} are equal to '1'), may stop
7 monitoring the Paging Channel or the Forward Common Control Channel after processing a
8 *General Page Message* containing CLASS_0_DONE equal to '1'. Similarly, a mobile station
9 which is operating in the slotted mode, has a class 1 IMSI assigned, and does not have a
10 TMSI assigned (all the bits of TMSI_CODE_{s-p} are equal to '1'), may stop monitoring the
11 Paging Channel or the Forward Common Control Channel after processing a *General Page*
12 *Message* containing CLASS_1_DONE equal to '1'.

13 A mobile station which is operating in the slotted mode, has a class 0 IMSI assigned, and
14 has a TMSI assigned (the bits of TMSI_CODE_{s-p} are not all equal to '1'), may stop
15 monitoring the Paging Channel or the Forward Common Control Channel after processing a
16 *General Page Message* containing both CLASS_0_DONE equal to '1' and TMSI_DONE equal
17 to '1'. Similarly, a mobile station which is operating in the slotted mode, has a class 1 IMSI
18 assigned, and has a TMSI assigned (the bits of TMSI_CODE_{s-p} are not all equal to '1'), may
19 stop monitoring the Paging Channel or the Forward Common Control Channel after
20 processing a *General Page Message* containing both CLASS_1_DONE equal to '1' and
21 TMSI_DONE equal to '1'.

22 If ORDERED_TMSIS is equal to '1' and CLASS_0_DONE is equal to '1', a mobile station
23 which has a class 0 IMSI assigned, is operating in the slotted mode, and has a TMSI
24 assigned (the bits of TMSI_CODE_{s-p} are not all equal to '1'), may stop monitoring the
25 Paging Channel or the Forward Common Control Channel after processing a page record
26 with a TMSI_CODE value of higher numerical value than TMSI_CODE_{s-p}.

27 If ORDERED_TMSIS is equal to '1' and CLASS_1_DONE is equal to '1', a mobile station
28 which has a class 1 IMSI assigned, is operating in the slotted mode, and has a TMSI
29 assigned (the bits of TMSI_CODE_{s-p} are not all equal to '1'), may stop monitoring the
30 Paging Channel or the Forward Common Control Channel after processing a page record
31 with a TMSI_CODE value of higher numerical value than TMSI_CODE_{s-p}.

32 The mobile station continues to monitor the Paging Channel or the Forward Common
33 Control Channel for one additional slot unless, within its assigned slot, the mobile station
34 receives a *General Page Message* containing the appropriate indicator permitting it to stop
35 monitoring the Paging Channel or the Forward Common Control Channel (CLASS_0_DONE,
36 CLASS_1_DONE, TMSI_DONE, or ORDERED_TMSIS equal to '1', whichever is appropriate).
37 This allows the base station to carry over a message begun in the assigned slot into the
38 following slot, if necessary.

2.6.2.1.1.1.2 Overview of Stopping Monitoring via the Universal Page Message

Layer 3 determines when a mobile station operating in the slotted mode may stop monitoring the Forward Common Control Channel based upon indications from Layer 2 (see [4]). When the *Universal Page Message* is used on the Forward Common Control Channel, Layer 2 determines whether there is an address mismatch or a broadcast address mismatch, based upon the address information received in the *Universal Page Message*. Based upon the address mismatch and broadcast address mismatch indications received from Layer 2, Layer 3 can determine when no further messages or records addressed to an individual mobile station will be present in the slot.

The *Universal Page Message* contains the READ_NEXT_SLOT field, which, when equal to '1' and received in an assigned slot, indicates to a mobile station that it is to monitor the Forward Common Control Channel in time to receive the first bit of the slot following the assigned slot. This allows the base station to use both an assigned slot and the following slot for pages if all of the pages for an assigned slot cannot be fit into the assigned slot. The *Universal Page Message* also contains the READ_NEXT_SLOT_BCAST field, which, when equal to '1' and received in an assigned slot or broadcast slot, indicates to a mobile station configured to receive broadcast messages that it is to monitor the Forward Common Control Channel in time to receive the first bit of the subsequent slot. This allows the base station to use the subsequent slot for enhanced broadcast pages if all of the enhanced broadcast pages for an assigned slot or broadcast slot cannot be fit into the slot.

2.6.2.1.1.1.2 Overview of Broadcast Messages on Paging Channel

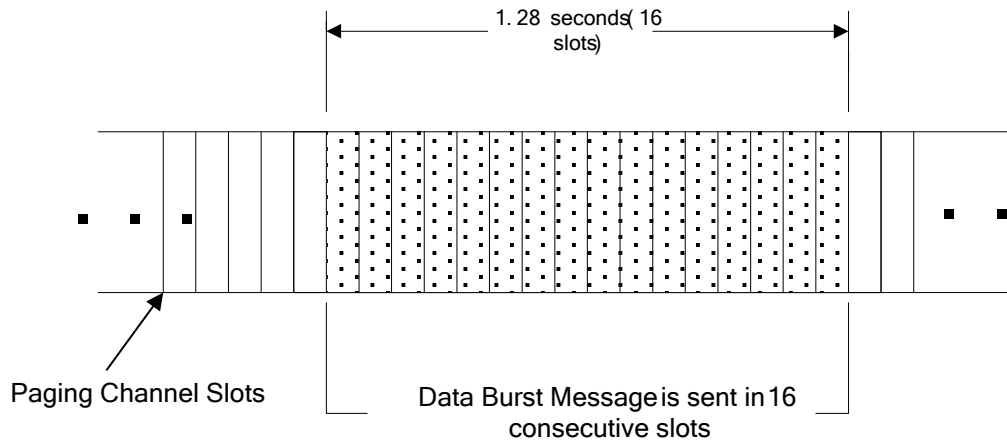

The Paging Channel protocol provides two methods for the transmission of broadcast messages. Each method enables mobile stations operating in the slotted mode or in the non-slotted mode to receive broadcast messages. A broadcast message on the Paging Channel is a *Data Burst Message* that has a broadcast address type. A mobile station operating in the slotted mode has assigned slots that it monitors to receive Paging Channel messages (see 2.6.2.1.1.1). A broadcast page is a record within a *General Page Message* that has a broadcast address type. A base station may transmit a broadcast page in an assigned slot to inform mobile stations monitoring that slot that a broadcast message will be transmitted in a predetermined subsequent slot. A slot that a mobile station monitors in order to receive either a broadcast page or a broadcast message is referred to as a broadcast slot.

2.6.2.1.1.1.2.1 Method 1: Multi-Slot Broadcast Message Transmission

According to this method, a broadcast message is sent in a sufficient number of assigned slots such that it may be received by all mobile stations that are operating in the slotted mode.

Figure 2.6.2.1.1.1.2.1-1 shows an example for the case when the maximum slot cycle index is equal to 0. In this example, the broadcast message fits in a single slot. The *Data Burst Message* is transmitted in 16 consecutive slots.

1

2

3 **Figure 2.6.2.1.1.2.1-1. Multi-Slot Broadcast Message Transmission Example**

4 2.6.2.1.1.2.2 Method 2: Periodic Broadcast Paging

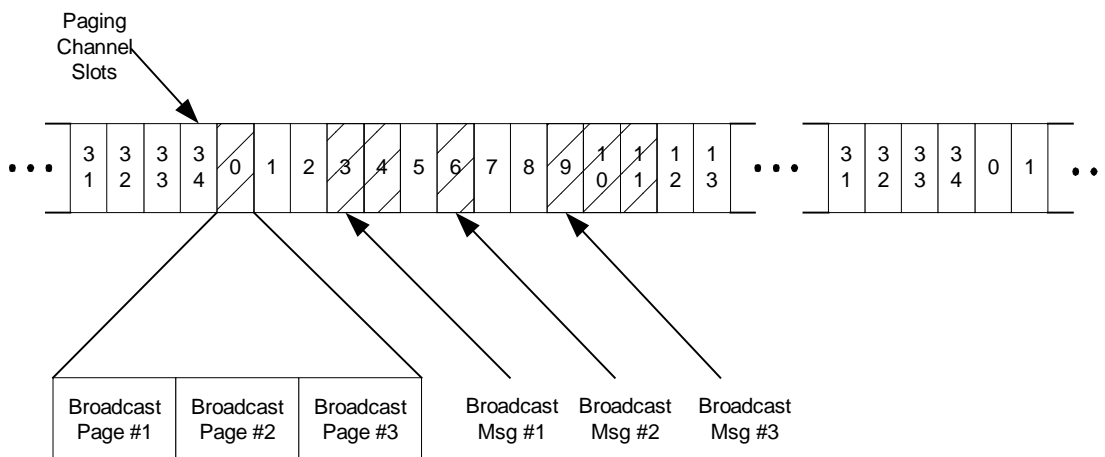

5 According to this method, mobile stations configured to receive broadcast messages
 6 monitor a specific broadcast slot (the first slot of a broadcast paging cycle; see
 7 2.6.2.1.1.3.3). There are two methods of sending broadcast messages used with Periodic
 8 Broadcast Paging.

9 If all of the broadcast messages to be transmitted fit within the first slot of a broadcast
 10 paging cycle, they may all be transmitted in this broadcast slot. If there is a single
 11 broadcast message to be transmitted, it may be transmitted beginning in this broadcast
 12 slot.

13 Alternately, one or more broadcast pages may be transmitted in the first slot of a broadcast
 14 paging cycle. Each broadcast page is associated with a subsequent broadcast slot. For
 15 each broadcast page, an associated broadcast message may be transmitted in the
 16 associated subsequent broadcast slot. The broadcast slot for the associated broadcast
 17 message is determined according to the position of the broadcast page within the *General*
 18 *Page Message* transmitted in the first slot of the broadcast paging cycle.

19 Figure 2.6.2.1.1.2.2-1 shows an example of Periodic Broadcast Paging when the
 20 broadcast index is set to 1. A *General Page Message* containing three broadcast pages is
 21 transmitted in the first slot of the broadcast paging cycle. For each of the three broadcast
 22 pages, a *Data Burst Message* is transmitted in a subsequent slot.

23

1
2 **Figure 2.6.2.1.1.1.2.2-1. Periodic Broadcast Paging Example**

3 2.6.2.1.1.1.3 Overview of Broadcast Messages on Broadcast Control Channel

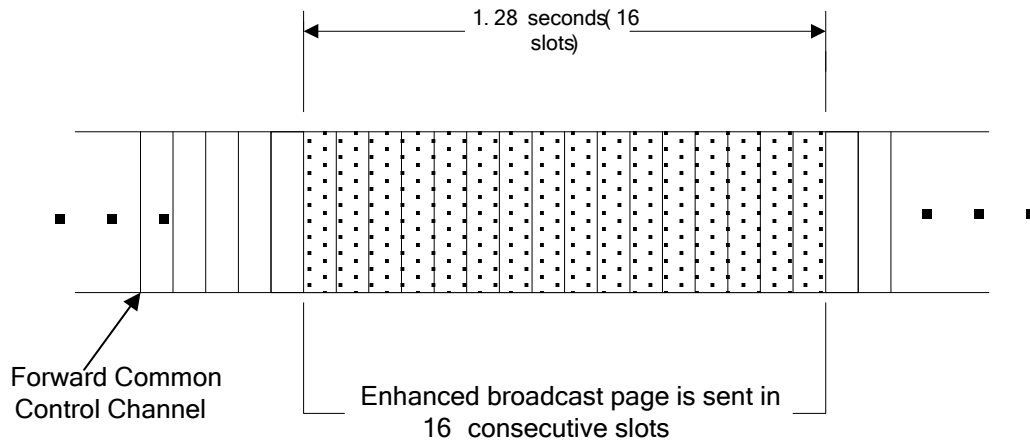

4 The Broadcast Control Channel/Forward Common Control Channel protocol provides two
5 methods for the transmission of broadcast messages. Each method enables mobile
6 stations operating in the slotted mode or in the non-slotted mode to receive broadcast
7 messages on the Broadcast Control Channel when $NUM_BCCH_BCAST_S$ is not equal to
8 '000'. A broadcast message on the Broadcast Control Channel is a *Data Burst Message*
9 that has a broadcast address type. A mobile station operating in the slotted mode has
10 assigned Forward Common Control Channel slots that it monitors to receive Forward
11 Common Control Channel messages (see 2.6.2.1.1.1). A mobile station operating in the
12 slotted mode and configured to receive broadcast messages may also have special assigned
13 Forward Common Control Channel slots, called broadcast slots, that it monitors to receive
14 enhanced broadcast pages. An enhanced broadcast page is a record within a *General Page*
15 *Message* or a *Universal Page Message* that has a broadcast address type and that includes
16 broadcast message scheduling information. A base station may transmit an enhanced
17 broadcast page in an assigned Forward Common Control Channel slot, or in a broadcast
18 slot, to inform mobile stations that a broadcast message will be transmitted in a specified
19 Broadcast Control Channel slot. The enhanced broadcast page identifies the Broadcast
20 Control Channel and the slot the mobile station is to monitor to receive the broadcast
21 message.

22 2.6.2.1.1.1.3.1 Method 1: Multi-Slot Enhanced Broadcast Paging

23 According to this method, an enhanced broadcast page is sent in a sufficient number of
24 assigned slots on the Forward Common Control Channel such that it may be received by
25 all mobile stations that are operating in the slotted mode.

26 Figure 2.6.2.1.1.1.3.1-1 shows an example for the case when the maximum slot cycle index
27 is equal to 0. The enhanced broadcast page is transmitted in 16 consecutive slots.

1

2

3

Figure 2.6.2.1.1.1.3.1-1. Multi-Slot Enhanced Broadcast Paging Example

4

2.6.2.1.1.1.3.2 Method 2: Periodic Enhanced Broadcast Paging

According to this method, mobile stations configured to receive broadcast messages monitor a specific broadcast slot (the first slot of a broadcast paging cycle).

One or more enhanced broadcast pages may be transmitted in the first slot of a broadcast paging cycle and/or in the subsequent slot. Each enhanced broadcast page is associated with a subsequent broadcast slot. The broadcast slot for the associated broadcast message is determined according to a time offset specified in the enhanced broadcast page. In addition, a broadcast slot for a repeat of the broadcast message can be specified via a time offset from the slot of the first broadcast message.

2.6.2.1.1.1.4 Overview of Broadcast Messages on Forward Common Control Channel

The Forward Common Control Channel protocol provides two methods for the transmission of broadcast messages. Each method enables mobile stations operating in the slotted mode or in the non-slotted mode to receive broadcast messages on the Forward Common Control Channel when $NUM_BCCH_BCAST_s$ equals '000'. A broadcast message on the Forward Common Control Channel is a *Data Burst Message* that has a broadcast address type. A mobile station operating in the slotted mode has assigned Forward Common Control Channel slots that it monitors to receive Forward Common Control Channel messages (see 2.6.2.1.1.1). An enhanced broadcast page is a record within a *General Page Message* or a *Universal Page Message* that has a broadcast address type. A base station may transmit an enhanced broadcast page in an assigned slot to inform mobile stations monitoring that slot that a broadcast message will be transmitted in the same F-CCCH where the enhanced broadcast page is received. A slot that a mobile station monitors in order to receive either an enhanced broadcast page or a broadcast message is referred to as a broadcast slot.

28

2.6.2.1.1.4.1 Method 1: Multi-Slot Broadcast Message Transmission

According to this method, a broadcast message is sent in a sufficient number of assigned slots on the Forward Common Control Channel such that it may be received by all mobile stations that are operating in the slotted mode.

Figure 2.6.2.1.1.4.1-1 shows an example for the case when the maximum slot cycle index is equal to 0. In this example, the broadcast message fits in a single slot. The *Data Burst Message* is transmitted in 16 consecutive slots.

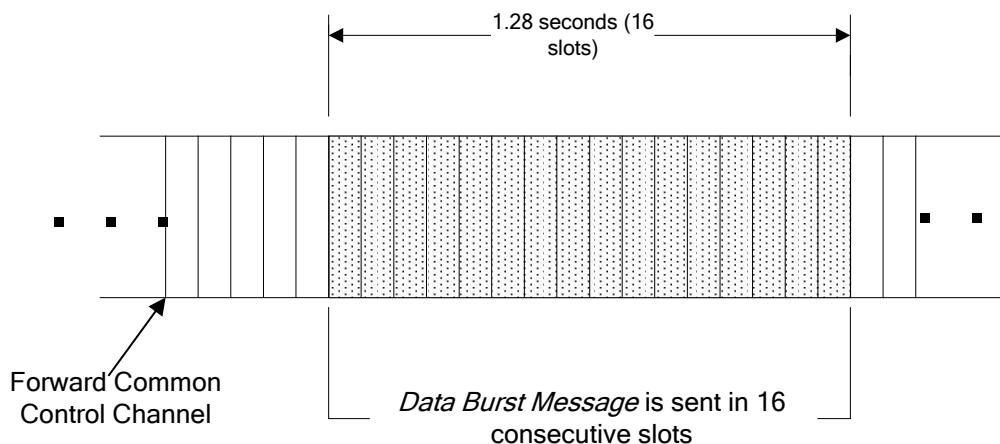

Figure 2.6.2.1.1.4.1-1. Multi-Slot Broadcast Message Transmission Example

2.6.2.1.1.4.2 Method 2: Periodic Enhanced Broadcast Paging

According to this method, mobile stations configured to receive broadcast messages monitor a specific broadcast slot (the first slot of a broadcast paging cycle). There are two methods of sending broadcast messages used with Periodic Enhanced Broadcast Paging.

If all of the broadcast messages to be transmitted fit within the first slot of a broadcast paging cycle, they may all be transmitted in this broadcast slot. If there is a single broadcast message to be transmitted, it may be transmitted beginning in this broadcast slot.

Alternately, one or more enhanced broadcast pages may be transmitted in the first slot of a broadcast paging cycle. Each enhanced broadcast page is associated with a subsequent broadcast slot. For each enhanced broadcast page, an associated broadcast message may be transmitted in the associated subsequent broadcast slot. The broadcast slot for the associated broadcast message is determined according to a time offset specified in the enhanced broadcast page. In addition, a broadcast slot for a repeat of the broadcast message can be specified via a time offset from the slot of the first broadcast message.

2.6.2.1.1.2 Non-Slotted Mode Requirements

A mobile station operating in the non-slotted mode shall monitor the Paging Channel or the Forward Common Control Channel/Primary Broadcast Control Channel at all times. If the mobile station declares a loss of the Paging Channel or the Forward Common Control Channel/Primary Broadcast Control Channel (see 2.6.2.1.1.4), the mobile station shall

1 enter the *System Determination Substate* of the *Mobile Station Initialization State* with a
2 system lost indication (see 2.6.1.1).

3 When a mobile station monitors the Paging Channel or the Forward Common Control
4 Channel in any state other than the *Mobile Station Idle State*, it shall operate in the non-
5 slotted mode.

6 A mobile station monitoring the Paging Channel shall operate in the non-slotted mode
7 when $PACA_S$ is equal to enabled.

8 A mobile station monitoring the Paging Channel shall operate in the non-slotted mode
9 when $SLOTTED_S$ is equal to NO.

10 2.6.2.1.1.3 Slotted Mode Requirements

11 A mobile station monitoring the Paging Channel shall not operate in the slotted mode if any
12 of the following conditions are true:

- 13 • $SLOTTED_S$ is equal to NO,
- 14 • Bit 5 of the station class mark is set to '0' (see 2.3.3),
- 15 • $PACA_S$ is equal to enabled, or
- 16 • The mobile station's configuration parameters are not current (see 2.6.2.2).

17 A mobile station monitoring the Forward Common Control Channel shall not operate in the
18 slotted mode if either of the following conditions is true:

- 19 • Bit 5 of the station class mark is set to '0' (see 2.3.3), or
- 20 • The mobile station's configuration parameters are not current (see 2.6.2.2).

21 A mobile station monitoring the Forward Common Control Channel with bit 5 of the station
22 class mark set to '1' shall monitor all Forward Common Control Channel slots (see
23 2.6.2.1.1.3.1) if either of the following conditions is true:

- 24 • $SLOTTED_S$ is equal to NO, or
- 25 • $PACA_S$ is equal to enabled.

26 During operation in the slotted mode, the mobile station shall ensure that its stored
27 configuration parameter values are current (see 2.6.2.2).

28 If the mobile station declares a loss of the Paging Channel or the Forward Common Control
29 Channel/Primary Broadcast Control Channel (see 2.6.2.1.1.4), the mobile station shall
30 enter the *System Determination Substate* of the *Mobile Station Initialization State* with a
31 system lost indication (see 2.6.1.1).

32 2.6.2.1.1.3.1 Monitoring Assigned Slots

33 The mobile station shall monitor the Paging Channel or the Forward Common Control
34 Channel in each of its assigned slots, if any of the following conditions is true:

- 35 • The mobile station does not support Quick Paging Channel operation, or
- 36 • $QPCH_SUPPORTED_S$ is equal to '0', or

- 1 • RSC_MODE_ENABLED is equal to YES, IGNORE_QPCH_s is equal to '1', and RSCI_s is
2 equal to -3 or -4.

3 If none of the above conditions is true, then for each of its assigned slots, the mobile
4 station shall perform the following:

- 5 • The mobile station should check its assigned paging indicators in the complete Quick
6 Paging Channel slot immediately preceding its assigned Paging Channel or Forward
7 Common Control Channel slot, as specified in 2.6.2.1.2.1; the mobile station shall
8 monitor the assigned Paging Channel or Forward Common Control Channel slot if the
9 paging indicators meet the conditions specified in 2.6.2.1.2.2.
- 10 • If the mobile station does not check its assigned paging indicators, the mobile station
11 shall monitor its assigned Paging Channel or Forward Common Control Channel slot.

12 If the mobile station supports Quick Paging Channel operation, the mobile station is
13 configured to receive broadcast messages, BCAST_INDEX_s is not equal to '000', and
14 QPCH_BI_SUPPORTED_s equals '1', then for each of its assigned broadcast slots on the
15 Forward Common Control Channel or Paging Channel, the mobile station shall perform the
16 following:

- 17 • The mobile station should check the broadcast indicators in the complete Quick Paging
18 Channel broadcast slot immediately preceding its assigned broadcast slot, as specified
19 in 2.6.2.1.1.3.3.
- 20 • The mobile station should receive its assigned broadcast slot on the Forward Common
21 Control Channel or Paging Channel if the broadcast indicators meet the conditions
22 specified in 2.6.2.1.2.1.

23 The mobile station shall monitor each slot following an assigned slot in which the mobile
24 station received a *Universal Page Message* with READ_NEXT_SLOT equal to '1', and shall
25 begin monitoring the Forward Common Control Channel in time to receive the first bit of
26 the slot. If the mobile station is configured to receive broadcast messages, it shall monitor
27 each slot following an assigned slot in which the mobile station received a *Universal Page*
28 *Message* with READ_NEXT_SLOT_BCAST equal to '1', and shall begin monitoring the
29 Forward Common Control Channel in time to receive the first bit of the slot.

30 If SLOTTED_s is equal to NO or PACA_s is equal to enabled, the mobile station may stop
31 monitoring a Forward Common Control Channel slot when Layer 3 receives an address
32 mismatch indication from Layer 2. When the mobile station stops monitoring a Forward
33 Common Control Channel slot when SLOTTED_s is equal to NO or PACA_s is equal to
34 enabled, the mobile station shall begin monitoring the subsequent Forward Common
35 Control Channel slot in time to receive the first bit of the slot.

36 If the mobile station monitors a Paging Channel or Forward Common Control Channel slot,
37 it shall begin monitoring the Paging Channel or the Forward Common Control Channel in
38 time to receive the first bit of the slot. If the mobile station is not configured to receive
39 broadcast addresses, the mobile station shall continue to monitor the Paging Channel or
40 the Forward Common Control Channel until one of the following conditions is satisfied:

- 41 • Layer 3 receives an address mismatch indication from Layer 2 (see [4]); or

- 1 • The mobile station monitors the assigned slot and the slot following the assigned slot,
2 and the mobile station receives at least one valid message (see [4]).

3 If the mobile station is configured to receive broadcast addresses and the mobile station is
4 monitoring a Paging Channel, the mobile station shall continue to monitor the Paging
5 Channel until one of the preceding conditions is satisfied and should monitor the Paging
6 Channel until Layer 3 receives a broadcast address mismatch indication from Layer 2 (see
7 [4]).

8 If the mobile station is configured to receive broadcast addresses and the mobile station is
9 monitoring a Forward Common Control Channel, the mobile station shall continue to
10 monitor the Forward Common Control Channel until one of the preceding conditions is
11 satisfied and should monitor the Forward Common Control Channel until Layer 3 receives
12 a broadcast address mismatch indication from Layer 2 (see [4]).

13 The mobile station shall monitor each slot following a broadcast slot in which the mobile
14 station received a *Universal Page Message* with READ_NEXT_SLOT_BCAST equal to '1', and
15 shall begin monitoring the Forward Common Control Channel in time to receive the first bit
16 of the slot.

17 For each broadcast slot monitored to receive broadcast pages or broadcast messages that is
18 not one of its assigned slots, the mobile station should begin monitoring the Paging
19 Channel or the Forward Common Control Channel in the first bit of the broadcast slot.

20 The mobile station should continue to monitor the Paging Channel or the Forward
21 Common Control Channel until one of the following conditions is satisfied:

- 22 • Layer 3 receives a broadcast address mismatch indication from Layer 2; or
23 • The mobile station monitors the Paging Channel or the Forward Common Control
24 Channel to receive all messages beginning in the broadcast slot and in the slot following
25 the broadcast slot, and the mobile station receives at least one valid message (see [4]).

26 To determine its assigned slots, the mobile station shall use the hash function specified in
27 2.6.7.1 to select a number, PGSLOT, in the range 0 to 2047 (spanning the maximum slot
28 cycle length, which is 163.84 seconds). The mobile station's assigned slots shall be those
29 slots in which

$$30 \quad (\lfloor t/4 \rfloor - \text{PGSLOT}) \bmod (16 \times T) = 0,$$

31 where t is the System Time in 20ms frames and T is the slot cycle length in units of 1.28
32 seconds given by

$$33 \quad T = 2^i,$$

34 where i is the slot cycle index which can take the values -4, -3, -2, -1, 0, 1, 2, 3, 4, 5, 6,
35 and 7.

36 For each slot on the Broadcast Control Channel monitored to receive broadcast messages,
37 the mobile station should begin monitoring the Broadcast Control Channel in the first bit of
38 the slot. The mobile station should continue to monitor the Broadcast Control Channel
39 until one of the following conditions is satisfied:

- 1 • The mobile station has monitored all frames of a Broadcast Control Channel slot and
2 the frame quality for all of the frames of the slot was insufficient; or
- 3 • The mobile station monitors the Broadcast Control Channel slot specified by the
4 enhanced broadcast page and the slot did not contain an SCI bit set to '1' (see [4]).
- 5 • The mobile station has received a broadcast *Data Burst Message* having the same
6 BURST_TYPE and broadcast address as the enhanced broadcast page which
7 announced the *Data Burst Message*.

8 2.6.2.1.1.3.2 Determination of the Slot Cycle Index

9 When the SID and NID of the current base station (SID_s and NID_s, as stored from the
10 *System Parameters Message* or *ANSI-41 System Parameters Message*) do not match any
11 entry of SID_NID_LIST_s, the mobile station shall use a slot cycle index no greater than the
12 smaller of MAX_SLOT_CYCLE_INDEX_s and 1; otherwise:

- 13 • If RSC_MODE_ENABLED is equal to YES, the mobile station shall use a slot cycle index
14 no greater than min(RSCI_s, SLOT_CYCLE_INDEX_s).
- 15 • Otherwise, the mobile station shall use a slot cycle index no greater than
16 SLOT_CYCLE_INDEX_s (see 2.6.2.2.1.6).

17 If the mobile station is directed by the user to modify the preferred slot cycle index
18 (SLOT_CYCLE_INDEX_p), the mobile station shall perform parameter-change registration
19 (see 2.6.5.1.6).

20 2.6.2.1.1.3.3 Slot Cycles for Broadcast Message Transmission

21 2.6.2.1.1.3.3.1 Slot Cycles for Broadcast Message Transmission on the Paging Channel

22 Distribution of broadcast messages relies on specially defined Paging Channel slot cycles.
23 The definitions are as follows:

24 *Maximum paging cycle:* On the Paging Channel, a maximum paging cycle is a Paging
25 Channel slot cycle (see 2.6.2.1.1.3.1) having a duration of M slots such that:

$$26 \quad M = 2^i \times 16, 0 \leq i \leq 7$$

27 where $i = \text{MAX_SLOT_CYCLE_INDEX}_s$ as received in the *System Parameters Message*.

28 The first slot of each maximum paging cycle is any Paging Channel slot in which

$$29 \quad \lfloor t/4 \rfloor \bmod M = 0,$$

30 where t represents system time in 20ms frames.

31 *Broadcast paging cycle:* On the Paging Channel, a broadcast paging cycle is a Paging
32 Channel slot cycle (see 2.6.2.1.1.3.1) having a duration of B + 3 slots where:

$$33 \quad B = 2^i \times 16, 1 \leq i \leq 7$$

1 where $i = \text{BCAST_INDEX}_s$ as received in the *Extended System Parameters Message*, or set
 2 by default when the *Extended System Parameters Message* is not sent.

3 The first slot of each broadcast paging cycle is any Paging Channel slot in which

$$4 \quad \lfloor t/4 \rfloor \bmod (B + 3) = 0,$$

5 where t represents system time in 20ms frames.

6 2.6.2.1.1.3.3.2 Slot Cycles for Broadcast Message Transmission on the Forward 7 Common Control Channel

8 Distribution of broadcast messages relies on specially defined Forward Common Control
 9 Channel slot cycles. The definitions are as follows:

10 *Maximum paging cycle:* On the Forward Common Control Channel, a maximum paging
 11 cycle is a Forward Common Channel slot cycle (see 2.6.2.1.1.3.1) having a duration of M
 12 slots such that:

$$13 \quad M = 2^i \times 16, 0 \leq i \leq 7$$

14 where $i = \text{MAX_SLOT_CYCLE_INDEX}_s$ as received in the *MC-RR Parameters Message*.

15 The first slot of each maximum paging cycle is any Forward Common Control Channel slot
 16 in which

$$17 \quad \lfloor t/4 \rfloor \bmod M = 0,$$

18 where t represents system time in 20ms frames.

19 *Broadcast paging cycle:* On the Forward Common Control Channel, a broadcast paging
 20 cycle is a Forward Common Control Channel slot cycle (see 2.6.2.1.1.3.1) having a duration
 21 of $B + 7$ slots where:

$$22 \quad B = 2^{1+i} \times 16, 1 \leq i \leq 7$$

23 where $i = \text{BCAST_INDEX}_s$ as received in the *MC-RR Parameters Message*.

24 The first slot of each broadcast paging cycle is any Forward Common Control Channel slot
 25 in which

$$26 \quad \lfloor t/4 \rfloor \bmod (B + 7) = 0,$$

27 where t represents system time in 20ms frames.

28 2.6.2.1.1.3.4 Monitoring Paging Channel Broadcasts

29 The following requirements apply to mobile stations monitoring the Paging Channel and
 30 supporting the reception of broadcast messages.

31 If BCAST_INDEX_s is equal to '000', the mobile station shall monitor only its assigned
 32 Paging Channel slots (see 2.6.2.1.1.3.1).

1 If $BCAST_INDEX_s$ is not equal to '000', and the mobile station is configured to receive
 2 messages addressed to broadcast addresses, the mobile station should also monitor the
 3 Paging Channel beginning with the first slot of each broadcast paging cycle (see
 4 2.6.2.1.1.3.3).

5 If the mobile station receives a broadcast page containing a burst type and broadcast
 6 address for a *Data Burst Message* that the mobile station has been configured to receive
 7 (see 2.6.2.3), the mobile station should monitor the slot in which the corresponding
 8 broadcast Paging Channel message will be sent, determined as follows:

- 9 • The mobile station shall consider a broadcast page to have been received in the paging
 10 slot in which the *General Page Message* containing the broadcast page began.
- 11 • If $BCAST_INDEX_s$ is not equal to '000', the paging slot containing the broadcast page is
 12 defined as the reference slot.
- 13 • Let n represent the ordinal number of the broadcast page relative to other broadcast
 14 pages that are contained in the same *General Page Message* ($n = 1, 2, 3, \dots$). The mobile
 15 station should monitor the Paging Channel slot that occurs $n \times 3$ paging slots after the
 16 reference slot.

17 After receiving a broadcast message or a broadcast page for a *Data Burst Message* and a
 18 corresponding broadcast Paging Channel message when $BCAST_INDEX_s$ is not equal to
 19 '000', the mobile station should discard all further broadcast pages and all further
 20 broadcast Paging Channel messages containing the same $BURST_TYPE$ and BC_ADDR
 21 fields that are received within $4 \times (B + 3)$ paging slots of the first paging slot in the
 22 broadcast paging cycle in which the broadcast page or broadcast message was first
 23 received. ($B + 3$ is the duration of the broadcast paging cycle as defined in 2.6.2.1.1.3.3).

24 After receiving a broadcast message or a broadcast page for a *Data Burst Message* and a
 25 corresponding broadcast Paging Channel message when $BCAST_INDEX_s$ is equal to '000',
 26 the mobile station should discard all further broadcast pages and all further broadcast
 27 Paging Channel messages containing the same $BURST_TYPE$ and BC_ADDR fields that are
 28 received within $16 \times 2^{MAX_SLOT_CYLCE_INDEX_s}$ slots of the paging slot in which the
 29 broadcast page or broadcast message was first received.

30 If the mobile station receives a broadcast page containing a burst type and broadcast
 31 address for BCMC that the mobile station has been configured to receive (see 2.6.2.3), the
 32 mobile station shall do the following:

- 33 • If the burst type and broadcast address²⁹ indicates that response to the broadcast page
 34 is required, then the mobile station shall enter the *Update Overhead Information*
 35 *Substate* of the *System Access State* (see 2.6.3.2) with a page response indication within
 36 T_{33m} seconds after the page message is received.

²⁹ Format of broadcast address for BCMC is defined in BCMC service document (see [\[39\]](#)[53]).

- 1 • If the burst type and broadcast address indicates to monitor broadcast messages, then
2 the mobile station shall continue to monitor the paging channel for a *BCMC Service*
3 *Parameters Message* containing the BCMC_FLOW_ID in the broadcast address as
4 follows:
 - 5 - The mobile station shall monitor the F-PCH for the duration of four F-PCH slots
6 from the slot in which the broadcast page was received or until the *BCMC Service*
7 *Parameters Message* containing the BCMC_FLOW_ID is received; if the mobile
8 station detects the start of the *BCMC Service Parameters Message*, the mobile
9 station shall monitor the F-PCH until the entire *BCMC Service Parameters Message*
10 is received.

11 2.6.2.1.1.3.5 Support of Broadcast Delivery Options on the Paging Channel

12 A mobile station configured to receive broadcast messages shall support reception of
13 broadcast messages transmitted using Multi-Slot Broadcast Message Transmission (see
14 3.6.2.4.1.1.2.1.1).

15 A mobile station configured to receive broadcast messages shall support reception of
16 broadcast messages transmitted using Periodic Broadcast Paging (see 3.6.2.4.1.1.2.1.2).

17 2.6.2.1.1.3.6 Monitoring the Forward Common Control Channel for the Enhanced 18 Broadcast Page

19 The following requirements apply to mobile stations monitoring the Forward Common
20 Control Channel and supporting the reception of broadcast messages.

21 If BCAST_INDEX_s is equal to '000', the mobile station shall monitor only its assigned Quick
22 Paging Channel slots or its assigned Forward Common Control Channel slots (see
23 2.6.2.1.2) for enhanced broadcast pages.

24 If BCAST_INDEX_s is not equal to '000', and the mobile station is configured to receive
25 messages addressed to broadcast addresses, the mobile station should also monitor the
26 Quick Paging Channel broadcast slots or the Forward Common Control Channel broadcast
27 slots (see 2.6.2.1.2) beginning with the first slot of each broadcast paging cycle.

28 If the mobile station receives an enhanced broadcast page containing a burst type and
29 broadcast address for a *Data Burst Message* that the mobile station has been configured to
30 receive and NUM_BCCH_BCAST_s does not equal '000', the mobile station should monitor at
31 least one Broadcast Control Channel slot in which the corresponding broadcast message
32 will be sent, determined as follows:

- 33 • The mobile station shall monitor the Broadcast Control Channel slot which begins 40
34 ms × (1 + TIME_OFFSET) later than the beginning of the slot in which the message
35 containing the enhanced broadcast page began or the Broadcast Control Channel slot
36 which begins 40 ms × (1 + REPEAT_TIME_OFFSET) later than the Broadcast Control
37 Channel slot in which the first transmission began.

38 If the mobile station receives an enhanced broadcast page containing a burst type and
39 broadcast address for a *Data Burst Message* that the mobile station has been configured to
40 receive and NUM_BCCH_BCAST_s equals '000', the mobile station should monitor the slot in

1 which the corresponding broadcast Forward Common Control Channel message will be
2 sent, determined as follows:

- 3 • The mobile station shall consider an enhanced broadcast page to have been received in
4 the Forward Common Control Channel slot in which the *General Page Message* or the
5 *Universal Page Message* containing the enhanced broadcast page began.
- 6 • When NUM_BCCH_BCAST_s equals 0, the mobile station shall monitor the Forward
7 Common Control Channel slot which begins $40 \text{ ms} \times (1 + \text{TIME_OFFSET})$ later than the
8 beginning of the slot in which the message containing the enhanced broadcast page
9 began or the Forward Common Control Channel slot which begins $40 \text{ ms} \times (1 +$
10 $\text{REPEAT_TIME_OFFSET})$ later than the Forward Common Control Channel slot in
11 which the first transmission began. After receiving an enhanced broadcast page for a
12 *Data Burst Message* and a corresponding broadcast message when BCAST_INDEX_s is
13 not equal to '000', the mobile station should discard all further enhanced broadcast
14 pages containing the same BURST_TYPE and having the same broadcast address that
15 are received within $4 \times (B + 7)$ slots of the first slot in the broadcast paging cycle in
16 which the enhanced broadcast page was received. ($B + 7$ is the duration of the
17 broadcast paging cycle as defined in 2.6.2.1.1.3.3.1). The mobile station should ignore
18 broadcast messages for which a corresponding enhanced broadcast page was not
19 received.

20 After receiving an enhanced broadcast page for a *Data Burst Message* and a corresponding
21 broadcast message when BCAST_INDEX_s is equal to '000', the mobile station should
22 discard all further enhanced broadcast pages containing the same BURST_TYPE and
23 having the same broadcast address that are received within $16 \times 2^{\text{MAX_SLOT_CYLCE_INDEX}_s}$
24 slots of the slot in which the enhanced broadcast page was received. The mobile station
25 should ignore broadcast messages for which a corresponding enhanced broadcast page was
26 not received.

27 If the mobile station received an enhanced broadcast page for a *Data Burst Message* and a
28 corresponding broadcast message, and the broadcast message announced by a pending
29 enhanced broadcast page containing the same BURST_TYPE and having the same
30 broadcast address has not yet been received, the mobile station shall ignore the pending
31 enhanced broadcast page.

32 If the mobile station receives a broadcast page containing a burst type and broadcast
33 address for BCMC that the mobile station has been configured to receive (see 2.6.2.3), the
34 mobile station shall do the following:

- 35 • If the burst type and broadcast address indicates that response to the broadcast page is
36 required, then the mobile station shall enter the *Update Overhead Information Substate*
37 of the *System Access State* (see 2.6.3.2) with a page response indication within T_{33m}
38 seconds after the page message is received.
- 39 • If the burst type and broadcast address indicates to monitor broadcast messages, then
40 the mobile station shall monitor the Primary Broadcast Control Channel slot for a
41 *BCMC Service Parameters Message* containing the BCMC_FLOW_ID in the broadcast
42 address, determined as follows:

- 1 - The mobile station shall start monitoring the Primary Broadcast Control Channel
2 slot which begins $40 \text{ ms} \times (1 + \text{TIME_OFFSET})$ later than the beginning of the slot in
3 which the message containing the enhanced broadcast page began or the Primary
4 Broadcast Control Channel slot which begins $40 \text{ ms} \times (1 + \text{REPEAT_TIME_OFFSET})$
5 later than the Primary Broadcast Control Channel slot in which the first
6 transmission began.
- 7 - The mobile station shall continue to monitor the Primary Broadcast Control
8 Channel for the duration of four F-BCCH slots or until the *BCMC Service Parameters*
9 *Message* containing the *BCMC_FLOW_ID* is received; if the mobile station detects
10 the start of the *BCMC Service Parameters Message*, the mobile station shall monitor
11 the F-BCCH until the entire *BCMC Service Parameters Message* is received.

12 2.6.2.1.1.3.7 Support of Broadcast Delivery Options on the Forward Common Control
13 Channel/Broadcast Control Channel

14 2.6.2.1.1.3.7.1 Support of Broadcast Delivery Options on the Forward Common Control
15 Channel when NUM_BCCH_BCAST_s does not equals '000'

16 A mobile station configured to receive broadcast messages shall support reception of
17 broadcast messages transmitted using Multi-Slot Enhanced Broadcast Paging (see
18 2.6.2.1.1.1.3.1).

19 A mobile station configured to receive broadcast messages shall support reception of
20 broadcast messages transmitted using Periodic Enhanced Broadcast Paging (see
21 2.6.2.1.1.1.3.2).

22 2.6.2.1.1.3.7.2 Support of Broadcast Delivery Options on the Forward Common
23 Control Channel when NUM_BCCH_BCAST_s equals '000'

24 A mobile station configured to receive broadcast messages shall support reception of
25 broadcast messages transmitted using Multi-Slot Enhanced Broadcast Message
26 Transmission (see 2.6.2.1.1.1.4.1).

27 A mobile station configured to receive broadcast messages shall support reception of
28 broadcast messages transmitted using Periodic Enhanced Broadcast Paging (see
29 2.6.2.1.1.1.4.2).

30

31 2.6.2.1.1.3.8 Slot Cycles for BSPM Transmission

32 2.6.2.1.1.3.8.1 BSPM Slot Cycle on the Paging Channel

33 On the Paging Channel, a BSPM slot cycle is a Paging Channel slot cycle having a duration
34 of $B + 1$ slots where:

35
$$B = 2^i \times 16, 0 \leq i \leq 15$$

36 where $i = \text{BSPM_PERIOD_INDEX}_s$ as received in the *Extended System Parameters Message*.

37 The first slot of each BSPM slot cycle is any Paging Channel slot in which

38
$$\lfloor t/4 \rfloor \bmod (B + 1) = 0,$$

1 where t represents system time in 20ms frames.

2 2.6.2.1.1.3.8.2 BSPM Slot Cycle on the Primary Broadcast Control Channel

3 On the Primary Broadcast Control Channel, a BSPM slot cycle is a Primary Broadcast
4 Control Channel slot cycle having a duration of $B + 1$ slots where:

$$5 \quad B = 2^i \times 16, 0 \leq i \leq 15$$

6 where $i = \text{BSPM_PERIOD_INDEX}_s$ as received in the *MC-RR Parameters Message*.

7 The first slot of each BSPM slot cycle is any Primary Broadcast Control Channel slot in
8 which

$$9 \quad \lfloor t/2 \rfloor \bmod (B + 1) = 0, (40\text{ms})$$

$$10 \quad \lfloor t/4 \rfloor \bmod (B + 1) = 0, (80\text{ms})$$

$$11 \quad \lfloor t/8 \rfloor \bmod (B + 1) = 0, (160\text{ms})$$

12 where t represents system time in 20ms frames and the number in the parenthesis
13 represents the duration of the Primary Broadcast Control Channel slot (see [2]).

14 2.6.2.1.1.4 Common Channel Supervision

15 The mobile station shall monitor the Paging Channel, the Forward Common Control
16 Channel, or the Primary Broadcast Control Channel as specified in 2.6.2.1.1. The mobile
17 station shall set a timer for T_{30m} seconds whenever it begins to monitor the Paging
18 Channel, the Forward Common Control Channel, or the Primary Broadcast Control
19 Channel. The mobile station shall reset the timer for T_{30m} seconds whenever it gets an
20 indication that a valid message was received on the Paging Channel, the Forward Common
21 Control Channel, or the Primary Broadcast Control Channel, whether addressed to the
22 mobile station or not (see [4]). The mobile station shall disable the timer when it is not
23 monitoring the Paging Channel, the Forward Common Control Channel, or the Primary
24 Broadcast Control Channel. If the timer expires, the mobile station shall declare a loss of
25 the Paging Channel, the Forward Common Control Channel, or the Primary Broadcast
26 Control Channel.

27 2.6.2.1.1.5 RL Underload Indicator Monitoring Procedures

28 The mobile station shall monitor the Paging Channel as specified in 2.6.2.1.1. If the mobile
29 station receives a *General Page Message*, it shall set $\text{RL_UNDERLOAD_INDICATOR}_s$ to
30 $\text{RL_UNDERLOAD_INDICATOR}_r$.

31 2.6.2.1.2 Quick Paging Channel Monitoring Procedures

32 2.6.2.1.2.1 Overview

33 The Quick Paging Channel is divided into 80 ms slots called Quick Paging Channel slots.

1 The Quick Paging Channel protocol provides for scheduling the transmission of paging
 2 indicators for a mobile station in Quick Paging Channel slots assigned to the mobile
 3 station. Support of this feature is optional.

4 The Quick Paging Channel protocol provides for scheduling the transmission of
 5 configuration change indicators for mobile stations in Quick Paging Channel slots.
 6 Support of this feature is optional.

7 The Quick Paging Channel protocol provides for scheduling the transmission of broadcast
 8 indicators for mobile stations in Quick Paging Channel broadcast slots. Support of this
 9 feature is optional.

10 If the mobile station is operating in the slotted mode and it supports the Quick Paging
 11 Channel, and QPCH_SUPPORTED_s is equal to '1', the mobile station monitors paging
 12 indicators on the Quick Paging Channel³⁰ as follows:

13 The mobile station's assigned Quick Paging Channel slots are offset from its assigned
 14 Paging Channel slots or its assigned Forward Common Control Channel slots by 100 ms,
 15 as shown in Figure 2.6.2.1.2.1-1. Two paging indicators are assigned to a mobile station in
 16 its assigned Quick Paging Channel slot. In the following, t^* is the start time of the mobile
 17 station's assigned Paging Channel or Forward Common Control Channel slot. According to
 18 the hash function specified in 2.6.7.1, paging indicators are assigned as follows:

- 19 • The first paging indicator for the mobile station is assigned between (t^*-100) ms and $(t^*-$
 20 $80)$ ms (marked as 1 in Figure 2.6.2.1.2.1-1) and the second paging indicator is
 21 assigned between (t^*-60) ms and (t^*-40) ms (marked as 3 in the figure); or
- 22 • The first paging indicator for the mobile station is assigned between (t^*-80) ms and $(t^*-$
 23 $60)$ ms (marked as 2 in the figure) and the second paging indicator is assigned between
 24 (t^*-40) ms and (t^*-20) ms (marked as 4 in the figure).

25 If the mobile station is operating in the slotted mode and it supports the Quick Paging
 26 Channel, the mobile station can, when performing an idle handoff to a base station whose
 27 Paging Channel or Forward Common Control Channel/Primary Broadcast Control Channel
 28 has recently been monitored, monitor one or more configuration change indicators.
 29 Configuration change indicators are scheduled every 40 ms on the first Quick Paging
 30 Channel.

31 If the mobile station is operating in the slotted mode, is configured to receive the broadcast
 32 messages, supports the Quick Paging Channel, BCAST_INDEX_s is not equal to '000',
 33 QPCH_SUPPORTED_s is equal to '1', and QPCH_BI_SUPPORTED_s is equal to '1', the mobile
 34 station monitors broadcast indicators on the Quick Paging Channel as follows:

- 35 • The mobile station's assigned Quick Paging Channel broadcast slots are offset from its
 36 assigned Forward Common Control Channel or Paging Channel broadcast slots by 100
 37 ms, as shown in Figure 2.6.2.1.2.1-1.

³⁰ One exception is if the mobile station is operating in the reduced slot cycle mode with a reduced slot cycle index of -3 or -4, and IGNORE_QPCH_s is equal to '1'.

- 1 • The mobile station monitors one or more broadcast indicators in an assigned Quick
- 2 Paging Channel broadcast slot.

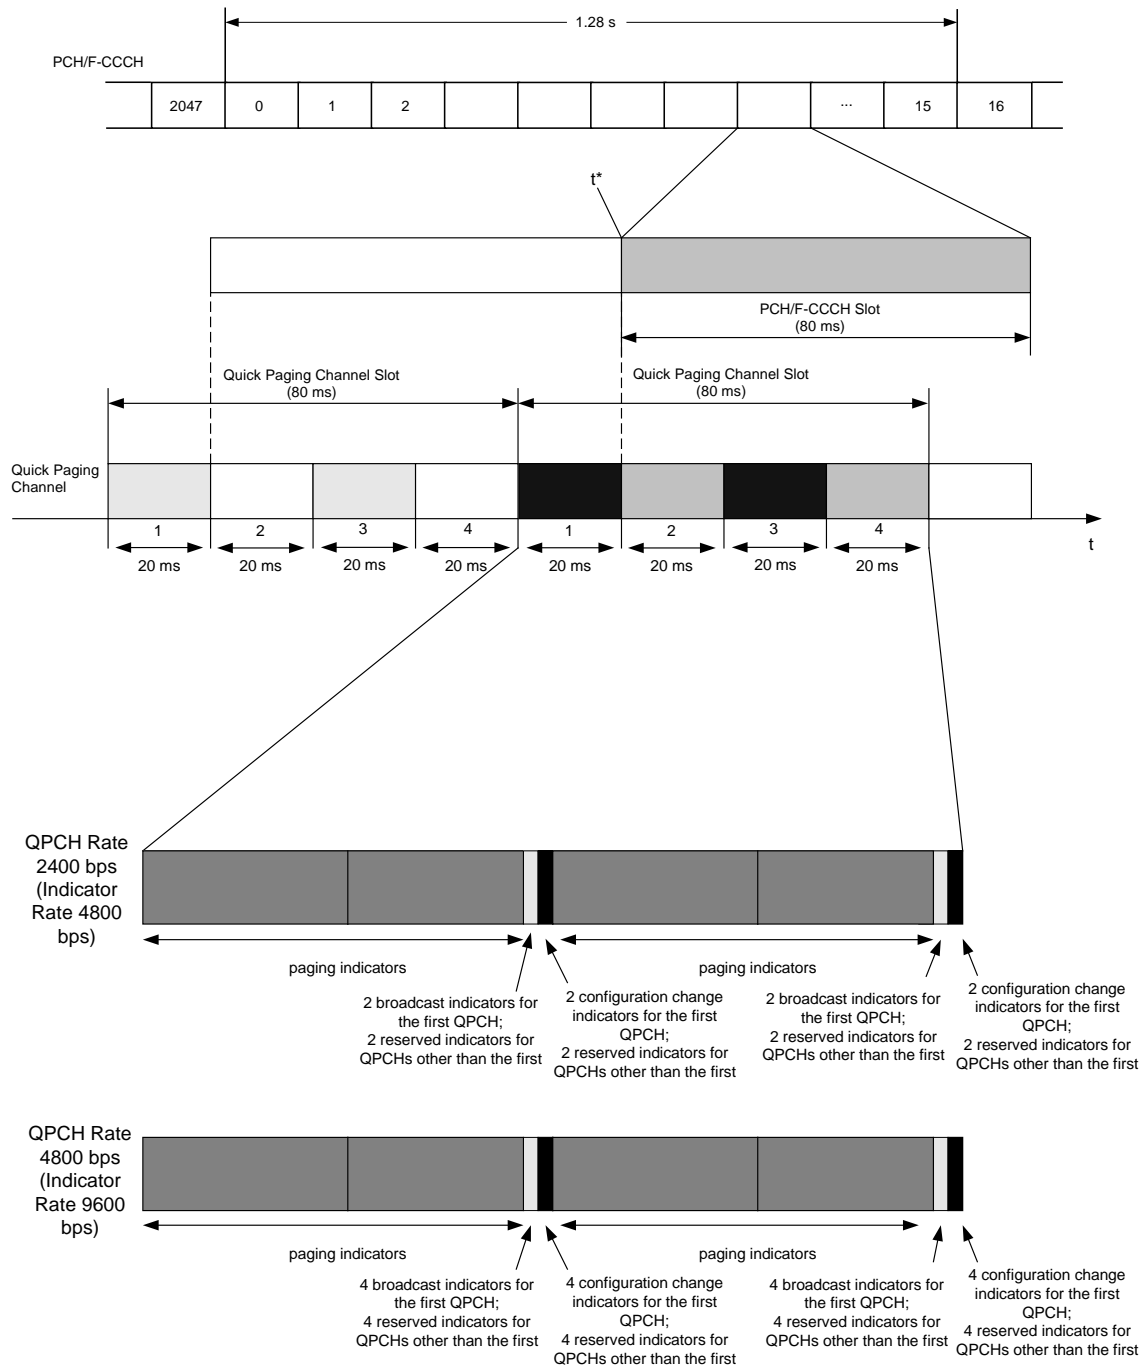

Figure 2.6.2.1.2.1-1. Quick Paging Channel Timeline

1 2.6.2.1.2.2 Requirements

2 A mobile station operating in the slotted mode should monitor the paging indicators in the
3 mobile station's assigned Quick Paging Channel slot if all of the following conditions hold:

- 4 • The mobile station supports the Quick Paging Channel;
- 5 • QPCH_SUPPORTED_s = '1'; and
- 6 • The mobile station is not monitoring the Paging Channel or the Forward Common
7 Control Channel.

8 The mobile station's assigned Quick Paging Channel slots shall be those slots in which

$$9 \quad \lfloor (t+5)/4 \rfloor - \text{PGSLOT} \bmod (16 \times T) = 0.$$

10 where t is the System Time in 20ms frames, PGSLOT is selected in the range 0 to 2047 by
11 using the hash function specified in 2.6.7.1, and T is the slot cycle length in units of 1.28
12 seconds such that

$$13 \quad T = 2^i,$$

14 and i is the slot cycle index which can take the values -4, -3, -2, -1, 0, 1, 2, 3, 4, 5, 6, and
15 7.

16 To determine the position of the mobile station's two assigned paging indicators respective
17 to the beginning of the mobile station's assigned Quick Paging Channel slot, the mobile
18 station shall use the hash function specified in 2.6.7.1. The R1 and R2 outputs of the
19 hashing algorithm correspond to an indicator bit position relative to the beginning of the
20 Quick Paging Channel slot. The hashing algorithm is so devised that two paging indicators
21 (R1 and R2) for a mobile station will be in the first and third quarter slot or the second and
22 fourth quarter slot.

23 If the mobile station checks assigned paging indicators, the mobile station shall perform
24 the following:

- 25 • If the mobile station detects that one of the paging indicators is set to "OFF", the mobile
26 station need not detect another paging indicator.
- 27 • If the mobile station does not detect that at least one of the paging indicators is set to
28 "OFF", the mobile station shall monitor its assigned Paging Channel or Forward
29 Common Control Channel slot immediately following its assigned Quick Paging
30 Channel slot.³¹

31 When performing an idle handoff to a base station whose Paging Channel or Forward
32 Common Control Channel was previously monitored, a mobile station operating in the

³¹ A case for which the mobile station may not be able to detect that at least one of the paging indicators is set to "OFF" is for a mobile station that misses a part of or its entire Quick Paging Channel slot during overhead information update. In this case, the mobile station monitors its assigned Paging Channel slot.

1 slotted mode should monitor one or more configuration change indicators on the first
2 Quick Paging Channel for the new base station if all of the following conditions hold:

- 3 • The mobile station supports the Quick Paging Channel;
- 4 • The mobile station has knowledge that the new base station supports the Quick Paging
5 Channel;
- 6 • The mobile station has knowledge that the new base station supports configuration
7 change indicators,
- 8 • The mobile station is not monitoring the Paging Channel or the Forward Common
9 Control Channel; and
- 10 • No more than T_{31m} seconds have elapsed since the mobile station last received a valid
11 message on the new Paging Channel or the new Forward Common Control Channel.

12 Before monitoring a configuration change indicator, the mobile station shall perform the
13 following:

- 14 • The mobile station shall set $ASSIGNED_QPAGECH_s$ equal to $QPAGECH_s$, and
- 15 • The mobile station shall set $QPAGECH_s$ equal to 1.

16 Before monitoring a paging indicator subsequent to monitoring a configuration change
17 indicator, the mobile station shall set $QPAGECH_s$ equal to $ASSIGNED_QPAGECH_s$.

18 If the Quick Paging Channel data rate is 2400 bps (indicator rate is 4800 bps), the bit
19 positions of the mobile station's first pair of configuration change indicators shall be the
20 last two bits in the first 40 ms half of a Quick Paging Channel slot. The bit positions of the
21 mobile station's second pair of configuration change indicators shall be the last two bits in
22 a Quick Paging Channel slot.

23 If the Quick Paging Channel data rate is 4800 bps (indicator rate is 9600 bps), the bit
24 positions of the mobile station's first four configuration change indicators shall be the last
25 four bits in the first 40 ms half of a Quick Paging Channel slot. The bit positions of the
26 mobile station's second four configuration change indicators shall be the last four bits in a
27 Quick Paging Channel slot.

28 If the mobile station monitors a configuration change indicator and determines that it is set
29 to "OFF", the mobile station can enter or remain in the slotted mode after an idle handoff
30 (see 2.6.2.1.4.2).

31 If a mobile station is operating in the slotted mode and is configured to receive broadcast
32 messages, it should monitor the broadcast indicators in the mobile station's assigned
33 Quick Paging Channel broadcast slot if all of the following conditions hold:

- 34 • The mobile station supports the Quick Paging Channel;
- 35 • $BCAST_INDEX_s$ is not equal to '000'
- 36 • $QPCH_BI_SUPPORTED_s = '1'$; and
- 37 • The mobile station is not monitoring the Forward Common Control Channel, the
38 Primary Broadcast Control Channel, or the Paging Channel.

1 The mobile station's assigned Quick Paging Channel broadcast slots shall be those slots in
2 which

$$3 \quad \lfloor (t+5)/4 \rfloor \bmod (B + 7) = 0.$$

4 where t is the System Time in 20ms frames, and B is the broadcast paging cycle such that
5 $B = 2^{1+i} \times 16$, $1 \leq i \leq 7$ and $i = \text{BCAST_INDEX}_S$ as received in the *MC-RR Parameters*
6 *Message*.

7 The mobile station's assigned Quick Paging Channel broadcast slots shall be those slots in
8 which

$$9 \quad \lfloor (t+5)/4 \rfloor \bmod (B + 3) = 0.$$

10 where t is the System Time in 20ms frames, and B is the broadcast paging cycle such that
11 $B = 2^i \times 16$, $1 \leq i \leq 7$ and $i = \text{BCAST_INDEX}_S$ as received in the *Extended System Parameters*
12 *Message*.

13 The mobile station should monitor one or more broadcast indicators on the Quick Paging
14 Channel. If the Quick Paging Channel data rate is 2400 bps (indicator rate is 4800 bps),
15 the bit positions of the mobile station's first pair of broadcast indicators shall be the two
16 bits prior to the last two bits in the first 40 ms half of a Quick Paging Channel slot. The bit
17 positions of the mobile station's second pair of broadcast indicators shall be the two bits
18 prior to the last two bits in a Quick Paging Channel slot.

19 If the Quick Paging Channel data rate 4800 bps (indicator rate is 9600 bps), the bit
20 positions of the mobile station's first four broadcast indicators shall be the four bits prior to
21 the last four bits in the first 40 ms half of a Quick Paging Channel slot. The bit positions of
22 the mobile station's second four broadcast indicators shall be the four bits prior to the last
23 four bits in a Quick Paging Channel slot.

24 If the mobile station monitors broadcast indicators and determines that they are not set to
25 "OFF", the mobile station should perform the following:

- 26 • The mobile station should receive its assigned broadcast slot on the Forward Common
27 Control Channel or Paging Channel immediately following its assigned Quick Paging
28 Channel broadcast slot.

29 2.6.2.1.3 Registration

30 While in the *Mobile Station Idle State*, the mobile station shall perform the registration
31 procedures specified in 2.6.5.5.2.1.

32 2.6.2.1.4 Idle Handoff

33 2.6.2.1.4.1 Pilot Search

34 An idle handoff occurs when a mobile station has moved from the coverage area of one
35 base station into the coverage area of another base station during the *Mobile Station Idle*
36 *State*. If the mobile station detects a Pilot Channel signal from another base station that is
37 sufficiently stronger than that of the current base station, the mobile station determines
38 that an idle handoff should occur.

1 If both AP_IDT_MSG_SEQ_s and INTRA_FREQ_HO_HYS_s are not set to NULL, the mobile
 2 station shall only perform idle handoff to another pilot on the same frequency as the
 3 current base station when the following condition is satisfied:

$$4 \quad \text{Target Pilot Ec/Io (dB)} > (\text{INTRA_FREQ_HO_SLOPE}_s/8) \times \text{Current Pilot Ec/Io (dB)} + \\
 5 \quad \text{INTRA_FREQ_HO_HYS}_s \text{ (dB).}$$

6 If both AP_IDT_MSG_SEQ_s and INTER_FREQ_HO_HYS_s are not set to NULL, the mobile
 7 station shall only perform idle handoff to another pilot on a different frequency than that of
 8 the current base station when the following condition is satisfied:

$$9 \quad \text{Target Pilot Ec/Io (dB)} > (\text{INTER_FREQ_HO_SLOPE}_s/8) \times \text{Current Pilot Ec/Io (dB)} + \\
 10 \quad \text{INTER_FREQ_HO_HYS}_s \text{ (dB).}$$

11 When multiple idle handoff candidates are available, the mobile station should select, if
 12 any, a candidate which supports Primary Broadcast Control Channel.

13 Pilot Channels are identified by their offsets relative to the zero offset pilot PN sequence
 14 (see 3.1.3.2.1). Pilot offsets are grouped into sets describing their status with regard to
 15 pilot searching.

16 The following sets of pilot offsets are defined for a mobile station in the *Mobile Station Idle*
 17 *State*. Each pilot offset is a member of only one set.

- 18 • Active Set: The pilot offset of the Forward CDMA Channel whose Paging Channel or
 19 Forward Common Control Channel is being monitored.
- 20 • Neighbor Set: The offsets of the Pilot Channels that are likely candidates for idle
 21 handoff. The members of the Neighbor Set are specified in the *Neighbor List Message*,
 22 *Extended Neighbor List Message*, and the *General Neighbor List Message* on the Paging
 23 Channel, and the *Universal Neighbor List Message* on the Primary Broadcast Control
 24 Channel.
- 25 • Remaining Set: The set of all possible pilot offsets in the current system (integer
 26 multiples of PILOT_INC_s) on the current CDMA Frequency Assignment, excluding the
 27 pilots in the Neighbor Set and the Active Set.
- 28 • Private Neighbor Set: The offsets of the Pilot Channels for the private systems that are
 29 likely candidates for idle handoff. The members of the Private Neighbor Set are
 30 specified in the *Private Neighbor List Message*.

31 The mobile station shall support a Neighbor Set size of at least N_{8m} pilots (see Annex D).

32 In the *Mobile Station Idle State*, the mobile station shall continuously search for the
 33 strongest Pilot Channel signal on the corresponding CDMA Frequency Assignment
 34 whenever it monitors the Paging Channel or the Forward Common Control Channel.

35 The mobile station may search other frequencies and band classes. For example, if a pilot
 36 in the Neighbor Set or in the Private Neighbor Set is on a different Frequency Assignment
 37 than that of the mobile station, this frequency should be included in the search criteria.
 38 Search performance criteria are defined in [11]. If both AP_IDT_MSG_SEQ_s and
 39 INTER_FREQ_SRCH_TH_s are not set to NULL, the MS shall only start searching on different

1 frequencies than that of the current pilot when its current pilot E_c/I_o is below
 2 $INTER_FREQ_SRCH_TH_S$.

3 This search should be governed by the following:

- 4 • Active Set: The search window size for the pilot in the Active Set shall be the number of
 5 PN chips specified in Table 2.6.6.2.1-1 corresponding to $SRCH_WIN_A_S$. The mobile
 6 station should center the search window for the pilot of the Active Set around the
 7 earliest arriving usable multipath component of the pilot. If the mobile station receives
 8 a value greater than or equal to 13 for $SRCH_WIN_A_T$, it may store and use the value 13
 9 in $SRCH_WIN_A_S$.
- 10 • Neighbor Set: The search window size for each pilot in the Neighbor Set shall be the
 11 number of PN chips specified in Table 2.6.6.2.1-1 corresponding to
 12 $SRCH_WIN_NGHBR_S$ field of the $NGHBR_REC$ for the pilot. The mobile station should
 13 center the search window for each pilot in the Neighbor Set around the pilot's PN
 14 sequence offset plus the corresponding $SRCH_OFFSET_NGHBR_S$ (see Table 2.6.6.2.1-2)
 15 using timing defined by the mobile station's time reference (see [2]). The mobile station
 16 should use the $SEARCH_PRIORITY$ field of the $NGHBR_REC$ for the corresponding pilot
 17 to schedule its neighbor search. If $ADD_PILOT_REC_INCL$ field of the $NGHBR_REC$ for
 18 the corresponding pilot is equal to '1', the mobile station shall use the information
 19 included in the $NGHBR_PILOT_REC$ field for searching the neighbor.

20 If the mobile station supports hopping pilot beacons and the $TIMING_INCL$ field of the
 21 $NGHBR_REC$ for the corresponding pilot is equal to '1', then the mobile station shall use
 22 the information included in the $NGHBR_TX_OFFSET$, $NGHBR_TX_DURATION$, and
 23 $NGHBR_TX_PERIOD$ fields of the $NGHBR_REC$ for the corresponding pilot to schedule the
 24 time for searching the neighbor.

- 25 • Remaining Set: The search window size for each pilot in the Remaining Set shall be the
 26 number of PN chips specified in Table 2.6.6.2.1-1 corresponding to $SRCH_WIN_R_S$. The
 27 mobile station should center the search window for each pilot in the Remaining Set
 28 around the pilot's PN sequence offset using timing defined by the mobile station's time
 29 reference (see [2]). The mobile station should only search for Remaining Set pilots
 30 whose pilot PN sequence offset indices are equal to integer multiples of $PILOT_INC_S$.
- 31 • Private Neighbor Set: The search window size for each pilot in the Private Neighbor Set
 32 shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to
 33 $SRCH_WIN_PRI_NGHBR_S$ field of the PRI_NGHBR_REC for the pilot. The mobile station
 34 should center the search window for each pilot in the Private Neighbor Set around the
 35 pilot's PN sequence offset using timing defined by the mobile station's time reference
 36 (see [2]).

37 If the mobile station determines that one of the Neighbor Set, Private Neighbor Set or
 38 Remaining Set Pilot Channel signals is sufficiently stronger (see [11]) than the Pilot
 39 Channel of the Active Set, the mobile station should perform an idle handoff as follows:

- 40 • If the mobile station is currently monitoring a Forward Supplemental Channel, the
 41 mobile station shall perform an idle handoff as specified in 2.6.13.4;
- 42 • Otherwise, the mobile station shall perform an idle handoff as specified in 2.6.2.1.4.2.

1 If RER_MODE_ENABLED is equal to YES, the mobile station performs idle handoff to a
2 Pilot Channel that is not in RER_PILOT_LIST (see 2.6.4.4.2 and [4]), RER_SID_s is equal to
3 SID_s, RER_NID_s is equal to NID_s, and RER_MODE_SUPPORTED_s is equal to '1', the mobile
4 station shall send a *Radio Environment Message* by performing the *Mobile Station Message*
5 *Transmission Operation* as specified in 2.6.2.6.

6 A mobile station operating in slotted mode, which is successfully demodulating the Paging
7 Channel or the Forward Common Control Channel, should not perform an idle handoff
8 while it is required to monitor its assigned slot (see 2.6.2.1.1.3.1).

9 2.6.2.1.4.2 Idle Handoff Procedures

10 While performing an idle handoff, the mobile station should not begin operating in non-
11 slotted mode after the idle handoff if all of the following conditions hold:

- 12 • The mobile station supports the Quick Paging Channel;
- 13 • The mobile station has knowledge that the new base station supports configuration
14 change indicators;
- 15 • The mobile station determines that the Quick Paging Channel configuration change
16 indicator for the new Quick Paging Channel is set to "OFF" (see 2.6.2.1.2.1); and
- 17 • No more than T_{31m} seconds have elapsed since the mobile station last received a valid
18 message on the new Paging Channel or Forward Common Control Channel/Primary
19 Broadcast Control Channel.

20 Otherwise, the mobile station shall operate in non-slotted mode until the mobile station
21 has received at least one valid configuration message or mobile station-addressed page on
22 the new Paging Channel or Forward Common Control Channel/Primary Broadcast Control
23 Channel. Following the reception of this message the mobile station may resume slotted
24 mode operation in accordance with 2.6.2.1.1.3. After performing an idle handoff, the
25 mobile station shall discard all unprocessed messages received on the old Paging Channel
26 or Forward Common Control Channel/Primary Broadcast Control Channel.

27 If the new base station is listed in NGHBR_REC_LIST for the old base station (see 2.6.2.2.3,
28 2.6.2.2.7, and 2.6.2.1.4.1), the mobile station shall use the corresponding 3-bit
29 NGHBR_CONFIG field to determine the actions required to transition to the new base
30 station. If the new base station is not listed in NGHBR_REC_LIST for the old base station,
31 the mobile station shall perform the handoff operation using the same procedure as for a
32 pilot in NGHBR_REC_LIST with the NGHBR_CONFIG field set to '011'.

33 If the mobile station is currently monitoring the Paging Channel and selected a neighbor
34 base station for idle handoff which supports Primary Broadcast Control Channel, the
35 mobile station shall perform the following:

- 36 • The mobile station shall enter the *System Determination Substate* of the *Mobile Station*
37 *Initialization State* with a new system indication, upon performing idle handoff to this
38 neighbor base station.
- 39 • The mobile station shall not perform any of the remaining procedures in this section.

40 If the NGHBR_CONFIG field is '000', the mobile station shall perform the following:

- 1 • The mobile station shall set ACC_MSG_SEQ_s, GAPM_SEQ_s, and CURR_ACC_MSG_SEQ
2 to NULL (see 2.6.2.2) and shall set PILOT_PN_s to the pilot offset index of the base
3 station transmitting the new Paging Channel or Forward Common Control
4 Channel/Primary Broadcast Control Channel.
- 5 • If the mobile station has not stored configuration parameters for the new Paging
6 Channel or Forward Common Control Channel and Primary Broadcast Control
7 Channel, or if the stored information is not current, the mobile station shall perform
8 the following:
- 9 - If the mobile station has monitored the Paging Channel before the idle handoff, the
10 mobile station shall set CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s,
11 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
12 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
13 GLOB_SERV_REDIR_MSG_SEQ_s, EXT_GLOB_SERV_REDIR_MSG_SEQ_s,
14 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
15 USER_ZONE_ID_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
16 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
17 ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s and PRI_NGHBR_LST_MSG_SEQ_s to NULL.
- 18 - If the mobile station has monitored the Forward Common Control Channel/Primary
19 Broadcast Control Channel before the idle handoff, the mobile station shall set
20 CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s, UNI_NGHBR_LST_MSG_SEQ_s,
21 MC_RR_PAR_MSG_SEQ_s, EXT_GLOB_SERV_REDIR_MSG_SEQ_s,
22 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
23 USER_ZONE_ID_MSG_SEQ_s, and PRI_NGHBR_LST_MSG_SEQ_s,
24 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
25 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s to
26 NULL.
- 27 • If the stored information for the new Paging Channel or the Forward Common Control
28 Channel and Primary Broadcast Control Channel is current, the mobile station shall
29 set CONFIG_MSG_SEQ_s to the stored information for the new Paging Channel or
30 Forward Common Control Channel and Primary Broadcast Control Channel, and the
31 mobile station shall set NGHBR_REC_LIST to the stored information for the new Paging
32 Channel or the new Forward Common Control Channel and Primary Broadcast Control
33 Channel.
- 34 - If the associated NGHBR_BAND_s or NGHBR_FREQ_s of the new base station in
35 NGHBR_REC_LIST of the old base station is not equal to CDMABAND_s and
36 CDMACH_s respectively, the mobile station shall set CDMABAND_s to
37 NGHBR_BAND_s, CDMACH_s to NGHBR_FREQ_s, and tune to the new CDMA
38 Channel. The mobile station shall begin monitoring the Paging Channel or the
39 Forward Common Control Channel/Primary Broadcast Control Channel of the new
40 base station, using the same rate, code rate, and code channel, as applicable.
- 41 - If PACA_s is equal to enabled, the mobile station shall enter the *Update Overhead*
42 *Information Substate* of the *System Access State* (see 2.6.3) with an origination

1 indication within T_{33m} seconds to re-originate the PACA call using the new base
2 station.

3 If the NGHBR_CONFIG field is '001', the mobile station shall perform the following:

- 4 • The mobile station shall set ACC_MSG_SEQ_s, GAPM_SEQ_s and CURR_ACC_MSG_SEQ
5 to NULL and shall set PILOT_PN_s to the pilot offset index of the base station
6 transmitting the new Paging Channel.
- 7 • If the stored information for Primary Paging Channel or any of the Paging Channels on
8 the associated NGHBR_FREQ_s of the new base station in NGHBR_REC_LIST of the old
9 base station is current, the mobile station shall perform the following:
 - 10 - The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a new
11 Paging Channel number in the range 1 to PAGE_CHAN_s, where PAGE_CHAN_s is the
12 value stored for the Paging Channel whose stored information is current. The
13 mobile station shall store the new Paging Channel number as PAGECH_s. The mobile
14 station shall perform the following:
 - 15 + If the mobile station has not stored configuration parameters for the new Paging
16 Channel, or if the stored parameters are not current (see 2.6.2.2), the mobile
17 station shall set CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s,
18 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
19 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
20 EXT_SYS_PAR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
21 PRI_NGHBR_LST_MSG_SEQ_s, and EXT_GLOB_SERV_REDIR_MSG_SEQ_s,
22 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
23 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
24 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s,
25 HDPPM_MSG_SEQ_s and GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
 - 26 + If the stored information for the new Paging Channel is current, the mobile
27 station shall set CONFIG_MSG_SEQ_s to the stored information for the new
28 Paging Channel and set NGHBR_REC_LIST to the stored information for the new
29 Paging Channel.
 - 30 - If the mobile station has monitored the Forward Common Control Channel/Primary
31 Broadcast Control Channel before the idle handoff, the mobile station shall set
32 Paging Channel data rate, PRATs = '00'.
 - 33 - If the associated NGHBR_BANDs or NGHBR_FREQs of the new base station in
34 NGHBR_REC_LIST of the old base station is not equal to CDMABANDs and
35 CDMACHs respectively, the mobile station shall set CDMABANDs to
36 NGHBR_BANDs, CDMACHs to NGHBR_FREQs, and tune to the new CDMA
37 Channel. The mobile station shall begin monitoring the new Paging Channel of the
38 new base station.
- 39 • If none of the Paging Channel stored information on the associated NGHBR_FREQ_s of
40 the new base station in NGHBR_REC_LIST of the old base station are current, the
41 mobile station shall perform the following:

- 1 - The mobile station shall set CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s,
2 NGHBR_LST_MSG_SEQ_s, EXT_NGHRBR_LST_MSG_SEQ_s,
3 GEN_NGHRBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
4 GLOB_SERV_REDIR_MSG_SEQ_s, EXT_GLOB_SERV_REDIR_MSG_SEQ_s,
5 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
6 USER_ZONE_ID_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
7 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
8 ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s and PRI_NGHRBR_LST_MSG_SEQ_s to NULL.
- 9 - If the mobile station has monitored the Forward Common Control Channel/Primary
10 Broadcast Control Channel before the idle handoff, the mobile station shall set
11 Paging Channel data rate, PRAT_s = '00'.
- 12 - The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the Primary
13 Paging Channel. If the associated NGHBR_BAND_s or NGHBR_FREQ_s of the new
14 base station in NGHBR_REC_LIST of the old base station is not equal to
15 CDMABAND_s and CDMACH_s respectively, the mobile station shall set CDMABAND_s
16 to NGHBR_BAND_s, CDMACH_s to NGHBR_FREQ_s, and tune to the new CDMA
17 Channel. The mobile station shall begin monitoring the Primary Paging Channel of
18 the new base station.
- 19 • If PACA_s is equal to enabled, the mobile station shall enter the *Update Overhead*
20 *Information Substate* of the *System Access State* (see 2.6.3) with an origination indication
21 within T_{33m} seconds to re-originate the PACA call using the new base station.
- 22 If the NGHBR_CONFIG field is '010', the mobile station shall perform the following:
- 23 • The mobile station shall set ACC_MSG_SEQ_s, GAPM_SEQ_s and CURR_ACC_MSG_SEQ_s
24 to NULL and shall set PILOT_PN_s to the pilot offset index of the base station
25 transmitting the new Paging Channel or Forward Common Control Channel/Primary
26 Broadcast Control Channel.
- 27 • If the mobile station has monitored the Paging Channel before the idle handoff, the
28 mobile station shall perform the following:
- 29 - If the stored information for Primary Paging Channel or any of the Paging Channels
30 on the target frequency or any of the frequencies of the new base station is current,
31 the mobile station shall perform the following:
- 32 + The mobile station shall use the hash algorithm specified in 2.6.7.1 and the
33 stored value of the number of CDMA channels to determine the new CDMA
34 Channel and shall set FREQ_NEW to this new CDMA Channel. The mobile
35 station shall perform the following:
- 36 ○ If the stored information for any of the Paging Channels on the CDMA
37 channel specified by FREQ_NEW is current, the mobile station shall perform
38 the following:

1 The mobile station shall use the hash algorithm specified in 2.6.7.1 to select
 2 a new Paging Channel number in the range 1 to PAGE_CHAN_s, where
 3 PAGE_CHAN_s is the value stored for the Paging Channel whose stored
 4 information is current. The mobile station shall store the new Paging
 5 Channel number as PAGECH_s. The mobile station shall perform the
 6 following:

- 7 – If the mobile station has not stored configuration parameters for the
 8 new Paging Channel, or if the stored parameters are not current (see
 9 2.6.2.2), the mobile station shall set CONFIG_MSG_SEQ_s, SYS_PAR-
 10 _MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
 11 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
 12 CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
 13 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s, and
 14 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
 15 FD_CHAN_LST_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
 16 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
 17 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s and
 18 GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 19 – If the stored information for the new Paging Channel is current, the
 20 mobile station shall set CONFIG_MSG_SEQ_s to the stored
 21 information for the new Paging Channel and set NGHBR_REC_LIST
 22 to the stored information for the new Paging Channel.

23 If the band class corresponding to FREQ_NEW is not equal to CDMABAND_s
 24 of the old base station or FREQ_NEW is not equal to CDMACH_s of the old
 25 base station, the mobile station shall set CDMABAND_s to band class
 26 corresponding to FREQ_NEW and shall set CDMACH_s to FREQ_NEW,
 27 and tune to the new CDMA Channel. The mobile station shall begin
 28 monitoring the new Paging Channel of the new base station.

- 29 ○ If none of the Paging Channel stored information on the CDMA channel
 30 specified by FREQ_NEW are current, the mobile station shall perform the
 31 following:

32 The mobile station shall set CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s,
 33 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
 34 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
 35 EXT_SYS_PAR_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s,
 36 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
 37 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, and
 38 PRI_NGHBR_LST_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
 39 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
 40 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s to NULL.

1 The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
 2 Primary Paging Channel. If the band class corresponding to FREQ_NEW
 3 is not equal to CDMABAND_s of the old base station or FREQ_NEW is not
 4 equal to CDMACH_s of the old base station, the mobile station shall set
 5 CDMABAND_s to band class corresponding to FREQ_NEW and shall set
 6 CDMACH_s to FREQ_NEW, and tune to the new CDMA Channel. The
 7 mobile station shall begin monitoring the Primary Paging Channel of the
 8 new base station.

- 9 - If none of the Paging Channel stored information on any of the frequencies of the
 10 new base station are current, the mobile station shall perform the following:
 - 11 + The mobile station shall set CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s,
 12 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
 13 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
 14 EXT_SYS_PAR_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s,
 15 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
 16 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, and
 17 PRI_NGHBR_LST_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
 18 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
 19 ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s to NULL.
 - 20 + The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the Primary
 21 Paging Channel. If the associated NGHBR_BAND_s or NGHBR_FREQ_s of the new
 22 base station in NGHBR_REC_LIST of the old base station is not equal to
 23 CDMABAND_s and CDMACH_s of the old base station respectively, the mobile
 24 station shall set CDMABAND_s to NGHBR_BAND_s, and CDMACH_s to
 25 NGHBR_FREQ_s; otherwise, the mobile station shall set CDMACH_s as follows:
 - 26 ○ If the *Extended CDMA Channel List Message* is being sent on the old base
 27 station, set CDMACH_s to the first CDMA Channel given in the *Extended*
 28 *CDMA Channel List Message* for the old base station.
 - 29 ○ Otherwise, set CDMACH_s to the first CDMA Channel given in the *CDMA*
 30 *Channel List Message* for the old base station.

31 Then the mobile station shall tune to the new CDMA channel and begin
 32 monitoring the Primary Paging Channel of the new base station.

- 33 • If the mobile station has monitored the Forward Common Control Channel/Primary
 34 Broadcast Control Channel before the idle handoff, the mobile station shall perform the
 35 following:
 - 36 - If the stored information for any of the Forward Common Control Channels and
 37 Primary Broadcast Control Channel on any of the frequencies of the new base
 38 station is current, the mobile station shall perform the following:
 - 39 + The mobile station shall use the hash algorithm specified in 2.6.7.1 and the
 40 stored value of the number of CDMA channels to determine the new CDMA

- 1 Channel and shall set `FREQ_NEW` to this new CDMA Channel. The mobile
 2 station shall perform the following
- 3 ○ If the stored information for any of the Forward Common Control Channels
 4 and Primary Broadcast Control Channel on the CDMA channel specified by
 5 `FREQ_NEW` is current, the mobile station shall perform the following:
 - 6 ◇ The mobile station shall use the hash algorithm specified in 2.6.7.1 to
 7 select a new Forward Common Control Channel number in the range 1
 8 to `NUM_FCCCHs`, where `NUM_FCCCHs` is the stored value. The mobile
 9 station shall store the new Forward Common Control Channel number
 10 as `FCCCH_IDs`.
 - 11 ◇ If the stored information for this new Forward Common Control Channel
 12 and Primary Broadcast Control Channel is current, the mobile station
 13 shall perform the following:
 - 14 – The mobile station shall set `CONFIG_MSG_SEQs` to the stored
 15 information for this new Forward Common Control Channel and
 16 Primary Broadcast Control Channel and the mobile station shall set
 17 `NGHBR_REC_LIST` to the stored information for this new Forward
 18 Common Control Channel and Primary Broadcast Control Channel.
 - 19 – If the band class corresponding to `FREQ_NEW` is not equal to
 20 `CDMABANDs` of the old base station or `FREQ_NEW` is not equal to
 21 `CDMACHs` of the old base station, the mobile station shall set
 22 `CDMABANDs` to band class corresponding to `FREQ_NEW` and shall
 23 set `CDMACHs` to `FREQ_NEW`, and tune to the new CDMA Channel.
 24 The mobile station shall begin monitoring the new Forward Common
 25 Control Channel/Primary Broadcast Control Channel of the new base
 26 station.
 - 27 ◇ If the stored information for this new Forward Common Control Channel
 28 and Primary Broadcast Control Channel is not current, the mobile
 29 station shall perform the following:
 - 30 – The mobile station shall set `CONFIG_MSG_SEQs`,
 31 `A41_SYS_PAR_MSG_SEQs`, `UNI_NGHBR_LST_MSG_SEQs`,
 32 `MC_RR_PAR_MSG_SEQs`, `EXT_GLOB_SERV_REDIR_MSG_SEQs`,
 33 `EXT_CHAN_LST_MSG_SEQs`, `FD_CHAN_LST_MSG_SEQs`,
 34 `USER_ZONE_ID_MSG_SEQs`, `AP_PILOT_INFO_MSG_SEQs`,
 35 `AP_IDT_MSG_SEQs`, `AP_ID_TEXT_MSG_SEQs`, `GOI_MSG_SEQs`,
 36 `FREQ_GOI_MSG_SEQs`, `ATIM_MSG_SEQs`, `HDPPM_MSG_SEQs` and
 37 `PRI_NGHBR_LST_MSG_SEQs` to NULL.

- 1 – If the band class corresponding to `FREQ_NEW` is not equal to
2 `CDMABANDs` of the old base station or `FREQ_NEW` is not equal to
3 `CDMACHs` of the old base station, the mobile station shall set
4 `CDMABANDs` to band class corresponding to `FREQ_NEW` and shall
5 set `CDMACHs` to `FREQ_NEW`, and tune to the new CDMA Channel.
6 The mobile station shall begin monitoring the Primary Broadcast
7 Control Channel of the new base station.
- 8 ○ If none of the Forward Common Control Channel and Primary Broadcast
9 Control Channel stored information on the CDMA channel specified by
10 `FREQ_NEW` are current, the mobile station shall perform the following:

11 The mobile station shall set `CONFIG_MSG_SEQs`,
12 `A41_SYS_PAR_MSG_SEQs`, `UNI_NGHBR_LST_MSG_SEQs`,
13 `MC_RR_PAR_MSG_SEQs`, `EXT_GLOB_SERV_REDIR_MSG_SEQs`,
14 `EXT_CHAN_LST_MSG_SEQs`, `FD_CHAN_LST_MSG_SEQs`,
15 `USER_ZONE_ID_MSG_SEQs`, `AP_PILOT_INFO_MSG_SEQs`,
16 `AP_IDT_MSG_SEQs`, `AP_ID_TEXT_MSG_SEQs`, `GOI_MSG_SEQs`,
17 `FREQ_GOI_MSG_SEQs`, `ATIM_MSG_SEQs`, `HDPPM_MSG_SEQs` and
18 `PRI_NGHBR_LST_MSG_SEQs` to NULL.

19 If the associated `NGHBR_BANDs` of the new base station in
20 `NGHBR_REC_LIST` of the old base station is not equal to `CDMABANDs` or
21 the associated `NGHBR_FREQs` of the new base station in
22 `NGHBR_REC_LIST` of the old base station is not equal to `CDMACHs` of
23 the old base station, the mobile station shall set `CDMABANDs` to
24 `NGHBR_BANDs`, `CDMACHs` to `NGHBR_FREQs`, and tune to the new
25 CDMA Channel. Otherwise, the mobile station shall set `CDMACHs` to
26 the first CDMA Channel given in the *Extended CDMA Channel List*
27 *Message* for the old base station and tune to the new CDMA channel.

28 Then the mobile station shall begin monitoring the Primary Broadcast
29 Control Channel of the new base station, using the same rate, code rate,
30 and code channel.

- 31 - If none of the Forward Common Control Channel and Primary Broadcast Control
32 Channel stored information on any of the frequencies of the new base station are
33 current, the mobile station shall perform the following:
- 34 + The mobile station shall set `CONFIG_MSG_SEQs`, `A41_SYS_PAR_MSG_SEQs`,
35 `UNI_NGHBR_LST_MSG_SEQs`, `MC_RR_PAR_MSG_SEQs`,
36 `EXT_GLOB_SERV_REDIR_MSG_SEQs`, `EXT_CHAN_LST_MSG_SEQs`,
37 `FD_CHAN_LST_MSG_SEQs`, `USER_ZONE_ID_MSG_SEQs`,
38 `AP_PILOT_INFO_MSG_SEQs`, `AP_IDT_MSG_SEQs`, `AP_ID_TEXT_MSG_SEQs`,
39 `GOI_MSG_SEQs`, `FREQ_GOI_MSG_SEQs`, `ATIM_MSG_SEQs`,
40 `HDPPM_MSG_SEQs` and `PRI_NGHBR_LST_MSG_SEQs` to NULL.
- 41 + If the associated `NGHBR_BANDs` or `NGHBR_FREQs` of the new base station in
42 `NGHBR_REC_LIST` of the old base station is not equal to `CDMABANDs` and
43 `CDMACHs` of the old base station respectively, the mobile station shall set

- 1 CDMABAND_s to NGHBR_BAND_s, CDMACH_s to NGHBR_FREQ_s, and tune to the
 2 new CDMA Channel. Otherwise, the mobile station shall set CDMACH_s to the
 3 first CDMA Channel given in the *Extended CDMA Channel List Message* for the
 4 old base station and tune to the new CDMA channel.
- 5 + Then the mobile station shall begin monitoring the Primary Broadcast Control
 6 Channel of the new base station, using the same rate, code rate, and code
 7 channel.
- 8 • If PACA_s is equal to enabled, the mobile station shall enter the *Update Overhead*
 9 *Information Substate* of the *System Access State* (see 2.6.3) with an origination indication
 10 within T_{33m} seconds to re-originate the PACA call using the new base station.
- 11 If the NGHBR_CONFIG field is '011', the mobile station shall perform the following:
- 12 • Enter the *System Determination Substate* of the *Mobile Station Initialization State* with a
 13 new system indication (see 2.6.1.1).
- 14 If the NGHBR_CONFIG field is '100', the mobile station shall perform the following:
- 15 • The mobile station shall set ACC_MSG_SEQ_s, GAPM_SEQ_s and CURR_ACC_MSG_SEQ
 16 to NULL (see 2.6.2.2) and shall set PILOT_PN_s to the pilot offset index of the base
 17 station transmitting the new Forward Common Control Channel/Primary Broadcast
 18 Control Channel.
- 19 • If the stored information for any of the Forward Common Control Channels and Primary
 20 Broadcast Control Channel on the associated NGHBR_FREQ_s of the new base station in
 21 NGHBR_REC_LIST of the old base station is current, the mobile station shall perform
 22 the following:
- 23 - The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a new
 24 Forward Common Control Channel number in the range 1 to NUM_FCCCH_s, where
 25 NUM_FCCCH_s is the stored value. The mobile station shall store the new Forward
 26 Common Control Channel number as FCCCH_ID_s.
- 27 - If the mobile station has not stored configuration parameters for this new Forward
 28 Common Control Channel and Primary Broadcast Control Channel, or if the stored
 29 information is not current, the mobile station shall perform the following:
- 30 + The mobile station shall set CONFIG_MSG_SEQ_s,
 31 A41_SYS_PAR_MSG_SEQ_s, UNI_NGHBR_LST_MSG_SEQ_s,
 32 MC_RR_PAR_MSG_SEQ_s, EXT_GLOB_SERV_REDIR_MSG_SEQ_s,
 33 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
 34 USER_ZONE_ID_MSG_SEQ_s, and PRI_NGHBR_LST_MSG_SEQ_s,
 35 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
 36 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s,
 37 HDPPM_MSG_SEQ_s to NULL.
- 38 + If the associated NGHBR_BAND_s or NGHBR_FREQ_s of the new base station
 39 in NGHBR_REC_LIST of the old base station is not equal to CDMABAND_s and
 40 CDMACH_s respectively, the mobile station shall set CDMABAND_s to

- 1 NGHBR_BAND_s, CDMACH_s to NGHBR_FREQ_s, and tune to the new CDMA
2 Channel.
- 3 + Then the mobile station shall begin monitoring the Primary Broadcast Control
4 Channel of the new base station, using the same rate, code rate, and code
5 channel.
- 6 - If the stored information for this new Forward Common Control Channel and
7 Primary Broadcast Control Channel is current, the mobile station shall perform the
8 following:
- 9 + The mobile station shall set CONFIG_MSG_SEQ_s to the stored information for
10 this new Forward Common Control Channel and Primary Broadcast Control
11 Channel and the mobile station shall set NGHBR_REC_LIST to the stored
12 information for this new Forward Common Control Channel and Primary
13 Broadcast Control Channel.
- 14 + If the associated NGHBR_BAND_s or NGHBR_FREQ_s of the new base station in
15 NGHBR_REC_LIST of the old base station is not equal to CDMABAND_s and
16 CDMACH_s respectively, the mobile station shall set CDMABAND_s to
17 NGHBR_BAND_s, CDMACH_s to NGHBR_FREQ_s, and tune to the new CDMA
18 Channel. The mobile station shall begin monitoring the new Forward Common
19 Control Channel/Primary Broadcast Control Channel of the new base station.
- 20 • If none of the Forward Common Control Channel and Primary Broadcast Control
21 Channel stored information on the associated NGHBR_FREQ_s of the new base station
22 in NGHBR_REC_LIST of the old base station are current, the mobile station shall
23 perform the following:
- 24 - The mobile station shall set CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s,
25 UNI_NGHBR_LST_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s,
26 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
27 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, and
28 PRI_NGHBR_LST_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
29 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
30 ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s to NULL.
- 31 - If the associated NGHBR_BAND_s or NGHBR_FREQ_s of the new base station in
32 NGHBR_REC_LIST of the old base station is not equal to CDMABAND_s and
33 CDMACH_s respectively, the mobile station shall set CDMABAND_s to
34 NGHBR_BAND_s, CDMACH_s to NGHBR_FREQ_s, and tune to the new CDMA
35 Channel.
- 36 - The mobile station shall begin monitoring the Primary Broadcast Control Channel of
37 the new base station, using the same rate, code rate, and code channel.
- 38 • If PACA_s is equal to enabled, the mobile station shall enter the *Update Overhead*
39 *Information Substate* of the *System Access State* (see 2.6.3) with an origination indication
40 within T_{33m} seconds to re-originate the PACA call using the new base station.

2.6.2.1.5 Primary Broadcast Control Channel Monitoring

2.6.2.1.5.1 General Overview

The Broadcast Control Channel is divided into 40, 80, or 160 ms slots called the Broadcast Control Channel slots (see 3.1.3.5 in [2]). The Primary Broadcast Control Channel will be used for control messages. Support for the Primary Broadcast Control Channel is mandatory for mobile stations. The Primary Broadcast Control Channel will operate with the Forward Common Control Channels and the Quick Paging Channels, or only with the Forward Common Control Channels.

After a mobile station acquires and synchronizes with a new base station that supports a Primary Broadcast Control Channel, the mobile station monitors the Primary Broadcast Control Channel to receive overhead information. Once the mobile station has received the updated overhead information from the Primary Broadcast Control Channel, the mobile station may begin to monitor a Forward Common Control Channel or a Quick Paging Channel, if it is supported.

2.6.2.1.5.2 Requirements

If the base station supports the Primary Broadcast Control Channel, the mobile station shall monitor the Primary Broadcast Control Channel for overhead messages. If the mobile station determines that the CONFIG_MSG_SEQ has changed, the mobile station shall monitor the Primary Broadcast Control Channel to receive updated overhead messages.

2.6.2.1.6 System Reselection Procedures

If the mobile station supports more than one operating mode or the Remaining Set/Neighbor Set contains pilots on frequencies different from the current frequency, the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system reselection indication (see 2.6.1.1) if all of the following are true:

- RESELECT_INCLUDED_s is equal to '1';
- The following inequality is satisfied:

$$-20 \times \log_{10} (E_c/I_0) > EC_{IO_THRESH}_s$$

where E_c/I_0 is the measured E_c/I_0 of the active pilot; and

- The following inequality is satisfied:

$$pilot_power < EC_THRESH_s - 115$$

where $pilot_power$ (dBm/1.23 MHz) = $10 \times \log_{10} (PS)$ (dB) + mean input power (dBm/1.23 MHz) and PS is the strength of the active pilot, as specified in 2.6.6.2.2.

2.6.2.1.7 Slotted Timer Expiration

Upon expiration of the slotted T_{MS} Slotted timer, the mobile station shall disable the timer, set T_SLOTTED_s to T_{74m}, and set SLOTTED_s to YES.

1 2.6.2.1.8 Exiting the Reduced Slot Cycle Mode

2 If RSC_MODE_ENABLED is equal to YES, then at the system time specified by
 3 RSC_END_TIME, the mobile station shall set RSC_MODE_ENABLED to NO and set
 4 SLOTTED_s to YES.

5 2.6.2.1.9 Radio Environment Report Timer Expiration

6 Upon expiration of the radio environment report timer, the mobile station shall disable the
 7 timer and set RER_MODE_ENABLED to NO. If TKZ_MODE_PENDING is equal to YES, then
 8 the mobile station shall perform the following:

- 9 • Set TKZ_MODE_ENABLED to YES and TKZ_MODE_PENDING to NO.
- 10 • Initialize the tracking zone list (TKZ_LIST) to NULL.
- 11 • Enable the tracking zone update timer with an initial value of infinity if
 12 TKZ_UPDATE_PRD_s is equal to '1111'; otherwise, the mobile station shall enable the
 13 tracking zone update timer with an initial value of $2^{\text{TKZ_UPDATE_PRD}_s} + 6$ seconds.

14 2.6.2.2 Response to Overhead Information Operation

15 The overhead messages on the Primary Broadcast Control Channel are:

- 16 • *ANSI-41 System Parameters Message*
- 17 • *MC-RR Parameters Message*
- 18 • *Enhanced Access Parameters Message*
- 19 • *Universal Neighbor List Message*
- 20 • *User Zone Identification Message*
- 21 • *Private Neighbor List Message*
- 22 • *Extended Global Service Redirection Message*
- 23 • *Extended CDMA Channel List Message*
- 24 • *ANSI-41 RAND Message*
- 25 • *BCMC Service Parameters Message*
- 26 • *Access Point Identification Message*
- 27 • *Access Point Identification Text Message*
- 28 • *Access Point Pilot Information Message*
- 29 • *General Overhead Information Message*
- 30 • *Frequent General Overhead Information Message*
- 31 • *Flex Duplex CDMA Channel List Message*
- 32 • *Alternative Technologies Information Message*

33 The overhead messages on the Paging Channel are:

- 34 • *System Parameters Message*

- 1 • *Access Parameters Message*
- 2 • *Neighbor List Message*
- 3 • *CDMA Channel List Message*
- 4 • *Extended System Parameters Message*
- 5 • *Global Service Redirection Message*
- 6 • *Extended Neighbor List Message*
- 7 • *General Neighbor List Message*
- 8 • *User Zone Identification Message*
- 9 • *Private Neighbor List Message*
- 10 • *Extended Global Service Redirection Message*
- 11 • *Extended CDMA Channel List Message*
- 12 • *Access Point Identification Message*
- 13 • *Access Point Identification Text Message*
- 14 • *Access Point Pilot Information Message*
- 15 • *General Overhead Information Message*
- 16 • *Frequent General Overhead Information Message*
- 17 • *Flex Duplex CDMA Channel List Message*
- 18 • *Alternative Technologies Information Message*
- 19 • *Generic Access Parameters Message*
- 20 • *HDP Parameters Message*

21 The *Response to Overhead Information Operation* is performed whenever the mobile station
22 receives an overhead message. The mobile station updates internally stored information
23 from the received message's data fields.

24 Configuration parameters and access parameters are received in the configuration
25 messages and the *Access Parameters Message*, *Generic Access Parameters Message* or the
26 *Enhanced Access Parameters Message*.

27 The configuration messages on the Primary Broadcast Control Channel are:

- 28 • *ANSI-41 System Parameters Message*
- 29 • *MC-RR Parameters Message*
- 30 • *Universal Neighbor List Message*
- 31 • *User Zone Identification Message*
- 32 • *Private Neighbor List Message*
- 33 • *Extended Global Service Redirection Message*
- 34 • *Extended CDMA Channel List Message*

- 1 • *Access Point Identification Message*
- 2 • *Access Point Identification Text Message*
- 3 • *Access Point Pilot Information Message*
- 4 • *General Overhead Information Message*
- 5 • *Frequent General Overhead Information Message*
- 6 • *Flex Duplex CDMA Channel List Message*
- 7 • *Alternative Technologies Information Message*

8 The configuration messages on the Paging Channel are:

- 9 • *System Parameters Message*
- 10 • *Neighbor List Message*
- 11 • *CDMA Channel List Message*
- 12 • *Extended System Parameters Message*
- 13 • *Global Service Redirection Message*
- 14 • *Extended Neighbor List Message*
- 15 • *General Neighbor List Message*
- 16 • *User Zone Identification Message*
- 17 • *Private Neighbor List Message*
- 18 • *Extended Global Service Redirection Message*
- 19 • *Extended CDMA Channel List Message*
- 20 • *Access Point Identification Message*
- 21 • *Access Point Identification Text Message*
- 22 • *Access Point Pilot Information Message*
- 23 • *General Overhead Information Message*
- 24 • *Frequent General Overhead Information Message*
- 25 • *Flex Duplex CDMA Channel List Message*
- 26 • *Alternative Technologies Information Message*

27 Associated with the set of configuration messages sent on each Paging Channel or Primary
 28 Broadcast Control Channel is a configuration message sequence number
 29 (CONFIG_MSG_SEQ). When the contents of one or more of the configuration messages
 30 change, the configuration message sequence number is incremented. For each of the
 31 configuration messages received, the mobile station stores the configuration message
 32 sequence number contained in the configuration message (A41_SYS_PAR_MSG_SEQ_s,
 33 MC_RR_PAR_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
 34 AP_PILOT_INFO_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
 35 GEN_NGHBR_LST_MSG_SEQ_s, UNI_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,

1 EXT_SYS_PAR_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
2 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
3 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
4 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, or ATIM_MSG_SEQ_s or
5 HDPPM_MSG_SEQ_s). The mobile station also stores the most recently received
6 configuration message sequence number (CONFIG_MSG_SEQ_s) contained in any message
7 (see 2.6.2.2.1, 2.6.2.2.3, 2.6.2.2.4, 2.6.2.2.5, 2.6.2.2.6, 2.6.2.2.7, 2.6.2.2.8, 2.6.2.2.9,
8 2.6.2.2.10, 2.6.2.2.11, 2.6.2.2.12, 2.6.2.2.13, 2.6.2.2.14, 2.6.2.2.17, 2.6.2.2.19, 2.6.2.2.20,
9 2.6.2.2.21, 2.6.2.2.22, 2.6.2.2.23, 2.6.2.2.24 and 2.6.2.3). The mobile station examines
10 the stored values of the configuration message sequence numbers to determine whether
11 the configuration parameters stored by the mobile station are current.

12 The field EXT_SYS_PARAMETER in the *System Parameters Message*, when set equal to '0',
13 indicates that the base station is not sending the *Extended System Parameters Message*.
14 When the mobile station receives the *System Parameters Message* with the
15 EXT_SYS_PARAMETER field set equal to '0', the mobile station shall set
16 EXT_SYS_PAR_MSG_SEQ_s to CONFIG_MSG_SEQ_s to indicate that the *Extended System*
17 *Parameters Message* is current.

18 The field EXT_CHAN_LST in the *System Parameters Message*, when set equal to '0',
19 indicates that the base station is not sending the *Extended CDMA Channel List Message*.
20 When the mobile station receives the *System Parameters Message* with the EXT_CHAN_LST
21 field set equal to '0', the mobile station shall set EXT_CHAN_LST_MSG_SEQ_s to
22 CONFIG_MSG_SEQ_s to indicate that the *Extended CDMA Channel List Message* is current.

23 The field GEN_NGHBR_LST in the *System Parameters Message*, when set equal to '0',
24 indicates that the base station is not sending the *General Neighbor List Message*. When the
25 mobile station receives the *System Parameters Message* with the GEN_NGHBR_LST field set
26 equal to '0', the mobile station shall set the GEN_NGHBR_LST_MSG_SEQ_s to
27 CONFIG_MSG_SEQ_s to indicate that the *General Neighbor List Message* is current.

28 The field EXT_NGHBR_LST in the *System Parameters Message*, when set equal to '0',
29 indicates that the base station is not sending the *Extended Neighbor List Message*. When
30 the mobile station receives the *System Parameters Message* with the EXT_NGHBR_LST field
31 set equal to '0', the mobile station shall set EXT_NGHBR_LIST_MSG_SEQ_s to
32 CONFIG_MSG_SEQ_s to indicate that the *Extended Neighbor List Message* is current.

33 The field GLOBAL_REDIRECT in the *System Parameters Message*, when set equal to '0',
34 indicates that the base station is not sending the *Global Service Redirection Message*. When
35 the mobile station receives the *System Parameters Message* with the GLOBAL_REDIRECT
36 field set equal to '0', the mobile station shall set GLOB_SERV_REDIR_MSG_SEQ_s to
37 CONFIG_MSG_SEQ_s to indicate that the *Global Service Redirection Message* is current.

38 The field EXT_GLOBAL_REDIRECT in the *System Parameters Message* or *MC-RR*
39 *Parameters Message*, when set equal to '0', indicates that the base station is not sending
40 the *Extended Global Service Redirection Message*. When the mobile station receives the
41 *System Parameters Message* or *MC-RR Parameters Message* with the
42 EXT_GLOBAL_REDIRECT field set equal to '0', the mobile station shall set

1 EXT_GLOB_SERV_REDIREC_MSG_SEQ_s to CONFIG_MSG_SEQ_s to indicate that the *Extended*
2 *Global Service Redirection Message* is current.

3 The field USER_ZONE_ID in the *System Parameters Message* or *MC-RR Parameters*
4 *Message*, when set equal to '0', indicates that the base station is not sending the *User Zone*
5 *Identification Message*. When the mobile station receives the *System Parameters Message* or
6 *MC-RR Parameters Message* with the USER_ZONE_ID field set equal to '0', the mobile
7 station shall set USER_ZONE_ID_MSG_SEQ_s to CONFIG_MSG_SEQ_s to indicate that the
8 *User Zone Identification Message* is current.

9 The field PRI_NGHR_LST in the *System Parameters Message* or *MC-RR Parameters*
10 *Message*, when set equal to '0', indicates that the base station is not sending the *Private*
11 *Neighbor List Message*. When the mobile station receives the *System Parameters Message*
12 or *MC-RR Parameters Message* with the PRI_NGHR_LST field set equal to '0', the mobile
13 station shall set PRI_NGHR_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s to indicate that the
14 *Private Neighbor List Message* is current.

15 The field ATIM_IND in the *System Parameters Message* or *MC-RR Parameters Message*, when
16 set equal to '0' or if ATIM_IND is omitted, indicates that the base station is not sending the
17 *Alternative Technologies Information Message*. When the mobile station receives the *System*
18 *Parameters Message* or *MC-RR Parameters Message* with the ATIM_IND field set equal to '0',
19 or if the ATIM_IND field is omitted in the *System Parameters Message* or *MC-RR Parameters*
20 *Message*, the mobile station shall set ATIM_MSG_SEQ_s to CONFIG_MSG_SEQ_s to indicate
21 that the *Alternative Technologies Information Message* is current.

22 The field AP_PILOT_INFO in the *System Parameters Message* or *MC-RR Parameters Message*,
23 when set equal to '0' or if AP_PILOT_INFO is omitted, indicates that the base station is not
24 sending the *Access Point Pilot Information Message*. When the mobile station receives the
25 *System Parameters Message* or *MC-RR Parameters Message* with the AP_PILOT_INFO field
26 set equal to '0', or if the AP_PILOT_INFO field is omitted in the *System Parameters Message*
27 or *MC-RR Parameters Message*, the mobile station shall set AP_PILOT_INFO_MSG_SEQ_s to
28 CONFIG_MSG_SEQ_s to indicate that the *Access Point Pilot Information Message* is current.

29 The field AP_IDT in the *System Parameters Message* or *MC-RR Parameters Message*, when
30 set equal to '0' or if AP_IDT is omitted, indicates that the base station is not sending the
31 *Access Point Identification Message*. When the mobile station receives the *System*
32 *Parameters Message* or *MC-RR Parameters Message* with the AP_IDT field set equal to '0', or
33 if the field AP_IDT is omitted in the *System Parameters Message* or *MC-RR Parameters*
34 *Message*, the mobile station shall set AP_IDT_MSG_SEQ_s to CONFIG_MSG_SEQ_s to
35 indicate that the *Access Point Identification Message* is current.

36 The field AP_ID_TEXT in the *System Parameters Message* or *MC-RR Parameters Message*,
37 when set equal to '0' or if AP_ID_TEXT is omitted, indicates that the base station is sending
38 the *Access Point Identification Text Message*. When the mobile station receives the *System*
39 *Parameters Message* or *MC-RR Parameters Message* with the AP_ID_TEXT field set equal to
40 '0', or if the field AP_ID_TEXT is omitted in the *System Parameters Message* or *MC-RR*
41 *Parameters Message*, the mobile station shall set AP_ID_TEXT_MSG_SEQ_s to
42 CONFIG_MSG_SEQ_s to indicate that the *Access Point Identification Text Message* is current.

1 The field GEN_OVHD_INF_IND in the *System Parameters Message* or *MC-RR Parameters*
2 *Message*, when set equal to '0' or if GEN_OVHD_INF_IND is omitted, indicates that the base
3 station is not sending the *General Overhead Information Message*. When the mobile station
4 receives the *System Parameters Message* or *MC-RR Parameters Message* with the
5 GEN_OVHD_INF_IND field set equal to '0', or if the GEN_OVHD_INF_IND field is omitted in
6 the *System Parameters Message* or *MC-RR Parameters Message*, the mobile station shall set
7 GOI_MSG_SEQ_s to CONFIG_MSG_SEQ_s to indicate that the *General Overhead Information*
8 *Message* is current.

9 The field FREQ_GEN_OVHD_INF_IND in the *System Parameters Message* or *MC-RR*
10 *Parameters Message*, when set equal to '0' or if FREQ_GEN_OVHD_INF_IND is omitted,
11 indicates that the base station is not sending the *Frequent General Overhead Information*
12 *Message*. When the mobile station receives the *System Parameters Message* or *MC-RR*
13 *Parameters Message* with the FREQ_GEN_OVHD_INF_IND field set equal to '0', or if the
14 FREQ_GEN_OVHD_INF_IND field is omitted in the *System Parameters Message* or *MC-RR*
15 *Parameters Message*, the mobile station shall set FREQ_GOI_MSG_SEQ_s to
16 CONFIG_MSG_SEQ_s to indicate that the *Frequent General Overhead Information Message* is
17 current.

18 The field FD_CHAN_LST_IND in the *System Parameters Message* or *MC-RR Parameters*
19 *Message*, when set equal to '0' or if FD_CHAN_LST_IND is omitted, indicates that the base
20 station is not sending the *Flex Duplex CDMA Channel List Message*. When the mobile
21 station receives the *System Parameters Message* or *MC-RR Parameters Message* with the
22 FD_CHAN_LST_IND field set equal to '0', or if the FD_CHAN_LST_IND field is omitted in the
23 *System Parameters Message* or *MC-RR Parameters Message*, the mobile station shall set
24 FD_CHAN_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s to indicate that the *Flex Duplex CDMA*
25 *Channel List Message* is current.

26 The field HDPPM_IND in the *System Parameters Message*, when set equal to '0' or if
27 HDPPM_IND is omitted, indicates that the base station is not sending the *HDP Parameters*
28 *Message*. When the mobile station receives the *System Parameters Message* with the
29 HDPPM_IND field set equal to '0', or if the HDPPM_IND field is omitted in the *System*
30 *Parameters Message*, the mobile station shall set HDPPM_MSG_SEQ_s to
31 CONFIG_MSG_SEQ_s to indicate that the *HDP Parameters Message* is current.

32 The configuration message sequence number is also included in the *General Page Message*
33 and the *Universal Page Message*. This allows the mobile station to determine whether the
34 stored configuration parameters are current without waiting for a configuration message.

35 *Access Parameters Messages*, *Generic Access Parameters Message* or *Enhanced Access*
36 *Parameters Messages* are independently sequence-numbered by the ACC_MSG_SEQ field.
37 The mobile station stores the most recently received *Access Parameters Message*, *Generic*
38 *Access Parameters Message* or *Enhanced Access Parameters Messages* sequence number .

39 Paging Channels, Broadcast Control Channels, and Forward Common Control Channels
40 shall be considered different if they are transmitted by different base stations, if they are
41 transmitted on different code channels, or if they are transmitted on different CDMA
42 Channels. Configuration and access parameters from one Paging Channel or Primary
43 Broadcast Control Channel shall not be used while monitoring a different Paging Channel

1 or Primary Broadcast Control Channel/Forward Common Control Channel except for
 2 registration and authentication parameters while the mobile station is performing an
 3 access probe handoff or access handoff. The mobile station shall ignore any overhead
 4 message whose PILOT_PN_r field is not equal to the pilot offset index (PILOT_PN_s) of the
 5 base station whose Paging Channel or Primary Broadcast Control Channel is being
 6 monitored.

7 The mobile station may store the configuration parameters from Paging Channels or
 8 Primary Broadcast Control Channel it has recently monitored. When a mobile station
 9 starts monitoring a Paging Channel or a Primary Broadcast Control Channel/Forward
 10 Common Control Channel that it has recently monitored, the mobile station can determine
 11 whether the stored parameters are current by examining the CONFIG_MSG_SEQ_s in a
 12 configuration message or a page message.

13 The mobile station shall use a special value, NULL, to be stored in place of sequence
 14 numbers for messages that have not been received or are marked as not current. The
 15 special value NULL shall be unequal to any valid message sequence number.

16 The mobile station shall consider the stored configuration parameters to be current only if
 17 all of the following conditions are true:

- 18 • If the mobile station is monitoring the Paging Channel, the following stored
 19 configuration message sequence numbers (SYS_PAR_MSG_SEQ_s,
 20 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
 21 EXT_SYS_PAR_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
 22 AP_ID_TEXT_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s,
 23 EXT_CHAN_LST_MSG_SEQ_s, EXT_GLOB_SERV_REDIR_MSG_SEQ_s and
 24 GLOB_SERV_REDIR_MSG_SEQ_s) are equal to CONFIG_MSG_SEQ_s; and
- 25 • If the mobile station is monitoring the Forward Common Control Channel/ Primary
 26 Broadcast Control Channel, the following stored configuration message sequence
 27 numbers (A41_SYS_PAR_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s,
 28 UNI_NGHBR_LST_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
 29 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s,
 30 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s, and
 31 EXT_GLOB_SERV_REDIR_MSG_SEQ_s) are equal to CONFIG_MSG_SEQ_s; and
- 32 • If the mobile station supports flexible spacing between forward and reverse channels,
 33 stored configuration message sequence number FD_CHAN_LST_MSG_SEQ_s is equal to
 34 CONFIG_MSG_SEQ_s; and
- 35 • CONFIG_MSG_SEQ_s is not equal to NULL; and
- 36 • No more than T_{31m} seconds (see Annex D) or MS implementation specific value have
 37 elapsed since the mobile station last received a valid message on the Paging Channel or
 38 the Primary Broadcast Control Channel/Forward Common Control Channel for which
 39 the parameters were stored.

40 If the configuration parameters are not current, the mobile station shall process the stored
 41 parameters upon receipt of the configuration messages as described in 2.6.2.2.1, 2.6.2.2.3,
 42 2.6.2.2.4, 2.6.2.2.5, 2.6.2.2.6, 2.6.2.2.7, 2.6.2.2.8, 2.6.2.2.9, 2.6.2.2.10, 2.6.2.2.11,

1 2.6.2.2.12, 2.6.2.2.13, 2.6.2.2.14, 2.6.2.2.17, 2.6.2.2.19, 2.6.2.2.20, 2.6.2.2.21, 2.6.2.2.22,
2 2.6.2.2.23 and 2.6.2.2.24.

3 2.6.2.2.1 System Parameters Message

4 Whenever a *System Parameters Message* is received on the Paging Channel, the
5 configuration message sequence number, CONFIG_MSG_SEQ_r, shall be compared to that
6 stored in SYS_PAR_MSG_SEQ_s. If the comparison results in a match, the mobile station
7 may ignore the message. If the comparison results in a mismatch, then the mobile station
8 shall process the remaining fields in the message as described in 2.6.2.2.1.1, 2.6.2.2.1.2,
9 2.6.2.2.1.3, 2.6.2.2.1.4, 2.6.2.2.1.5, 2.6.2.2.1.6, 2.6.2.2.1.7, 2.6.2.2.1.8, and 2.6.2.2.1.9.

10 If PAGE_CHAN, REG_PRD, BASE_LAT, BASE_LONG, or PWR_REP_THRESH are not within
11 the valid ranges specified in 3.7.2.3.2.1, then the mobile station shall ignore the *System*
12 *Parameters Message* that contains them.

13 If BAND_CLASS is equal to '00001' and if EXT_SYS_PARAMETERS_r is not equal to '1', the
14 mobile station shall ignore the *System Parameters Message* containing these fields.

15 2.6.2.2.1.1 Stored Parameters

16 The mobile station shall store the following parameters:

- 17 • Configuration message sequence number (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
18 SYS_PAR_MSG_SEQ_s = CONFIG_MSG_SEQ_r)
- 19 • Base station identification (BASE_ID_s = BASE_ID_r)
- 20 • Base station class (BASE_CLASS_s = BASE_CLASS_r)
- 21 • Maximum slot cycle index (if MAX_EXT_SCI_INCL_r = '1' and
22 MAX_EXT_SCI_SUPPORTED_p = '1', set MAX_SLOT_CYCLE_INDEX_s = MAX_EXT_SCI_r.
23 Otherwise set MAX_SLOT_CYCLE_INDEX_s = MAX_SLOT_CYCLE_INDEX_r)
- 24 • Home registration indicator (HOME_REG_s = HOME_REG_r)
- 25 • SID roamer registration indicator (FOR_SID_REG_s = FOR_SID_REG_r)
- 26 • NID roamer registration indicator (FOR_NID_REG_s = FOR_NID_REG_r)
- 27 • Power-up registration indicator (POWER_UP_REG_s = POWER_UP_REG_r)
- 28 • Power-down registration indicator (POWER_DOWN_REG_s = POWER_DOWN_REG_r)
- 29 • Parameter-change registration indicator (PARAMETER_REG_s = PARAMETER_REG_r)
- 30 • Search window size for the Active Set and Candidate Set
31 (SRCH_WIN_A_s = SRCH_WIN_A_r)
- 32 • Search window size for the Neighbor Set (SRCH_WIN_N_s = SRCH_WIN_N_r)
- 33 • Search window size for the Remaining Set (SRCH_WIN_R_s = SRCH_WIN_R_r)
- 34 • Maximum age for retention of Neighbor Set members
35 (NGHBR_MAX_AGE_s = NGHBR_MAX_AGE_r)
- 36 • Power control reporting threshold (PWR_REP_THRESH_s = PWR_REP_THRESH_r)

- 1 • Power control reporting frame count ($PWR_REP_FRAMES_s = PWR_REP_FRAMES_r$)
- 2 • Threshold report mode indicator
- 3 ($PWR_THRESH_ENABLE_s = PWR_THRESH_ENABLE_r$)
- 4 • Periodic report mode indicator ($PWR_PERIOD_ENABLE_s = PWR_PERIOD_ENABLE_r$).
- 5 • Power report delay ($PWR_REP_DELAY_s = PWR_REP_DELAY_r$)
- 6 • Pilot detection threshold ($T_ADD_s = T_ADD_r$)
- 7 • Pilot drop threshold ($T_DROP_s = T_DROP_r$)
- 8 • Active Set versus Candidate Set comparison threshold ($T_COMP_s = T_COMP_r$)
- 9 • Drop timer value ($T_TDROP_s = T_TDROP_r$)
- 10 • Drop timer range value ($T_TDROP_RANGE_s = T_TDROP_RANGE_r$) if
- 11 $T_TDROP_RANGE_INCL_r$ is equal to '1'; otherwise, $T_TDROP_RANGE_s = '0000'$
- 12 • *Extended System Parameters Message* sent
- 13 ($EXT_SYS_PARAMETER_s = EXT_SYS_PARAMETER_r$)
- 14 • *Global Service Redirection Message* sent ($GLOBAL_REDIRECT_s = GLOBAL_REDIRECT_r$)
- 15 • *Extended Global Service Redirection Message* sent
- 16 ($EXT_GLOBAL_REDIRECT_s = EXT_GLOBAL_REDIRECT_r$)
- 17 • *Extended Neighbor List Message* sent
- 18 ($EXT_NGHBR_LST_s = EXT_NGHBR_LST_r$)
- 19 • *General Neighbor List Message* sent
- 20 ($GEN_NGHBR_LST_s = GEN_NGHBR_LST_r$)
- 21 • *User Zone Identification Message* sent
- 22 ($USER_ZONE_ID_s = USER_ZONE_ID_r$)
- 23 • *Private Neighbor List Message* sent
- 24 ($PRI_NGHBR_LST_s = PRI_NGHBR_LST_r$)
- 25 • *Extended CDMA Channel List Message* sent
- 26 ($EXT_CHAN_LST_s = EXT_CHAN_LST_r$)
- 27 • If $NEG_SLOT_CYCLE_INDEX_SUP_r$ is included and equal to '1', the mobile station shall
- 28 set $MIN_SLOT_CYCLE_INDEX$ to -4; otherwise, the mobile station shall set
- 29 $MIN_SLOT_CYCLE_INDEX$ to 0.
- 30 • If $RC_BITMAP_CAPABILITY_EXT_ALLOWED_r$ is included and is equal to '1', the mobile
- 31 station shall set $RC_BITMAP_CAPABILITY_EXT_ALLOWED_s$ to '1'; otherwise, the mobile
- 32 station shall set $RC_BITMAP_CAPABILITY_EXT_ALLOWED_s$ to '0'. If the *Call Recovery*
- 33 *Request Message* supported indicator $CRRM_MSG_IND$ is included, the mobile station
- 34 shall set $CRRM_MSG_IND_s = CRRM_MSG_IND_r$. Otherwise, the mobile station shall set
- 35 $CRRM_MSG_IND_s$ to '0'.

36 The mobile station shall also store the following parameters:

1 • If the mobile station is not in the *Origination Attempt Substate*, or *Page Response*
 2 *Substate*, the mobile station shall store the following prior to storing the remaining
 3 parameters:

- 4 - Registered system identification (REG_SID_s = SID_s).
- 5 - Registered network identification (REG_NID_s = NID_s).
- 6 - Registered registration zone (REG_REG_ZONE_s = REG_ZONE_s).
- 7 - Registered zone timer length (REG_ZONE_TIMER_s = ZONE_TIMER_r).
- 8 • System identification (SID_s = SID_r)
- 9 • Network identification (NID_s = NID_r)
- 10 • Registration zone (REG_ZONE_s = REG_ZONE_r)
- 11 • Number of registration zones to be retained (TOTAL_ZONES_s = TOTAL_ZONES_r)
- 12 • Zone timer length (ZONE_TIMER_s = ZONE_TIMER_r)
- 13 • Multiple SID storage indicator (MULT_SIDS_s = MULT_SIDS_r)
- 14 • Multiple NID storage indicator (MULT_NIDS_s = MULT_NIDS_r)
- 15 • Registration period (REG_PRD_s = REG_PRD_r)
- 16 • Base station latitude (BASE_LAT_s = BASE_LAT_r)
- 17 • Base station longitude (BASE_LONG_s = BASE_LONG_r)
- 18 • Registration distance (REG_DIST_s = REG_DIST_r)
- 19 • Base station horizontal location uncertainty (LOC_UNC_H_s = LOC_UNC_H_r)
- 20 • Base station height (HEIGHT_s = HEIGHT_r)
- 21 • Base station vertical location uncertainty (LOC_UNC_V_s = LOC_UNC_V_r)

22 If EXT_SYS_PARAMETER_s is equal to '0', then the mobile station shall perform the
 23 following:

- 24 • Set EXT_SYS_PAR_MSG_SEQ_s to CONFIG_MSG_SEQ_s,
- 25 • Set BCAST_INDEX_s to MAX_SLOT_CYCLE_INDEX_s,
- 26 • Set IMSI_O to IMSI_M by setting IMSI_O_S_s to IMSI_M_S_p (i.e., setting IMSI_O_S1_s to
 27 IMSI_M_S1_p and IMSI_O_S2_s to IMSI_M_S2_p), MCC_O_s to MCC_M_p, IMSI_O_11_12_s to
 28 IMSI_M_11_12_p, and IMSI_O_ADDR_NUM_s to IMSI_M_ADDR_NUM_p,
- 29 • Set RESELECT_INCLUDED_s to '0',
- 30 • For Band Class 0, if the mobile station determines it is operating in Korea, set P_REV_s
 31 to '00000010'; otherwise, set P_REV_s to '00000011'. For Band Class 3, set P_REV_s to
 32 '00000011'. For Band Class 1 and Band Class 4, set P_REV_s to '00000001', and
- 33 • Set P_REV_IN_USE_s to the lesser value of P_REV_s and MOB_P_REV_p of the current
 34 band class.

- 1 If EXT_CHAN_LST_s is equal to '0', then the mobile station shall set
 2 EXT_CHAN_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
- 3 If GLOBAL_REDIRECT_s is equal to '0', then the mobile station shall set GLOB_SERV-
 4 _REDIR_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
- 5 If EXT_GLOBAL_REDIRECT_s is equal to '0', then the mobile station shall set
 6 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
- 7 If EXT_NGHBR_LST_s is equal to '0', then the mobile station shall set
 8 EXT_NGHBR_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
- 9 If GEN_NGHBR_LST_s is equal to '0', then the mobile station shall perform the following:
- 10 • Set GEN_NGHBR_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
 - 11 • Set the SRCH_WIN_NGHBR field of NGHBR_REC to SRCH_WIN_N_s for all entries.
 - 12 • Set the SRCH_OFFSET_NGHBR field of NGHBR_REC to '000' for all entries.
 - 13 • Set the TIMING_INCL field of NGHBR_REC to '0' for all entries.
 - 14 • Set RESQ_ENABLED_s to '0'.
 - 15 • Set the NGHBR_RESQ_CONFIGURED field of NGHBR_REC to '0' for all entries.
 - 16 • If EXT_NGHBR_LST_s is equal to '0':
 - 17 - Set the SEARCH_PRIORITY field of the NGHBR_REC to '10' (high) for all entries.
 - 18 - Set the NGHBR_BAND field of the NGHBR_REC to CDMABAND_s for all entries.
 - 19 - Set the NGHBR_FREQ field of the NGHBR_REC to CDMACH_s for all entries.
- 20 If GEN_NGHBR_LST_s is equal to '1', GEN_NGHBR_LST_MSG_SEQ_s is equal to
 21 CONFIG_MSG_SEQ_s, and SETTING_SEARCH_WIN is equal to '1', the mobile station shall
 22 perform the following:
- 23 • Set the SRCH_WIN_NGHBR field of each NGHBR_REC to SEARCH_WIN_N_s for all
 24 NGHBR_SET_SIZE_s entries.
 - 25 • Set SETTING_SEARCH_WIN to '0'.
- 26 If USER_ZONE_ID_s is equal to '0', then the mobile station shall perform the following:
- 27 • Set USER_ZONE_ID_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
 - 28 • Set the UZID field of the UZ_REC to '0000000000000000' for all entries.
 - 29 • Set the UZ_REV field of the UZ_REC to '0000' for all entries.
 - 30 • Set the TEMP_SUB field of the UZ_REC to '0' for all entries.
- 31 If USER_ZONE_ID_s is equal to '1' and the mobile station does not support Tiered Services,
 32 then the mobile station shall set USER_ZONE_ID_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
- 33 If PRI_NGHBR_LST_s is equal to '0', then the mobile station shall set
 34 PRI_NGHBR_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.

1 If PRI_NGHRBR_LST_s is equal to '1' and the mobile station does not support Tiered Services,
2 then the mobile station shall set PRI_NGHRBR_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.

3 The mobile station shall also store the following parameters:

- 4 • *Access Point Pilot Information Message* sent
5 (AP_PILOT_INFO_s = AP_PILOT_INFO_r) if included; otherwise, AP_PILOT_INFO_s = '0'
- 6 • If the APPIM_PERIOD_INDEX is included in the message APPIM_PERIOD_INDEX_s =
7 APPIM_PERIOD_INDEX_r. Otherwise, APPIM_PERIOD_INDEX_s = 0.
- 8 • *Access Point Identification Message* sent
9 (AP_IDTs = AP_IDTr) if included; otherwise, AP_IDTs = '0'
- 10 • *Access Point Identification Text Message* sent
11 (AP_ID_TEXTs = AP_ID_TEXTr) if included; otherwise, AP_ID_TEXTs = '0'
- 12 • *General Overhead Information Message* sent
13 (GEN_OVHD_INF_INDs = GEN_OVHD_INF_INDr) if included; otherwise,
14 GEN_OVHD_INF_INDs = '0'
- 15 • If the GEN_OVHD_CYCLE_INDEX is included in the message
16 GEN_OVHD_CYCLE_INDEX_s = GEN_OVHD_CYCLE_INDEX_r. Otherwise,
17 GEN_OVHD_CYCLE_INDEX_s = 0.
- 18 • *Frequent General Overhead Information Message* sent
19 (FREQ_GEN_OVHD_INF_INDs = FREQ_GEN_OVHD_INF_INDr) if included; otherwise,
20 FREQ_GEN_OVHD_INF_INDs = '0'.
- 21 • *Flex Duplex CDMA Channel List Message* sent
22 (FD_CHAN_LST_INDs = FD_CHAN_LST_INDr) if included; otherwise,
23 FD_CHAN_LST_INDs = '0'.
- 24 • *Alternative Technologies Information Message* sent
25 (ATIM_INDs = ATIM_INDr) if included; otherwise, ATIM_INDs = '0'
- 26 • *Generic Access Parameters Message* sent
27 (GAPM_INDs = GAPM_INDr) if included; otherwise, GAPM_INDs = '0'
- 28 • *HDP Parameters Message* sent
29 (HDPPM_INDs = HDPPM_INDr) if included; otherwise, HDPPM_INDs = '0'
- 30 • If the ATIM_CYCLE_INDEX is included in the message ATIM_CYCLE_INDEX_s =
31 ATIM_CYCLE_INDEX_r. Otherwise, ATIM_CYCLE_INDEX_s = 0.
- 32 • Additional Geo Location Type Record allowed in *General Extension Message* indicator
33 (ADD_LOC_GEM_ALLOWED_s = ADD_LOC_GEM_ALLOWED_r) if included; otherwise,
34 ADD_LOC_GEM_ALLOWED_s = '0'.
- 35 • If the CAPABILITY_GEM_ALLOWED is included in the message, then
36 CAPABILITY_GEM_ALLOWED_s = CAPABILITY_GEM_ALLOWED_r. Otherwise,
37 CAPABILITY_GEM_ALLOWED_s = 0.

- 1 • If the R_SCH_GEM_ALLOWED is included in the message, then
2 R_SCH_GEM_ALLOWED_s = R_SCH_GEM_ALLOWED_r. Otherwise,
3 R_SCH_GEM_ALLOWED_s = 0.
- 4 • If the EXT_REG_PRD_INCL is included in the message, then EXT_REG_PRD_INCL_s =
5 EXT_REG_PRD_INCL_r. Otherwise, EXT_REG_PRD_INCL_s = 0.
- 6 • If the EXT_REG_PRD is included in the message, then EXT_REG_PRD_s =
7 EXT_REG_PRD_r. Otherwise, EXT_REG_PRD_s = 0.
- 8 • If the HDPPM_CYCLE_INDEX is included in the message HDPPM_CYCLE_INDEX_s =
9 HDPPM_CYCLE_INDEX_r. Otherwise, HDPPM_CYCLE_INDEX_s = 0.

10 The mobile station shall ignore any fields at the end of the *System Parameters Message* that
11 are not defined according to the protocol revision level (MOB_P_REV_p of the current band
12 class) being used by the mobile station.

13 2.6.2.2.1.2 Paging Channel Assignment Change

14 If the number of Paging Channels specified in the *System Parameters Message*
15 (PAGE_CHAN_r) is different from PAGE_CHAN_s, the mobile station shall use the hash
16 algorithm specified in 2.6.7.1 to select a new Paging Channel number in the range 1 to
17 PAGE_CHAN_r. The mobile station shall store the new Paging Channel number as
18 PAGECH_s. The mobile station shall then set PAGE_CHAN_s to PAGE_CHAN_r. The mobile
19 station shall set ACC_MSG_SEQ_s and GAPM_SEQ_s to NULL. If the mobile station has not
20 stored configuration parameters for the new Paging Channel, or if the stored parameters
21 are not current (see 2.6.2.2), the mobile station shall set CONFIG_MSG_SEQ_s, SYS_PAR-
22 _MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
23 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
24 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s, and
25 EXT_GLOB_SERV_REDIRECT_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
26 FD_CHAN_LST_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
27 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s,
28 HDPPM_MSG_SEQ_s and GLOB_SERV_REDIRECT_MSG_SEQ_s to NULL. The mobile station
29 shall then begin monitoring the new Paging Channel as specified in 2.6.2.1.1.

30 2.6.2.2.1.3 RESCAN Parameter

31 If the RESCAN_r field in the *System Parameters Message* equals '1', the mobile station shall
32 enter the *System Determination Substate* of the *Mobile Station Initialization State* with a
33 rescan indication (see 2.6.1.1).

34 2.6.2.2.1.4 Roaming Status

35 The mobile station shall determine the roaming status for the mobile station (see 2.6.5.3).
36 The mobile station should indicate to the user whether the mobile station is roaming.

37 2.6.2.2.1.5 Registration

38 The mobile station shall update stored variables and perform other registration procedures
39 as specified in 2.6.5.5.2.2.

2.6.2.2.1.6 Slot Cycle Index

The mobile station shall set $SLOT_CYCLE_INDEX_S$ to :

$$\max\left(\begin{array}{l} MIN_SLOT_CYCLE_INDEX_S, \\ \min(SLOT_CYCLE_INDEX_REG, MAX_SLOT_CYCLE_INDEX_S) \end{array}\right).$$

Where, $SLOT_CYCLE_INDEX_REG$ is computed based on the slot cycle index value included in the last registration attempt (see 2.6.5.5.3.1 and 2.6.5.5.3.2).

If the mobile station is operating in the slotted mode, it shall set its slot cycle length as described in 2.6.2.1.1.3.

2.6.2.2.1.7 PACA Disable for SID Change

If $PACA_S$ is equal to enabled, and SID_S is not equal to $PACA_SID_S$, the mobile station shall set $PACA_S$ to disabled and $PACA_CANCEL$ to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.

2.6.2.2.1.8 Retry Delay Disable for Packet Zone ID or SID/NID Change

The mobile station shall set $RETRY_DELAY_S[RETRY_TYPE]$ to 0 when the mobile station determines that the Packet Zone Identification or the System Identification/Network Identification (SID/NID pair) has been changed, where $RETRY_TYPE$ is equal to '001', '010', '011', '100', or '101'.

2.6.2.2.1.9 Encryption key reset for SID/NID Change

When the mobile station determines that the System Identification/Network Identification (SID/NID pair) has been changed, it shall perform the following:

- The mobile station shall disable the key setup timer if the timer is running.
- If there is an entry in the mobile station's $SID_NID_LIST_S$ that matches the previous SID/NID pair, the mobile station shall perform the following:
 - The mobile station shall save the following encryption/integrity related parameters associated with previous SID/NID pair:
 - + KEY_ID ,
 - + $ENC_KEY[KEY_ID]$ and $INT_KEY[KEY_ID]$,
 - + $TX_EXT_SSEQ[0][KEY_ID]$, $TX_EXT_SSEQ[1][KEY_ID]$,
 $RX_EXT_SSEQ[0][KEY_ID]$, and $RX_EXT_SSEQ[1][KEY_ID]$ and
 - + $C_SIG_ENCRYPT_MODE_S$.
 - If there are more than one SID/NID pairs in the $SID_NID_LIST_S$ for which there are associated encryption/integrity related parameters saved, the mobile station may remove the parameters associated with the SID/NID pair that was visited at the earliest time.
- If there is an entry in the mobile station's $SID_NID_LIST_S$ that matches the base station's SID and NID and the following encryption/integrity related parameters last

1 used in that system (SID/NID pair) are stored in the mobile station, the mobile station
2 shall restore them:

- 3 - KEY_ID,
- 4 - ENC_KEY[KEY_ID] and INT_KEY[KEY_ID],
- 5 - TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID], RX_EXT_SSEQ[0][KEY_ID],
6 and RX_EXT_SSEQ[1][KEY_ID] and
- 7 - C_SIG_ENCRYPT_MODE_s.
- 8 • Otherwise, the mobile station shall set ENC_KEY['00'], ENC_KEY['01'], INT_KEY['00'],
9 and INT_KEY['01'] to NULL.

10 2.6.2.2.2 Access Parameters Message

11 Whenever an *Access Parameters Message* is received on the Paging Channel, the sequence
12 number, ACC_MSG_SEQ_r, shall be compared to ACC_MSG_SEQ_s. If the comparison
13 results in a match, the mobile station may ignore the message. If the comparison results
14 in a mismatch, then the mobile station shall process the remaining fields in the message as
15 follows.

16 If PROBE_PN_RAN, MAX_REQ_SEQ, or MAX_RSP_SEQ are not within the valid ranges
17 specified in 3.7.2.3.2.2, then the mobile station shall ignore the *Access Parameters Message*
18 that contains them.

19 The mobile station shall store the following parameters:

- 20 • *Access Parameters Message* sequence number (ACC_MSG_SEQ_s = ACC_MSG_SEQ_r)
- 21 • Number of Access Channels (ACC_CHAN_s = ACC_CHAN_r)
- 22 • Nominal transmit power offset (NOM_PWR_s = NOM_PWR_r)
- 23 • Initial power offset for access (INIT_PWR_s = INIT_PWR_r)
- 24 • Power increment (PWR_STEP_s = PWR_STEP_r)
- 25 • Number of access probes (NUM_STEP_s = NUM_STEP_r)
- 26 • Maximum Access Channel message capsule size (MAX_CAP_SZ_s = MAX_CAP_SZ_r)
- 27 • Access Channel preamble length (PAM_SZ_s = PAM_SZ_r)
- 28 • Persistence modifier for Access Channel attempts for registrations which are not
29 responses to the *Registration Request Order* (REG_PSIST_s = REG_PSIST_r)
- 30 • Persistence modifier for Access Channel attempts for message transmissions
31 (MSG_PSIST_s = MSG_PSIST_r)
- 32 • If PSIST_EMG_INCL_r is equal to '0', the mobile station shall set the persistence modifier
33 for emergency calls from mobile stations in access overload classes 0 to 9
34 (PSIST_EMG_s) to '000'; otherwise, the mobile station shall set PSIST_EMG_s equal
35 to PSIST_EMG_r.
- 36 • Time randomization for Access Channel probes (PROBE_PN_RAN_s = PROBE_PN_RAN_r)

- 1 • Acknowledgment timeout ($ACH_ACC_TMO_s = ACC_TMO_r$)
- 2 • Access Channel probe backoff range ($PROBE_BKOFF_s = PROBE_BKOFF_r$)
- 3 • Access Channel probe sequence backoff range ($BKOFF_s = BKOFF_r$)
- 4 • Maximum number of probe sequences for an Access Channel request
- 5 ($MAX_REQ_SEQ_s = MAX_REQ_SEQ_r$)
- 6 • Maximum number of probe sequences for an Access Channel response
- 7 ($MAX_RSP_SEQ_s = MAX_RSP_SEQ_r$)
- 8 • If $CDMABAND_s$ is equal to '0', the mobile station shall set extended nominal transmit
- 9 power $NOM_PWR_EXT_s$ to '0'; otherwise, the mobile station shall store extended
- 10 nominal transmit power ($NOM_PWR_EXT_s = NOM_PWR_EXT_r$).
- 11 • IC threshold ($IC_THRESH_s = -7$)

12 The mobile station shall also store the following parameters:

- 13 • Authentication mode (if $AUTH_r$ is equal to '00' or '01', then $AUTH_s = AUTH_r$; otherwise
- 14 $AUTH_s = '01'$)
- 15 • Random challenge value ($RAND_s = RAND_r$)
- 16 • Network overload indicator ($NET_OVRLD_INDICATOR_s = NET_OVRLD_INDICATOR_r$)
- 17 • Network access priority ($NETWORK_ACCESS_PRIORITY_s =$
- 18 $NETWORK_ACCESS_PRIORITY_r$)

19

20 The mobile station shall ignore any fields at the end of the *Access Parameters Message*

21 which are not defined according to the protocol revision level ($MOB_P_REV_p$ of the current

22 band class) being used by the mobile station.

23 The mobile station shall store the persistence parameter number according to the following

24 rule:

- 25 • If the mobile station's access overload class is in the range 0-9, set $PSIST_s$ equal to
- 26 $PSIST(0-9)_r$;
- 27 • If the mobile station's access overload class is in the range 10-12, set $PSIST_s$ equal
- 28 to $PSIST(n)_r$, where n is equal to the mobile station access overload class;
- 29 • If the mobile station's access overload class is 14, it shall set
 - 30 ○ $PSIST_M_s = PSIST(0-9)_r$, if the last digit of the associated decimal
 - 31 representation of its $IMSI_M$ by a decimal to binary conversion as specified
 - 32 in Table 2.3.5-1 is in the range 0-9.
 - 33 ○ $PSIST14_s = PSIST(14)_r$;
 - 34 ○ $PSIST15_s = PSIST(15)_r$.

35

36 The mobile station shall store the Access Control based on Call Type (ACCT) information as

37 follows:

- 1 • Set ACCT_SO_LIST to NULL.
- 2 • Set ACCT_SO_GRP_LIST to NULL.
- 3 • If ACCT_INCL_T is equal to '1' and ACCOLC_P is in the range 0 to 9, then the mobile
4 station shall perform the following:
 - 5 - Set ACCT_INCL_EMG_S to ACCT_INCL_EMG_T.
 - 6 - If ACCT_SO_INCL_T is equal to '1', then for each ACCT_SO_T included in this message:
 - 7 + If ACCT_AOC_BITMAP_INCL_T is equal to '0', or if ACCT_AOC_BITMAP_INCL_T is
8 equal to '1' and the bit in the associated ACCT_AOC_BITMAP1_T corresponding to
9 the mobile station's ACCOLC_P (see Table 3.7.2.3.2.2-1) is equal to '1', then add
10 ACCT_SO_T to ACCT_SO_LIST.
 - 11 - If ACCT_SO_GRP_INCL_T is equal to '1', then for each ACCT_SO_GRP_T included in
12 this message:
 - 13 + If ACCT_AOC_BITMAP_INCL_T is equal to '0', or if ACCT_AOC_BITMAP_INCL_T is
14 equal to '1' and the bit in the associated ACCT_AOC_BITMAP2_T corresponding to
15 the mobile station's ACCOLC_P (see Table 3.7.2.3.2.2-1) is equal to '1', then add
16 ACCT_SO_GRP_T to ACCT_SO_GRP_LIST.

17 The mobile station shall set CURR_ACC_MSG_SEQ equal to ACC_MSG_SEQ_T.

18 2.6.2.2.3 Neighbor List Message

19 Whenever a valid *Neighbor List Message* is received on the current Paging Channel
20 (PAGECH_S), the configuration message sequence number, CONFIG_MSG_SEQ_T, shall be
21 compared to that stored in NGHBR_LST_MSG_SEQ_S. If the comparison results in a match,
22 the mobile station may ignore the message. If the comparison results in a mismatch, then
23 the mobile station shall process the remaining fields in the message as follows.

24 If the PILOT_INC field is not within the valid range specified in 3.7.2.3.2.3, then the mobile
25 station shall ignore the *Neighbor List Message* that contains it.

26 The mobile station shall store the following parameters:

- 27 • Configuration message sequence number (CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_T,
28 NGHBR_LST_MSG_SEQ_S = CONFIG_MSG_SEQ_T)
- 29 • Pilot PN sequence offset increment (PILOT_INC_S = PILOT_INC_T)

30 The mobile station shall set NGHBR_SET_SIZE_S to the number of neighboring base stations
31 contained in the *Neighbor List Message*.

32 For each of the neighboring base stations contained in the *Neighbor List Message*, the
33 mobile station shall perform the following:

- 34 • If the *i*th occurrence of NGHBR_CONFIG_T is equal to '000', '001', or '010', set the
35 NGHBR_CONFIG field of NGHBR_REC[i] to the *i*th occurrence of NGHBR_CONFIG_T;
36 otherwise, set the NGHBR_CONFIG field of NGHBR_REC [i] to '011'.
- 37 • Set the NGHBR_PN field of NGHBR_REC [i] to the *i*th occurrence of NGHBR_PN_T.

1 If GEN_NGHRB_LST_MSG_SEQ_s is not equal to CONFIG_MSG_SEQ_s, the mobile station
2 shall perform the following:

- 3 • Set the SEARCH_PRIORITY field of the NGHRB_REC to '10' (high) for all
4 NGHRB_SET_SIZE_s entries.
- 5 • Set the NGHRB_BAND field of NGHRB_REC to CDMABAND_s for all NGHRB_SET_SIZE_s
6 entries.
- 7 • If NGHRB_CONFIG_r equals '010', set the NGHRB_FREQ field of NGHRB_REC to the
8 first CDMA Channel listed in the *CDMA Channel List Message or Extended CDMA*
9 *Channel List Message* transmitted by the current base station for all
10 NGHRB_SET_SIZE_s entries; otherwise, set the NGHRB_FREQ field of NGHRB_REC to
11 CDMACH_s for all NGHRB_SET_SIZE_s entries.
- 12 • Set the SRCH_WIN_NGHRB field of NGHRB_REC to SRCH_WIN_N_s for all
13 NGHRB_SET_SIZE_s entries.
- 14 • Set the SRCH_OFFSET_NGHRB field of NGHRB_REC to '000' for all NGHRB_SET_SIZE_s
15 entries.

16 The mobile station shall set the ACCESS_ENTRY_HO field of the NGHRB_REC to '0' for all
17 NGHRB_SET_SIZE_s entries if any of the following conditions are met:

- 18 • EXT_SYS_PARAMETER_s is equal to '0',
- 19 • NGHRB_SET_ENTRY_INFO_s is equal to '0', or
- 20 • EXT_SYS_PAR_MSG_SEQ_s is not equal to CONFIG_MSG_SEQ_s.

21 The mobile station shall set the ACCESS_HO_ALLOWED field of the NGHRB_REC to '0' for
22 all NGHRB_SET_SIZE_s entries if any of the following conditions are met:

- 23 • EXT_SYS_PARAMETER_s is equal to '0',
- 24 • NGHRB_SET_ACCESS_INFO_s is equal to '0', or
- 25 • EXT_SYS_PAR_MSG_SEQ_s is not equal to CONFIG_MSG_SEQ_s.

26 The mobile station shall update the idle handoff Neighbor Set (see 2.6.2.1.4) so that it
27 consists only of pilot offsets listed in the *Neighbor List Message*. If the *Neighbor List*
28 *Message* contains more pilot offsets than the mobile station can store, the mobile station
29 shall store the pilot offsets beginning at the start of the *Neighbor List Message*, up to the
30 limits of the mobile station's Neighbor Set storage capacity.

31 2.6.2.2.4 CDMA Channel List Message

32 Whenever a *CDMA Channel List Message* is received on the Paging Channel, the
33 configuration message sequence number, CONFIG_MSG_SEQ_r, shall be compared to that
34 stored in CHAN_LST_MSG_SEQ_s. If the comparison results in a match, the mobile station
35 may ignore the message. If the comparison results in a mismatch, then the mobile station
36 shall process the remaining fields in the message as follows.

1 The mobile station shall store the following parameters:

- 2 • Configuration message sequence number (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
- 3 CHAN_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r)

4 The mobile station shall perform the following:

- 5 • If SYS_PAR_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s, and FD_CHAN_LST_MSG_SEQ_s
- 6 are current,
 - 7 - If EXT_CHAN_LST_s is equal to '1', the mobile station shall ignore this message.
 - 8 - If EXT_CHAN_LST_s is equal to '0', the mobile station shall process this message as
 - 9 described below.
- 10 • Otherwise,
 - 11 - if the mobile station does not support flexible spacing between forward and reverse
 - 12 channels the mobile station shall process this message after SYS_PAR_MSG_SEQ_s
 - 13 and EXT_SYS_PAR_MSG_SEQ_s are current.
 - 14 - Otherwise, the mobile station shall process this message after
 - 15 SYS_PAR_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s, and FD_CHAN_LST_MSG_SEQ_s
 - 16 become current.

17 If the FD_CHAN_LST_MSG_SEQ_s is current and the mobile station supports at least one
 18 bandclass listed by the base station in the *Flex Duplex CDMA Channel List Message*, the
 19 mobile station shall ignore this message. Otherwise, mobile station shall process this
 20 message as follows:

21 The mobile station shall use the hash algorithm specified in 2.6.7.1 and the number of
 22 channels listed in the *CDMA Channel List Message* to determine the CDMA Channel
 23 (Frequency Assignment) for its Paging Channel. If the CDMA Frequency Assignment has
 24 changed (the computed CDMA Channel is different from CDMACH_s), the mobile station
 25 shall perform the following actions:

- 26 • Set CDMACH_s to the new CDMA Channel.
- 27 • Set PAGE_CHAN_s to '1'.
- 28 • Set PAGECH_s to the Primary Paging Channel.
- 29 • If the stored configuration parameters is not current (see 2.6.2.2) for the corresponding
 30 base station and frequency assignment, set CONFIG_MSG_SEQ_s,
- 31 SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
- 32 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
- 33 EXT_SYS_PAR_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s, USER_ZONE_ID-
- 34 _MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
- 35 FD_CHAN_LST_MSG_SEQ_s, EXT_GLOB_SERV_REDIR_MSG_SEQ_s,
- 36 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
- 37 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s,
- 38 GAPM_SEQ_s and ACC_MSG_SEQ_s to NULL.
- 39 • Tune to the new CDMA Channel.

2.6.2.2.5 Extended System Parameters Message

Whenever an *Extended System Parameters Message* is received on the Paging Channel, the configuration message sequence number, CONFIG_MSG_SEQ_r, shall be compared to that stored in EXT_SYS_PAR_MSG_SEQ_s. If the comparison results in a match, the mobile station may ignore the message. If the comparison results in a mismatch, then the mobile station shall process the remaining fields in the message as follows.

If the protocol revision level supported by the mobile station (MOB_P_REV_p) is less than the minimum protocol revision level supported by the base station (MIN_P_REV_r), the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a protocol mismatch indication (see 2.6.1.1). Otherwise, the mobile station shall store the following parameters:

- Configuration message sequence number (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r, EXT_SYS_PAR_MSG_SEQ_s = CONFIG_MSG_SEQ_r)
- Preferred Access Channel MSID type (PREF_MSID_TYPE_s = PREF_MSID_TYPE_r)
- Extended Preferred Access Channel MSID type (EXT_PREF_MSID_TYPE_s = EXT_PREF_MSID_TYPE_r) if included; otherwise, set EXT_PREF_MSID_TYPE_s to NULL.
- MEID Required indicator (MEID_REQD_s = MEID_REQD_r) if included; otherwise, set MEID_REQD_s to '0'
- Broadcast slot cycle index (BCAST_INDEX_s = BCAST_INDEX_r)
- The mobile station shall set its operational IMSI, IMSI_O, as follows:
 - If IMSI_T_SUPPORTED_r is equal to '0', the mobile station shall set IMSI_O to IMSI_{Mp}.
 - If IMSI_T_SUPPORTED_r is equal to '1' and the mobile station's IMSI_{Tp} has been programmed, the mobile station shall set IMSI_O to IMSI_{Tp}.
 - If IMSI_T_SUPPORTED_r is equal to '1' and the mobile station's IMSI_{Tp} has not been programmed, the mobile station shall set IMSI_O to IMSI_{Mp}.
- If MCC_r = '111111111' and IMSI_{11_12r} = '111111', the mobile station shall set the IMSI_O to IMSI_{Mp} and store:
 - Mobile Country Code (MCC_s = MCC_{Mp}) and
 - IMSI 11th and 12th digits (IMSI_{11_12s} = IMSI_{M_11_12p});
 otherwise, the mobile station shall store:
 - Mobile Country Code (MCC_s = MCC_r) and
 - IMSI 11th and 12th digits (IMSI_{11_12s} = IMSI_{11_12r}).
- Least significant digit of MNC (IMSI_{10s} = IMSI_{10r}), if included.
- If IMSI_O is set to the IMSI_M, the mobile station shall set:

- 1 - IMSI_O_S_s to IMSI_M_S_p (i.e., IMSI_O_S1_s to IMSI_M_S1_p and IMSI_O_S2_s to
2 IMSI_M_S2_p)
- 3 - IMSI_O_11_12_s to IMSI_M_11_12_p
- 4 - MCC_O_s to MCC_M_p
- 5 - IMSI_O_ADDR_NUM_s to IMSI_M_ADDR_NUM_p
- 6 • If IMSI_O is set to the IMSI_T, the mobile station shall set:
- 7 - IMSI_O_S_s to IMSI_T_S_p (i.e., IMSI_O_S1_s to IMSI_T_S1_p and IMSI_O_S2_s to
8 IMSI_T_S2_p).
- 9 - IMSI_O_11_12_s to IMSI_T_11_12_p
- 10 - MCC_O_s to MCC_T_p
- 11 - IMSI_O_ADDR_NUM_s to IMSI_T_ADDR_NUM_p
- 12 • If IMSI_O has been changed, the mobile station shall set SYS_PAR_MSG_SEQ_s,
13 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s to
14 NULL, and set PAGE_CHAN_s to '1', and set PAGECH_s to the Primary Paging Channel.
- 15 • Protocol revision level (P_REV_s = P_REV_r) if included in the message; otherwise, set
16 P_REV_s as follows:
- 17 - For Band Class 0, if the mobile station determines it is operating in Korea, set
18 P_REV_s to '00000010'; otherwise, set P_REV_s to '00000011'.
- 19 - For Band Class 3, set P_REV_s to '00000011'.
- 20 - For Band Class 1 and Band Class 4, set P_REV_s to '00000001'.
- 21 • Minimum protocol revision level (MIN_P_REV_s = MIN_P_REV_r) if included in the
22 message; otherwise, MIN_P_REV_s = '00000010' for Band Class 0, MIN_P_REV_s =
23 '00000001' for Band Class 1 and Band Class 4, and MIN_P_REV_s = '00000011' for
24 Band Class 3.
- 25 • Protocol revision level currently in use (P_REV_IN_USE_s = the lesser value of P_REV_s
26 and MOB_P_REV_p of the current band class)
- 27 • Slope of the handoff add/drop criterion (SOFT_SLOPE_s = SOFT_SLOPE_r) if included in
28 the message; otherwise, SOFT_SLOPE_s = '000000'.
- 29 • Intercept of the handoff add criterion (ADD_INTERCEPT_s = ADD_INTERCEPT_r)
- 30 • Intercept of the handoff drop criterion (DROP_INTERCEPT_s = DROP_INTERCEPT_r)
- 31 • Delete foreign TMSI (DELETE_FOR_TMSI_s = DELETE_FOR_TMSI_r)
- 32 • Use TMSI (USE_TMSI_s = USE_TMSI_r)
- 33 • TMSI zone length (TMSI_ZONE_LEN_s = TMSI_ZONE_LEN_r)
- 34 • TMSI zone number (TMSI_ZONE_s = TMSI_ZONE_r)
- 35 • Maximum number of alternative service options (MAX_NUM_ALT_SO_s =
36 MAX_NUM_ALT_SO_r).

- 1 • System reselection indicator ($RESELECT_INCLUDED_S = RESELECT_INCLUDED_T$) if
2 included in the message; otherwise, $RESELECT_INCLUDED_S = '0'$.
- 3 • Pilot reporting indicator ($PILOT_REPORT_S = PILOT_REPORT_T$)
- 4 • Neighbor Set access entry handoff information indicator ($NGHBR_SET_ENTRY_INFO_S =$
5 $NGHBR_SET_ENTRY_INFO_T$) if included in the message; otherwise,
6 $NGHBR_SET_ENTRY_INFO_S = '0'$.
- 7 • Neighbor Set access handoff information indicator ($NGHBR_SET_ACCESS_INFO_S =$
8 $NGHBR_SET_ACCESS_INFO_T$) if included in the message; otherwise,
9 $NGHBR_SET_ACCESS_INFO_S = '0'$.
- 10 • Short Data Burst supported indicator ($SDB_SUPPORTED_S = SDB_SUPPORTED_T$)
- 11 • Nominal reverse traffic channel output power offset relative to Reverse Pilot Channel
12 power ($RLGAIN_TRAFFIC_PILOT_S = RLGAIN_TRAFFIC_PILOT_T$)
- 13 • Broadcast GPS Assist Indicator ($BROADCAST_GPS_ASST_S = BROADCAST_GPS_ASST_T$)
- 14 • Reverse Power Control Delay ($REV_PWR_CNTL_DELAY_S = REV_PWR_CNTL_DELAY_T$) if
15 included
- 16 • Permission for the mobile station to request QoS settings in the *Origination Message*,
17 *Origination Continuation Message*, or *Enhanced Origination Message* ($MOB_QOS_S =$
18 MOB_QOS_T)
- 19 • If $ENC_SUPPORTED_T$ is equal to '1', the mobile station shall store:
20 - Signaling encryption supported indicator ($SIG_ENCRYPT_SUP_S =$
21 $SIG_ENCRYPT_SUP_T$)
22 - User information encryption supported indicator ($UI_ENCRYPT_SUP_S =$
23 $UI_ENCRYPT_SUP_T$)
- 24 • Sync ID supported indicator ($USE_SYNC_ID_S = USE_SYNC_ID_T$)
- 25 • Concurrent services supported indicator ($CS_SUPPORTED_S = CS_SUPPORTED_T$)
- 26 • Maximum number of additional service reference identifiers allowed in origination
27 ($MAX_ADD_SERV_INSTANCE_S = MAX_ADD_SERV_INSTANCE_T$), if included; otherwise,
28 the mobile station shall set $MAX_ADD_SERV_INSTANCE_S$ to 0.
- 29 • Primary Broadcast Control Channel supported indicator ($BCCH_SUPPORTED_S =$
30 $BCCH_SUPPORTED_T$).
- 31 • Pilot information request supported indicator ($PILOT_INFO_REQ_SUPPORTED_S =$
32 $PILOT_INFO_REQ_SUPPORTED_T$).
- 33 • Message integrity supported indicator ($MSG_INTEGRITY_SUP_S =$
34 $MSG_INTEGRITY_SUP_T$), if $P_REV_IN_USE_S$ is greater than or equal to 10; otherwise,
35 $MSG_INTEGRITY_SUP_S = 0$.
- 36 • If $MSG_INTEGRITY_SUP_T$ is equal to '1' and $SIG_INTEGRITY_SUP_INCL_T$ is equal to '1',
37 the mobile station shall store the message integrity algorithms that the base station

- 1 supports (SIG_INTEGRITY_SUP_s = SIG_INTEGRITY_SUP_r); otherwise, the mobile station
 2 shall set SIG_INTEGRITY_SUP_s to '00000000'.
- 3 • Band class information request indicator (BAND_CLASS_INFO_REQ_s =
 4 BAND_CLASS_INFO_REQ_r)
 - 5 • Alternate CDMA band class (ALT_BAND_CLASS_s = ALT_BAND_CLASS_r), if
 6 BAND_CLASS_INFO_REQ_r is equal to '1'.
 - 7 • CDMA off time report supported indicator
 8 (CDMA_OFF_TIME_REP_SUP_IND_s = CDMA_OFF_TIME_REP_SUP_IND_r)
 - 9 • If CDMA_OFF_TIME_REP_SUP_IND_r is equal to '1', the mobile station shall store:
 - 10 - CDMA off time report threshold (CDMA_OFF_TIME_REP_THRESHOLD_s =
 11 CDMA_OFF_TIME_REP_THRESHOLD_r in units specified by
 12 CDMA_OFF_TIME_REP_UNIT_r)
 - 13 • Control Hold Mode supported indicator (CHM_SUPPORTED_s = CHM_SUPPORTED_r) if
 14 included; otherwise, the mobile station shall perform the following:
 - 15 - If P_REV_IN_USE_s is less than six, set CHM_SUPPORTED_s to '0'.
 - 16 - Otherwise, set CHM_SUPPORTED_s to '1'.
 - 17 • Release to Idle State allowed indicator (RELEASE_TO_IDLE_IND_s =
 18 RELEASE_TO_IDLE_IND_r).
 - 19 • *Reconnect Message* supported indicator
 20 (RECONNECT_MSG_IND_s = RECONNECT_MSG_IND_r).
 - 21 • Short Data Burst allowed in *Reconnect Message* allowed indicator
 22 (SDB_IN_RCNM_IND_s = SDB_IN_RCNM_IND_r), if included; otherwise, set
 23 SDB_IN_RCNM_IND_s to '0'.
 - 24 • Forward Packet Data Channel supported Indicator (FOR_PDCH_SUPPORTED_s =
 25 FOR_PDCH_SUPPORTED_r).
 - 26 • PDCH Control Hold Mode supported indicator (PDCH_CHM_SUPPORTED_s =
 27 PDCH_CHM_SUPPORTED_r) if included; otherwise, set PDCH_CHM_SUPPORTED_s to '0'.
 - 28 • If RER_MODE_SUPPORTED_r is not included, the mobile station shall set
 29 RER_MODE_SUPPORTED_s to '0'; otherwise, the mobile station shall set
 30 RER_MODE_SUPPORTED_s to RER_MODE_SUPPORTED_r.
 - 31 • If TKZ_MODE_SUPPORTED_r is not included, the mobile station shall set
 32 TKZ_MODE_SUPPORTED_s to '0'; otherwise, the mobile station shall set
 33 TKZ_MODE_SUPPORTED_s to TKZ_MODE_SUPPORTED_r. If TKZ_MODE_SUPPORTED_s
 34 is equal to '1', the mobile station shall store the tracking zone identifier
 35 (TKZ_ID_s = TKZ_ID_r).
 - 36 • If AUTO_FCSO_ALLOWED_r is not included, the mobile station shall set
 37 AUTO_FCSO_ALLOWED_s to '0'; otherwise, the mobile station shall set
 38 AUTO_FCSO_ALLOWED_s to AUTO_FCSO_ALLOWED_r.

- 1 • If CAND_BAND_INFO_REQ_r is included, the mobile station shall set
2 CAND_BAND_INFO_REQ_s to CAND_BAND_INFO_REQ_r; otherwise, the mobile station
3 shall set CAND_BAND_INFO_REQ_s to '0'.
- 4 If BYPASS_REG_IND_r is included, the mobile station shall set BYPASS_REG_IND_s to
5 BYPASS_REG_IND_r; otherwise, the mobile station shall set BYPASS_REG_IND_s to '00'.
- 6 If BCCH_SUPPORTED_s equals '1', the mobile station shall enter the *System Determination*
7 *Substate* of the *Mobile Station Initialization State* with a new system indication.
- 8 If P_REV_IN_USE_s has been changed, the mobile station shall set ACC_MSG_SEQ_s,
9 GAPM_SEQ_s, CURR_ACC_MSG_SEQ, SYS_PAR_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
10 GEN_NGHBR_LST_MSG_SEQ_s, and GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 11 If NGHBR_SET_ENTRY_INFO is equal to '1', the mobile station shall store the access entry
12 handoff in order and message processing operation indicator (ACC_ENT_HO_ORDER_s =
13 ACC_ENT_HO_ORDER_r).
- 14 If the mobile station supports packet data service options, the mobile station shall store the
15 packet data services zone identifier (PACKET_ZONE_ID_s = PACKET_ZONE_ID_r); otherwise,
16 the mobile station shall set PACKET_ZONE_ID_s to '00000000'.
- 17 If the mobile station supports packet data service options and the PZ_HYST_ENABLED field
18 is included, the mobile station shall store the packet zone hysteresis enabled indicator
19 (PZ_HYST_ENABLED_s = PZ_HYST_ENABLED_r); otherwise, the mobile station shall set
20 PZ_HYST_ENABLED_s to '1'.
- 21 If the mobile station supports packet data service options and the PZ_HYST_LIST_LEN field
22 is included, the mobile station shall store the packet zone hysteresis list length
23 (PZ_HYST_LIST_LEN_s = PZ_HYST_LIST_LEN_r); otherwise, the mobile station shall set
24 PZ_HYST_LIST_LEN_s to 4.
- 25 If the mobile station supports packet data service options and the PZ_HYST_ACT_TIMER
26 field is included, the mobile station shall store the packet zone hysteresis activation timer
27 (PZ_HYST_ACT_TIMER_s = PZ_HYST_ACT_TIMER_r); otherwise, the mobile station shall set
28 PZ_HYST_ACT_TIMER_s to 30 seconds.
- 29 If the mobile station supports packet data service options and the PZ_HYST_TIMER_MUL
30 field and the PZ_HYST_TIMER_EXP field are included, the mobile station shall store the
31 packet zone hysteresis timer (PZ_HYST_TIMER_s = PZ_HYST_TIMER_MUL_r × 8 ^
32 PZ_HYST_TIMER_EXP_r); otherwise, the mobile station shall set PZ_HYST_TIMER_s to 60
33 seconds.
- 34 If RESELECT_INCLUDED_s is equal to '1', the mobile station shall store:
- 35 • Pilot power threshold (EC_THRESH_s = EC_THRESH_r)
- 36 • Pilot E_c/I₀ threshold (EC_IO_THRESH_s = EC_IO_THRESH_r)
- 37 If NGHBR_SET_ACCESS_INFO_s is equal to '1', the mobile station shall store:
- 38 • Access handoff permitted indicator (ACCESS_HO_s = ACCESS_HO_r)

- 1 • Access probe handoff permitted indicator ($ACCESS_PROBE_HO_S = ACCESS_PROBE_HO_T$)
- 2
- 3 • If $ACCESS_PROBE_HO_S$ is equal to '1', access handoff list update permitted indicator
- 4 ($ACC_HO_LIST_UPD_S = ACC_HO_LIST_UPD_T$)
- 5 • Maximum number of times that the mobile station is permitted to perform an access
- 6 probe handoff ($MAX_NUM_PROBE_HO_S = MAX_NUM_PROBE_HO_T$)
- 7 • Access handoff permitted for message response indicator ($ACCESS_HO_MSG_RSP_S =$
- 8 $ACCESS_HO_MSG_RSP_T$)
- 9 • Access probe handoff permitted for other messages indicator
- 10 ($ACC_PROBE_HO_OTHER_MSG_S = ACC_PROBE_HO_OTHER_MSG_T$)

11 If $NGHBR_SET_ENTRY_INFO_S$ or $NGHBR_SET_ACCESS_INFO_S$ is equal to '1', the mobile
12 station shall store the size of the Neighbor Set ($NGHBR_SET_SIZE_S = NGHBR_SET_SIZE_T$).

13 If $NGHBR_SET_ENTRY_INFO_S$ is equal to '0', then for all $NGHBR_SET_SIZE_S$ occurrences of
14 $ACCESS_ENTRY_HO$, the mobile station shall set the $ACCESS_ENTRY_HO$ field of
15 $NGHBR_REC[i]$ to '0'.

16 If $NGHBR_SET_ENTRY_INFO_S$ is equal to '1', then for all $NGHBR_SET_SIZE_S$ occurrences of
17 $ACCESS_ENTRY_HO$, the mobile station shall set the $ACCESS_ENTRY_HO$ field of
18 $NGHBR_REC[i]$ to the i^{th} occurrence of $ACCESS_ENTRY_HO_T$.

19 If $NGHBR_SET_ACCESS_INFO_S$ is equal to '0', then for all $NGHBR_SET_SIZE_S$ occurrences
20 of $ACCESS_HO_ALLOWED$, the mobile station shall set the $ACCESS_HO_ALLOWED$ field of
21 $NGHBR_REC[i]$ to '0'.

22 If $NGHBR_SET_ACCESS_INFO_S$ is equal to '1', then for all $NGHBR_SET_SIZE_S$ occurrences
23 of $ACCESS_HO_ALLOWED$, the mobile station shall set the $ACCESS_HO_ALLOWED$ field of
24 $NGHBR_REC[i]$ to the i^{th} occurrence of $ACCESS_HO_ALLOWED_T$.

25 The mobile station shall set all bits of $TMSI_CODE_{S-p}$ to '1' if all of the following conditions
26 are met:

- 27 • The bits of $TMSI_CODE_{S-p}$ are not all equal to '1',
- 28 • $DELETE_FOR_TMSI_S$ is equal to '1', and
- 29 • $ASSIGNING_TMSI_ZONE_LEN_{S-p}$ is not equal to $TMSI_ZONE_LEN_S$, or the least
- 30 significant $ASSIGNING_TMSI_ZONE_LEN_{S-p}$ octets of $ASSIGNING_TMSI_ZONE_{S-p}$ are
- 31 not equal to $TMSI_ZONE_S$.

32 If the mobile station supports the Quick Paging Channel operation:

- 33 • The mobile station shall set $QPCH_SUPPORTED_S$ to $QPCH_SUPPORTED_T$.
- 34 • If $QPCH_SUPPORTED_T = '1'$:
 - 35 - The mobile station shall set $QPCH_RATE_S$ to $QPCH_RATE_T$.
 - 36 - If the number of Quick Paging Channels specified in the received message
 - 37 (NUM_QPCH_T) is different from NUM_QPCH_S , the mobile station shall use the hash
 - 38 algorithm specified in 2.6.7.1 to select a new Quick Paging Channel number in the

1 range 1 to NUM_QPCH_r. The mobile station shall store the new Quick Paging
 2 Channel number as QPAGECH_s and as ASSIGNED_QPAGECH_s. The mobile station
 3 shall then set NUM_QPCH_s to NUM_QPCH_r.

- 4 - The mobile station shall set QPCH_POWER_LEVEL_PAGE_s to
 5 QPCH_POWER_LEVEL_PAGE_r.
- 6 - The mobile station shall set QPCH_CCI_SUPPORTED_s to QPCH_CCI_SUPPORTED_r.
- 7 - If QPCH_CCI_SUPPORTED_r = '1', the mobile station shall set
 8 QPCH_POWER_LEVEL_CONFIG_s to QPCH_POWER_LEVEL_CONFIG_r.
- 9 • The mobile station shall set QPCH_BI_SUPPORTED_s to QPCH_BI_SUPPORTED_r, if
 10 included.
- 11 • If QPCH_BI_SUPPORTED_r = '1', the mobile station shall set
 12 QPCH_POWER_LEVEL_BCAST_s to QPCH_POWER_LEVEL_BCAST_r.

13 If the mobile station supports the *Device Information Message* on the r-csch, the mobile
 14 station shall store:

- 15 • Autonomous message supported indicator
 16 (AUTO_MSG_SUPPORTED_s = AUTO_MSG_SUPPORTED_r)

17 If AUTO_MSG_SUPPORTED_r is equal to '1' and the mobile station supports the *Device*
 18 *Information Message* on the r-csch, the mobile station shall store:

- 19 • Autonomous message interval
 20 (AUTO_MSG_INTERVAL_s = AUTO_MSG_INTERVAL_r)

21 The mobile station shall store mobile station initiated position location determination
 22 supported indicator (MS_INIT_POS_LOC_SUP_IND_s = MS_INIT_POS_LOC_SUP_IND_r).

23 The mobile station shall set FOR_PDCH_COMMON_PARMS_s = '0'.

24 If both FOR_PDCH_SUPPORTED_r and PDCH_PARMS_INCL_r are included and equal to '1',
 25 the mobile station shall perform the following:

- 26 • If FOR_PDCH_RLGAIN_INCL_r is included and equal to '1', the mobile station shall set:
 27 - (RLGAIN_ACKCH_PILOT_s = RLGAIN_ACKCH_PILOT_r),
 28 - (RLGAIN_CQICH_PILOT_s = RLGAIN_CQICH_PILOT_r).
- 29 • The mobile station shall set
 30 NUM_SOFT_SWITCHING_FRAMES_s = NUM_SOFT_SWITCHING_FRAMES_r + 1, and
 31 NUM_SOFTER_SWITCHING_FRAMES_s = NUM_SOFTER_SWITCHING_FRAMES_r + 1.
- 32 • The mobile station shall set
 33 NUM_SOFT_SWITCHING_FRAMES_CHM_s = NUM_SOFT_SWITCHING_FRAMES_r + 1,
 34 and NUM_SOFTER_SWITCHING_FRAMES_CHM_s =
 35 NUM_SOFTER_SWITCHING_FRAMES_r + 1.
- 36 • The mobile station shall set NUM_SOFT_SWITCHING_SLOTS_s according to Table
 37 3.7.2.3.2.21-9 based on the value of NUM_SOFT_SWITCHING_SLOTS_r.

- 1 • The mobile station shall set NUM_SOFTER_SWITCHING_SLOTS_s according to Table
2 3.7.2.3.2.21-9 based on the value of NUM_SOFTER_SWITCHING_SLOTS_r.
- 3 • The mobile station shall set PDCH_SOFT_SWITCHING_DELAY_s to
4 PDCH_SOFT_SWITCHING_DELAY_r + 1, and PDCH_SOFTER_SWITCHING_DELAY_s to
5 PDCH_SOFTER_SWITCHING_DELAY_r + 1.
- 6 • The mobile station shall set FOR_PDCH_COMMON_PARMS_s = '1'.
- 7 • The mobile station shall set WALSH_TABLE_ID_s = WALSH_TABLE_ID_r.
- 8 • The mobile station shall set NUM_PDCCH_s = NUM_PDCCH_r.
- 9 • The mobile station shall store FOR_PDCH_WALSH_s[i] to the ith occurrence of
10 FOR_PDCH_WALSH_r.

11 If FOR_PDCH_SUPPORTED_r is included and equal to '1', then the mobile station shall set
12 Reverse Packet Data Channel supported indicator (REV_PDCH_SUPPORTED_s =
13 REV_PDCH_SUPPORTED_r).

14 If REV_PDCH_PARAMS_INCL_r is not included, or if it is included and equal to '0', the mobile
15 station shall set REV_PDCH_PARAMS_INCL_s to '0'; otherwise, the mobile station shall set
16 REV_PDCH_PARAMS_INCL_s to '1' and perform the following:

- 17 • If REV_PDCH_RLGAIN_INCL_r is equal to '1', the mobile station shall set:
 - 18 - (RLGAIN_SPICH_PILOT_s = RLGAIN_SPICH_PILOT_r).
 - 19 - (RLGAIN_REQCH_PILOT_s = RLGAIN_REQCH_PILOT_r).
 - 20 - (RLGAIN_PDCCH_PILOT_s = RLGAIN_PDCCH_PILOT_r).
- 21 • If REV_PDCH_PARAMS_1_INCL_r is equal to '1', the mobile station shall set:
 - 22 - (REV_PDCH_TABLE_SEL_s = REV_PDCH_TABLE_SEL_r).
 - 23 - (REV_PDCH_MAX_AUTO_TPR_s to REV_PDCH_MAX_AUTO_TPR_r).
 - 24 - (REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_s =
25 REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_r+1).
- 26 • If REV_PDCH_OPER_PARAMS_INCL_r is equal to '1', the mobile station shall set:
 - 27 - (REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_s
28 =REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_r+1).
 - 29 - (REV_PDCH_DEFAULT_PERSISTENCE_s = REV_PDCH_DEFAULT_PERSISTENCE_r).
 - 30 - (REV_PDCH_RESET_PERSISTENCE_s = REV_PDCH_RESET_PERSISTENCE_r).
 - 31 - (REV_PDCH_GRANT_PRECEDENCE_s = REV_PDCH_GRANT_PRECEDENCE_r).
 - 32 - (REV_PDCH_MSIB_SUPPORTED_s = REV_PDCH_MSIB_SUPPORTED_r).
 - 33 - (REV_PDCH_SOFT_SWITCHING_RESET_IND_s =
34 REV_PDCH_SOFT_SWITCHING_RESET_IND_r).

1 The mobile station shall store the following parameters:

- 2 • *BCMC Service Parameters Message* sent
3 (SENDING_BSPM_S = SENDING_BSPM_T), if included; otherwise, set SENDING_BSPM_S to
4 '0'.
- 5 • *BCMC Service Parameters Message* transmission periodicity index
6 (BSPM_PERIOD_INDEX_S = BSPM_PERIOD_INDEX_T) if SENDING_BSPM_T equals '1';
7 otherwise, BSPM_PERIOD_INDEX_S = NULL.
- 8 • If BSPM_PERIOD_INDEX_S is not equal to NULL, the mobile station shall set
9 BSPM_WAIT_TIME to (B + 1) × 160ms, where

$$10 \quad B = 2^i \times 16, 0 \leq i \leq 15$$

11 and $i = \text{BSPM_PERIOD_INDEX}_S$.

12 If CAND_BAND_INFO_REQ_T is set to '1', the mobile station shall store the number of
13 candidate band classes minus one (NUM_CAND_BAND_CLASS_S =
14 NUM_CAND_BAND_CLASS_T).

15 If CAND_BAND_INFO_REQ_T is set to '1', the mobile station shall perform the following for
16 each occurrence of the CAND_BAND_CLASS record:

- 17 • Set the CAND_BAND_CLASS field of CAND_BAND_CLASS_REC[i] to the i^{th} occurrence
18 of CAND_BAND_CLASS_T.
- 19 • Set the SUBCLASS_INFO_INCL field of CAND_BAND_CLASS_REC[i] to the i^{th}
20 occurrence of SUBCLASS_INFO_INCL_T.
- 21 • If the i^{th} occurrence of SUBCLASS_INFO_INCL_T is set to '1', set the
22 SUBCLASS_REC_LEN field of CAND_BAND_CLASS_REC[i] to the corresponding value of
23 SUBCLASS_REC_LEN_T.
- 24 • If the i^{th} occurrence of SUBCLASS_INFO_INCL_T is set to '1', the mobile station shall
25 perform the following for each band subclass indicator received:
 - 26 - Set the BAND_SUBCLASS_IND_REC[j] field of CAND_BAND_CLASS_REC[i] to the j^{th}
27 occurrence of BAND_SUBCLASS_IND_T in the CDMA_BAND_CLASS_REC[i].

28 If TX_PWR_LIMIT_INCL_T is set to '1' and the mobile station is operating in the 1915MHz –
29 1920MHz block of the PCS band, the mobile station shall store the transmit power limit
30 TX_PWR_LIMIT_S = (TX_PWR_LIMIT_T - 30dBm); otherwise, the mobile station shall set
31 TX_PWR_LIMIT_S to the limit defined in [11].

32 2.6.2.2.6 Global Service Redirection Message

33 Whenever a *Global Service Redirection Message* is received on the Paging Channel, the
34 configuration message sequence number, CONFIG_MSG_SEQ_T, shall be compared to that
35 stored in GLOB_SERV_REDIR_MSG_SEQ_S. If the comparison results in a match or if
36 SYS_PAR_MSG_SEQ_S is not current, the mobile station may ignore the message; otherwise,
37 the mobile station shall store the following parameters:

- 1 • Configuration message sequence number ($CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_R$,
2 $GLOB_SERV_REDIR_MSG_SEQ_S = CONFIG_MSG_SEQ_R$)
- 3 • The mobile station shall ignore this message, if any of the following conditions is true:
- 4 - $EXT_GLOBAL_REDIRECT_S = '1'$
- 5 - $EXCL_P_REV_MS_R = '1'$
- 6 - Type of redirection as specified by $RECORD_TYPE_R$ is not supported
- 7 - $BAND_CLASS_R$ is not supported ($RECORD_TYPE_R = '0000010'$)
- 8 - None of the included $CDMA_CHAN_R$ are supported ($RECORD_TYPE_R = '0000010'$)
- 9 If the subfield corresponding to the access overload class, $ACCOLC_P$, of the mobile station
10 is set equal to '1' in the $REDIRECT_ACCOLC_R$ field of the received message, the mobile
11 station shall store the following parameters and then shall enter the *System Determination*
12 *Substate* of the *Mobile Station Initialization State* with a redirection indication (see 2.6.1.1):
- 13 • Return if fail indicator ($RETURN_IF_FAIL_S = RETURN_IF_FAIL_R$)
- 14 • If $DELETE_TMSI_R$ is equal to '1', the mobile station shall set all the bits of
15 $TMSI_CODE_{S-p}$ to '1'
- 16 • Redirection record ($REDIRECT_REC_S =$ redirection record from received message)
- 17 • If $RECORD_TYPE_R = '00000001'$, the mobile station shall:
- 18 - Set $CDMA_MODE_S$ to '1'
- 19 - Set $DIGITAL_REG_{S-p}$ to '00000000'
- 20 - Set the maximum delay upon redirection ($MAX_REDIRECT_DELAY_S =$
21 $MAX_REDIRECT_DELAY_R$)

22 2.6.2.2.7 Extended Neighbor List Message

23 Whenever a valid *Extended Neighbor List Message* is received on the current Paging
24 Channel ($PAGECH_S$), the configuration message sequence number, $CONFIG_MSG_SEQ_R$,
25 shall be compared to that stored in $EXT_NGHBR_LST_MSG_SEQ_S$. If the comparison
26 results in a match, the mobile station may ignore the message. If the comparison results
27 in a mismatch, then the mobile station shall process the remaining fields in the message as
28 follows.

29 If the $PILOT_INC$ field is not within the valid range specified in 3.7.2.3.2.14, then the
30 mobile station shall ignore the *Extended Neighbor List Message* that contains it.

31 The mobile station shall store the following parameters:

- 32 • Configuration message sequence number ($CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_R$,
33 $EXT_NGHBR_LST_MSG_SEQ_S = CONFIG_MSG_SEQ_R$,
34 $NGHBR_LST_MSG_SEQ_S = CONFIG_MSG_SEQ_R$)
- 35 • Pilot PN sequence offset increment ($PILOT_INC_S = PILOT_INC_R$)

1 The mobile station shall set NGHBR_SET_SIZE_S to the number of neighboring base stations
2 contained in the *Extended Neighbor List Message*.

3 For each of the neighboring base stations contained in the *Extended Neighbor List Message*,
4 if FREQ_INCL_R equals '0', or if FREQ_INCL_R equals '1' and NGHBR_BAND_R is supported, the
5 mobile station shall perform the following:

- 6 • If the i^{th} occurrence of NGHBR_CONFIG_R is equal to '000', '001', or '010', set the
7 NGHBR_CONFIG field of $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of NGHBR_CONFIG_R ;
8 otherwise, set the NGHBR_CONFIG field of $\text{NGHBR_REC}[i]$ to '011'.
- 9 • Set the NGHBR_PN field of $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of NGHBR_PN_R .
- 10 • Set the SEARCH_PRIORITY field of $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of
11 SEARCH_PRIORITY_R .

12 For each of the neighboring base stations contained in the *Extended Neighbor List Message*,
13 if FREQ_INCL_R equals '1' and NGHBR_BAND_R is supported, the mobile station shall also
14 perform the following:

- 15 • Set the NGHBR_BAND field of $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of NGHBR_BAND_R .
- 16 • Set the NGHBR_FREQ field of $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of NGHBR_FREQ_R .

17 For each of the neighboring base stations contained in the *Extended Neighbor List Message*,
18 if FREQ_INCL_R equals '0', the mobile station shall also perform the following:

- 19 • Set the NGHBR_BAND field of $\text{NGHBR_REC}[i]$ to CDMABAND_S .
- 20 • If NGHBR_CONFIG_R equals '010', set the NGHBR_FREQ field of $\text{NGHBR_REC}[i]$ to the
21 first CDMA Channel listed in the *CDMA Channel List Message* or *Extended CDMA*
22 *Channel List Message* transmitted by the current base station; otherwise, set the
23 NGHBR_FREQ field of $\text{NGHBR_REC}[i]$ to CDMACH_S .

24 If $\text{GEN_NGHBR_LST_MSG_SEQ}_S$ is not equal to CONFIG_MSG_SEQ_S , the mobile station
25 shall perform the following:

- 26 • Set the SRCH_WIN_NGHBR field of NGHBR_REC to SRCH_WIN_N_S for all
27 NGHBR_SET_SIZE_S entries.
- 28 • Set the SRCH_OFFSET_NGHBR field of NGHBR_REC to '000' for all NGHBR_SET_SIZE_S
29 entries.

30 The mobile station shall set the ACCESS_ENTRY_HO field of the NGHBR_REC to '0' for all
31 NGHBR_SET_SIZE_S entries if any of the following conditions are met:

- 32 • $\text{EXT_SYS_PARAMETER}_S$ is equal to '0',
- 33 • $\text{NGHBR_SET_ENTRY_INFO}_S$ is equal to '0', or
- 34 • $\text{EXT_SYS_PAR_MSG_SEQ}_S$ is not equal to CONFIG_MSG_SEQ_S .

35 The mobile station shall set the ACCESS_HO_ALLOWED field of the NGHBR_REC to '0' for
36 all NGHBR_SET_SIZE_S entries if any of the following conditions are met:

- 37 • $\text{EXT_SYS_PARAMETER}_S$ is equal to '0',

- 1 • NGHBR_SET_ACCESS_INFO_s is equal to '0', or
- 2 • EXT_SYS_PAR_MSG_SEQ_s is not equal to CONFIG_MSG_SEQ_s.

3 The mobile station shall update the idle handoff Neighbor Set (see 2.6.2.1.4) so that it
 4 consists only of pilot offsets listed in the *Extended Neighbor List Message*. If the *Extended*
 5 *Neighbor List Message* contains more pilot offsets than the mobile station can store, the
 6 mobile station shall store the pilot offsets beginning at the start of the *Extended Neighbor*
 7 *List Message*, up to the limits of the mobile station's Neighbor Set storage capacity.

8 2.6.2.2.8 General Neighbor List Message

9 Whenever a valid *General Neighbor List Message* is received on the current Paging Channel
 10 (PAGECH_s), the configuration message sequence number, CONFIG_MSG_SEQ_r shall be
 11 compared to that stored in GEN_NGHBR_LST_MSG_SEQ_s. If the comparison results in a
 12 match, the mobile station may ignore the message. If the comparison results in a
 13 mismatch, then the mobile station shall process the remaining fields in the message as
 14 follows.

15 If the PILOT_INC field is not within the valid range specified in 3.7.2.3.2.22, then the
 16 mobile station shall ignore the *General Neighbor List Message* that contains it.

17 The mobile station shall store the following parameters:

- 18 • Configuration message sequence number
 19 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
 20 GEN_NGHBR_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r).
- 21 • Pilot PN sequence offset increment (PILOT_INC_s = PILOT_INC_r).

22 If NGHBR_CONFIG_PN_INCL_r is equal to '1' and FREQ_FIELDS_INCL_r is equal to '1', the
 23 mobile station shall store the following parameters:

- 24 • Configuration message sequence number
 25 (EXT_NGHBR_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
 26 NGHBR_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r).

27 The mobile station shall set NGHBR_SET_SIZE_s to the number of neighboring base stations
 28 contained in the *General Neighbor List Message*.

29 For each of the neighboring base stations contained in the *General Neighbor List Message*, if
 30 FREQ_INCL_r equal '0', or if FREQ_INCL_r equal '1' and NGHBR_BAND_r is supported, the
 31 mobile station shall perform the following:

- 32 • If NGHBR_CONFIG_PN_INCL_r is equal to '1', set the NGHBR_CONFIG and NGHBR_PN
 33 fields as follows:
 - 34 - If the *i*th occurrence of NGHBR_CONFIG_r is equal to '000', '001', or '010', set the
 35 NGHBR_CONFIG field of NGHBR_REC[*i*] to the *i*th occurrence of NGHBR_CONFIG_r;
 36 otherwise, set the NGHBR_CONFIG field of NGHBR_REC[*i*] to '011'.
 - 37 - Set the NGHBR_PN field of NGHBR_REC[*i*] to the *i*th occurrence of NGHBR_PN_r.

- 1 • If $NGHBR_SRCH_MODE_r = '00'$ or $'10'$ and $EXT_NGHBR_LST_MSG_SEQ_s$ is not equal
2 to $CONFIG_MSG_SEQ_r$, set $SEARCH_PRIORITY$ field of each $NGHBR_REC$ to $'10'$ (high)
3 for all $NGHBR_SET_SIZE_s$ entries.
- 4 • If $NGHBR_SRCH_MODE_r = '01'$ or $'11'$, set the $SEARCH_PRIORITY$ field of
5 $NGHBR_REC[i]$ to the i^{th} occurrence of $SEARCH_PRIORITY_r$.
- 6 • If $NGHBR_SRCH_MODE_r = '00'$ or $'01'$, set the $SRCH_WIN_NGHBR$ field of each
7 $NGHBR_REC$ to $SEARCH_WIN_s$ for all $NGHBR_SET_SIZE_s$ entries if
8 $SYS_PAR_MSG_SEQ_s$ is equal to $CONFIG_MSG_SEQ_s$; otherwise, set
9 $SETTING_SEARCH_WIN$ to $'1'$.
- 10 • If $NGHBR_SRCH_MODE_r = '00'$ or $'01'$, set the $SRCH_OFFSET_NGHBR$ field of each
11 $NGHBR_REC$ to $'000'$.
- 12 • If $NGHBR_SRCH_MODE_r = '10'$ or $'11'$:
- 13 - set the $SRCH_WIN_NGHBR$ field of $NGHBR_REC[i]$ to the i^{th} occurrence of
14 $SRCH_WIN_NGHBR_r$
- 15 - if $SRCH_OFFSET_INCL_r$ equals $'1'$, set the $SRCH_OFFSET_NGHBR$ field of
16 $NGHBR_REC[i]$ to the i^{th} occurrence of $SRCH_OFFSET_NGHBR_r$, and
17
18 - if $SRCH_OFFSET_INCL_r$ equals $'0'$, set the $SRCH_OFFSET_NGHBR$ field of each
19 $NGHBR_REC$ to $'000'$.
- 19 • If USE_TIMING_r is equal to $'1'$, set the $TIMING_INCL$ field of $NGHBR_REC[i]$ to the i^{th}
20 occurrence of $TIMING_INCL_r$; otherwise, set the $TIMING_INCL$ field of $NGHBR_REC$ to
21 $'0'$ for all entries.
- 22 • If $BCCH_IND_INCL_r$ is equal to $'1'$, set the $BCCH_SUPPORT$ field of $NGHBR_REC[i]$ to
23 the i^{th} occurrence of $BCCH_SUPPORT_r$; otherwise, set the $BCCH_IND_INCL$ field of
24 $NGHBR_REC$ to $'0'$ for all entries.
- 25 • Set the $NGHBR_PDCH_SUPPORTED$ field of $NGHBR_REC[i]$ to the i^{th} occurrence of
26 $NGHBR_PDCH_SUPPORTED_r$ if included; otherwise, set the
27 $NGHBR_PDCH_SUPPORTED$ field of $NGHBR_REC$ to $'0'$ for all entries.
- 28 • The mobile station shall set $RESQ_ENABLED_s = RESQ_ENABLED_r$. If
29 $RESQ_ENABLED_s$ is equal to $'1'$, then the mobile station shall store:
- 30 - Call rescue delay timer value ($RESQ_DELAY_TIME_s = RESQ_DELAY_TIME_r$)
- 31 - Call rescue allowed timer value ($RESQ_ALLOWED_TIME_s =$
32 $RESQ_ALLOWED_TIME_r$)
- 33 - Call rescue attempt timer value ($RESQ_ATTEMPT_TIME_s = RESQ_ATTEMPT_TIME_r$)
- 34 - Code channel index for call rescue ($RESQ_CODE_CHAN_s = RESQ_CODE_CHAN_r$)
- 35 - Quasi-Orthogonal Function mask identifier for call rescue ($RESQ_QOF_s =$
36 $RESQ_QOF_r$)

- 1 - Minimum time between consecutive rescues ($RESQ_MIN_PERIOD_S =$
2 $RESQ_MIN_PERIOD_T + 1$) if $RESQ_MIN_PERIOD_INCL_T$ is equal to '1'; otherwise,
3 $RESQ_MIN_PERIOD_S = '00000'$.
- 4 - The required number of transmissions of a regular PDU before declaring L2
5 Acknowledgment Failure when Call Rescue is enabled
6 ($RESQ_NUM_TOT_TRANS_20MS_S = RESQ_NUM_TOT_TRANS_20MS_T$) if included;
7 otherwise, set $RESQ_NUM_TOT_TRANS_20MS_S$ to N_{1m} .
- 8 - The required number of transmissions of a mini PDU before declaring L2
9 Acknowledgment Failure when Call Rescue is enabled
10 ($RESQ_NUM_TOT_TRANS_5MS_S = RESQ_NUM_TOT_TRANS_5MS_T$) if included;
11 otherwise, set $RESQ_NUM_TOT_TRANS_5MS_S$ to N_{15m} .
- 12 - The Traffic Channel preamble length for Call Rescue Soft Handoff when operating in
13 Radio Configuration 1 or 2 ($RESQ_NUM_PREAMBLE_RC1_RC2_S =$
14 $RESQ_NUM_PREAMBLE_RC1_RC2_T$).
- 15 - The Traffic Channel preamble length for Call Rescue Soft Handoff when operating in
16 Radio Configuration greater than 2 ($RESQ_NUM_PREAMBLE_S =$
17 $RESQ_NUM_PREAMBLE_T$).
- 18 - The power level adjustment to be applied to the last closed-loop power level when
19 re-enabling the transmitter for call rescue soft handoff ($RESQ_POWER_DELTA_S =$
20 $RESQ_POWER_DELTA_T$).
- 21 - Set the $NGHBR_RESQ_CONFIGURED$ field of $NGHBR_REC[i]$ to the i^{th} occurrence
22 of $NGHBR_RESQ_CONFIGURED_T$.

23 For each of the neighboring base stations contained in the *General Neighbor List Message*, if
24 $FREQ_FIELDS_INCL_T$ equals '1', $FREQ_INCL_T$ equals '1', and $NGHBR_BAND_T$ is supported,
25 the mobile station shall also perform the following:

- 26 • Set the $NGHBR_BAND$ field of $NGHBR_REC[i]$ to the i^{th} occurrence of $NGHBR_BAND_T$.
- 27 • Set the $NGHBR_FREQ$ field of $NGHBR_REC[i]$ to the i^{th} occurrence of $NGHBR_FREQ_T$.

28 For each of the neighboring base stations contained in the *General Neighbor List Message*, if
29 USE_TIMING_T is equal to '1' and $TIMING_INCL_T$ equals '1', the mobile station shall also
30 perform the following:

- 31 • Set the $NGHBR_TX_OFFSET$ field of $NGHBR_REC[i]$ to the i^{th} occurrence of
32 $NGHBR_TX_OFFSET_T$.
- 33 • If $GLOBAL_TIMING_INCL_T$ is equal to '1', then the mobile station shall:
 - 34 - Set the $NGHBR_TX_DURATION$ field of $NGHBR_REC$ to $GLOBAL_TX_DURATION_T$
35 for all entries.
 - 36 - Set the $NGHBR_TX_PERIOD$ field of $NGHBR_REC$ to $GLOBAL_TX_PERIOD_T$ for all
37 entries.
- 38 • If $GLOBAL_TIMING_INCL_T$ is equal to '0', then the mobile station shall:

- 1 - Set the NGHBR_TX_DURATION field of NGHBR_REC[i] to the i^{th} occurrence of
2 NGHBR_TX_DURATION_T.
- 3 - Set the NGHBR_TX_PERIOD field of NGHBR_REC[i] to the i^{th} occurrence of
4 NGHBR_TX_PERIOD_T.

5 For each of the neighboring base stations contained in the *General Neighbor List Message*, if
6 $\text{FREQ_FIELDS_INCL}_T$ equals '1' and FREQ_INCL_T equals '0', or if $\text{FREQ_FIELDS_INCL}_T$
7 equals '0' and $\text{EXT_NGHBR_LST_MSG_SEQ}_S$ is not equal to CONFIG_MSG_SEQ_T , the
8 mobile station shall also perform the following:

- 9 • Set the NGHBR_BAND field of NGHBR_REC[i] to CDMABAND_S .
- 10 • If NGHBR_CONFIG_T equals '010', set the NGHBR_FREQ field of NGHBR_REC[i] to the
11 first CDMA Channel listed in the *CDMA Channel List Message* or *Extended CDMA*
12 *Channel List Message* transmitted by the current base station; otherwise, set the
13 NGHBR_FREQ field of NGHBR_REC[i] to CDMACH_S .

14 The mobile station shall set the ACCESS_ENTRY_HO field of the NGHBR_REC to '0' for all
15 NGHBR_SET_SIZE_S entries if any of the following conditions are met:

- 16 • $\text{EXT_SYS_PARAMETER}_S$ is equal to '0'
- 17 • $\text{NGHBR_SET_ENTRY_INFO}_S$ is equal to '0', or
- 18 • $\text{EXT_SYS_PAR_MSG_SEQ}_S$ is not equal to CONFIG_MSG_SEQ_S .

19 The mobile station shall set the ACCESS_HO_ALLOWED field of the NGHBR_REC to '0' for
20 all NGHBR_SET_SIZE_S entries if any of the following conditions are met:

- 21 • $\text{EXT_SYS_PARAMETER}_S$ is equal to '0'
- 22 • $\text{NGHBR_SET_ACCESS_INFO}_S$ is equal to '0', or
- 23 • $\text{EXT_SYS_PAR_MSG_SEQ}_S$ is not equal to CONFIG_MSG_SEQ_S .

24 The mobile station shall update the idle handoff Neighbor Set (see 2.6.2.1.4) so that it
25 consists only of pilot offsets listed in the *General Neighbor List Message*. If the *General*
26 *Neighbor List Message* contains more pilot offsets than the mobile station can store, the
27 mobile station shall store the pilot offsets beginning at the start of the *General Neighbor List*
28 *Message*, up to the limits of the mobile station's Neighbor Set storage capacity.

29 For each of the neighboring base stations contained in the *General Neighbor List Message*,
30 the mobile station shall set the ADD_PILOT_REC_INCL field of NGHBR_REC[i] to the i^{th}
31 occurrence of $\text{ADD_PILOT_REC_INCL}_T$. If $\text{ADD_PILOT_REC_INCL}_T$ equals '1', for each pilot
32 included in the message, the mobile station shall also perform the following:

- 33 • Set the NGHBR_PILOT_REC_TYPE field of NGHBR_PILOT_REC to
34 $\text{NGHBR_PILOT_REC_TYPE}_T$.
- 35 • If $\text{NGHBR_PILOT_REC_TYPE}_T$ is equal to '000'. The mobile station shall:
- 36 - Set the TD_POWER_LEVEL field of NGHBR_PILOT_REC to TD_POWER_LEVEL_T .
- 37 - Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_T .
- 38 • If $\text{NGHBR_PILOT_REC_TYPE}_T$ is equal to '001', the mobile station shall:

- 1 - Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.
- 2 - Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
- 3 AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
- 4 • If NGHBR_PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
- 5 - Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.
- 6 - Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
- 7 AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
- 8 - Set the AUX_TD_POWER_LEVEL field of NGHBR_PILOT_REC to
- 9 AUX_TD_POWER_LEVEL_r.
- 10 - Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
- 11 • If NGHBR_PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
- 12 - Set the SR3_PRIMARY_PILOT field of NGHBR_PILOT_REC to SR3_PRIMARY_PILOT_r.
- 13 - Set the SR3_PILOT_POWER1 field of NGHBR_PILOT_REC to SR3_PILOT_POWER1_r.
- 14 - Set the SR3_PILOT_POWER2 field of NGHBR_PILOT_REC to SR3_PILOT_POWER2_r.
- 15 • If NGHBR_PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
- 16 - Set the SR3_PRIMARY_PILOT field of NGHBR_PILOT_REC to SR3_PRIMARY_PILOT_r.
- 17 - Set the SR3_PILOT_POWER1 field of NGHBR_PILOT_REC to SR3_PILOT_POWER1_r.
- 18 - Set the SR3_PILOT_POWER2 field of NGHBR_PILOT_REC to SR3_PILOT_POWER2_r.
- 19 - Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.
- 20 - Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
- 21 AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
- 22 - If ADD_INFO_INCL1_r is equal to '1', set the AUX_PILOT_QOF1 field of
- 23 NGHBR_PILOT_REC to QOF1_r and set the AUX_PILOT_WALSH_CODE1 field of
- 24 NGHBR_PILOT_REC to AUX_PILOT_WALSH1_r with the Walsh Code length specified
- 25 by WALSH_LENGTH1_r.
- 26 - Otherwise, set the AUX_PILOT_QOF1 field of NGHBR_PILOT_REC to QOF_r and set
- 27 the AUX_PILOT_WALSH_CODE1 field of NGHBR_PILOT_REC to
- 28 AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
- 29 - If ADD_INFO_INCL2_r is equal to '1', set the AUX_PILOT_QOF2 field of
- 30 NGHBR_PILOT_REC to QOF2_r and set the AUX_PILOT_WALSH_CODE2 field of
- 31 NGHBR_PILOT_REC to AUX_PILOT_WALSH2_r with the Walsh Code length specified
- 32 by WALSH_LENGTH2_r.
- 33 - Otherwise, set the AUX_PILOT_QOF2 field of NGHBR_PILOT_REC to QOF_r and set
- 34 the AUX_PILOT_WALSH_CODE2 field of NGHBR_PILOT_REC to
- 35 AUX_PILOT_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
- 36 If HRPD_NGHBR_INCL_r equals '1', the mobile station shall set NUM_HRPD_NGHBR_s to
- 37 NUM_HRPD_NGHBR_r, the number of neighboring HRPD systems contained in the *General*

1 *Neighbor List Message*. For each of the neighboring HRPD systems contained in the
2 *General Neighbor List Message*, the mobile station shall perform the following:

- 3 • Set the PN field of HRPD_NGHBR_LIST[i] to the i^{th} occurrence of NGHBR_PN_r.
- 4 • Set the BAND_CLASS field of HRPD_NGHBR_LIST[i] to the i^{th} occurrence of
5 NGHBR_BAND_r if NGHBR_FREQ_INCL_r equals '1'; otherwise, set the BAND_CLASS
6 field of HRPD_NGHBR_LIST[i] to CDMABAND_s.
- 7 • Set the CDMA_FREQ field of HRPD_NGHBR_LIST[i] to the i^{th} occurrence of
8 NGHBR_FREQ_r if NGHBR_FREQ_INCL_r equals '1'; otherwise, set the BAND_CLASS field
9 of HRPD_NGHBR_LIST[i] to CDMACH_s.
- 10 • Set the PN_ASSOCIATION field of HRPD_NGHBR_LIST[i] to the i^{th} occurrence of
11 PN_ASSOCIATION_IND_r.
- 12 • Set the DATA_ASSOCIATION field of HRPD_NGHBR_LIST[i] to the i^{th} occurrence of
13 DATA_ASSOCIATION_IND_r.

14 2.6.2.2.9 User Zone Identification Message

15 Whenever a *User Zone Identification Message* is received on the Paging Channel or Primary
16 Broadcast Control Channel, and if the mobile station supports Tiered Services, the mobile
17 station shall compare the configuration message sequence number, CONFIG_MSG_SEQ_r,
18 to that stored in USER_ZONE_ID_MSG_SEQ_s. If the comparison results in a match, the
19 mobile station may ignore the message. If the comparison results in a mismatch, then the
20 mobile station shall process the remaining fields in the message as follows.

21 The mobile station shall store the following parameters:

- 22 • Configuration message sequence number (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
23 USER_ZONE_ID_MSG_SEQ_s = CONFIG_MSG_SEQ_r)
- 24 • UZ_EXIT_RCVD_s = UZ_EXIT_r

25 The mobile station shall set NUM_UZID_s to the number of User Zones contained in the *User*
26 *Zone Identification Message*.

27 For each User Zone contained in the *User Zone Identification Message*, the mobile station
28 shall perform the following:

- 29 • Set the UZID field of UZ_REC(i) to the i^{th} occurrence of UZID_r.
- 30 • Set the UZ_REV field of the UZ_REC(i) to the i^{th} occurrence of UZ_REV_r.
- 31 • Set the TEMP_SUB field of the UZ_REC(i) to the i^{th} occurrence of TEMP_SUB_r.

32 2.6.2.2.10 Private Neighbor List Message

33 Whenever a *Private Neighbor List Message* is received on the Paging Channel or Primary
34 Broadcast Control Channel, and if the mobile station supports Tiered Services, the mobile
35 station shall compare the configuration message sequence number, CONFIG_MSG_SEQ_r,
36 to that stored in PRI_NGHBR_LST_MSG_SEQ_s. If the comparison results in a match, the
37 mobile station may ignore the message. If the comparison results in a mismatch, then the
38 mobile station shall process the remaining fields in the message as follows.

1 The mobile station shall store the following parameters:

- 2 • Configuration message sequence number ($CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_R$,
- 3 $PRI_NGHBR_LST_MSG_SEQ_S = CONFIG_MSG_SEQ_R$)
- 4 • Common configuration included indicator ($COMMON_INCL_S = COMMON_INCL_R$)

5 The mobile station shall set $NUM_PRI_NGHBR_S$ to the number of Private Neighbor base
6 stations contained in the *Private Neighbor List Message*.

7 For each Private Neighbor base station contained in the *Private Neighbor List Message* the
8 mobile station shall perform the following:

- 9 • Set the $SRCH_WIN_PRI_NGHBR$ field of $PRI_NGHBR_REC(i)$ to $SRCH_WIN_PN_R$.
- 10 • Set the SID field of $PRI_NGHBR_REC(i)$ to the i^{th} occurrence SID_R .
- 11 • Set the NID field of $PRI_NGHBR_REC(i)$ to the i^{th} occurrence NID_R .
- 12 • Set the PRI_NGHBR_PN field of $PRI_NGHBR_REC(i)$ to the i^{th} occurrence
13 $PRI_NGHBR_PN_R$.
- 14 • If $COMMON_INCL_R$ is equal to '1', then the mobile station shall:
 - 15 - Set the $BAND_CLASS$ field of $PRI_NGHBR_REC(i)$ to $COMMON_BAND_CLASS_R$.
 - 16 - Set the $NGHBR_FREQ$ field of $PRI_NGHBR_REC(i)$ to $COMMON_NGHBR_FREQ_R$.
- 17 • If $COMMON_INCL_R$ is equal to '0', then the mobile station shall:
 - 18 - Set the $BAND_CLASS$ field of $PRI_NGHBR_REC(i)$ to the i^{th} occurrence of
19 $BAND_CLASS_R$.
 - 20 - Set the $NGHBR_FREQ$ field of $PRI_NGHBR_REC(i)$ to the i^{th} occurrence of
21 $NGHBR_FREQ_R$.
- 22 • If i^{th} occurrence of $UZID_INCL_R$ is equal to '0', then the mobile station shall set the
23 PS_NUM_UZID field of $PRI_NGHBR_REC(i)$ to '0000'.
- 24 • If i^{th} occurrence of $UZID_INCL_R$ is equal to '1', then the mobile station shall set the
25 PS_NUM_UZID field of $PRI_NGHBR_REC(i)$ to the NUM_UZID_R associated with the i^{th}
26 occurrence of $UZID_INCL_R$.
- 27 • For each User Zone supported by the i^{th} private system, the mobile station shall
28 perform the following:
 - 29 - Set the $PS_UZID(j)$ field of $PRI_NGHBR_REC(i)$ to the j^{th} occurrence of $UZID_R$.
 - 30 - Set the $PS_UZ_REV(j)$ field of $PRI_NGHBR_REC(i)$ to the j^{th} occurrence of UZ_REV_R .
 - 31 - Set the $PS_TEMP_SUB(j)$ field of $PRI_NGHBR_REC(i)$ to the j^{th} occurrence of
32 $TEMP_SUB_R$.

33 2.6.2.2.11 Extended Global Service Redirection Message

34 Whenever an *Extended Global Service Redirection Message* is received on the Paging
35 Channel or Primary Broadcast Control Channel, the configuration message sequence
36 number, $CONFIG_MSG_SEQ_R$, shall be compared to that stored in

1 EXT_GLOB_SERV_REDIREC_MSG_SEQ_s. If the comparison results in a match, the mobile
 2 station may ignore the message. If the comparison results in a mismatch, the mobile
 3 station shall store the following parameters:

- 4 • Configuration message sequence number (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
 5 GLOB_SERV_REDIREC_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
 6 EXT_GLOB_SERV_REDIREC_MSG_SEQ_s = CONFIG_MSG_SEQ_r)

7 The mobile station shall perform the following:

- 8 • The mobile station shall set (RETURN_IF_FAIL_s = RETURN_IF_FAIL_r),
 9 TEMP_TMSI_CODE to TMSI_CODE_{s-p}, and clear the REDIRECT_REC_LIST. For $i=1$ to
 10 (NUM_ADD_RECORD_r + 1), the mobile station shall perform the following:

- 11 - If all the following conditions are satisfied from the i^{th} redirection record:
 12 + The subfield corresponding to the access overload class, ACCOLC_p, of the
 13 mobile station is set equal to '1' in the REDIRECT_ACCOLC_r field or
 14 ADD_REDIRECT_ACCOLC_r of the i^{th} redirection record.
 15 + MOB_P_REV_p is in the redirection mobile protocol revision range associated
 16 with the i^{th} redirection record (REDIRECT_P_REV_INCL_r = '1' and
 17 EXCL_P_REV_IND_r = '0', and (REDIRECT_P_MIN_r ≤ MOB_P_REV_p ≤
 18 REDIRECT_P_MAX_r) where i is equal to 1).
 19 + MOB_P_REV_p is not in any of the excluded mobile protocol revision range
 20 associated with the i^{th} redirection record (REDIRECT_P_REV_INCL_r = '1' and
 21 EXCL_P_REV_IND_r = '1' and (MOB_P_REV_p < REDIRECT_P_MIN_r or
 22 MOB_P_REV_p > REDIRECT_P_MAX_r)).
 23 + Type of redirection as specified by RECORD_TYPE_r (i is equal to 1) or
 24 ADD_RECORD_TYPE_r is supported.
 25 + BAND_CLASS_r is supported (RECORD_TYPE_r = '00000010' or
 26 ADD_RECORD_TYPE_r = '00000010').
 27 + At least one of the CDMA_CHAN_r is supported for at least one band subclass
 28 (when included) corresponding to REDIRECT_SUBCLASS_r = '1'.
 29 (RECORD_TYPE_r = '00000010' or ADD_RECORD_TYPE_r = '00000010').

30 then mobile station shall store the following parameters from the redirection record:

- 31 + Set DELETE_TMSI field of REDIRECT_REC_LIST[j] to DELETE_TMSI_r (i is equal
 32 to 1) or ADD_DELETE_TMSI_r, where j (i.e., the initial j value is set to 0) is
 33 incremented by 1 whenever the i^{th} redirection record satisfies the redirection
 34 record selection conditions above.
 35 + Set REDIRECT_REC_LIST[j] to the i^{th} redirection record from the received
 36 message.
 37 + Set RECORD_TYPE field of REDIRECT_REC_LIST[j] to RECORD_TYPE_r (i is
 38 equal to 1) or ADD_RECORD_TYPE_r.

- 1 + If RECORD_TYPE_r = '00000001' (*i* is equal to 1) or ADD_RECORD_TYPE_r =
2 '00000001', the mobile station shall:
- 3 ○ Set CDMA_MODE_s to '1'
- 4 ○ Set DIGITAL_REG field of REDIRECT_REC_LIST[*j*] to '00000000'.
- 5 ○ Set MAX_REDIRECT_DELAY field of REDIRECT_REC_LIST[*j*] to
6 MAX_REDIRECT_DELAY_r.
- 7 + If LAST_SEARCH_RECORD_IND_r or ADD_LAST_SEARCH_RECORD_IND_r is
8 equal to '1', the mobile station shall ignore the rest of the message.
- 9 • If REDIRECT_REC_LIST[*j*] is not empty, the mobile station shall enter the *System*
10 *Determination Substate* of the *Mobile Station Initialization State* with a redirection
11 indication (see 2.6.1.1); otherwise, the mobile station shall ignore the *Extended Global*
12 *Service Redirection Message*.

13 2.6.2.2.12 Extended CDMA Channel List Message Overview

14 The mobile station may receive the *Extended CDMA Channel List Message* from the Paging
15 Channel or from the Primary Broadcast Control Channel. The mobile station shall follow
16 requirements defined in 2.6.2.2.12.1 or 2.6.2.2.12.2 to process the *Extended CDMA*
17 *Channel List Message*.

18 2.6.2.2.12.1 Extended CDMA Channel List Message on Paging Channel

19 Whenever an *Extended CDMA Channel List Message* is received on the Paging Channel, the
20 mobile station shall compare the configuration message sequence number,
21 CONFIG_MSG_SEQ_r, to that stored in EXT_CHAN_LST_MSG_SEQ_s. If the comparison
22 results in a match, the mobile station may ignore the message. If the comparison results
23 in a mismatch, then the mobile station shall process the remaining fields in the message as
24 follows:

25 If the *Extended CDMA Channel List Message* lists CDMA channels from more than one band
26 class and the mobile station hashes to a band class other than the current band class, the
27 mobile station shall process this message after NGHBR_LST_MSG_SEQ_s,
28 EXT_NGHBR_LST_MSG_SEQ_s and GEN_NGHBR_LST_MSG_SEQ_s become current.

29 The mobile station shall store the following parameters:

- 30 • Configuration message sequence number (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
31 EXT_CHAN_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
32 CHAN_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r).

33 The mobile station shall process this message if FD_CHAN_LST_MSG_SEQ_s is current and
34 the mobile station does not support any bandclass listed by the base station in the *Flex*
35 *Duplex CDMA Channel List Message* or if the mobile station does not support flexible
36 spacing between forward and reverse channels. Otherwise, the mobile station shall ignore
37 this message.

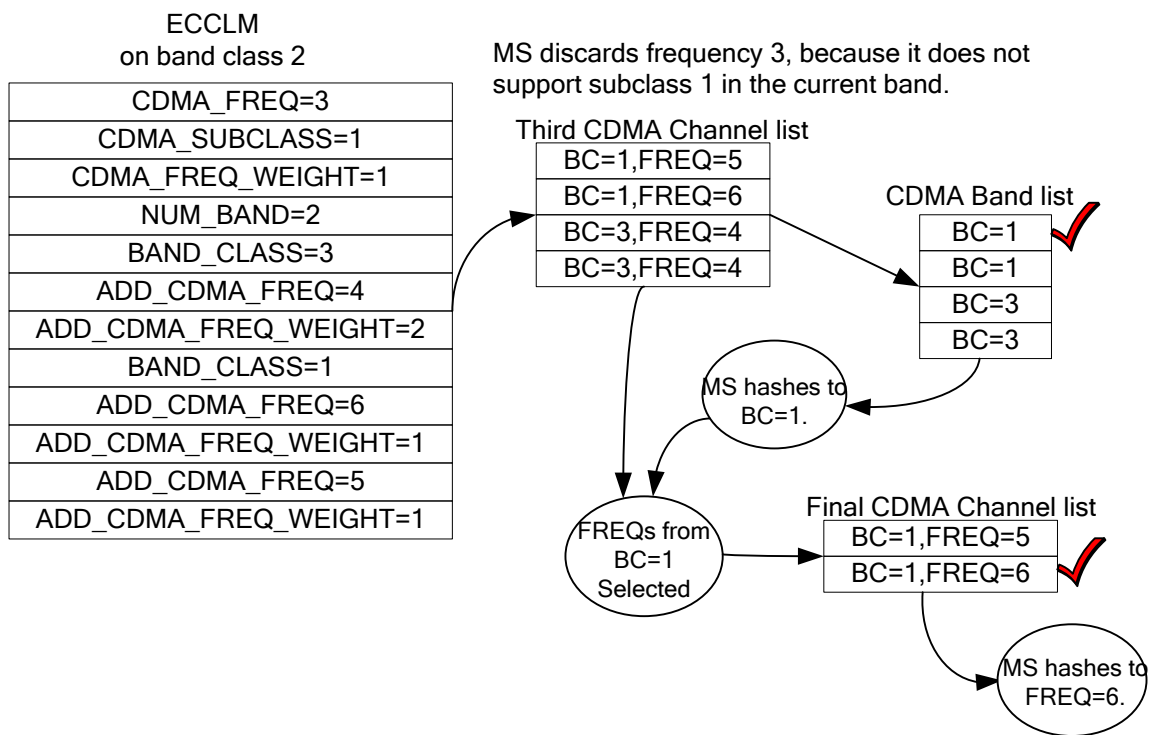

38 The mobile station shall determine the CDMA Channel (Frequency Assignment) for its
39 Paging Channel as follows:

- 1 • Starting from an empty list, the mobile station shall generate the first CDMA Channel
2 list from the *Extended CDMA Channel List Message* as follows:
- 3 - For each band class record included in this message, the mobile station shall
4 perform the following:
- 5 + If band subclass information is included for this band class record
6 (SUBCLASS_INFO_INCL_T = '1' or ADD_SUBCLASS_INFO_INCL_T = '1'), the mobile
7 station shall add only those channels belonging to the band class and band
8 subclasses that are supported by both the mobile station and the base station,
9 in the order they appear in the *Extended CDMA Channel List Message*³².
- 10 + Otherwise (SUBCLASS_INFO_INCL_T = '0', ADD_SUBCLASS_INFO_INCL_T = '0' or
11 P_REV_IN_USE_S is less than 11), the mobile station shall add only those
12 channels that it supports for the associated band class, in the order they appear
13 in the *Extended CDMA Channel List Message*.
- 14 - If P_REV_IN_USE_S is greater than or equal to 11, the mobile station shall sort the
15 channels first by the ascending order of band class value, as specified in ~~[30]~~[53],
16 then by the ascending order of CDMA_FREQ within each band class.
- 17 • If RC_QPCH_SEL_INCL_T is equal to '1' and the mobile station is capable of RC greater
18 than 2 or capable of supporting Quick Paging Channel, the mobile station shall
19 eliminate the channels with RC_QPCH_HASH_IND_T equal to '0' from the first CDMA
20 Channel list to generate the second CDMA Channel list while preserving the order in
21 the first CDMA Channel list. Otherwise, the mobile station shall set the second CDMA
22 Channel list to be equal to the first CDMA Channel list.
- 23 • The mobile station shall generate the third CDMA Channel list as follows.
- 24 - If CDMA_FREQ_WEIGHT_INCL_T is equal to '0', the mobile station shall set the third
25 CDMA Channel list to be equal to the second CDMA Channel list.
- 26 - If CDMA_FREQ_WEIGHT_INCL_T is equal to '1', starting with an empty third CDMA
27 Channel list, for each entry "E" in the second CDMA Channel list in the order they
28 appear, the mobile station shall append N consecutive entries "E" at the end of the
29 third CDMA Channel list, where N is the weight of "E" and equals either
30 CDMA_FREQ_WEIGHT_T+1 or ADD_CDMA_FREQ_WEIGHT_T+1 appropriately.
- 31 • The mobile station shall generate a CDMA band list as follows. Starting with an empty
32 CDMA band list, for each channel in the third CDMA Channel list in the order they
33 appear, the mobile station shall append an entry equal to the band class of that
34 channel, at the end of the CDMA band list.

³² The mobile station will not discard frequencies as long as they belong to a subclass that is both listed in the message and supported by the mobile station. If the base station does not list any subclass, the mobile station assumes that all subclasses are supported by the base station. The subclass to frequency mapping is not provided in the *Extended CDMA Channel List Message*; the mobile station needs to refer to [45] to find the mapping.

- 1 • The mobile station shall use the hash algorithm specified in 2.6.7.1 and the size of the
- 2 CDMA band list to compute the band class for its Paging Channel.
- 3 • The mobile station shall eliminate those channels which are not in the computed band
- 4 class from the third CDMA channel list to generate the final CDMA channel list.
- 5 • If the final CDMA Channel list is empty, the mobile station shall enter the *System*
- 6 *Determination Substate* with an acquisition failure indication.
- 7 • The mobile station shall then use the hash algorithm specified in 2.6.7.1 and the size of
- 8 the final CDMA channel list to determine the CDMA Channel (Frequency Assignment)
- 9 for its Paging Channel.

10 Figure 2.6.2.2.12.1-1 shows an example of the hashing procedure.

11
12
13
14

Figure 2.6.2.2.12.1-1. Hashing Example

15 If the CDMA Frequency Assignment has changed but the band class is the same (the
16 computed CDMA Channel is different from CDMACH_S but the computed CDMA band class
17 is the same as CDMABAND_S), the mobile station shall perform the following actions:

- 18 • If the stored configuration parameters is not current (see 2.6.2.2) for the corresponding
- 19 base station and frequency assignment, the mobile station shall perform the following
- 20 actions:
- 21 - Set CDMACH_S to the new CDMA Channel.

- 1 - Set PAGE_CHAN_s to '1'.
- 2 - Set PAGECH_s to the Primary Paging Channel.
- 3 - Set CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
 4 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
 5 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
 6 EXT_SYS_PAR_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s,
 7 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, USER_ZONE_IDMSG_SEQ_s,
 8 PRI_NGHBR_LST_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
 9 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
 10 ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s to NULL.
 11 The mobile station shall keep the parameters associated with the current overhead
 12 messages until they are updated on the new Paging Channel³³.
- 13 - Tune to the new CDMA Channel.
- 14 • Otherwise, the mobile station shall perform the following actions:
- 15 - Set CDMACH_s to the new CDMA Channel.
- 16 - The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a new
 17 Paging Channel number in the range 1 to PAGE_CHAN_s, where PAGE_CHAN_s is the
 18 value stored for the Paging Channel whose stored information is current. The
 19 mobile station shall store the new Paging Channel number as PAGECH_s.
- 20 - Tune to the new CDMA Channel and shall begin monitoring the new Paging
 21 Channel.

22 If the band class has changed (the computed CDMA band class is different than
 23 CDMABAND_s), the mobile station shall perform the following actions:

- 24 • If BYPASS_SYS_DET_IND_s is equal to '0' for this CDMA channel, the mobile station
 25 shall perform the following:
- 26 - Set NEW_BAND_RECORD.NEW_BAND_CLASS to the computed band class
- 27 - Set NEW_BAND_RECORD.NEW_FREQ to the computed CDMA Channel
- 28 - The mobile station shall enter the *System Determination Substate* of the *Mobile*
 29 *Station Initialization State* with a new band indication.
- 30 • If BYPASS_SYS_DET_IND_s is equal to '1' for this CDMA channel, the mobile station
 31 shall perform the following:

³³ This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1 - If the stored configuration parameters is not current (see 2.6.2.2) for the
 2 corresponding base station and frequency assignment, the mobile station shall
 3 perform the following actions:
- 4 + Set CDMACH_S to the new CDMA Channel.
 - 5 + Set CDMABAND_S to the new band class.
 - 6 + Set PAGE_CHAN_S to '1'.
 - 7 + Set PAGECH_S to the Primary Paging Channel.
 - 8 + Set CONFIG_MSG_SEQ_S, SYS_PAR_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S,
 9 CHAN_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S,
 10 FD_CHAN_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S,
 11 GEN_NGHBR_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S,
 12 GLOB_SERV_REDIR_MSG_SEQ_S, EXT_GLOB_SERV_REDIR_MSG_SEQ_S,
 13 USER_ZONE_IDMSG_SEQ_S, PRI_NGHBR_LST_MSG_SEQ_S,
 14 AP_PILOT_INFO_MSG_SEQ_S, AP_IDT_MSG_SEQ_S, AP_ID_TEXT_MSG_SEQ_S,
 15 GOI_MSG_SEQ_S, FREQ_GOI_MSG_SEQ_S, ATIM_MSG_SEQ_S, GAPM_SEQ_S and
 16 ACC_MSG_SEQ_S, HDPPM_MSG_SEQ_S to NULL. The mobile station shall keep
 17 the parameters associated with the current overhead messages until they are
 18 updated on the new Paging Channel³⁴.
 - 19 + Tune to the new CDMA Channel.
- 20 - Otherwise, the mobile station shall perform the following actions:
- 21 + Set CDMACH_S to the new CDMA Channel.
 - 22 + Set CDMABAND_S to the new band class.
 - 23 + The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a
 24 new Paging Channel number in the range 1 to PAGE_CHAN_S, where
 25 PAGE_CHAN_S is the value stored for the Paging Channel whose stored
 26 information is current. The mobile station shall store the new Paging Channel
 27 number as PAGECH_S.
 - 28 + Tune to the new CDMA Channel and shall begin monitoring the new Paging
 29 Channel.

30 2.6.2.2.12.2 Extended CDMA Channel List Message on Primary Broadcast Control 31 Channel

32 Whenever the *Extended CDMA Channel List Message* is received on the Primary Broadcast
 33 Control Channel, the mobile station shall compare the configuration message sequence

³⁴ This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

1 number, CONFIG_MSG_SEQ_r, to that stored in CONFIG_MSG_SEQ_s. If the comparison
 2 results in a match, the mobile station may ignore the message. If the comparison results
 3 in a mismatch, the mobile station shall process the remaining fields in the message as
 4 follows:

5 If the *Extended CDMA Channel List Message* lists CDMA channels from more than one band
 6 class and the mobile station hashes to a band class other than the current band class, the
 7 mobile station shall process this message after UNI_NGHBR_LST_MSG_SEQ_s becomes
 8 current.

9 The mobile station shall store the following parameters:

- 10 • Configuration message sequence number (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
 11 EXT_CHAN_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r).

12 The mobile station shall process this message if FD_CHAN_LST_MSG_SEQ_s is current and
 13 the mobile station does not support any bandclass listed by the base station in the *Flex*
 14 *Duplex CDMA Channel List Message* or if the mobile station does not support flexible
 15 spacing between forward and reverse channels. Otherwise, the mobile station shall ignore
 16 this message.

17 To determine the CDMA Channel (Frequency Assignment) for its Primary Broadcast Control
 18 Channel, the mobile station shall first select a subset of CDMA channels from the *Extended*
 19 *CDMA Channel List Message* that will be used for channel hashing. The attributes for
 20 channel selection are support for that frequency, the band subclass (if included), RC
 21 greater than 2, Quick Paging Channel and transmit diversity. The mobile station shall first
 22 select the entire CDMA channel list for channel hashing. Starting from an empty list, the
 23 mobile station shall then select the first CDMA Channel list as follows:

- 24 • For each band class record included in this message, the mobile station shall perform
 25 the following:
 - 26 - If band subclass information is included for this band class record
 27 (SUBCLASS_INFO_INCL_r = '1' or ADD_SUBCLASS_INFO_INCL_r = '1'), the mobile
 28 station shall add only those channels belonging to the band class and band
 29 subclasses that are supported by both the mobile station and the base station, in
 30 the order they appear in the *Extended CDMA Channel List Message*³⁵.
 - 31 - Otherwise (SUBCLASS_INFO_INCL_r = '0', ADD_SUBCLASS_INFO_INCL_r = '0' or
 32 P_REV_IN_USE_s is less than 11), the mobile station shall add only those channels
 33 that it supports for the associated band class, in the order they appear in the
 34 *Extended CDMA Channel List Message*.

³⁵ The mobile station will not discard frequencies as long as they belong to a subclass that is both listed in the message and supported by the mobile station. If the base station does not list any subclass, the mobile station assumes that all subclasses are supported by the base station. The subclass to frequency mapping is not provided in the *Extended CDMA Channel List Message*; the mobile station needs to refer to [45] to find the mapping.

- 1 • If $P_REV_IN_USE_s$ is greater than or equal to 11, the mobile station shall sort the
 2 channels first by the ascending order of band class value as specified in ~~[30]~~[53], then
 3 by the ascending order of $CDMA_FREQ$ within each band class.
- 4 • If $TD_SEL_INCL_r$ is equal to '1', the mobile station shall perform the following:
- 5 - If the mobile station is capable of supporting the transmit diversity mode specified
 6 by TD_MODE_r , the mobile station shall select those CDMA channels that have
 7 $TD_HASH_IND_r$ set to '1' from the CDMA channel list for the first CDMA Channel
 8 list while preserving the order.
- 9 - If the mobile station is not capable of supporting the transmit diversity mode
 10 specified by TD_MODE_r , the mobile station shall select those CDMA channels that
 11 have $TD_HASH_IND_r$ set to '0' from the CDMA channel list for the first CDMA
 12 Channel list while preserving the order.
- 13 • If $TD_SEL_INCL_r$ is equal to '0', the mobile station shall select the entire list for the first
 14 CDMA Channel list.

15 From this first CDMA Channel list, the mobile station shall select the second CDMA
 16 Channel list as follows:

- 17 • If $RC_QPCH_SEL_INCL_r$ is equal to '1' and the mobile station is capable of RC greater
 18 than 2 or capable of supporting QPCH, the mobile station shall select those CDMA
 19 channels with $RC_QPCH_HASH_IND_r$ set to '1' for the second CDMA Channel list for
 20 CDMA channel hashing while preserving the order. If this list is empty, the mobile
 21 station shall use the first CDMA Channel list as the second CDMA Channel list for
 22 CDMA channel hashing.
- 23 • Otherwise, the mobile station shall use the first CDMA Channel list as the second
 24 CDMA Channel list for CDMA channel hashing.

25 From this second CDMA Channel list, the mobile station shall select the third CDMA
 26 Channel listsubset as follows:

- 27 • If $CDMA_FREQ_WEIGHT_INCL_r$ is equal to '0', the mobile station shall set the third
 28 CDMA Channel list to be equal to the second CDMA Channel list
- 29 • If $CDMA_FREQ_WEIGHT_INCL_r$ is equal to '1', starting with an empty third CDMA
 30 Channel list, for each entry "E" in the second CDMA Channel list in the order they
 31 appear, the mobile station shall append N consecutive entries "E" at the end of the
 32 third CDMA Channel, where N is the weight of "E" and equals either
 33 $CDMA_FREQ_WEIGHT_{r+1}$ or $ADD_CDMA_FREQ_WEIGHT_{r+1}$ appropriately

34 The mobile station shall determine the band class for its Primary Broadcast Control
 35 Channel as follows:

- 36 • The mobile station shall generate a CDMA band list as follows. Starting with an empty
 37 CDMA band list, for each channel in the third CDMA Channel list in the order they
 38 appear, the mobile station shall append an entry equal to the band class of that
 39 channel, at the end of the CDMA band list

- 1 • The mobile station shall use the hash algorithm specified in 2.6.7.1 and the size of the
2 CDMA band list to compute the band class for its Primary Broadcast Control Channel.

3 After the band class has been selected, the mobile station shall determine the CDMA
4 Channel (Frequency Assignment) for its Primary Broadcast Control Channel as follows:

- 5 • The mobile station shall eliminate those channels which are not in the computed band
6 class from the third CDMA Channel list to generate the final CDMA Channel list.
- 7 • If the final CDMA Channel list is empty, the mobile station shall enter the *System*
8 *Determination Substate* with an acquisition failure indication
- 9 • The mobile station shall then use the hash algorithm specified in 2.6.7.1 with the
10 number of channels in the final CDMA Channel list to determine the CDMA Channel
11 (Frequency Assignment) for its Primary Broadcast Control Channel.

12 If the CDMA Frequency Assignment has changed but the band class is the same (the
13 computed CDMA Channel is different from CDMACH_s but the computed CDMA band class
14 is CDMABAND_s), the mobile station shall perform the following:

- 15 • Set CDMACH_s to the new CDMA Channel.
- 16 • Set CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s,
17 UNI_NGHBR_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
18 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, and
19 PRI_NGHBR_LST_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
20 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s,
21 GAPM_SEQ_s and ACC_MSG_SEQ_s to NULL. The mobile station shall keep the
22 parameters associated with the current overhead messages until they are updated on
23 the new Primary Broadcast Control Channel³⁶.
- 24 • If the mobile station is operating in the Spreading Rate 1:
- 25 - If the assigned CDMA channel supports transmit diversity, the mobile station shall
26 set the following fields corresponding to the assigned CDMA channel:
- 27 + SR1_TD_POWER_LEVEL_s = TD_POWER_LEVEL_r.
- 28 + SR1_TD_MODE_s = TD_MODE_r.
- 29 + BRAT_s = SR1_BRAT_TD_s.
- 30 + BCCH_CODE_RATE_s = SR1_CRAT_TD_s.
- 31 + BCCH_s = BCCH_CODE_CHAN_TD_s.

³⁶ This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

1 - Otherwise, the mobile station shall set the following fields corresponding to the
2 assigned CDMA channel:

- 3 + $BRAT_s = SR1_BRAT_NON_TD_s$,
- 4 + $BCCH_CODE_RATE_s = SR1_CRAT_NON_TD_s$,
- 5 + $BCCH_s = BCCH_CODE_CHAN_NON_TD_s$,
- 6 • Tune to the new CDMA Channel

7 If the band class has changed (the computed CDMA band class is different than
8 $CDMABAND_s$), the mobile station shall perform the following actions:

- 9 • If $BYPASS_SYS_DET_IND_r$ is equal to '0' for this CDMA channel, the mobile station
10 shall perform the following:
 - 11 - Set $NEW_BAND_RECORD.NEW_BAND_CLASS$ to the computed band class.
 - 12 - Set $NEW_BAND_RECORD.NEW_FREQ$ to the computed CDMA Channel.
 - 13 - The mobile station shall enter the *System Determination Substate* of the *Mobile*
14 *Station Initialization State* with a new band indication.
- 15 • If $BYPASS_SYS_DET_IND_r$ is equal to '1' for this CDMA channel, the mobile station
16 shall perform the following:
 - 17 - Set $CDMACH_s$ to the new CDMA Channel.
 - 18 - Set $CDMABAND_s$ to the new band class.
 - 19 - Set $CONFIG_MSG_SEQ_s$, $A41_SYS_PAR_MSG_SEQ_s$, $MC_RR_PAR_MSG_SEQ_s$,
20 $UNI_NGHBR_LST_MSG_SEQ_s$, $EXT_CHAN_LST_MSG_SEQ_s$,
21 $FD_CHAN_LST_MSG_SEQ_s$, $USER_ZONE_ID_MSG_SEQ_s$, and
22 $PRI_NGHBR_LST_MSG_SEQ_s$, $AP_PILOT_INFO_MSG_SEQ_s$, $AP_IDT_MSG_SEQ_s$,
23 $AP_ID_TEXT_MSG_SEQ_s$, $GOI_MSG_SEQ_s$, $FREQ_GOI_MSG_SEQ_s$,
24 $ATIM_MSG_SEQ_s$, $GAPM_SEQ_s$ and $ACC_MSG_SEQ_s$ to NULL. The mobile station
25 shall keep the parameters associated with the current overhead messages until they
26 are updated on the new Primary Broadcast Control Channel³⁷.
 - 27 - If the mobile station is operating in the Spreading Rate 1:
 - 28 + If the assigned CDMA channel supports transmit diversity, the mobile station
29 shall set the following fields corresponding to the assigned CDMA channel:
 - 30 ○ $SR1_TD_POWER_LEVEL_s = TD_POWER_LEVEL_r$.
 - 31 ○ $SR1_TD_MODE_s = TD_MODE_r$.

³⁷ This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1 ○ BRAT_S = SR1_BRAT_TD_S.
- 2 ○ BCCH_CODE_RATE_S = SR1_CRAT_TD_S.
- 3 ○ BCCH_S = BCCH_CODE_CHAN_TD_S.
- 4 - Otherwise, the mobile station shall set the following fields corresponding to the
5 assigned CDMA channel:
- 6 + BRAT_S = SR1_BRAT_NON_TD_S,
- 7 + BCCH_CODE_RATE_S = SR1_CRAT_NON_TD_S,
- 8 + BCCH_S = BCCH_CODE_CHAN_NON_TD_S,
- 9 - Tune to the new CDMA Channel

10 2.6.2.2.13ANSI-41 System Parameters Message

11 Whenever an *ANSI-41 System Parameters Message* is received, the configuration message
12 sequence number, CONFIG_MSG_SEQ_r, shall be compared to that stored in
13 A41_SYS_PAR_MSG_SEQ_s. If the comparison results in a match, the mobile station may
14 ignore the message. If the comparison results in a mismatch, then the mobile station shall
15 process the remaining fields in the message as described in 2.6.2.2.13.1, 2.6.2.2.13.2,
16 2.6.2.2.13.3, and 2.6.2.2.13.4.

17 If REG_PRD is not within the valid range specified in 3.7.2.3.2.31, then the mobile station
18 shall ignore the *ANSI-41 System Parameters Message* that contains it.

19 2.6.2.2.13.1 Stored Parameters

20 The mobile station shall store the following parameters:

- 21 • Configuration message sequence number (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
22 A41_SYS_PAR_MSG_SEQ_s = CONFIG_MSG_SEQ_r)
- 23 • Home registration indicator (HOME_REG_s = HOME_REG_r)
- 24 • SID roamer registration indicator (FOR_SID_REG_s = FOR_SID_REG_r)
- 25 • NID roamer registration indicator (FOR_NID_REG_s = FOR_NID_REG_r)
- 26 • Power-up registration indicator (POWER_UP_REG_s = POWER_UP_REG_r)
- 27 • Power-down registration indicator (POWER_DOWN_REG_s = POWER_DOWN_REG_r)
- 28 • Parameter-change registration indicator (PARAMETER_REG_s = PARAMETER_REG_r)
- 29 • Preferred Enhanced Access Channel MSID type
30 (PREF_MSID_TYPE_s = PREF_MSID_TYPE_r)
- 31 • Extended Preferred Enhanced Access Channel MSID type
32 (EXT_PREF_MSID_TYPE_s = EXT_PREF_MSID_TYPE_r), if included; otherwise, set
33 EXT_PREF_MSID_TYPE_s to NULL.
- 34 • MEID Required indicator is included (MEID_REQD_s = MEID_REQD_r), if included;
35 otherwise, set MEID_REQD_s to '0'

- 1 • The mobile station shall set its operational IMSI, IMSI_O, as follows:
- 2 - If IMSI_T_SUPPORTED_r is equal to '0', the mobile station shall set IMSI_O to
- 3 IMSI_{Mp}.
- 4 - If IMSI_T_SUPPORTED_r is equal to '1' and the mobile station's IMSI_{Tp} has been
- 5 programmed, the mobile station shall set IMSI_O to IMSI_{Tp}.
- 6 - If IMSI_T_SUPPORTED_r is equal to '1' and the mobile station's IMSI_{Tp} has not
- 7 been programmed, the mobile station shall set IMSI_O to IMSI_{Mp}.
- 8 - If IMSI_O has been changed, the mobile station shall set MC_RR_PAR_MSG_SEQ_s,
- 9 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s to NULL and set
- 10 NUM_FCCCH_s to '1' and FCCCH_ID_s to '1'.
- 11 • If OTHER_INFO_INCL_r is set to '1', the mobile station shall store:
- 12 - Base station identification (BASE_ID_s = BASE_ID_r)
- 13 - If MCC_r = '111111111' and IMSI_11_12_r = '111111', the mobile station shall set
- 14 the IMSI_O to IMSI_{Mp} and store:
- 15 + Mobile Country Code (MCC_s = MCC_{Mp}) and
- 16 + IMSI 11th and 12th digits (IMSI_11_12_s = IMSI_{M_11_12p});
- 17 - Otherwise, the mobile station shall store:
- 18 + Mobile Country Code (MCC_s = MCC_r) and
- 19 + IMSI 11th and 12th digits (IMSI_11_12_s = IMSI_11_12_r).
- 20 - Broadcast GPS assist indicator (BROADCAST_GPS_ASST_s =
- 21 BROADCAST_GPS_ASST_r)
- 22 - Signaling encryption supported indicator (SIG_ENCRYPT_SUP_s =
- 23 SIG_ENCRYPT_SUP_r)
- 24 • Least significant digit of MNC (IMSI_10_s = IMSI_10_r), if included.
- 25 • If IMSI_O is set to the IMSI_M, the mobile station shall set:
- 26 - IMSI_{O_Ss} to IMSI_{M_Sp} (i.e., IMSI_{O_S1s} to IMSI_{M_S1p} and IMSI_{O_S2s} to
- 27 IMSI_{M_S2p})
- 28 - IMSI_{O_11_12s} to IMSI_{M_11_12p}
- 29 - MCC_{O_s} to MCC_{Mp}
- 30 - IMSI_{O_ADDR_NUMs} to IMSI_{M_ADDR_NUMp}
- 31 • If IMSI_O is set to the IMSI_T, the mobile station shall set:
- 32 - IMSI_{O_Ss} to IMSI_{T_Sp} (i.e., IMSI_{O_S1s} to IMSI_{T_S1p} and IMSI_{O_S2s} to
- 33 IMSI_{T_S2p}).
- 34 - IMSI_{O_11_12s} to IMSI_{T_11_12p}
- 35 - MCC_{O_s} to MCC_{Tp}

- 1 - IMSI_O_ADDR_NUM_s to IMSI_T_ADDR_NUM_p
- 2 • Delete foreign TMSI (DELETE_FOR_TMSI_s = DELETE_FOR_TMSI_r)
- 3 • Use TMSI (USE_TMSI_s = USE_TMSI_r)
- 4 • TMSI zone length (TMSI_ZONE_LEN_s = TMSI_ZONE_LEN_r)
- 5 • TMSI zone number (TMSI_ZONE_s = TMSI_ZONE_r)
- 6 • Maximum number of alternative service options (MAX_NUM_ALT_SO_s =
- 7 MAX_NUM_ALT_SO_r).
- 8 • The mobile station shall set all bits of TMSI_CODE_{s-p} to '1' if all of the following
- 9 conditions are met:
- 10 - The bits of TMSI_CODE_{s-p} are not all equal to '1',
- 11 - DELETE_FOR_TMSI_s is equal to '1', and
- 12 - ASSIGNING_TMSI_ZONE_LEN_{s-p} is not equal to TMSI_ZONE_LEN_s, or the least
- 13 significant ASSIGNING_TMSI_ZONE_LEN_{s-p} octets of
- 14 ASSIGNING_TMSI_ZONE_{s-p} are not equal to TMSI_ZONE_s.
- 15 • Message integrity supported indicator (MSG_INTEGRITY_SUP_s =
- 16 MSG_INTEGRITY_SUP_r), if P_REV_IN_USE_s is greater than or equal to 10; otherwise,
- 17 MSG_INTEGRITY_SUP_s = 0.
- 18 • If MSG_INTEGRITY_SUP_r is equal to '1' and SIG_INTEGRITY_SUP_INCL_r is equal to '1',
- 19 the mobile station shall store the message integrity algorithms that the base station
- 20 supports (SIG_INTEGRITY_SUP_s = SIG_INTEGRITY_SUP_r); otherwise, the mobile station
- 21 shall set SIG_INTEGRITY_SUP_s to '00000000'.
- 22 If the mobile station supports packet data service options, the mobile station shall store the
- 23 packet data services zone identifier (PACKET_ZONE_ID_s = PACKET_ZONE_ID_r); otherwise,
- 24 the mobile station shall set PACKET_ZONE_ID_s to '00000000'.
- 25 If the mobile station supports packet data service options and the PZ_HYST_ENABLED field
- 26 is included, the mobile station shall store the packet zone hysteresis enabled indicator
- 27 (PZ_HYST_ENABLED_s = PZ_HYST_ENABLED_r); otherwise, the mobile station shall set
- 28 PZ_HYST_ENABLED_s to '1'.
- 29 If the mobile station supports packet data service options and the PZ_HYST_LIST_LEN field
- 30 is included, the mobile station shall store the packet zone hysteresis list length
- 31 (PZ_HYST_LIST_LEN_s = PZ_HYST_LIST_LEN_r); otherwise, the mobile station shall set
- 32 PZ_HYST_LIST_LEN_s to 4.
- 33 If the mobile station supports packet data service options and the PZ_HYST_ACT_TIMER
- 34 field is included, the mobile station shall store the packet zone hysteresis activation timer
- 35 (PZ_HYST_ACT_TIMER_s = PZ_HYST_ACT_TIMER_r); otherwise, the mobile station shall set
- 36 PZ_HYST_ACT_TIMER_s to 30 seconds.
- 37 If the mobile station supports packet data service options and the PZ_HYST_TIMER_MUL
- 38 field and the PZ_HYST_TIMER_EXP field are included, the mobile station shall store the
- 39 packet zone hysteresis timer (PZ_HYST_TIMER_s = PZ_HYST_TIMER_MUL_r × 8 ^

1 PZ_HYST_TIMER_EXP_T); otherwise, the mobile station shall set PZ_HYST_TIMER_S to 60
2 seconds.

3 If the mobile station supports the *Device Information Message* on the r-csch, the mobile
4 station shall store:

- 5 • Autonomous message supported indicator
6 (AUTO_MSG_SUPPORTED_S = AUTO_MSG_SUPPORTED_T)

7 If AUTO_MSG_SUPPORTED_T is equal to '1' and the mobile station supports *the Device*
8 *Information Message* on the r-csch, the mobile station shall store:

- 9 • Autonomous message interval
10 (AUTO_MSG_INTERVAL_S = AUTO_MSG_INTERVAL_T)

11 The mobile station shall store concurrent service supported indicator (CS_SUPPORTED_S=
12 CS_SUPPORTED_T).

13 Maximum number of additional service reference identifiers allowed in origination
14 (MAX_ADD_SERV_INSTANCE_S = MAX_ADD_SERV_INSTANCE_T), if included; otherwise, the
15 mobile station shall set MAX_ADD_SERV_INSTANCE_S to 0.

16 The mobile station shall store mobile station initiated position location determination
17 supported indicator (MS_INIT_POS_LOC_SUP_IND_S = MS_INIT_POS_LOC_SUP_IND_T).

18 The mobile station shall also perform the following:

- 19 • If the mobile station is not in the *Origination Attempt Substate*, or *Page Response*
20 *Substate*, the mobile station shall store the following prior to storing the remaining
21 parameters:

- 22 - Registered system identification (REG_SID_S = SID_S).
- 23 - Registered network identification (REG_NID_S = NID_S).
- 24 - Registered registration zone (REG_REG_ZONE_S = REG_ZONE_S).
- 25 - Registered zone timer length (REG_ZONE_TIMER_S = ZONE_TIMER_T).

- 26 • System identification (SID_S = SID_T)
- 27 • Network identification (NID_S = NID_T)
- 28 • Registration zone (REG_ZONE_S = REG_ZONE_T)
- 29 • Number of registration zones to be retained (TOTAL_ZONES_S = TOTAL_ZONES_T)
- 30 • Zone timer length (ZONE_TIMER_S = ZONE_TIMER_T)
- 31 • Multiple SID storage indicator (MULT_SIDS_S = MULT_SIDS_T)
- 32 • Multiple NID storage indicator (MULT_NIDS_S = MULT_NIDS_T)
- 33 • Registration period (REG_PRD_S = REG_PRD_T)
- 34 • If DIST_REG_INCL is equal to '1', the mobile station shall store:
 - 35 - Registration distance (REG_DIST_S = REG_DIST_T)

- 1 • If DIST_REG_INCL is equal to '0', then the mobile station shall set REG_DIST_s equal to
2 '00000000000'.
- 3 • If TKZ_MODE_SUPPORTED_r is not included, the mobile station shall set
4 TKZ_MODE_SUPPORTED_s to '0'; otherwise, the mobile station shall set
5 TKZ_MODE_SUPPORTED_s to TKZ_MODE_SUPPORTED_r. If TKZ_MODE_SUPPORTED_s
6 is equal to '1', the mobile station shall store the tracking zone identifier
7 (TKZ_ID_s = TKZ_ID_r).

8 The mobile station shall ignore any fields at the end of the *ANSI-41 System Parameters*
9 *Message* that are not defined according to the protocol revision level (MOB_P_REV_p) of the
10 current band class) being used by the mobile station.

11 2.6.2.2.13.2 Roaming Status

12 The mobile station shall determine the roaming status for the mobile station (see 2.6.5.3).
13 The mobile station should indicate to the user whether the mobile station is roaming.

14 2.6.2.2.13.3 Registration

15 The mobile station shall update stored variables and perform other registration procedures
16 as specified in 2.6.5.5.2.2.

17 2.6.2.2.13.4 PACA Disable for SID Change

18 If PACA_s is equal to enabled, and SID_s is not equal to PACA_SID_s, the mobile station shall
19 set PACA_s to disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and
20 should indicate to the user that the PACA call has been canceled

21 2.6.2.2.14 MC-RR Parameters Message

22 Whenever an *MC-RR Parameters Message* is received, the configuration message sequence
23 number, CONFIG_MSG_SEQ_r, shall be compared to that stored in
24 MC_RR_PAR_MSG_SEQ_s. If the comparison results in a match, the mobile station may
25 ignore the message. If the comparison results in a mismatch, then the mobile station shall
26 process the remaining fields in the message as described in 2.6.2.2.14.1, 2.6.2.2.14.2, and
27 2.6.2.2.14.3.

28 If the protocol revision level supported by the mobile station (MOB_P_REV_p) is less than the
29 minimum protocol revision level supported by the base station (MIN_P_REV_r), the mobile
30 station shall enter the *System Determination Substate* of the *Mobile Station Initialization State*
31 with a protocol mismatch indication (see 2.6.1.1).

32 If BASE_LAT, BASE_LONG, or PWR_REP_THRESH is not within the valid ranges specified
33 in 3.7.2.3.2.31, then the mobile station shall ignore the *MC-RR Parameters Message* that
34 contains them.

35 If the mobile station supports Spreading Rate 3 on the common channel and SR3_INCL_s is
36 equal to '1', the mobile station shall set:

- 37 • BRAT_s = SR3_BRAT_r,
- 38 • BCCH_s = SR3_BCCH_CODE_CHAN_r;

- 1 • $BCCH_CODE_RATE_S = 1/3$;
- 2 • $SR3_PRIMARY_PILOT_S = SR3_PRIMARY_PILOT_R$;
- 3 • $SR3_PILOT_POWER1_S = SR3_PILOT_POWER1_R$;
- 4 • $SR3_PILOT_POWER2_S = SR3_PILOT_POWER2_R$;
- 5 • If $SR3_CENTER_FREQ_INCL_R$ is equal to '1', $POTENTIAL_CDMACH_S =$
- 6 $SR3_CENTER_FREQ_R$.

7 If $POTENTIAL_CDMACH_S$ is different from $CDMACH_S$, the mobile station shall set
8 $CDMACH_S = POTENTIAL_CDMACH_S$ and then tune to the CDMA Channel ($CDMACH_S$).

9 2.6.2.2.14.1 Stored Parameters

10 The mobile station shall store the following parameters:

- 11 • Configuration message sequence number ($CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_R$,
- 12 $MC_RR_PAR_MSG_SEQ_S = CONFIG_MSG_SEQ_R$)
- 13 • Base station identification ($BASE_ID_S = BASE_ID_R$)
- 14 • Protocol revision level ($P_REV_S = P_REV_R$)
- 15 • Protocol revision level currently in use ($P_REV_IN_USE_S =$ the lesser value of P_REV_S
- 16 and $MOB_P_REV_P$ of the current band class)
- 17 • Minimum protocol revision level ($MIN_P_REV_S = MIN_P_REV_R$).
- 18 • Search window size for the Active Set and Candidate Set
- 19 ($SRCH_WIN_A_S = SRCH_WIN_A_R$)
- 20 • Search window size for the Remaining Set ($SRCH_WIN_R_S = SRCH_WIN_R_R$)
- 21 • Pilot detection threshold ($T_ADD_S = T_ADD_R$)
- 22 • Pilot drop threshold ($T_DROP_S = T_DROP_R$)
- 23 • Active Set versus Candidate Set comparison threshold ($T_COMP_S = T_COMP_R$)
- 24 • Drop timer value ($T_TDROP_S = T_TDROP_R$)
- 25 • Drop timer range value ($T_TDROP_RANGE_S = T_TDROP_RANGE_R$) if
- 26 $T_TDROP_RANGE_INCL_R$ is equal to '1'; otherwise, $T_TDROP_RANGE_S = '0000'$
- 27 • Maximum age for retention of Neighbor Set members
- 28 ($NGHBR_MAX_AGE_S = NGHBR_MAX_AGE_R$)
- 29 • Slope of the handoff add/drop criterion ($SOFT_SLOPE_S = SOFT_SLOPE_R$)
- 30 • Intercept of the handoff add criterion ($ADD_INTERCEPT_S = ADD_INTERCEPT_R$)
- 31 • Intercept of the handoff drop criterion ($DROP_INTERCEPT_S = DROP_INTERCEPT_R$)
- 32 • If $ENC_SUPPORTED_R$ is equal to '1', the mobile station shall store:
 - 33 - Signaling encryption supported indicator ($SIG_ENCRYPT_SUP_S =$
 - 34 $SIG_ENCRYPT_SUP_R$)

- 1 - User information encryption supported indicator (UI_ENCRYPT_SUP_s =
2 UI_ENCRYPT_SUP_r)
- 3 If P_REV_IN_USE_s has been changed, the mobile station shall set ACC_MSG_SEQ_s,
4 GAPM_SEQ_s, CURR_ACC_MSG_SEQ, A41_SYS_PAR_MSG_SEQ_s,
5 UNI_NGHBR_LST_MSG_SEQ_s, and EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 6 If CCH_INFO_INCL_r is equal to '1', the mobile station shall store:
- 7 • If MCC_r = '111111111' and IMSI_11_12_r = '111111', the mobile station shall set the
8 IMSI_O to IMSI_M_p and store:
 - 9 - Mobile Country Code (MCC_s = MCC_{M_p}) and
 - 10 - IMSI 11th and 12th digits (IMSI_11_12_s = IMSI_M_11_12_p);
 - 11 • Otherwise, the mobile station shall store:
 - 12 - Mobile Country Code (MCC_s = MCC_r) and
 - 13 - IMSI 11th and 12th digits (IMSI_11_12_s = IMSI_11_12_r).
 - 14 • Least significant digit of MNC (IMSI_10_s = IMSI_10_r), if included.
 - 15 • If IMSI_O has been changed, the mobile station shall set EXT_CHAN_LST_MSG_SEQ_s,
16 FD_CHAN_LST_MSG_SEQ_s to NULL, and set NUM_FCCCH_s to '1' and FCCCH_ID_s to
17 '1'.
 - 18 • *Extended Global Service Redirection Message* sent
19 (EXT_GLOBAL_REDIRECT_s = EXT_GLOBAL_REDIRECT_r) if included; otherwise,
20 EXT_GLOBAL_REDIRECT_s = '0'
 - 21 • *User Zone Identification Message* sent
22 (USER_ZONE_ID_s = USER_ZONE_ID_r) if included; otherwise, USER_ZONE_ID_s = '0'
 - 23 • *Private Neighbor List Message* sent
24 (PRI_NGHBR_LST_s = PRI_NGHBR_LST_r) if included; otherwise, PRI_NGHBR_LST_s = '0'
 - 25 • *ANSI-41 RAND Message* sent
26 (SENDING_RAND_s = SENDING_RAND_r) if included; otherwise, SENDING_RAND_s = '0'
 - 27 • *Access Point Pilot Information Message* sent
28 (AP_PILOT_INFO_s = AP_PILOT_INFO_r) if included; otherwise, AP_PILOT_INFO_s = '0'
- 29 If the APPIM_PERIOD_INDEX is included in the message APPIM_PERIOD_INDEX_s =
30 APPIM_PERIOD_INDEX_r. Otherwise, APPIM_PERIOD_INDEX_s = 0.
- 31 • *Access Point Identification Message* sent
32 (AP_IDT_s = AP_IDT_r) if included; otherwise, AP_IDT_s = '0'
 - 33 • *Access Point Identification Text Message* sent
34 (AP_ID_TEXT_s = AP_ID_TEXT_r) if included; otherwise, AP_ID_TEXT_s = '0'
 - 35 • *General Overhead Information Message* sent
36 (GEN_OVHD_INF_IND_s = GEN_OVHD_INF_IND_r) if included; otherwise,
37 GEN_OVHD_INF_IND_s = '0'

1 If the GEN_OVHD_CYCLE_INDEX is included in the message GEN_OVHD_CYCLE_INDEX_S
2 = GEN_OVHD_CYCLE_INDEX_T. Otherwise, GEN_OVHD_CYCLE_INDEX_S = 0.

- 3 • *Frequent General Overhead Information Message* sent
4 (FREQ_GEN_OVHD_INF_IND_S = FREQ_GEN_OVHD_INF_IND_T) if included; otherwise,
5 FREQ_GEN_OVHD_INF_IND_S = '0'.
- 6 • *Flex Duplex CDMA Channel List Message* sent
7 (FD_CHAN_LST_IND_S = FD_CHAN_LST_IND_T) if included; otherwise,
8 FD_CHAN_LST_IND_S = '0'.
- 9 • *Alternative Technologies Information Message* sent
10 (ATIM_IND_S = ATIM_IND_T) if included; otherwise, ATIM_IND_S = '0'

11 If the ATIM_CYCLE_INDEX is included in the message ATIM_CYCLE_INDEX_S =
12 ATIM_CYCLE_INDEX_T.

13 Otherwise, ATIM_CYCLE_INDEX_S = 0.

- 14 • Maximum slot cycle index (MAX_SLOT_CYCLE_INDEX_S = MAX_SLOT_CYCLE_INDEX_T)
- 15 • *BCMC Service Parameters Message* sent
16 (SENDING_BSPM_S = SENDING_BSPM_T), if included; otherwise, set SENDING_BSPM_S to
17 '0'.
- 18 • *BCMC Service Parameters Message* transmission periodicity index
19 (BSPM_PERIOD_INDEX_S = BSPM_PERIOD_INDEX_T) if SENDING_BSPM_T equals '1';
20 otherwise, BSPM_PERIOD_INDEX_S = NULL.
- 21 • BSPM_PERIOD_INDEX_S is not equal to NULL, the mobile station shall set
22 BSPM_WAIT_TIME to $(B + 1) \times 160\text{ms}$ where

$$23 \quad B = 2^i \times 16, 0 \leq i \leq 15$$

24 and $i = \text{BSPM_PERIOD_INDEX}_S$.

- 25 • Power control reporting threshold (PWR_REP_THRESH_S = PWR_REP_THRESH_T)
- 26 • Power control reporting frame count (PWR_REP_FRAMES_S = PWR_REP_FRAMES_T)
- 27 • Threshold report mode indicator
28 (PWR_THRESH_ENABLE_S = PWR_THRESH_ENABLE_T)
- 29 • Periodic report mode indicator (PWR_PERIOD_ENABLE_S = PWR_PERIOD_ENABLE_T).
- 30 • Power report delay (PWR_REP_DELAY_S = PWR_REP_DELAY_T)
- 31 • System reselection indicator (RESELECT_INCLUDED_S = RESELECT_INCLUDED_T).
- 32 • Pilot reporting indicator (PILOT_REPORT_S = PILOT_REPORT_T)
- 33 • Short Data Burst supported indicator (SDB_SUPPORTED_S = SDB_SUPPORTED_T)
- 34 • Broadcast GPS Assist Indicator (BROADCAST_GPS_ASST_S = BROADCAST_GPS_ASST_T)
- 35 • Nominal reverse traffic channel output power offset relative to Reverse Pilot Channel
36 power (RLGAIN_TRAFFIC_PILOT_S = RLGAIN_TRAFFIC_PILOT_T)

- 1 • If NUM_FCCCH_r is not equal to '0':
- 2 - Number of the Forward Common Control Channels (NUM_FCCCH_s = NUM_FCCCH_r)
- 3 - Data rate for the Forward Common Control Channels (FCCCH_RATE_s =
- 4 FCCCH_RATE_r)
- 5 - Code rate for the Forward Common Control Channels (FCCCH_CODE_RATE_s =
- 6 FCCCH_CODE_RATE_r)
- 7 - For i = 0 to NUM_FCCCH_r - 1, store the channel code index for each Forward
- 8 Common Control Channel (FCCCH_CODE_CHAN_s[i] = FCCCH_CODE_CHAN_r)
- 9 • Broadcast index (BCAST_INDEX_s = BCAST_INDEX_r)
- 10 • The number of Broadcast Control Channels (NUM_BCCH_BCAST_s =
- 11 NUM_BCCH_BCAST_r)
- 12 • If NUM_BCCH_BCAST_r is greater than '000', i occurrences of the following fields, where
- 13 i ranges from 1 to NUM_BCCH_BCAST_r:
- 14 - Set the Broadcast Control Channel Number (BCN) to i+1
- 15 - BCCH Walsh code index (BCCH_CODE_CHAN[BCN]_s = BCCH_CODE_CHAN[i]_r)
- 16 - BCCH data rate (BRAT[BCN]_s = BRAT[i]_r)
- 17 - BCCH code rate (BCCH_CODE_RATE[BCN]_s = BCCH_CODE_RATE[i]_r)
- 18 • Sync ID supported indicator (USE_SYNC_ID_s = USE_SYNC_ID_r)
- 19 • Pilot information request supported indicator (PILOT_INFO_REQ_SUPPORTED_s =
- 20 PILOT_INFO_REQ_SUPPORTED_r).
- 21 • Band class information request indicator (BAND_CLASS_INFO_REQ_s =
- 22 BAND_CLASS_INFO_REQ_r)
- 23 • Alternate CDMA band class (ALT_BAND_CLASS_s = ALT_BAND_CLASS_r), if
- 24 BAND_CLASS_INFO_REQ_r is equal to '1'.
- 25 • Access entry handoff in order and message processing operation indicator
- 26 (ACC_ENT_HO_ORDER_s = ACC_ENT_HO_ORDER_r).
- 27 • If REV_PWR_CNTL_DELAY_INCL is equal to '1', reverse power control delay
- 28 (REV_PWR_CNTL_DELAY_s = REV_PWR_CNTL_DELAY_r)
- 29 • Permission indicator for the mobile station to request QoS settings in the *Origination*
- 30 *Message*, *Origination Continuation Message*, or *Enhanced Origination Message*
- 31 (MOB_QOS_s = MOB_QOS_r)
- 32 • If RESELECT_INCLUDED_s is equal to '1', the mobile station shall store:
- 33 - Pilot power threshold (EC_THRESH_s = EC_THRESH_r)
- 34 - Pilot E_c/I₀ threshold (EC_I0_THRESH_s = EC_I0_THRESH_r)
- 35 • Access handoff permitted indicator (ACCESS_HO_s = ACCESS_HO_r)

- 1 • Access probe handoff permitted indicator ($ACCESS_PROBE_HO_S =$
2 $ACCESS_PROBE_HO_T$)
- 3 • If $ACCESS_PROBE_HO_S$ is equal to '1', access handoff list update permitted indicator
4 ($ACC_HO_LIST_UPD_S = ACC_HO_LIST_UPD_T$)
- 5 • Maximum number of times that the mobile station is permitted to perform an access
6 probe handoff ($MAX_NUM_PROBE_HO_S = MAX_NUM_PROBE_HO_T$)
- 7 • Access handoff permitted for message response indicator ($ACCESS_HO_MSG_RSP_S =$
8 $ACCESS_HO_MSG_RSP_T$)
- 9 • Access probe handoff permitted for other messages indicator
10 ($ACC_PROBE_HO_OTHER_MSG_S = ACC_PROBE_HO_OTHER_MSG_T$)
- 11 • If $USER_ZONE_ID_S$ is equal to '0', then the mobile station shall perform the following:
12 - Set $USER_ZONE_ID_MSG_SEQ_S$ to $CONFIG_MSG_SEQ_S$.
13 - Set the UZID field of the UZ_REC to '0000000000000000' for all entries.
14 - Set the UZ_REV field of the UZ_REC to '0000' for all entries.
15 - Set the TEMP_SUB field of the UZ_REC to '0' for all entries.
- 16 • If $USER_ZONE_ID_S$ is equal to '1' and the mobile station does not support Tiered
17 Services, then the mobile station shall set $USER_ZONE_ID_MSG_SEQ_S$ to
18 $CONFIG_MSG_SEQ_S$.
- 19 • If $PRI_NGHBR_LST_S$ is equal to '0', then the mobile station shall set
20 $PRI_NGHBR_LST_MSG_SEQ_S$ to $CONFIG_MSG_SEQ_S$.
- 21 • If $PRI_NGHBR_LST_S$ is equal to '1' and the mobile station does not support Tiered
22 Services, then the mobile station shall set $PRI_NGHBR_LST_MSG_SEQ_S$ to
23 $CONFIG_MSG_SEQ_S$.
- 24 • If $EXT_GLOBAL_REDIRECT_S$ is equal to '0', then the mobile station shall set
25 $EXT_GLOB_SERV_REDIR_MSG_SEQ_S$ to $CONFIG_MSG_SEQ_S$.
- 26 • The mobile station shall perform the following:
27 - If $SENDING_RAND_S$ is equal to '1', the mobile station shall set $AUTH_S$ to '01';
28 otherwise, the mobile station shall set $AUTH_S$ to '00'.
- 29 • The mobile station shall store the following:
30 - Base station latitude ($BASE_LAT_S = BASE_LAT_T$)
31 - Base station longitude ($BASE_LONG_S = BASE_LONG_T$)
- 32 • If $CAND_BAND_INFO_REQ_T$ is included, the mobile station shall set
33 $CAND_BAND_INFO_REQ_S$ to $CAND_BAND_INFO_REQ_T$; otherwise, the mobile station
34 shall set $CAND_BAND_INFO_REQ_S$ to '0'.
- 35 • If $CAND_BAND_INFO_REQ_T$ is set to '1', the mobile station shall store the number of
36 candidate band classes minus one ($NUM_CAND_BAND_CLASS_S =$
37 $NUM_CAND_BAND_CLASS_T$).

- 1 • If CAND_BAND_INFO_REQ_r is set to '1', the mobile station shall perform the following
2 for each occurrence of the CAND_BAND_CLASS record:
- 3 - Set the CAND_BAND_CLASS field of CAND_BAND_CLASS_REC[j] to the ith
4 occurrence of CAND_BAND_CLASS_r.
- 5 - Set the SUBCLASS_REC_LEN field of CAND_BAND_CLASS_REC[j] to the
6 corresponding value of SUBCLASS_REC_LEN_r.
- 7 - If the ith occurrence of SUBCLASS_REC_LEN_r field is non-zero, the mobile station
8 shall perform the following for each band subclass indicator received:
- 9 + Set the BAND_SUBCLASS_IND_REC[j] field of CAND_BAND_CLASS_REC[j] to
10 the jth occurrence of BAND_SUBCLASS_IND_r in the
11 CDMA_BAND_CLASS_REC[j].
- 12 If TX_PWR_LIMIT_INCL_r is set to '1' and the mobile station is operating in the 1915MHz –
13 1920MHz block of the PCS band, the mobile station shall store the transmit power limit
14 TX_PWR_LIMIT_s = (TX_PWR_LIMIT_r - 30dB); otherwise, the mobile station shall set
15 TX_PWR_LIMIT_s to the limit defined in [11].
- 16 If CCH_INFO_INCL_r is equal to '1' and the mobile station supports the Quick Paging
17 Channel operation:
- 18 • The mobile station shall set QPCH_SUPPORTED_s to QPCH_SUPPORTED_r.
- 19 • If QPCH_SUPPORTED_r = '1':
- 20 - The mobile station shall set QPCH_RATE_s to QPCH_RATE_r.
- 21 - If the mobile station is monitoring the Primary Broadcast Control Channel in
22 Spreading Rate 1 and the number of Quick Paging Channels specified in the
23 received message (NUM_QPCH_r) is different from NUM_QPCH_s, the mobile station
24 shall use the hash algorithm specified in 2.6.7.1 to select a new Quick Paging
25 Channel number in the range 1 to NUM_QPCH_r. The mobile station shall store the
26 new Quick Paging Channel number as QPAGECH_s and as ASSIGNED_QPAGECH_s.
27 The mobile station shall then set NUM_QPCH_s to NUM_QPCH_r.
- 28 - If the mobile station is monitoring the Primary Broadcast Control Channel in
29 Spreading Rate 3 and the number of Quick Paging Channels specified in the
30 received message (NUM_QPCH_r) is different from NUM_QPCH_s, the mobile station
31 shall perform the following:
- 32 + The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a
33 new Quick Paging Channel number in the range 1 to NUM_QPCH_r.
- 34 + The mobile station shall store the new Quick Paging Channel number as
35 QPAGECH_s and as ASSIGNED_QPAGECH_s.
- 36 + For i = 0 to NUM_QPCH_s - 1, store the channel code index for each Quick Paging
37 Channel (QPCH_CODE_CHAN_s[i] = QPCH_CODE_CHAN_r).
- 38 • The mobile station shall set QPCH_POWER_LEVEL_PAGE_s to
39 QPCH_POWER_LEVEL_PAGE_r.

- 1 • The mobile station shall set QPCH_CCI_SUPPORTED_S to QPCH_CCI_SUPPORTED_T.
- 2 • If QPCH_CCI_SUPPORTED_T = '1', the mobile station shall set
3 QPCH_POWER_LEVEL_CONFIG_S to QPCH_POWER_LEVEL_CONFIG_T.
- 4 • The mobile station shall set QPCH_BI_SUPPORTED_S to QPCH_BI_SUPPORTED_T.
- 5 • If QPCH_BI_SUPPORTED_T = '1', the mobile station shall set
6 QPCH_POWER_LEVEL_BCAST_S to QPCH_POWER_LEVEL_BCAST_T.
- 7 The mobile station shall store the following:
- 8 • CDMA off time report supported indicator
9 (CDMA_OFF_TIME_REP_SUP_IND_S = CDMA_OFF_TIME_REP_SUP_IND_T)
- 10 • If CDMA_OFF_TIME_REP_SUP_IND_T is equal to '1', the mobile station shall store:
- 11 - CDMA off time report threshold (CDMA_OFF_TIME_REP_THRESHOLD_S =
12 CDMA_OFF_TIME_REP_THRESHOLD_T in units specified by
13 CDMA_OFF_TIME_REP_UNIT_T)
- 14 • Control Hold Mode supported indicator (CHM_SUPPORTED_S = CHM_SUPPORTED_T) if
15 included; otherwise, set CHM_SUPPORTED_S to '1'.
- 16 • Release to Idle State allowed indicator (RELEASE_TO_IDLE_IND_S =
17 RELEASE_TO_IDLE_IND_T).
- 18 • *Reconnect Message* supported indicator
19 (RECONNECT_MSG_IND_S = RECONNECT_MSG_IND_T).
- 20 • Short Data Burst allowed in *Reconnect Message* allowed indicator
21 (SDB_IN_RCNM_IND_S = SDB_IN_RCNM_IND_T), if included; otherwise, set
22 SDB_IN_RCNM_IND_S to '0'.
- 23 • Forward Packet Data Channel supported indicator (FOR_PDCH_SUPPORTED_S =
24 FOR_PDCH_SUPPORTED_T).
- 25 • PDCH Control Hold Mode supported indicator (PDCH_CHM_SUPPORTED_S =
26 PDCH_CHM_SUPPORTED_T) if included; otherwise, set PDCH_CHM_SUPPORTED_S to '0'.
- 27 The mobile station shall set FOR_PDCH_COMMON_PARMS_S = '0'.
- 28 If both FOR_PDCH_SUPPORTED_T and PDCH_PARMS_INCL_T are included and equal to '1',
29 the mobile station shall perform the following:
- 30 • If FOR_PDCH_RLGAIN_INCL_T is included and equal to '1', the mobile station shall set:
- 31 - (RLGAIN_ACKCH_PILOT_S = RLGAIN_ACKCH_PILOT_T).
- 32 - (RLGAIN_CQICH_PILOT_S = RLGAIN_CQICH_PILOT_T).
- 33 • The mobile station shall set
34 NUM_SOFT_SWITCHING_FRAMES_S = NUM_SOFT_SWITCHING_FRAMES_T + 1, and
35 NUM_SOFTER_SWITCHING_FRAMES_S = NUM_SOFTER_SWITCHING_FRAMES_T + 1.
- 36 • The mobile station shall set
37 NUM_SOFT_SWITCHING_FRAMES_CHM_S = NUM_SOFT_SWITCHING_FRAMES_T + 1,

- 1 and $\text{NUM_SOFTER_SWITCHING_FRAMES_CHM}_S =$
 2 $\text{NUM_SOFTER_SWITCHING_FRAMES}_T + 1$.
- 3 • The mobile station shall set $\text{NUM_SOFT_SWITCHING_SLOTS}_S$ according to Table
 4 3.7.2.3.2.21-9 based on the value of $\text{NUM_SOFT_SWITCHING_SLOTS}_T$.
 - 5 • The mobile station shall set $\text{NUM_SOFTER_SWITCHING_SLOTS}_S$ according to Table
 6 3.7.2.3.2.21-9 based on the value of $\text{NUM_SOFTER_SWITCHING_SLOTS}_T$.
 - 7 • The mobile station shall set $\text{PDCH_SOFT_SWITCHING_DELAY}_S$ to
 8 $\text{PDCH_SOFT_SWITCHING_DELAY}_T + 1$, and $\text{PDCH_SOFTER_SWITCHING_DELAY}_S$ to
 9 $\text{PDCH_SOFTER_SWITCHING_DELAY}_T + 1$.
 - 10 • The mobile station shall set $\text{FOR_PDCH_COMMON_PARMS}_S = '1'$.
 - 11 • The mobile station shall set $\text{WALSH_TABLE_ID}_S = \text{WALSH_TABLE_ID}_T$.
 - 12 • The mobile station shall set $\text{NUM_PDCCH}_S = \text{NUM_PDCCH}_T$.
 - 13 • The mobile station shall store $\text{FOR_PDCCH_WALSH}_S[i]$ to the i^{th} occurrence of
 14 FOR_PDCCH_WALSH_T .

15 The mobile station shall store the following:

- 16 • If $\text{NEG_SLOT_CYCLE_INDEX_SUP}_T$ is included and equal to '1', the mobile station shall
 17 set $\text{MIN_SLOT_CYCLE_INDEX}$ to -4; otherwise, the mobile station shall set
 18 $\text{MIN_SLOT_CYCLE_INDEX}$ to 0.
- 19 • If $\text{RER_MODE_SUPPORTED}_T$ is not included, the mobile station shall set
 20 $\text{RER_MODE_SUPPORTED}_S$ to '0'; otherwise, the mobile station shall set
 21 $\text{RER_MODE_SUPPORTED}_S$ to $\text{RER_MODE_SUPPORTED}_T$.
- 22 • If $\text{AUTO_FCSSO_ALLOWED}_T$ is not included, the mobile station shall set
 23 $\text{AUTO_FCSSO_ALLOWED}_S$ to '0'; otherwise, the mobile station shall set
 24 $\text{AUTO_FCSSO_ALLOWED}_S$ to $\text{AUTO_FCSSO_ALLOWED}_T$.

25 If $\text{FOR_PDCH_SUPPORTED}_T$ is equal to '1', then the mobile station shall set Reverse Packet
 26 Data Channel supported indicator ($\text{REV_PDCH_SUPPORTED}_S =$
 27 $\text{REV_PDCH_SUPPORTED}_T$).

28 If $\text{REV_PDCH_PARMS_INCL}_T$ is not included, or if it is included and equal to '0', the mobile
 29 station shall set $\text{REV_PDCH_PARMS_INCL}_S$ to '0'; otherwise, the mobile station shall set
 30 $\text{REV_PDCH_PARMS_INCL}_S$ to '1' and perform the following:

- 31 • If $\text{REV_PDCH_RLGAIN_INCL}_T$ is equal to '1', the mobile station shall set:
 - 32 - $(\text{RLGAIN_SPICH_PILOT}_S = \text{RLGAIN_SPICH_PILOT}_T)$.
 - 33 - $(\text{RLGAIN_REQCH_PILOT}_S = \text{RLGAIN_REQCH_PILOT}_T)$.
 - 34 - $(\text{RLGAIN_PDCCH_PILOT}_S = \text{RLGAIN_PDCCH_PILOT}_T)$.
- 35 • If $\text{REV_PDCH_PARMS_1_INCL}_T$ is equal to '1', the mobile station shall set:
 - 36 - $(\text{REV_PDCH_TABLE_SEL}_S = \text{REV_PDCH_TABLE_SEL}_T)$.
 - 37 - $(\text{REV_PDCH_MAX_AUTO_TPR}_S \text{ to } \text{REV_PDCH_MAX_AUTO_TPR}_T)$.

- 1 - (REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_s =
2 REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_r+1).
- 3 • If REV_PDCH_OPER_PARMS_INCL_r is equal to '1', the mobile station shall set:
- 4 - (REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_s
5 = REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_r+1).
- 6 - (REV_PDCH_DEFAULT_PERSISTENCE_s = REV_PDCH_DEFAULT_PERSISTENCE_r).
- 7 - (REV_PDCH_RESET_PERSISTENCE_s = REV_PDCH_RESET_PERSISTENCE_r).
- 8 - (REV_PDCH_GRANT_PRECEDENCE_s = REV_PDCH_GRANT_PRECEDENCE_r).
- 9 - (REV_PDCH_MSIB_SUPPORTED_s = REV_PDCH_MSIB_SUPPORTED_r).
- 10 - (REV_PDCH_SOFT_SWITCHING_RESET_IND_s
11 = REV_PDCH_SOFT_SWITCHING_RESET_IND_r).

12 The mobile station shall store the following:

- 13 • If BYPASS_REG_IND_r is included, the mobile station shall set BYPASS_REG_IND_s to
14 BYPASS_REG_IND_r; otherwise, the mobile station shall set BYPASS_REG_IND_s to '00'.
- 15 • If RC_BITMAP_CAPABILITY_EXT_ALLOWED_r is included and is equal to '1', the mobile
16 station shall set RC_BITMAP_CAPABILITY_EXT_ALLOWED_s to '1'; otherwise, the mobile
17 station shall set RC_BITMAP_CAPABILITY_EXT_ALLOWED_s to '0'.
- 18 • *Call Recovery Request Message* supported indicator CRRM_MSG_IND is included, the
19 mobile station shall set CRRM_MSG_IND_s = CRRM_MSG_IND_r. Otherwise, the mobile
20 station shall set CRRM_MSG_IND_s to '0'.
- 21 • Base station horizontal location uncertainty (LOC_UNC_H_s = LOC_UNC_H_r)
- 22 • Base station height (HEIGHT_s = HEIGHT_r)
- 23 • Base station vertical location uncertainty (LOC_UNC_V_s = LOC_UNC_V_r)
- 24 • *Additional Geo Location Type Record allowed in General Extension Message* indicator
25 (ADD_LOC_GEM_ALLOWED_s = ADD_LOC_GEM_ALLOWED_r) if included; otherwise,
26 ADD_LOC_GEM_ALLOWED_s = '0'.

27 The mobile station shall ignore any fields at the end of the *MC-RR Parameters Message* that
28 are not defined according to the protocol revision level (MOB_P_REV_p of the current band
29 class) being used by the mobile station.

30 2.6.2.2.14.2 Slot Cycle Index

31 The mobile station shall set SLOT_CYCLE_INDEX_s to:

$$32 \max \left(\begin{array}{l} \text{MIN_SLOT_CYCLE_INDEX}_s, \\ \min(\text{SLOT_CYCLE_INDEX_REG}, \text{MAX_SLOT_CYCLE_INDEX}_s) \end{array} \right).$$

33 Where, SLOT_CYCLE_INDEX_REG is computed based on the slot cycle index value
34 included in the last registration attempt (see 2.6.5.5.3.1 and 2.6.5.5.3.2).

1 If the mobile station is operating in the slotted mode, it shall set its slot cycle length as
2 described in 2.6.2.1.1.3.

3 2.6.2.2.14.3 Forward Common Control Channel Assignment Change

4 If the number of Forward Common Control Channels specified in the *MC-RR Parameters*
5 *Message* (NUM_FCCCH_T) is not equal to '0' and is different from NUM_FCCCH_S , the mobile
6 station shall use the hash algorithm specified in 2.6.7.1 to select a new Forward Common
7 Control Channel number in the range 1 to NUM_FCCCH_T and shall store this value as
8 $FCCCH_ID_S$. If NUM_FCCCH_T is not equal to '0', the mobile station shall store the FCCCH
9 rate ($FCCCH_RATE_S = FCCCH_RATE_T$), the FCCCH code rate ($FCCCH_CODE_RATE_S =$
10 $FCCCH_CODE_RATE_T$), and store $FCCCH_CODE_CHAN_T$ of the corresponding Forward
11 Common Control Channel as $FCCCH_CODE_CHAN_S$. The mobile station shall then set
12 NUM_FCCCH_S to NUM_FCCCH_T .

13 The mobile station shall set $ACC_MSG_SEQ_S$ and $GAPM_SEQ_S$ to NULL.

14 2.6.2.2.14.4 RESCAN Parameter

15 If the $RESCAN_T$ field in the *MC-RR Parameters Message* equals '1', the mobile station shall
16 enter the *System Determination Substate* of the *Mobile Station Initialization State* with a
17 rescan indication (see 2.6.1.1).

18 2.6.2.2.15 Enhanced Access Parameters Message

19 Whenever an *Enhanced Access Parameters Message* is received on the f-csch, the sequence
20 number, $ACC_MSG_SEQ_T$, shall be compared to $ACC_MSG_SEQ_S$. If the comparison
21 results in a match, the mobile station may ignore the message. If the comparison results
22 in a mismatch, then the mobile station shall process the remaining fields in the message as
23 follows:

24 If MAX_REQ_SEQ or MAX_RSP_SEQ are not within the valid ranges specified in
25 3.7.2.3.2.2, then the mobile station shall ignore the *Enhanced Access Parameters Message*
26 that contains them.

27 The mobile station shall store the following parameters:

- 28 • *Enhanced Access Parameters Message* sequence number
29 ($ACC_MSG_SEQ_S = ACC_MSG_SEQ_T$)
- 30 • Persistence related parameters:
 - 31 - If $PSIST_PARMS_INCL$ is equal to '1', store the following:
 - 32 + Persistence parameter number according to the following rule: If the mobile
33 station's access overload class is in the range 0-9 inclusive, set $PSIST_S$ equal to
34 $PSIST(0-9)_EACH_T$; otherwise set $PSIST_S$ equal to $PSIST(n)_EACH_T$, where n is
35 equal to the mobile station access overload class.
 - 36 + Persistence modifier for Enhanced Access Channel attempts for registrations
37 which are not responses to the *Registration Request Order*
38 ($REG_PSIST_S = REG_PSIST_EACH_T$).

- 1 + Persistence modifier for Enhanced Access Channel attempts for message
2 transmissions (MSG_PSIST_S = MSG_PSIST_EACH_T).
- 3 + Persistence modifier for emergency calls by the mobile stations in access
4 overload classes 0 to 9 (PSIST_EMG_S = PSIST_EMG_T).
- 5 - If PSIST_PARM_{S_INCL_T} is equal to '0', store the following:
6 + Set PSIST_S to 0.
- 7 + Persistence modifier for emergency calls by a mobile station in access overload
8 classes 0 to 9 (PSIST_EMG_S = '000').
- 9 + Persistence modifier for Enhanced Access Channel attempts for message
10 transmissions (MSG_PSIST_S = '000').
- 11 + Persistence modifier for Enhanced Access Channel attempts for registrations
12 which are not responses to the *Registration Request Order* (REG_PSIST_S = '000').
- 13 • The mobile station shall store the Access Control based on Call Type (ACCT)
14 information as follows:
- 15 - Set ACCT_SO_LIST to NULL.
- 16 - Set ACCT_SO_GRP_LIST to NULL.
- 17 - If ACCT_INCL_T is equal to '1' and ACCOLC_P is in the range 0 to 9, then the mobile
18 station shall perform the following:
- 19 + Set ACCT_INCL_EMG_S to ACCT_INCL_EMG_T.
- 20 + If ACCT_SO_INCL_T is equal to '1', then for each ACCT_SO_T included in this
21 message:
- 22 ○ If ACCT_AOC_BITMAP_INCL_T is equal to '0', or if ACCT_AOC_BITMAP_INCL_T
23 is equal to '1' and the bit in the associated ACCT_AOC_BITMAP1_T
24 corresponding to the mobile station's ACCOLC_P (see Table 3.7.2.3.2.2-1) is
25 equal to '1', then add ACCT_SO_T to ACCT_SO_LIST.
- 26 + If ACCT_SO_GRP_INCL_T is equal to '1', then for each ACCT_SO_GRP_T included in
27 this message:
- 28 ○ If ACCT_AOC_BITMAP_INCL_T is equal to '0', or if ACCT_AOC_BITMAP_INCL_T
29 is equal to '1' and the bit in the associated ACCT_AOC_BITMAP2_T
30 corresponding to the mobile station's ACCOLC_P (see Table 3.7.2.3.2.2-1) is
31 equal to '1', then add ACCT_SO_GRP_T to ACCT_SO_GRP_LIST.
- 32 • Link Access Control related parameters:
- 33 - Acknowledgment timeout (EACH_ACC_TMO_S = ACC_TMO_T)
- 34 - Maximum number of probe sequences for an Enhanced Access Channel request
35 (MAX_REQ_SEQ_S = MAX_REQ_SEQ_T)
- 36 - Maximum number of probe sequences for an Enhanced Access Channel response
37 (MAX_RSP_SEQ_S = MAX_RSP_SEQ_T)

- 1 • Mode Selection Table:
- 2 $NUM_MODE_SELECTION_ENTRIES_S = (NUM_MODE_SELECTION_ENTRIES_R + 1)$
- 3 For $i = 1$ to $NUM_MODE_SELECTION_ENTRIES_S$:
- 4 - $MODE_SELECTION_S[i].ACCESS_MODE = ACCESS_MODE$ field of the i^{th}
- 5 occurrence of the record
- 6 - $MODE_SELECTION_S[i].MIN_DURATION = ACCESS_MODE_MIN_DURATION$ field of
- 7 the i^{th} occurrence of the record
- 8 - $MODE_SELECTION_S[i].MAX_DURATION = ACCESS_MODE_MAX_DURATION$ field of
- 9 the i^{th} occurrence of the record
- 10 • Reverse gain adjustment of the Enhanced Access Channel or Reverse Common Control
- 11 Channel relative to the Reverse Pilot Channel ($RLGAIN_COMMON_PILOT_S =$
- 12 $RLGAIN_COMMON_PILOT_R$)
- 13 • The threshold level at which the interference correction begins to be applied
- 14 ($IC_THRESH_S = - IC_THRESH_R$)
- 15 • The maximum interference correction that can be applied ($IC_MAX_S = IC_MAX_R$)
- 16 • Mode-specific parameters for the Enhanced Access Channel:
- 17 For $i = 1$ to $NUM_MODE_PARAM_REC + 1$:
- 18 For $j = 0$ to 7:
- 19 If the $(j+1)^{th}$ subfield of $APPLICABLE_MODES$ is equal to '1', store the following
- 20 parameters:
- 21 - Nominal transmit power offset on the Enhanced Access Channel
- 22 ($MODE_PARAMS_S[j].EACH_NOM_PWR = EACH_NOM_PWR$ field of the i^{th}
- 23 occurrence of the record)
- 24 - Initial power offset for access on the Enhanced Access Channel
- 25 ($MODE_PARAMS_S[j].EACH_INIT_PWR = EACH_INIT_PWR$ field of the i^{th}
- 26 occurrence of the record)
- 27 - Power increment on the Enhanced Access Channel
- 28 ($MODE_PARAMS_S[j].EACH_PWR_STEP = EACH_PWR_STEP$ field of the i^{th}
- 29 occurrence of the record)
- 30 - Number of access probes on the Enhanced Access Channel
- 31 ($MODE_PARAMS_S[j].EACH_NUM_STEP = EACH_NUM_STEP$ field of the i^{th}
- 32 occurrence of the record)
- 33 - Preamble enabled indicator on the Enhanced Access Channel
- 34 ($MODE_PARAMS_S[j].EACH_PREAMBLE_ENABLED = EACH_PREAMBLE_ENA$
- 35 $BLED$ field of the i^{th} occurrence of the record)
- 36 - Number of preamble fractions sent on the Enhanced Access Channel if
- 37 $MODE_PARAMS_S[j].EACH_PREAMBLE_ENABLED$ is equal to '1'
- 38 ($MODE_PARAMS_S[j].EACH_PREAMBLE_NUM_FRAC =$

- 1 EACH_PREAMBLE_NUM_FRAC field of the i^{th} occurrence of the record)
- 2 – Fractional preamble duration on the Enhanced Access Channel if
3 MODE_PARMS_s[j].EACH_PREAMBLE_ENABLED is equal to '1'
4 (MODE_PARMS_s[j].EACH_PREAMBLE_FRAC_DURATION = EACH_PREAMBL
5 E_FRAC_DURATION field of the i^{th} occurrence of the record)
- 6 – Preamble gated-off duration on the Enhanced Access Channel if
7 MODE_PARMS_s[j].EACH_PREAMBLE_ENABLED is equal to '1'
8 (MODE_PARMS_s[j].EACH_PREAMBLE_OFF_DURATION = EACH_PREAMBLE
9 _OFF_DURATION field of the i^{th} occurrence of the record)
- 10 – Additional preamble duration on the Enhanced Access Channel if
11 MODE_PARMS_s[j].EACH_PREAMBLE_ENABLED is equal to '1'
12 (MODE_PARMS_s[j].EACH_PREAMBLE_ADD_DURATION =
13 EACH_PREAMBLE_ADD_DURATION field of the i^{th} occurrence of the record)
- 14 – Enhanced Access Channel probe backoff range
15 (MODE_PARMS_s[j].EACH_PROBE_BKOFF = EACH_PROBE_BKOFF field of
16 the i^{th} occurrence of the record)
- 17 – Enhanced Access Channel probe sequence backoff range
18 (MODE_PARMS_s[j].EACH_BKOFF = EACH_BKOFF field of the i^{th} occurrence
19 of the record)
- 20 – Enhanced Access Channel slot (MODE_PARMS_s[j].EACH_SLOT = 1 +
21 EACH_SLOT field of the i^{th} occurrence of the record)
- 22 – Enhanced Access Channel first slot offset
23 (MODE_PARMS_s[j].EACH_SLOT_OFFSET1 = EACH_SLOT_OFFSET1 field of
24 the i^{th} occurrence of the record)
- 25 – Enhanced Access Channel second slot offset
26 (MODE_PARMS_s[j].EACH_SLOT_OFFSET2 = EACH_SLOT_OFFSET2 field of
27 the i^{th} occurrence of the record)
- 28 • Additional parameters for the Basic Access Mode:
29 If BA_PARMS_LEN_r is equal to '000', set the Basic Access Mode supported indicator,
30 BA_SUPPORTED_s, to '0'; otherwise store the following parameters:
- 31 – Basic Access Mode supported indicator (BA_SUPPORTED_s = '1')
- 32 – Number of Enhanced Access Channels (NUM_EACH_BA_s = (NUM_EACH_BA_r + 1))
- 33 – Rate words supported on the Enhanced Access Channels
34 (EACH_BA_RATES_SUPPORTED_s = EACH_BA_RATES_SUPPORTED_r)
- 35 • Additional parameters for the Reservation Access Mode:
36 If RA_PARMS_LEN_r is equal to '00000', set the Reservation Access Mode supported
37 indicator, RA_SUPPORTED_s, to '0'; otherwise store the following parameters, if included
38 in the message:
- 39 – Reservation Access Mode supported indicator (RA_SUPPORTED_s = '1')
- 40 – Number of Enhanced Access Channels (NUM_EACH_RA_s = (NUM_EACH_RA_r + 1))

- 1 - Number of Common Assignment Channels ($NUM_CACH_S = (NUM_CACH_T + 1)$)
- 2 - Code rate of Common Assignment Channels ($CACH_CODE_RATE_S =$
3 $CACH_CODE_RATE_T$)
- 4 - For $i = 0$ to $NUM_CACH_S - 1$, store the channel code index for each Common
5 Assignment Channel ($CACH_CODE_CHAN_S[i] = CACH_CODE_CHAN_T$).
- 6 - Number of Reverse Common Control Channels ($NUM_RCCCH_S = (NUM_RCCCH_T +$
7 $1)$)
- 8 - Rate words supported on the Reverse Common Control Channels
9 ($RCCCH_RATES_SUPPORTED_S = RCCCH_RATES_SUPPORTED_T$)
- 10 - Preamble enabled indicator on the Reverse Common Control Channels
11 ($RCCCH_PREAMBLE_ENABLED_S = RCCCH_PREAMBLE_ENABLED_T$)
- 12 - Number of preamble fractions sent on the Reverse Common Control Channel if
13 $RCCCH_PREAMBLE_ENABLED_T$ is equal to '1'
14 ($RCCCH_PREAMBLE_NUM_FRAC_S = RCCCH_PREAMBLE_NUM_FRAC_T$)
- 15 - Fractional preamble duration on the Reverse Common Control Channel if
16 $RCCCH_PREAMBLE_ENABLED_T$ is equal to '1'
17 ($RCCCH_PREAMBLE_FRAC_DURATION_S = RCCCH_PREAMBLE_FRAC_DURATION_T$)
- 18 - Preamble gated-off duration on the Reverse Common Control Channel if
19 $RCCCH_PREAMBLE_ENABLED_T$ is equal to '1'
20 ($RCCCH_PREAMBLE_OFF_DURATION_S = RCCCH_PREAMBLE_OFF_DURATION_T$)
- 21 - Additional preamble duration on the Reverse Common Control Channel if
22 $RCCCH_PREAMBLE_ENABLED_T$ is equal to '1'
23 ($RCCCH_PREAMBLE_ADD_DURATION_S = RCCCH_PREAMBLE_ADD_DURATION_T$)
- 24 - Slot duration on the Reverse Common Control Channel ($RCCCH_SLOT_S = 1 +$
25 $RCCCH_SLOT_T$)
- 26 - First slot offset of the Reverse Common Control Channel ($RCCCH_SLOT_OFFSET1_S$
27 $= RCCCH_SLOT_OFFSET1_T$)
- 28 - Second slot offset of the Reverse Common Control Channel
29 ($RCCCH_SLOT_OFFSET2_S = RCCCH_SLOT_OFFSET2_T$)
- 30 - Nominal transmit power offset on the Reverse Common Control Channel
31 ($RCCCH_NOM_PWR_S = RCCCH_NOM_PWR_T$)
- 32 - Initial power offset for access on the Reverse Common Control Channel
33 ($RCCCH_INIT_PWR_S = RCCCH_INIT_PWR_T$)
- 34 - Power Control delay for the Reservation Access Mode
35 ($RA_PC_DELAY_S = RA_PC_DELAY_T$)
- 36 - Maximum delay to receive the *Early Acknowledgment Channel Assignment Message*
37 on the Common Assignment Channel
38 ($EACAM_CACH_DELAY_S = EACAM_CACH_DELAY_T$)
- 39 - Indicator for handoff supported on the Reverse Common Control Channels

- 1 (RCCCH_HO_SUPPORTED_s = RCCCH_HO_SUPPORTED_r)
- 2 - Threshold for handoff on the Reverse Common Control Channels if
 3 RCCCH_HO_SUPPORTED_r is equal to '1'
 4 (RCCCH_HO_THRESH_s = RCCCH_HO_THRESH_r)
- 5 - Maximum delay to receive the *Early Acknowledgment Channel Assignment Message*
 6 and the *Power Control Channel Assignment Message* if RCCCH_HO_SUPPORTED_r is
 7 equal to '1' (EACAM_PCCAM_DELAY_s = EACAM_PCCAM_DELAY_r)
- 8 - Number of Common Power Control Channels (NUM_CPCCH_s = (NUM_CPCCH_r + 1))
- 9 - Power control rate for the Common Power Control Channels
 10 (CPCCH_RATE_s = CPCCH_RATE_r)
- 11 - For $i = 0$ to NUM_CPCCH_s - 1, store the channel code index for each Common
 12 Power Control Channel (CPCCH_CODE_CHAN_s[i] = CPCCH_CODE_CHAN_r).
- 13 - Number of Power Control Subchannels for the Reservation Access Mode
 14 (NUM_PCSCH_RA_s = (NUM_PCSCH_RA_r + 1))
- 15 The mobile station shall set CURR_ACC_MSG_SEQ equal to ACC_MSG_SEQ_r.

16 2.6.2.2.16 ANSI-41 RAND Message

17 Whenever an *ANSI-41 RAND Message* is received, the mobile station shall process the fields
 18 in the message as follows.

19 The mobile station shall store the following parameters:

- 20 • Random challenge value (RAND_s = RAND_r)
- 21 • Current *Enhanced Access Parameters Message* Sequence Number
 22 (CURR_ACC_MSG_SEQ = ACC_MSG_SEQ_r).
- 23 • Pilot PN sequence offset increment (PILOT_PN_s = PILOT_PN_r)

24 The mobile station shall also compare the *Enhanced Access Parameters Message* sequence
 25 number, ACC_MSG_SEQ_r, with that stored in ACC_MSG_SEQ_s. If the comparison results
 26 in a mismatch, then the mobile station shall set ACC_MSG_SEQ_s to NULL (see 2.6.2.2).

27 The mobile station shall ignore any fields at the end of the *ANSI-41 RAND Message* which
 28 are not defined according to the protocol revision level (MOB_P_REV_p of the current band
 29 class) being used by the mobile station.

30 2.6.2.2.17 Universal Neighbor List Message

31 Whenever a valid *Universal Neighbor List Message* is received on the Primary Broadcast
 32 Control Channel, the configuration message sequence number, CONFIG_MSG_SEQ_r shall
 33 be compared to that stored in UNIV_NGHBR_LST_MSG_SEQ_s. If the comparison results in
 34 a mismatch, then the mobile station shall process the remaining fields in the message as
 35 described below.

36 The mobile station shall store the following parameters:

- 1 • Configuration message sequence number
 2 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
 3 UNIV_NGHRBR_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r).
- 4 If RADIO_INTERFACE_TYPE_r is equal to '0000' but the PILOT_INC field is not within the
 5 valid range specified in 3.7.2.3.2.33, then the mobile station shall ignore the entire record
 6 that contains it.
- 7 If RADIO_INTERFACE_TYPE_r is equal to '0000' and the PILOT_INC field is within the valid
 8 range specified in 3.7.2.3.2.33, the mobile station shall perform the following:
- 9 The mobile station shall store the Pilot PN sequence offset increment (PILOT_INC_s =
 10 PILOT_INC_r).
- 11 The mobile station shall set NGHRBR_SET_SIZE_s to NUM_NGHRBR_r.
- 12 For each of the neighboring base stations contained in the *Universal Neighbor List Message*,
 13 if FREQ_INCL_r is equal to '0', or if FREQ_INCL_r is equal to '1' and NGHRBR_BAND_r is
 14 supported, the mobile station shall perform the following:
- 15 • If the ith occurrence of NGHRBR_CONFIG_r is equal to '000', '001', '010', or '100', set the
 16 NGHRBR_CONFIG field of NGHRBR_REC[i] to the ith occurrence of NGHRBR_CONFIG_r;
 17 otherwise, set the NGHRBR_CONFIG field of NGHRBR_REC[i] to '011'.
 - 18 • Set the NGHRBR_PN field of NGHRBR_REC[i] to the ith occurrence of NGHRBR_PN_r.
 - 19 • If NGHRBR_CONFIG_r is equal to '011', set the BCCH_SUPPORT field of NGHRBR_REC[i] to
 20 BCCH_SUPPORT_r of the corresponding record.
 - 21 • Set the ADD_PILOT_REC_INCL field of NGHRBR_REC[i] to the ith occurrence of
 22 ADD_PILOT_REC_INCL_r. If ADD_PILOT_REC_INCL_r equals '1', for each pilot included
 23 in the message, the mobile station shall also perform the following:
 - 24 - Set the NGHRBR_PILOT_REC_TYPE field of NGHRBR_PILOT_REC to
 25 NGHRBR_PILOT_REC_TYPE_r.
 - 26 - If NGHRBR_PILOT_REC_TYPE_r is equal to '000'. The mobile station shall:
 - 27 + Set the TD_POWER_LEVEL field of NGHRBR_PILOT_REC to TD_POWER_LEVEL_r.
 - 28 + Set the TD_MODE field of NGHRBR_PILOT_REC to TD_MODE_r.
 - 29 - If NGHRBR_PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
 - 30 + Set the AUX_PILOT_QOF field of NGHRBR_PILOT_REC to QOF_r.
 - 31 + Set the AUX_PILOT_WALSH_CODE field of NGHRBR_PILOT_REC to
 32 AUX_PILOT_WALSH_r with the Walsh Code length specified by
 33 WALSH_LENGTH_r.
 - 34 - If NGHRBR_PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
 - 35 + Set the AUX_PILOT_QOF field of NGHRBR_PILOT_REC to QOF_r.
 - 36 + Set the AUX_PILOT_WALSH_CODE field of NGHRBR_PILOT_REC to AUX_WALSH_r
 37 with the Walsh Code length specified by WALSH_LENGTH_r.

- 1 + Set the AUX_TD_POWER_LEVEL field of NGHBR_PILOT_REC to
2 AUX_TD_POWER_LEVEL_r.
- 3 + Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
- 4 - If NGHBR_PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
- 5 + Set the SR3_PRIMARY_PILOT field of NGHBR_PILOT_REC to
6 SR3_PRIMARY_PILOT_r.
- 7 + Set the SR3_PILOT_POWER1 field of NGHBR_PILOT_REC to
8 SR3_PILOT_POWER1_r.
- 9 + Set the SR3_PILOT_POWER2 field of NGHBR_PILOT_REC to
10 SR3_PILOT_POWER2_r.
- 11 - If NGHBR_PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
- 12 + Set the SR3_PRIMARY_PILOT field of NGHBR_PILOT_REC to
13 SR3_PRIMARY_PILOT_r.
- 14 + Set the SR3_PILOT_POWER1 field of NGHBR_PILOT_REC to
15 SR3_PILOT_POWER1_r.
- 16 + Set the SR3_PILOT_POWER2 field of NGHBR_PILOT_REC to
17 SR3_PILOT_POWER2_r.
- 18 + Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.
- 19 + Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
20 AUX_PILOT_WALSH_r with the Walsh Code length specified by
21 WALSH_LENGTH_r.
- 22 + If ADD_INFO_INCL1_r is equal to '1', set the AUX_PILOT_QOF1 field of
23 NGHBR_PILOT_REC to QOF1_r and set the AUX_PILOT_WALSH_CODE1 field of
24 NGHBR_PILOT_REC to AUX_PILOT_WALSH1_r with the Walsh Code length
25 specified by WALSH_LENGTH1_r; otherwise, set the AUX_PILOT_QOF1 field of
26 NGHBR_PILOT_REC to QOF_r and set the AUX_PILOT_WALSH_CODE1 field of
27 NGHBR_PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code length
28 specified by WALSH_LENGTH_r.
- 29 + If ADD_INFO_INCL2_r is equal to '1', set the AUX_PILOT_QOF2 field of
30 NGHBR_PILOT_REC to QOF2_r and set the AUX_PILOT_WALSH_CODE2 field of
31 NGHBR_PILOT_REC to AUX_PILOT_WALSH2_r with the Walsh Code length
32 specified by WALSH_LENGTH2_r; otherwise, set the AUX_PILOT_QOF2 field of
33 NGHBR_PILOT_REC to QOF_r and set the AUX_PILOT_WALSH_CODE2 field of
34 NGHBR_PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code length
35 specified by WALSH_LENGTH_r.
- 36 • If NGHBR_SRCH_MODE_r = '00' or '10', set the SEARCH_PRIORITY field of each
37 NGHBR_REC to '10' (high) for all NGHBR_SET_SIZE_s entries.
- 38 • If NGHBR_SRCH_MODE_r = '01' or '11', set the SEARCH_PRIORITY field of
39 NGHBR_REC[i] to the ith occurrence of SEARCH_PRIORITY_r.

- 1 • If $\text{NGHBR_SRCH_MODE}_r = '00'$ or $'01'$, set the SRCH_WIN_NGHBR field of each
2 NGHBR_REC to SRCH_WIN_N_r for all NGHBR_SET_SIZE_s entries.
- 3 • If $\text{NGHBR_SRCH_MODE}_r = '00'$ or $'01'$, set the SRCH_OFFSET_NGHBR field of each
4 NGHBR_REC to $'000'$.
- 5 • If $\text{NGHBR_SRCH_MODE}_r = '10'$ or $'11'$:
- 6 - set the SRCH_WIN_NGHBR field of $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of
7 SRCH_WIN_NGHBR_r
- 8 - if $\text{SRCH_OFFSET_INCL}_r$ equals $'1'$, set the SRCH_OFFSET_NGHBR field of
9 $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of $\text{SRCH_OFFSET_NGHBR}_r$, and
- 10 - if $\text{SRCH_OFFSET_INCL}_r$ equals $'0'$, set the SRCH_OFFSET_NGHBR field of each
11 NGHBR_REC to $'000'$.
- 12 • If USE_TIMING_r is equal to $'1'$, set the TIMING_INCL field of $\text{NGHBR_REC}[i]$ to the i^{th}
13 occurrence of TIMING_INCL_r ; otherwise, set the TIMING_INCL field of NGHBR_REC to
14 $'0'$ for all entries.
- 15 • Set the $\text{NGHBR_PDCH_SUPPORTED}$ field of $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of
16 $\text{NGHBR_PDCH_SUPPORTED}_r$ if included; otherwise, set the
17 $\text{NGHBR_PDCH_SUPPORTED}$ field of NGHBR_REC to $'0'$ for all entries.
- 18 • The mobile station shall set $\text{RESQ_ENABLED}_s = \text{RESQ_ENABLED}_r$. If
19 RESQ_ENABLED_s is equal to $'1'$, then the mobile station shall store:
- 20 - Call rescue delay timer value ($\text{RESQ_DELAY_TIME}_s = \text{RESQ_DELAY_TIME}_r$)
- 21 - Call rescue allowed timer value ($\text{RESQ_ALLOWED_TIME}_s =$
22 $\text{RESQ_ALLOWED_TIME}_r$)
- 23 - Call rescue attempt timer value ($\text{RESQ_ATTEMPT_TIME}_s = \text{RESQ_ATTEMPT_TIME}_r$)
- 24 - Code channel index for call rescue ($\text{RESQ_CODE_CHAN}_s = \text{RESQ_CODE_CHAN}_r$)
- 25 - Quasi-Orthogonal Function mask identifier for call rescue ($\text{RESQ_QOF}_s =$
26 RESQ_QOF_r)
- 27 - Minimum time between consecutive rescues ($\text{RESQ_MIN_PERIOD}_s =$
28 $\text{RESQ_MIN_PERIOD}_r + 1$) if $\text{RESQ_MIN_PERIOD_INCL}_r$ is equal to $'1'$; otherwise,
29 $\text{RESQ_MIN_PERIOD}_s = '00000'$.
- 30 - The required number of transmissions of a regular PDU before declaring L2
31 Acknowledgment Failure when Call Rescue is enabled
32 ($\text{RESQ_NUM_TOT_TRANS_20MS}_s = \text{RESQ_NUM_TOT_TRANS_20MS}_r$) if included;
33 otherwise, set $\text{RESQ_NUM_TOT_TRANS_20MS}_s$ to N_{1m} .
- 34 - The required number of transmissions of a mini PDU before declaring L2
35 Acknowledgment Failure when Call Rescue is enabled
36 ($\text{RESQ_NUM_TOT_TRANS_5MS}_s = \text{RESQ_NUM_TOT_TRANS_5MS}_r$) if included;
37 otherwise, set $\text{RESQ_NUM_TOT_TRANS_5MS}_s$ to N_{15m} .

- 1 - The Traffic Channel preamble length for Call Rescue Soft Handoff when operating in
 2 Radio Configuration 1 or 2 ($RESQ_NUM_PREAMBLE_RC1_RC2_S =$
 3 $RESQ_NUM_PREAMBLE_RC1_RC2_T$).
- 4 - The Traffic Channel preamble length for Call Rescue Soft Handoff when operating in
 5 Radio Configuration greater than 2 ($RESQ_NUM_PREAMBLE_S =$
 6 $RESQ_NUM_PREAMBLE_T$).
- 7 - The power level adjustment to be applied to the last closed-loop power level when
 8 re-enabling the transmitter for call rescue soft handoff ($RESQ_POWER_DELTA_S =$
 9 $RESQ_POWER_DELTA_T$).
- 10 - Set the $NGHBR_RESQ_CONFIGURED$ field of $NGHBR_REC[i]$ to the i^{th} occurrence
 11 of $NGHBR_RESQ_CONFIGURED_T$.

12 For each of the neighboring base stations contained in the *Universal Neighbor List Message*,
 13 if $FREQ_FIELDS_INCL_T$ equals '1', $FREQ_INCL_T$ equals '1', and $NGHBR_BAND_T$ is
 14 supported, the mobile station shall also perform the following:

- 15 • Set the $NGHBR_BAND$ field of $NGHBR_REC[i]$ to the i^{th} occurrence of $NGHBR_BAND_T$.
- 16 • Set the $NGHBR_FREQ$ field of $NGHBR_REC[i]$ to the i^{th} occurrence of $NGHBR_FREQ_T$.

17 For each of the neighboring base stations contained in the *Universal Neighbor List Message*,
 18 if USE_TIMING_T is equal to '1' and $TIMING_INCL_T$ equals '1', the mobile station shall also
 19 perform the following:

- 20 • Set the $NGHBR_TX_OFFSET$ field of $NGHBR_REC[i]$ to the i^{th} occurrence of
 21 $NGHBR_TX_OFFSET_T$.
- 22 • If $GLOBAL_TIMING_INCL_T$ is equal to '1', then the mobile station shall:
 - 23 - Set the $NGHBR_TX_DURATION$ field of $NGHBR_REC$ to $GLOBAL_TX_DURATION_T$
 24 for all entries.
 - 25 - Set the $NGHBR_TX_PERIOD$ field of $NGHBR_REC$ to $GLOBAL_TX_PERIOD_T$ for all
 26 entries.
- 27 • If $GLOBAL_TIMING_INCL_T$ is equal to '0', then the mobile station shall:
 - 28 - Set the $NGHBR_TX_DURATION$ field of $NGHBR_REC[i]$ to the i^{th} occurrence of
 29 $NGHBR_TX_DURATION_T$.
 - 30 - Set the $NGHBR_TX_PERIOD$ field of $NGHBR_REC[i]$ to the i^{th} occurrence of
 31 $NGHBR_TX_PERIOD_T$.

32 For each of the neighboring base stations contained in the *Universal Neighbor List Message*,
 33 if $FREQ_FIELDS_INCL_T$ equals '1' and $FREQ_INCL_T$ equals '0', the mobile station shall also
 34 perform the following:

- 35 • Set the $NGHBR_BAND$ field of $NGHBR_REC[i]$ to $CDMABAND_S$.
- 36 • If $NGHBR_CONFIG_T$ equals '010', set the $NGHBR_FREQ$ field of $NGHBR_REC[i]$ to the
 37 first CDMA Channel listed in the *CDMA Channel List Message or Extended CDMA*
 38 *Channel List Message* transmitted by the current base station; otherwise, set the
 39 $NGHBR_FREQ$ field of $NGHBR_REC[i]$ to $CDMACH_S$.

1 If NGHBR_SET_ENTRY_INFO_r is equal to '0', then for all NGHBR_SET_SIZE_s occurrences of
 2 ACCESS_ENTRY_HO, the mobile station shall set the ACCESS_ENTRY_HO field of
 3 NGHBR_REC[i] to '0'.

4 If NGHBR_SET_ENTRY_INFO_r is equal to '1', then for all NGHBR_SET_SIZE_s occurrences of
 5 ACCESS_ENTRY_HO, the mobile station shall set the ACCESS_ENTRY_HO field of
 6 NGHBR_REC[i] to the *i*th occurrence of ACCESS_ENTRY_HO_r.

7 If NGHBR_SET_ACCESS_INFO_r is equal to '0', then for all NGHBR_SET_SIZE_s occurrences
 8 of ACCESS_HO_ALLOWED, the mobile station shall set the ACCESS_HO_ALLOWED field of
 9 NGHBR_REC[i] to '0'.

10 If NGHBR_SET_ACCESS_INFO_r is equal to '1', then for all NGHBR_SET_SIZE_s occurrences
 11 of ACCESS_HO_ALLOWED, the mobile station shall set the ACCESS_HO_ALLOWED field of
 12 NGHBR_REC[i] to the *i*th occurrence of ACCESS_HO_ALLOWED_r.

13 The mobile station shall update the idle handoff Neighbor Set (see 2.6.2.1.4) so that it
 14 consists only of pilot offsets listed in the *Universal Neighbor List Message*. If the *Universal*
 15 *Neighbor List Message* contains more pilot offsets than the mobile station can store, the
 16 mobile station shall store the pilot offsets beginning at the start of the *Universal Neighbor*
 17 *List Message*, up to the limits of the mobile station's Neighbor Set storage capacity.

18 If RADIO_INTERFACE_TYPE_r is equal to '0001', the mobile station shall process the fields
 19 contained in the record as follows:

20 If RADIO_INTERFACE_TYPE_r is equal to '0010', the mobile station shall process the fields
 21 contained in the record as follows:

22 The mobile station shall set NUM_HRPD_NGHBR_s to NUM_HRPD_NGHBR_r, the number of
 23 neighboring HRPD systems contained in the *Universal Neighbor List Message*. For each of
 24 the neighboring HRPD systems contained in the *Universal Neighbor List Message*, the
 25 mobile station shall perform the following:

- 26 • Set the PN field of HRPD_NGHBR_LIST[i] to the *i*th occurrence of NGHBR_PN_r.
- 27 • Set the BAND_CLASS field of HRPD_NGHBR_LIST[i] to the *i*th occurrence of
 28 NGHBR_BAND_r if NGHBR_FREQ_INCL_r equals '1'; otherwise, set the BAND_CLASS
 29 field of HRPD_NGHBR_LIST[i] to CDMABAND_s.
- 30 • Set the CDMA_FREQ field of HRPD_NGHBR_LIST[i] to the *i*th occurrence of
 31 NGHBR_FREQ_r if NGHBR_FREQ_INCL_r equals '1'; otherwise, set the BAND_CLASS field
 32 of HRPD_NGHBR_LIST[i] to CDMACH_s.
- 33 • Set the PN_ASSOCIATION field of HRPD_NGHBR_LIST[i] to the *i*th occurrence of
 34 PN_ASSOCIATION_IND_r.
- 35 • Set the DATA_ASSOCIATION field of HRPD_NGHBR_LIST[i] to the *i*th occurrence of
 36 DATA_ASSOCIATION_IND_r.

37 2.6.2.2.18BCMC Service Parameters Message

38 The mobile station may receive the *BCMC Service Parameters Message* on the Paging
 39 Channel or on the Primary Broadcast Control Channel.

1 When the mobile station desires to receive the *BCMC Service Parameters Message* on the
 2 Paging Channel, the mobile station shall monitor the F-PCH for the duration of four F-PCH
 3 slots from the first slot of a BSPM slot cycle (see 2.6.2.1.1.3.8.1) for the start of the *BCMC*
 4 *Service Parameters Message* transmission or until the *BCMC Service Parameters Message*
 5 with DIFF_BSPM_r equal to '0' is received; if the mobile station detects the start of the *BCMC*
 6 *Service Parameters Message*, the mobile station shall monitor the F-PCH until the entire
 7 *BCMC Service Parameters Message* is received.

8 When the mobile station desires to receive the *BCMC Service Parameters Message* on the
 9 Primary Broadcast Control Channel, the mobile station shall monitor the F-BCCH for the
 10 duration of four F-BCCH slots from the first slot of a BSPM slot cycle (see 2.6.2.1.1.3.8.2)
 11 for the start of the *BCMC Service Parameters Message* transmission or until the *BCMC*
 12 *Service Parameters Message* with DIFF_BSPM_r equal to '0' is received; if the mobile station
 13 detects the start of the *BCMC Service Parameters Message*, the mobile station shall monitor
 14 the F-BCCH until the entire *BCMC Service Parameters Message* is received.

15 Whenever the *BCMC Service Parameters Message* is received, the mobile station shall
 16 compare the BSPM sequence number, BSPM_MSG_SEQ_r , to that stored in
 17 BSPM_MSG_SEQ_s . If the comparison results in a match and $\text{FULL_BSPM_IND} = '1'$, the
 18 mobile station may ignore the message. If the comparison results in a mismatch, the
 19 mobile station shall process the remaining fields in the message as follows:

20 The mobile station shall perform the following:

- 21 • If DIFF_BSPM_r equals '0', the mobile station shall perform the following:
 - 22 - The mobile station shall delete the currently stored *BCMC Service Parameters*
 23 *Message* parameters and shall store the parameters received in this *BCMC Service*
 24 *Parameters Message* as described below.
 - 25 - The mobile station shall set FULL_BSPM_IND to '1'.
- 26 • If DIFF_BSPM_r equals '1',
 - 27 - If $(\text{BSPM_MSG_SEQ}_r - \text{BSPM_MSG_SEQ}_s)$ modulo 64 is greater than one, the
 28 mobile station shall perform the following:
 - 29 + The mobile station shall delete the currently stored *BCMC Service Parameters*
 30 *Message* parameters and shall store the parameters received in this *BCMC*
 31 *Service Parameters Message* as described below.
 - 32 + The mobile station shall set FULL_BSPM_IND to '0'.
 - 33 - Otherwise, the mobile station shall perform the following:
 - 34 + The mobile station shall update the currently stored *BCMC Service Parameters*
 35 *Message* parameters with the parameters received in this *BCMC Service*
 36 *Parameters Message* as described below.

1 The mobile station shall delete $BCMC_RETRY_DELAY_LIST_S[i]$ from BCMC Retry Delay List
 2 if $BCMC_RETRY_DELAY_LIST_S[i].BCMC_FLOW_ID$ is included in the *BCMC Service*
 3 *Parameters Message*.

4 The mobile station shall store the following parameters:

- 5 • BSPM sequence number ($BSPM_MSG_SEQ_S = BSPM_MSG_SEQ_R$).
- 6 • Frequency change registration required indication ($FREQ_CHG_REG_REQUIRED_S$
 7 = $FREQ_CHG_REG_REQUIRED_R$).
- 8 • Frequency change registration timer
 9 ($FREQ_CHG_REG_TIMER_S = FREQ_CHG_REG_TIMER_R$) if
 10 $FREQ_CHG_REG_TIMER_IND_R$ equals '1'; otherwise, set $FREQ_CHG_REG_TIMER_S$ to
 11 NULL.
- 12 • Autonomous BCMC request allowed indicator
 13 ($AUTO_REQ_ALLOWED_IND_S = AUTO_REQ_ALLOWED_IND_R$).
- 14 • If USE_TIME_R is set to '1' set the $BSPM_ACTION_TIME_S = ACTION_TIME_R$; otherwise, set
 15 the $BSPM_ACTION_TIME_S = NULL$. A BSPM with an explicit action time shall take effect
 16 when System Time (in 80 ms units) modulo 64 becomes equal to
 17 $BSPM_ACTION_TIME_S$.
- 18 • BCMC on traffic channel supported indicator
 19 ($BCMC_ON_TRAFFIC_SUP_S = BCMC_ON_TRAFFIC_SUP_R$).
- 20 • Length of time stamp for use on r-csch
 21 ($ACH_TIME_STAMP_SHORT_LENGTH_S = ACH_TIME_STAMP_SHORT_LENGTH_R$) if
 22 $NON_DEFAULT_VALUE_INCLUDED_R$ equals '1'; otherwise,
 23 $ACH_TIME_STAMP_SHORT_LENGTH_S$ shall be set to 10.
- 24 • Length of time stamp ($TIME_STAMP_LONG_LENGTH_S = TIME_STAMP_LONG_LENGTH_R$)
 25 if $NON_DEFAULT_VALUE_INCLUDED_R$ equals '1'; otherwise,
 26 $TIME_STAMP_LONG_LENGTH_S$ shall be set to 52.
- 27 • Unit for time stamp length ($TIME_STAMP_UNIT_S = TIME_STAMP_UNIT_R$) if
 28 $NON_DEFAULT_VALUE_INCLUDED_R$ equals '1'; otherwise, $TIME_STAMP_UNIT_S$ shall be
 29 set to 6.
- 30 • If $REGISTRATION_REQ_FLAG_INCL_R$ equals '1', the mobile station shall compute and
 31 store a BCMC registration required timer expiration value:
 32
$$REGISTRATION_REQ_TIMER_MAX = (2^{REGISTRATION_REQ_TIMER_PERIOD_R} \times 80 \text{ ms}).$$
- 33 • For $i=1$ to NUM_FSCH_R , store the following:
 34 - $FBSCH_LIST_S[i].FSCH_ID$ = the position where this Forward Supplemental Channel
 35 is listed in this message (i.e. First Forward Supplemental Channel listed is given
 36 $FSCH_ID$ of '001', second one is given $FSCH_ID$ of '010', and so on).

- 1 - FBSCH_LIST_s[i].FSCH_BAND_CLASS = ith occurrence of FSCH_BAND_CLASS_r
 2 (Band class of the Forward Supplemental Channel) if FSCH_BAND_CLASS_INCL_r
 3 equals '1'; otherwise, FBSCH_LIST_s[i].FSCH_BAND_CLASS = CDMABAND_s.
- 4 - FBSCH_LIST_s[i].FSCH_FREQ = ith occurrence of FSCH_FREQ_r (Frequency
 5 assignment of the forward broadcast supplemental channel) if FSCH_FREQ_INCL_r
 6 equals '1'; otherwise, FBSCH_LIST_s[i].FSCH_FREQ = CDMACH_s.
- 7 - FBSCH_LIST_s[i].FSCH_CODE_CHAN = ith occurrence of FSCH_CODE_CHAN_r (Code
 8 channel index of the forward broadcast supplemental channel)
- 9 - FBSCH_LIST_s[i].FSCH_PLCM (Public Long code mask of the Forward Broadcast
 10 Supplemental Channel) shall be set as follows:
- 11 + If FSCH_PLCM_SCHEME_INDr equals '00', FBSCH_LIST_s[i].FSCH_PLCM shall
 12 be set to PLCM_42 as specified in 2.6.13.10.1.
- 13 + If FSCH_PLCM_SCHEME_INDr equals '01', FBSCH_LIST_s[i].FSCH_PLCM shall
 14 be set to PLCM_42 as specified in 2.6.13.10.2.
- 15 + If FSCH_PLCM_SCHEME_INDr equals '10', the mobile station shall perform the
 16 following:
- 17 o If FSCH_PLCM_INDr equals '0', FBSCH_LIST_s[i].FSCH_PLCM shall be set to
 18 PLCM_42 as specified in 2.6.13.10.1.
- 19 o If FSCH_PLCM_INDr equals '1', FBSCH_LIST_s[i].FSCH_PLCM shall be set to
 20 PLCM_42 as specified in 2.6.13.10.2.
- 21 - FBSCH_LIST_s[i].FSCH_MUX_OPTION = ith occurrence of FSCH_MUX_OPTION_r
 22 (Multiplex Option of the Forward Broadcast Supplemental Channel).
- 23 - FBSCH_LIST_s[i].FSCH_RC = ith occurrence of FSCH_RC_r (Radio configuration of the
 24 forward broadcast supplemental channel).
- 25 - FBSCH_LIST_s[i].FSCH_CODING = ith occurrence of FSCH_CODING_r (Coding type of
 26 the Forward Broadcast Supplemental Channel).
- 27 - FBSCH_LIST_s[i].FSCH_OUTERCODE_RATE = ith occurrence of
 28 FSCH_OUTERCODE_RATE_r (Outer Code Rate of the Forward Broadcast
 29 Supplemental Channel) if FSCH_OUTERCODE_INCL_r equals '1'; otherwise,
 30 FBSCH_LIST_s[i].FSCH_OUTERCODE_RATE = NULL.
- 31 - FBSCH_LIST_s[i].FSCH_OUTERCODE_OFFSET = ith occurrence of
 32 FSCH_OUTERCODE_OFFSET_r (Outer Coding Buffer Offset of the Forward
 33 Broadcast Supplemental Channel) if FSCH_OUTERCODE_INCL_r equals '1';
 34 otherwise, FBSCH_LIST_s[i].FSCH_OUTERCODE_OFFSET = NULL.
- 35 - FBSCH_LIST_s[i].FSCH_NUM_BITS_IDX = ith occurrence of FSCH_NUM_BITS_IDX_r
 36 (Number of information bits index of the forward broadcast supplemental channel).

- 1 - FBSCH_LIST_s[i].FSCH_FRAME_40_USED = ith occurrence of
2 FSCH_FRAME_40_USED_r (40ms frame used indicator of the forward broadcast
3 supplemental channel).
- 4 - FBSCH_LIST_s[i].FSCH_FRAME_80_USED = ith occurrence of
5 FSCH_FRAME_80_USED_r (80ms frame used indicator of the forward broadcast
6 supplemental channel).
- 7 - FBSCH_LIST_s[i].TDM_STRUCTURE_IND = ith occurrence of TDM_
8 STRUCTURE_IND_r (TDM structure used indicator).
- 9 + FBSCH_LIST_s[i].TDM_SLOT_LENGTH = ith occurrence of TDM_SLOT_LENGTH_r
10 (TDM slot length).
- 11 + If TDM_SUPER_PERIOD_MASK_LEN_r is included, FBSCH_LIST_s[i].
12 TDM_SUPER_PERIOD_MASK_LEN = ith occurrence of
13 TDM_SUPER_PERIOD_MASK_LEN_r (TDM super period mask length indicator).
14 Otherwise, set FBSCH_LIST_s[i].TDM_SUPER_PERIOD_MASK_LEN as specified in
15 Table 3.7.2.3.2.38-3, based on FSCH_OUTERCODE_RATE field corresponding to
16 FSCH_ID field included in this record
- 17 + If TDM_MEGA_PERIOD_MASK_LEN_r is included, FBSCH_LIST_s[i].
18 TDM_MEGA_PERIOD_MASK_LEN = ith occurrence of
19 TDM_MEGA_PERIOD_MASK_LEN_r (TDM mega period mask length indicator).
20 Otherwise, set FBSCH_LIST_s[i]. TDM_MEGA_PERIOD_MASK_LEN as specified in
21 Table 3.7.2.3.2.38-6.
- 22 • For i=1 to the number of flows included in this message, store the following:
- 23 - BCMC_FLOW_LIST_s[i].BCMC_FLOW_ID = ith occurrence of BCMC_FLOW_ID (BCMC
24 flow identifier). See section 2.6.13.11.
- 25 - If REGISTRATION_REQ_FLAG_INCL_r equals '1', and ith occurrence of
26 FLOW_INFO_ON_OTHER_FREQ_r equals '0',
27 BCMC_FLOW_LIST_s[i].REGISTRATION_REQ_FLAG = ith occurrence of
28 REGISTRATION_REQ_FLAG_r(Registration required flag).
- 29 - If AUTH_SIGNATURE_REQUIRED_r equals '1',
30 BCMC_FLOW_LIST_s[i].AUTH_SIGNATURE_REQ_IND = ith occurrence of
31 AUTH_SIGNATURE_REQ_IND_r(Authorization signature required indication).
- 32 - If BCMC_ON_TRAFFIC_SUP_r is set to '1',
33 BCMC_FLOW_LIST_s[i].BCMC_FLOW_ON_TRAFFIC_IND = ith occurrence of
34 BCMC_FLOW_ON_TRAFFIC_IND_r (BCMC flow on traffic channel supported
35 identifier); otherwise, BCMC_FLOW_LIST_s[i].BCMC_FLOW_ON_TRAFFIC_IND = '0'.
- 36 - If the ith occurrence of NUM_LPM_ENTRIES_r equals '000', then
37 BCMC_FLOW_LIST_s[i].BCMC_FLOW_ON_IND = 0; otherwise,
38 BCMC_FLOW_LIST_s[i].BCMC_FLOW_ON_IND = 1 (BCMC flow On or Off Indicator).

- 1 - For $j=1$ to NUM_LPM_ENTRIES_r , store the following:
- 2 + $\text{BMC_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{FSCH_ID}$ = j th occurrence of FSCH_ID_r
- 3 (Forward broadcast supplemental channel identifier).
- 4 + If j th occurrence of TDM_USED_IND_r is set to 1, the mobile station shall store
- 5 the following:
- 6 ○ $\text{BMC_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{TDM_MASK}$ = j th occurrence of
- 7 TDM_MASK_r (TDM mask).
- 8 ○ If $\text{TDM_SUPER_PERIOD_MASK_INCL}_r$ is set to '1',
- 9 $\text{BMC_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{TDM_SUPER_PERIOD_MASK}$ = j th
- 10 occurrence of $\text{TDM_SUPER_PERIOD_MASK}_r$ (TDM super period mask).
- 11 Otherwise, set all bits of
- 12 $\text{BMC_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{TDM_SUPER_PERIOD_MASK}$ to '1'.
- 13 ○ If $\text{TDM_MEGA_PERIOD_MASK_INCL}_r$ is set to '1',
- 14 $\text{BMC_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{TDM_MEGA_PERIOD_MASK}$ = j th
- 15 occurrence of $\text{TDM_MEGA_PERIOD_MASK}_r$ (TDM mega period mask).
- 16 Otherwise, set all bits of
- 17 $\text{BMC_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{TDM_MEGA_PERIOD_MASK}$ to '1'.
- 18 ○ TDM period for BMC flow identified by
- 19 $\text{BMC_FLOW_LIST}_s[i].\text{BMC_FLOW_ID}$ on Forward Supplemental Channel
- 20 identified by $\text{BMC_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{FSCH_ID}$ is aligned at
- 21 system time (t) as specified in section 2.6.13.12.
- 22 + $\text{BMC_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{BSR_ID}$ = j th occurrence of BSR_ID_r (BMC
- 23 Service Reference identifier).
- 24 + For $k=0$ to NUM_NGHBR_r , store the following:
- 25 ○ $\text{BMC_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k].\text{NGHBR_PN}$ = k th
- 26 occurrence of NGHBR_PN_r (Neighbor pilot PN sequence offset index).
- 27 ○ $\text{BMC_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k].$
- 28 NGHBR_BMC_CONFIG = k th occurrence of $\text{NGHBR_BMC_CONFIG}_r$
- 29 (Neighbor BMC flow configuration).
- 30 ○ If $\text{NGHBR_BMC_CONFIG}_r$ equals '000', $\text{BMC_FLOW_LIST}_s[i].$
- 31 $\text{LPM_INFO}[j].\text{NGHBR_INFO}[k].\text{NGHBR_FSCH_BAND_CLASS}$ = NULL;
- 32 otherwise, the mobile station shall store the following:
- 33 ◇ If $\text{NGHBR_BMC_CONFIG}_r$ equals '010' or $\text{NGHBR_BMC_CONFIG}_r$
- 34 equals '001' and $\text{NGHBR_FSCH_BAND_CLASS_INCL}_r$ equals '0',
- 35 $\text{BMC_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k].$
- 36 $\text{NGHBR_FSCH_BAND_CLASS}$ =
- 37 $\text{FBSCH_LIST}_s[i].\text{NGHBR_FSCH_BAND_CLASS}$ where i corresponds to the
- 38 entry of FBSCH_LIST_s where $\text{FBSCH_LIST}_s[i].\text{FSCH_ID}$ equals FSCH_ID
- 39 of this Forward Supplemental Channel.

- 1 ◇ Otherwise, $\text{BMC}_{\text{FLOW_LIST}}[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k].$
2 $\text{NGHBR_FSCH_BAND_CLASS} = k$ th occurrence of NGHBR_
3 FSCH_BAND_CLASS_r (Band class of the Forward Supplemental
4 Channel in the neighbor base station).
- 5 ○ If $\text{NGHBR_BMC}_{\text{CONFIG}}_r$ equals '000',
6 $\text{BMC}_{\text{FLOW_LIST}}[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k].$
7 $\text{NGHBR_FSCH_CDMA_FREQ} = \text{NULL}$; otherwise, the mobile station shall
8 store the following:
- 9 ◇ If $\text{NGHBR_BMC}_{\text{CONFIG}}_r$ equals '010' or $\text{NGHBR_BMC}_{\text{CONFIG}}_r$
10 equals '001' and $\text{NGHBR_FSCH_FREQ_INCL}_r$ equals '0',
11 $\text{BMC}_{\text{FLOW_LIST}}[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k].$
12 $\text{NGHBR_FSCH_CDMA_FREQ} =$
13 $\text{FBSCH_LIST}_s[i].\text{FSCH_CDMA_FREQ}$ where i corresponds to the entry of
14 FBSCH_LIST_s where $\text{FBSCH_LIST}_s[i].\text{FSCH_ID}$ equals FSCH_ID of this
15 Forward Supplemental Channel.
- 16 ◇ Otherwise, $\text{BMC}_{\text{FLOW_LIST}}[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k].$
17 $\text{NGHBR_FSCH_CDMA_FREQ} = k$ th occurrence of
18 $\text{NGHBR_FSCH_CDMA_FREQ}_r$ (Neighbor Frequency assignment of the
19 forward broadcast supplemental channel).
- 20 ○ If $\text{NGHBR_BMC}_{\text{CONFIG}}_r$ equals '000',
21 $\text{BMC}_{\text{FLOW_LIST}}[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k].$
22 $\text{NGHBR_FSCH_CODE_CHAN} = \text{NULL}$; otherwise, the mobile station shall
23 store the following:
- 24 ◇ If $\text{NGHBR_BMC}_{\text{CONFIG}}_r$ equals '001' or '010' and
25 $\text{NGHBR_FSCH_CODE_CHAN_INCL}_r$ equals '0',
26 $\text{BMC}_{\text{FLOW_LIST}}[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k].$
27 $\text{NGHBR_FSCH_CODE_CHAN} =$
28 $\text{FBSCH_LIST}_s[i].\text{FSCH_CODE_CHAN}$ where i corresponds to the entry of
29 FBSCH_LIST_s where $\text{FBSCH_LIST}_s[i].\text{FSCH_ID}$ equals FSCH_ID of this
30 Forward Supplemental Channel.
- 31 ◇ Otherwise, $\text{BMC}_{\text{FLOW_LIST}}[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k].$
32 $\text{NGHBR_FSCH_CODE_CHAN} = k$ th occurrence of

24 NGHBR_FSCH_NUM_BITS_IDX =
25 FBSCH_LIST_s[i].FSCH_NUM_BITS_IDX where i corresponds to the entry
26 of FBSCH_LIST_s where FBSCH_LIST_s[i].FSCH_ID equals FSCH_ID of
27 this Forward Supplemental Channel.
- 28 ◇ Otherwise, BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].
29 NGHBR_FSCH_NUM_BITS_IDX = kth occurrence of
30 NGHBR_FSCH_NUM_BITS_IDX_r (Neighbor Number of information bits
31 index of the forward broadcast supplemental channel).
- 32 ○ If NGHBR_BCMC_CONFIG_r equals '000',
33 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].
34 NGHBR_FSCH_FRAME_40_USED = NULL; otherwise, the mobile station
35 shall store the following:
- 36 ◇ If NGHBR_BCMC_CONFIG_r equals '010' or NGHBR_BCMC_CONFIG_r
37 equals '001' and NGHBR_FSCH_PARAMS_INCL_r equals '0',
38 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].
39 NGHBR_FSCH_FRAME_40_USED =
40 FBSCH_LIST_s[i].FSCH_FRAME_40_USED where i corresponds to the
41 entry of FBSCH_LIST_s where FBSCH_LIST_s[i].FSCH_ID equals FSCH_ID
42 of this FORWARD SUPPLEMENTAL CHANNEL.

- 1 ◇ Otherwise, $BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k]$.
 2 $NGHBR_FSCH_FRAME_40_USED = k$ th occurrence of
 3 $NGHBR_FSCH_FRAME_40_USED_r$ (Neighbor 40ms frame used indicator
 4 of the forward broadcast supplemental channel).
- 5 ○ If $NGHBR_BCMC_CONFIG_r$ equals '000',
 6 $BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k]$.
 7 $NGHBR_FSCH_FRAME_80_USED = NULL$; otherwise, the mobile station
 8 shall store the following:
- 9 ◇ If $NGHBR_BCMC_CONFIG_r$ equals '010' or $NGHBR_BCMC_CONFIG_r$
 10 equals '001' and $NGHBR_FSCH_PARMS_INCL_r$ equals '0',
 11 $BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k]$.
 12 $NGHBR_FSCH_FRAME_80_USED =$
 13 $FBSCH_LIST_s[i].FSCH_FRAME_80_USED$ where i corresponds to the
 14 entry of $FBSCH_LIST_s$ where $FBSCH_LIST_s[i].FSCH_ID$ equals $FSCH_ID$
 15 of this FORWARD SUPPLEMENTAL CHANNEL.
- 16 ◇ Otherwise, $BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k]$.
 17 $NGHBR_FSCH_FRAME_80_USED = k$ th occurrence of
 18 $NGHBR_FSCH_FRAME_80_USED_r$ (Neighbor 80ms frame used indicator
 19 of the forward broadcast supplemental channel).

20 For each of the neighboring base stations contained in the *BCMC Service Parameters*
 21 *Message* and supports the broadcast control channel, the mobile station shall store the
 22 following informations from the message:

- 23 • SR1 Non-TD BCCH support indicator ($BCMC_SR1_BCCH_NON_TD_INCL_s =$
 24 $BCMC_SR1_BCCH_NON_TD_INCL_r$)
- 25 • SR1 TD BCCH support indicator ($BCMC_SR1_TD_INCL_s = BCMC_SR1_TD_INCL_r$)
- 26 • If $BCMC_SR1_BCCH_NON_TD_INCL_r$ is equal to '1':
- 27 - $BCMC_SR1_BRAT_NON_TD_s = BCMC_SR1_BRAT_NON_TD_r$;
 28 - $BCMC_SR1_CRAT_NON_TD_s = BCMC_SR1_CRAT_NON_TD_r$;
- 29 - $BCMC_BCCH_CODE_CHAN_NON_TD_s =$
 30 $BCMC_SR1_BCCH_CODE_CHAN_NON_TD_r$.
- 31 • If $BCMC_SR1_TD_INCL_r$ is included and is equal to '1', and the mobile station supports
 32 the Transmit Diversity indicated by $BCMC_SR1_TD_MODE_r$:
- 33 - $BCMC_SR1_BRAT_TD_s = BCMC_SR1_BRAT_TD_r$;
 34 - $BCMC_SR1_CRAT_TD_s = BCMC_SR1_CRAT_TD_r$;
- 35 - $BCMC_BCCH_CODE_CHAN_TD_s = BCMC_SR1_BCCH_CODE_CHAN_TD_r$.
- 36 • If the mobile station supports the Transmit Diversity,
 37 $BCMC_SR1_BCCH_NON_TD_INCL_r$ is equal to '1', and $SR1_TD_INCL_r$ is equal to '0':
- 38 - $BCMC_SR1_BRAT_TD_s = BCMC_SR1_BRAT_NON_TD_r$;

- 1 - BCMC_SR1_CRAT_TD_s = BCMC_SR1_CRAT_NON_TD_r;
- 2 - BCMC_BCCH_CODE_CHAN_TD_s = BCMC_SR1_BCCH_CODE_CHAN_NON_TD_r.

3 2.6.2.2.19 Access Point Pilot Information Message

4 Whenever an *Access Point Pilot Information Message* is received on the Paging Channel or
 5 the Primary Broadcast Control Channel, the configuration message sequence number,
 6 CONFIG_MSG_SEQ_r, shall be compared to that stored in AP_PILOT_INFO_MSG_SEQ_s. If
 7 the comparison results in a match, the mobile station may refresh the lifetime that the
 8 information in the message remains valid to LIFETIME_s minutes after the reception of the
 9 message. If the comparison results in a mismatch, then the mobile station shall process
 10 the remaining fields in the message as follows.

11 The mobile station shall store the following parameters:

- 12 • Configuration message sequence number
 13 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
 14 AP_PILOT_INFO_MSG_SEQ_s = CONFIG_MSG_SEQ_r)
- 15 • Lifetime of the message
 16 (LIFETIME_s = LIFETIME_r),

17 For each of the Access Point Pilot Information record contained in the *Access Point Pilot*
 18 *Information Message*, the mobile station shall perform the following:

- 19 • Set the AP_ASSN_TYPE field of AP_NGHBR_REC_s[i] to the AP_ASSN_TYPE field of the *i*th
 20 occurrence of APPI_REC_r.
- 21 • If the AP_SID_SAME_AS_PREVIOUS field of the *i*th occurrence of APPI_REC_r is set to '1',
 22 set the AP_SID field of AP_NGHBR_REC_s[i] to the value of AP_SID field of
 23 AP_NGHBR_REC_s[i-1]. Otherwise, set the AP_SID field of AP_NGHBR_REC_s[i] to the
 24 AP_SID field of the *i*th occurrence of APPI_REC_r.
- 25 • If the AP_NID_SAME_AS_PREVIOUS field of the *i*th occurrence of APPI_REC_r is set to
 26 '1', set the AP_NID field of AP_NGHBR_REC_s[i] to the value of AP_NID field of
 27 AP_NGHBR_REC_s[i-1]. Otherwise, set the AP_NID field of AP_NGHBR_REC_s[i] to the
 28 AP_NID field of the *i*th occurrence of APPI_REC_r.
- 29 • If the AP_BAND_SAME_AS_PREVIOUS field of the *i*th occurrence of APPI_REC_r is set to
 30 '1', set the AP_BAND field of AP_NGHBR_REC_s[i] to the value of AP_BAND field of
 31 AP_NGHBR_REC_s[i-1]. Otherwise, set the AP_BAND field of AP_NGHBR_REC_s[i] to the
 32 AP_BAND field of the *i*th occurrence of APPI_REC_r.
- 33 • If the AP_FREQ_SAME_AS_PREVIOUS field of the *i*th occurrence of APPI_REC_r is set to
 34 '1', set the AP_FREQ field of AP_NGHBR_REC_s[i] to the value of AP_FREQ field of
 35 AP_NGHBR_REC_s[i-1]. Otherwise, set the AP_FREQ field of AP_NGHBR_REC_s[i] to the
 36 AP_FREQ field of the *i*th occurrence of APPI_REC_r.
- 37 • If the AP_PN_REC_SAME_AS_PREVIOUS field of the *i*th occurrence of APPI_REC_r is set
 38 to '1', set the AP_PN_REC array values of AP_NGHBR_REC_s[i] to the values of

1 AP_PN_REC array of AP_NGHBR_REC_S[i-1]. Otherwise, set the AP_PN_REC array values
2 (of length AP_PN_COUNT) of AP_NGHBR_REC_S[i] as follows:

- 3 - If AP_PN_REC_TYPE field of the i^{th} occurrence of APPI_REC_R is set to '000', set the
4 k^{th} value of the AP_PN_REC array of AP_NGHBR_REC_S[i] to the k^{th} value of AP_PN
5 field in the i^{th} occurrence of APPI_REC_R, where k is between 0 and AP_PN_COUNT-
6 1.
- 7 - If AP_PN_REC_TYPE field of the i^{th} occurrence of APPI_REC_R is set to '001', set the
8 k^{th} value of the AP_PN_REC array of AP_NGHBR_REC_S[i] to the AP_PN_START + ($k \times$
9 AP_PN_INC), where AP_PN_START and AP_PN_INC are fields in the i^{th} occurrence
10 of APPI_REC_R, where k is between 0 and AP_PN_COUNT-1.

11 The mobile station may store and use the information in the message if no *Access Point*
12 *Pilot Information Message* is received within LIFETIME_S minutes of the reception of the
13 *Access Point Pilot Information Message* that the information is obtained. The mobile station
14 shall not use the information after LIFETIME_S minutes of the reception of the last *Access*
15 *Point Pilot Information Message*.

16 The mobile station may use the information in the *Access Point Pilot Information Message* to
17 identify access point pilots. E.g. While on traffic channel, if mobile station detects access
18 point pilot then the mobile station may read *Access Point Identification Message* on that
19 pilot to get handoff information in the HO_INFO_RECORD field.

20 2.6.2.2.20 Access Point Identification Message

21 Whenever an *Access Point Identification Message* is received on the Paging Channel or the
22 Primary Broadcast Control Channel, the configuration message sequence number,
23 CONFIG_MSG_SEQ_R, shall be compared to that stored in AP_IDT_MSG_SEQ_S. If the
24 comparison results in a match, the mobile station may ignore the message. If the
25 comparison results in a mismatch, then the mobile station shall process the remaining
26 fields in the message as follows.

27 The mobile station shall store the following parameters:

- 28 • Configuration message sequence number
29 (CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_R,
30 AP_IDT_MSG_SEQ_S = CONFIG_MSG_SEQ_R)
- 31 • ASSTN_TYPE_S = ASSTN_TYPE_R
- 32 • System identification (SID_S = SID_R)
- 33 • Network identification (NID_S = NID_R)
- 34 • Access Point identification (AP_ID_S = AP_ID_R)
- 35 • Access Point identification mask (AP_ID_MASK_S = AP_ID_MASK_R)

36 If the HRPD_ACQ_REC_INCL field in the message is set to '1', then the mobile station shall
37 store the following fields:

- 38 • High Rate Packet Data PN (HRPD_PN_S = HRPD_PN_R)

- 1 • High Rate Packet Data band class (HRPD_BAND_CLASS_s = HRPD_BAND_CLASS_r)
 2 • High Rate Packet Data channel number (HRPD_CHANNEL_s = HRPD_CHANNEL_r)

3 Otherwise, the mobile station shall set the HRPD_BAND_CLASS_s and HRPD_CHANNEL_s
 4 fields to NULL.

5 If the LOC_REC_TYPE field in the message is set to '001' the mobile station shall store the
 6 following:

- 7 • Base station latitude (BASE_LAT_s = BASE_LAT_r)
 8 • Base station longitude (BASE_LONG_s = BASE_LONG_r)
 9 • Base station height (BASE_HEIGHT_s = BASE_HEIGHT_r)
 10 • Base station horizontal uncertainty (LOC_UNC_H_s = LOC_UNC_H_r)
 11 • Base station horizontal uncertainty (LOC_UNC_V_s = LOC_UNC_V_r)

12 Otherwise, the mobile station shall set the BASE_LAT_s, BASE_LONG_s, BASE_HEIGHT_s,
 13 LOC_UNC_H_s and LOC_UNC_V_s fields to NULL.

14 If the INTRA_FREQ_HO_HYS_INCL field in the message is set to '1', then the mobile station
 15 shall store the following field:

- 16 • Intra-frequency idle handoff hysteresis (INTRA_FREQ_HO_HYS_s =
 17 INTRA_FREQ_HO_HYS_r)

18 Otherwise, the mobile station shall set the INTRA_FREQ_HO_HYS_s field to NULL.

19 If the INTRA_FREQ_HO_SLOPE_INCL field in the message is set to '1', then the mobile
 20 station shall store the following field:

- 21 • Intra-frequency idle handoff slope (INTRA_FREQ_HO_SLOPE_s =
 22 INTRA_FREQ_HO_SLOPE_r)

23 Otherwise, the mobile station shall set the INTRA_FREQ_HO_SLOPE_s field to 8.

24 If the INTER_FREQ_HO_HYS_INCL field in the message is set to '1', then the mobile station
 25 shall store the following field:

- 26 • Inter-frequency idle handoff hysteresis (INTER_FREQ_HO_HYS_s =
 27 INTER_FREQ_HO_HYS_r)

28 Otherwise, the mobile station shall set the INTER_FREQ_HO_HYS_s field to NULL.

29 If the INTER_FREQ_HO_SLOPE_INCL field in the message is set to '1', then the mobile
 30 station shall store the following field:

- 31 • Inter-frequency idle handoff slope (INTER_FREQ_HO_SLOPE_s =
 32 INTER_FREQ_HO_SLOPE_r)

33 Otherwise, the mobile station shall set the INTER_FREQ_HO_SLOPE_s field to 8. If the
 34 INTER_FREQ_SRCH_TH_INCL field in the message is set to '1', then the mobile station
 35 shall store the following field:

- 1 • Inter-frequency idle search threshold ($INTER_FREQ_SRCH_TH_s =$
2 $INTER_FREQ_SRCH_TH_r$)

3 Otherwise, the mobile station shall set the $INTER_FREQ_SRCH_TH_s$ field to NULL.

4 The mobile station shall store $HO_INFO_RECORD_s$ included in the message as follows:

- 5 • $HO_INFO_COUNT_s = HO_INFO_COUNT_r$
- 6 • $HO_INFO_RECORD_s[i] = i^{th}$ HO_INFO_RECORD record in the message.

7 2.6.2.2.21 Access Point Identification Text Message

8 Whenever an *Access Point Identification Text Message* is received on the Paging Channel or
9 the Primary Broadcast Control Channel, the configuration message sequence number,
10 $CONFIG_MSG_SEQ_r$, shall be compared to that stored in $AP_ID_TEXT_MSG_SEQ_s$. If the
11 comparison results in a match, the mobile station may ignore the message. If the
12 comparison results in a mismatch, then the mobile station shall process the remaining
13 fields in the message as follows.

14 The mobile station shall store the following parameters:

- 15 • Configuration message sequence number
16 $(CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,$
17 $AP_ID_TEXT_MSG_SEQ_s = CONFIG_MSG_SEQ_r)$
- 18 • Message Encoding ($MSG_ENCODING_s = MSG_ENCODING_r$)
- 19 • Mobile station shall store i^{th} occurrence of the $CHAR_i$ field as follows
20 $CHAR_s[i] = CHAR_i$

21 2.6.2.2.22 General Overhead Information Message

22 Whenever a *General Overhead Information Message* is received on the Paging Channel or
23 the Primary Broadcast Control Channel, the configuration message sequence number,
24 $CONFIG_MSG_SEQ_r$, shall be compared to that stored in $GOI_MSG_SEQ_s$. If the
25 comparison results in a match, the mobile station may ignore the message. If the
26 comparison results in a mismatch, then the mobile station shall process the remaining
27 fields in the message as follows.

28 The mobile station shall store the following parameters:

- 29 • Configuration message sequence number
30 $(CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,$
31 $GOI_MSG_SEQ_s = CONFIG_MSG_SEQ_r)$

32 For each of the General Overhead Information record contained in the *General Overhead*
33 *Information Message*, the mobile station shall perform the following:

- 34 • Set the $GOI_REC_TYPE_s[i]$ to the GOI_REC_TYPE field of the i^{th} occurrence of
35 $GOI_REC_TYPE_r$.
- 36 • Set the $GOI_REC_s[i]$ to the GOI_REC field of the i^{th} occurrence of GOI_REC_r .

2.6.2.2.23 Flex Duplex CDMA Channel List Message Overview

The mobile station may receive the *Flex Duplex CDMA Channel List Message* from the Paging Channel or from the Primary Broadcast Control Channel. Whenever a *Flex Duplex CDMA Channel List Message* is received on the Paging Channel, the mobile station shall compare the configuration message sequence number, CONFIG_MSG_SEQ_r, to that stored in FD_CHAN_LST_MSG_SEQ_s. If the comparison results in a match, the mobile station may ignore the message. If the comparison results in a mismatch, then the mobile station shall process the remaining fields in the message as follows:

If the *Flex Duplex CDMA Channel List Message* lists CDMA channels from more than one band class and the mobile station hashes to a band class other than the current band class, the mobile station shall process this message after NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s and GEN_NGHBR_LST_MSG_SEQ_s become current.

If any of the REMAINING_FIELD_INCL fields included in this message is set to '0', the mobile station shall process the remaining message after EXT_CHAN_LST_MSG_SEQ_s is current.

The mobile station shall store the following parameters:

- Configuration message sequence number (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r, FD_CHAN_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r).
- If CAND_BAND_INFO_REQ_r is included, the mobile station shall set CAND_BAND_INFO_REQ_s to CAND_BAND_INFO_REQ_r; otherwise, the mobile station shall set CAND_BAND_INFO_REQ_s to '0'.
- The mobile station shall perform the following for each occurrence of the CAND_BAND_CLASS record:
 - Set the CAND_BAND_CLASS field of CAND_BAND_CLASS_REC[i] to the ith occurrence of CAND_BAND_CLASS_r.
 - Set the SUBCLASS_INFO_INCL field of CAND_BAND_CLASS_REC[i] to the corresponding value of SUBCLASS_INFO_INCL_r.
 - If the ith occurrence of SUBCLASS_INFO_INCL field of CAND_BAND_CLASS_REC[i] is set to '1', set the SUBCLASS_REC_LEN field of CAND_BAND_CLASS_REC[i] to the corresponding value of SUBCLASS_REC_LEN_r.
 - If the ith occurrence of SUBCLASS_INFO_INCL field of CAND_BAND_CLASS_REC[i] is set to '1', the mobile station shall perform the following for each band subclass indicator received:
 - + Set the BAND_SUBCLASS_IND_REC[j] field of CAND_BAND_CLASS_REC[i] to the jth occurrence of BAND_SUBCLASS_IND_r in the ith CAND_BAND_CLASS_REC record.
 - Set the TD_MODE field of CAND_BAND_CLASS_REC[i] to the ith occurrence of TD_MODE_r

- 1 - Set the BYPASS_SYS_DET_IND field of CAND_BAND_CLASS_REC[i] to the i^{th}
2 occurrence of BYPASS_SYS_DET_IND_r.
- 3 - Set the NUM_FREQ field of CAND_BAND_CLASS_REC[i] to the i^{th} occurrence of
4 NUM_FREQ_r.
- 5 - For each FREQ record included in the CAND_BAND_CLASS_REC[i], the mobile
6 station shall store the following:
- 7 + Set the CDMA_FREQ[j] field of CAND_BAND_CLASS_REC[i] to the j^{th} occurrence
8 of CDMA_FREQ_r in the i^{th} CAND_BAND_CLASS_REC record.
- 9 + If the j^{th} occurrence of REMAINING_FIELD_INCL field of the
10 CAND_BAND_CLASS_REC[i] is set to '1', the mobile station shall store the
11 following:
- 12 ○ Set the REV_CDMA_FREQ[j] field of CAND_BAND_CLASS_REC[i] to the j^{th}
13 occurrence of REV_CDMA_FREQ_r in the i^{th} CAND_BAND_CLASS_REC
14 record.
- 15 ○ Set the RC_QPCH_HASH_IND[j] field of CAND_BAND_CLASS_REC[i] to the
16 j^{th} occurrence of RC_QPCH_HASH_IND_r if the field corresponding to the
17 CDMA_FREQ[j] field of the i^{th} CAND_BAND_CLASS_REC record is included,
18 otherwise set it to '0'.
- 19 ○ Set the TD_HASH_IND[j] field of CAND_BAND_CLASS_REC[i] to the j^{th}
20 occurrence of TD_HASH_IND_r if the field corresponding to the
21 CDMA_FREQ[j] field of the i^{th} CAND_BAND_CLASS_REC record is included,
22 otherwise set it to '0'.
- 23 ○ Set the TD_POWER_LEVEL[j] field of CAND_BAND_CLASS_REC[i] to the j^{th}
24 occurrence of TD_POWER_LEVEL_r if the field corresponding to the
25 CDMA_FREQ[j] field of the i^{th} CAND_BAND_CLASS_REC record is included,
26 otherwise set it to '0'.
- 27 ○ Set the CDMA_FREQ_WEIGHT[j] field of CAND_BAND_CLASS_REC[i] to the
28 j^{th} occurrence of CDMA_FREQ_WEIGHT_r if the field corresponding to the
29 CDMA_FREQ[j] field of the i^{th} CAND_BAND_CLASS_REC record is included,
30 otherwise set it to '0'.
- 31 + Otherwise, the mobile station should set these fields as follows:
- 32 ○ If the base station is sending the *Extended CDMA Channel List Message* and
33 includes CDMA_FREQ[j] and CAND_BAND_CLASS pair the mobile station
34 shall store the following:
- 35 ◇ Set the REV_CDMA_FREQ[j] field of CAND_BAND_CLASS_REC[i]
36 according to [45].
- 37 ◇ If the RC_QPCH_HASH_IND_r field corresponding to the CDMA_FREQ[j]
38 and CAND_BAND_CLASS pair in the *Extended CDMA Channel List*
39 *Message* is included, set the RC_QPCH_HASH_IND[j] field of
40 CAND_BAND_CLASS_REC[i] to this value, Otherwise, set it to '0'.

- 1 ◇ If the TD_HASH_IND_r field corresponding to the CDMA_FREQ[j] and
2 CAND_BAND_CLASS pair in the *Extended CDMA Channel List Message* is
3 included, set the TD_HASH_IND[j] field of CAND_BAND_CLASS_REC[i] to
4 this value, Otherwise, set it to '0'.
- 5 ◇ If the TD_POWER_LEVEL_r field corresponding to the CDMA_FREQ[j] and
6 CAND_BAND_CLASS pair in the *Extended CDMA Channel List Message* is
7 included, set the TD_POWER_LEVEL[j] field of
8 CAND_BAND_CLASS_REC[i] to this value, Otherwise, set it to '0'.
- 9 ◇ If the CDMA_FREQ_WEIGHT_r field corresponding to the CDMA_FREQ[j]
10 and CAND_BAND_CLASS pair in the *Extended CDMA Channel List*
11 *Message* is included, set the CDMA_FREQ_WEIGHT[j] field of
12 CAND_BAND_CLASS_REC[i] to this value, Otherwise, set it to '0'.
- 13 ○ If the base station is not sending the *Extended CDMA Channel List Message*
14 or if the CDMA_FREQ[j] and CAND_BAND_CLASS pair is not included in the
15 *Extended CDMA Channel List Message* the mobile station shall set store the
16 following:
- 17 ◇ Set the REV_CDMA_FREQ[j] field of CAND_BAND_CLASS_REC[i]
18 according to [45].
- 19 ◇ Set the RC_QPCH_HASH_IND[j] field of CAND_BAND_CLASS_REC[i] to
20 '0'.
- 21 ◇ Set the TD_HASH_IND[j] field of CAND_BAND_CLASS_REC[i] to '0'.
- 22 ◇ Set the TD_POWER_LEVEL[j] field of CAND_BAND_CLASS_REC[i] to '0'.
- 23 ◇ Set the CDMA_FREQ_WEIGHT[j] field of CAND_BAND_CLASS_REC[i] to
24 '0'.

25 If this message is received on the Paging Channel, the mobile station shall process it as
26 specified in the section 2.6.2.2.23.1. Otherwise the mobile station shall process the
27 message as specified in section 2.6.2.2.23.2.

28 2.6.2.2.23.1 Flex Duplex CDMA Channel List Message on Paging Channel

29 The mobile station shall determine the CDMA Channel (Frequency Assignment) for its
30 Paging Channel as follows:

- 31 • Starting from an empty list, the mobile station shall generate the first CDMA Channel
32 list from the *Flex Duplex CDMA Channel List Message* as follows:
- 33 - For each band class record included in this message, the mobile station shall
34 perform the following:
- 35 + If band subclass information is included for this band class record
36 (SUBCLASS_INFO_INCL_s = '1'), the mobile station shall add only those channels
37 belonging to the band class and band subclasses that are supported by both the

- 1 mobile station and the base station, in the order they appear in the *Flex Duplex*
 2 *CDMA Channel List Message*³⁸.
- 3 + Otherwise (SUBCLASS_INFO_INCL_S = '0' or P_REV_IN_USE_S is less than 11), the
 4 mobile station shall add only those channels that it supports for the associated
 5 band class, in the order they appear in the *Flex Duplex CDMA Channel List*
 6 *Message*.
- 7 - If P_REV_IN_USE_S is greater than or equal to 11, the mobile station shall sort the
 8 channels first by the ascending order of band class value, as specified in ~~[30]~~[53],
 9 then by the ascending order of CDMA_FREQ within each band class.
- 10 • If RC_QPCH_SEL_INCL_T is equal to '1' and the mobile station is capable of RC greater
 11 than 2 or capable of supporting Quick Paging Channel, the mobile station shall
 12 eliminate the channels with RC_QPCH_HASH_IND_S equal to '0' from the first CDMA
 13 Channel list to generate the second CDMA Channel list while preserving the order in
 14 the first CDMA Channel list. Otherwise, the mobile station shall set the second CDMA
 15 Channel list to be equal to the first CDMA Channel list.
- 16 • The mobile station shall generate the third CDMA Channel list as follows.
- 17 - If CDMA_FREQ_WEIGHT_INCL_T is equal to '0', the mobile station shall set the third
 18 CDMA Channel list to be equal to the second CDMA Channel list.
- 19 - If CDMA_FREQ_WEIGHT_INCL_T is equal to '1', starting with an empty third CDMA
 20 Channel list, for each entry "E" in the second CDMA Channel list in the order they
 21 appear, the mobile station shall append N consecutive entries "E" at the end of the
 22 third CDMA Channel list, where N is the weight of "E" and equals
 23 CDMA_FREQ_WEIGHT_S+1.
- 24 • The mobile station shall generate a CDMA band list as follows. Starting with an empty
 25 CDMA band list, for each channel in the third CDMA Channel list in the order they
 26 appear, the mobile station shall append an entry equal to the band class of that
 27 channel, at the end of the CDMA band list.
- 28 • The mobile station shall use the hash algorithm specified in 2.6.7.1 and the size of the
 29 CDMA band list to compute the band class for its Paging Channel.
- 30 • The mobile station shall eliminate those channels which are not in the computed band
 31 class from the third CDMA channel list to generate the final CDMA channel list.
- 32 • If the final CDMA Channel list is empty, the mobile station shall proceed with the
 33 processing of *Extended CDMA Channel List message* and the *CDMA Channel List*
 34 *message*.

³⁸ The mobile station will not discard frequencies as long as they belong to a subclass that is both listed in the message and supported by the mobile station. If the base station does not list any subclass, the mobile station assumes that all subclasses are supported by the base station. The subclass to frequency mapping is not provided in the *Extended CDMA Channel List Message*; the mobile station needs to refer to [45] to find the mapping.

- 1 • The mobile station shall then use the hash algorithm specified in 2.6.7.1 and the size of
 2 the final CDMA channel list to determine the CDMA Channel (Frequency Assignment)
 3 for its Paging Channel.

4 Figure 2.6.2.2.12.1-1 shows an example of the hashing procedure.

5 If the CDMA Frequency Assignment has changed but the band class is the same (the
 6 computed CDMA Channel is different from CDMACH_s but the computed CDMA band class
 7 is the same as CDMABAND_s), the mobile station shall perform the following actions:

- 8 • If the stored configuration parameters is not current (see 2.6.2.2) for the corresponding
 9 base station and frequency assignment, the mobile station shall perform the following
 10 actions:

- 11 - Set CDMACH_s to the new CDMA Channel.
 12 - Set REVCDMACH_s to the Reverse CDMA Channel.
 13 - Set PAGE_CHAN_s to '1'.
 14 - Set PAGECH_s to the Primary Paging Channel.
 15 - Set CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
 16 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
 17 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
 18 EXT_SYS_PAR_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s,
 19 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, USER_ZONE_IDMSG_SEQ_s,
 20 PRI_NGHBR_LST_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
 21 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
 22 ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s to NULL.
 23 The mobile station shall keep the parameters associated with the current overhead
 24 messages until they are updated on the new Paging Channel³⁹

- 25 - Tune to the new CDMA Channel.

- 26 • Otherwise, the mobile station shall perform the following actions:

- 27 - Set CDMACH_s to the new CDMA Channel.
 28 - The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a new
 29 Paging Channel number in the range 1 to PAGE_CHAN_s, where PAGE_CHAN_s is the
 30 value stored for the Paging Channel whose stored information is current. The
 31 mobile station shall store the new Paging Channel number as PAGECH_s.
 32 - Tune to the new CDMA Channel and shall begin monitoring the new Paging
 33 Channel.

³⁹ This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1 If the band class has changed (the computed CDMA band class is different than
2 CDMABAND_S), the mobile station shall perform the following actions:
- 3 • If BYPASS_SYS_DET_IND_S is equal to '0' for this CDMA channel, the mobile station
4 shall perform the following:
 - 5 - Set NEW_BAND_RECORD.NEW_BAND_CLASS to the computed band class
 - 6 - Set NEW_BAND_RECORD.NEW_FREQ to the computed CDMA Channel
 - 7 - The mobile station shall enter the *System Determination Substate* of the *Mobile*
8 *Station Initialization State* with a new band indication.
 - 9 • If BYPASS_SYS_DET_IND_S is equal to '1' for this CDMA channel, the mobile station
10 shall perform the following:
 - 11 - If the stored configuration parameters is not current (see 2.6.2.2) for the
12 corresponding base station and frequency assignment, the mobile station shall
13 perform the following actions:
 - 14 + Set CDMACH_S to the new CDMA Channel.
 - 15 + Set REVCDMACH_S to the Reverse CDMA Channel.
 - 16 + Set CDMABAND_S to the new band class.
 - 17 + Set PAGE_CHAN_S to '1'.
 - 18 + Set PAGECH_S to the Primary Paging Channel.
 - 19 + Set CONFIG_MSG_SEQ_S, SYS_PAR_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S,
20 CHAN_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S,
21 FD_CHAN_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S,
22 GEN_NGHBR_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S,
23 GLOB_SERV_REDIR_MSG_SEQ_S, EXT_GLOB_SERV_REDIR_MSG_SEQ_S,
24 USER_ZONE_IDMSG_SEQ_S, PRI_NGHBR_LST_MSG_SEQ_S,
25 AP_PILOT_INFO_MSG_SEQ_S, AP_IDT_MSG_SEQ_S, AP_ID_TEXT_MSG_SEQ_S,
26 GOI_MSG_SEQ_S, FREQ_GOI_MSG_SEQ_S, ATIM_MSG_SEQ_S,
27 HDPPM_MSG_SEQ_S, GAPM_SEQ_S and ACC_MSG_SEQ_S to NULL. The mobile
28 station shall keep the parameters associated with the current overhead
29 messages until they are updated on the new Paging Channel⁴⁰.
 - 30 + Tune to the new CDMA Channel.
 - 31 - Otherwise, the mobile station shall perform the following actions:
 - 32 + Set CDMACH_S to the new CDMA Channel.

⁴⁰ This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1 + Set CDMABAND_S to the new band class.
- 2 + The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a
3 new Paging Channel number in the range 1 to PAGE_CHAN_S, where
4 PAGE_CHAN_S is the value stored for the Paging Channel whose stored
5 information is current. The mobile station shall store the new Paging Channel
6 number as PAGECH_S.
- 7 + Tune to the new CDMA Channel and shall begin monitoring the new Paging
8 Channel.

9 2.6.2.2.23.2 Flex Duplex CDMA Channel List Message on Primary Broadcast Control
10 Channel

11 To determine the CDMA Channel (Frequency Assignment) for its Primary Broadcast Control
12 Channel, the mobile station shall first select a subset of CDMA channels from the *Flex*
13 *Duplex CDMA Channel List Message* that will be used for channel hashing. The attributes
14 for channel selection are support for that frequency, the band subclass (if included), RC
15 greater than 2, Quick Paging Channel and transmit diversity. The mobile station shall first
16 select the entire CDMA channel list for channel hashing.

- 17 • Starting from an empty list, the mobile station shall then select the first CDMA Channel
18 list as follows:
- 19 - For each band class record included in this message, the mobile station shall
20 perform the following:
- 21 - If band subclass information is included for this band class record
22 (SUBCLASS_INFO_INCL_S = '1'), the mobile station shall add only those channels
23 belonging to the band class and band subclasses that are supported by both the
24 mobile station and the base station, in the order they appear in the *Flex Duplex*
25 *CDMA Channel List Message*⁴¹.
- 26 - Otherwise (SUBCLASS_INFO_INCL_S = '0' or P_REV_IN_USE_S is less than 11), the
27 mobile station shall add only those channels that it supports for the associated
28 band class, in the order they appear in the *Flex Duplex CDMA Channel List Message*.
- 29 • If P_REV_IN_USE_S is greater than or equal to 11, the mobile station shall sort the
30 channels first by the ascending order of band class value as specified in ~~[30]~~[53], then
31 by the ascending order of CDMA_FREQ within each band class.
- 32 • If TD_SEL_INCL_T is equal to '1', the mobile station shall perform the following:

⁴¹ The mobile station will not discard frequencies as long as they belong to a subclass that is both listed in the message and supported by the mobile station. If the base station does not list any subclass, the mobile station assumes that all subclasses are supported by the base station. The subclass to frequency mapping is not provided in the *Extended CDMA Channel List Message*; the mobile station needs to refer to [45] to find the mapping.

- 1 - If the mobile station is capable of supporting the transmit diversity mode specified
2 by TD_MODE_S, the mobile station shall select those CDMA channels that have
3 TD_HASH_IND_S set to '1' from the CDMA channel list for the first CDMA Channel
4 list while preserving the order.
- 5 - If the mobile station is not capable of supporting the transmit diversity mode
6 specified by TD_MODE_S, the mobile station shall select those CDMA channels that
7 have TD_HASH_IND_S set to '0' from the CDMA channel list for the first CDMA
8 Channel list while preserving the order.
- 9 • If TD_SEL_INCL_T is equal to '0', the mobile station shall select the entire list for the first
10 CDMA Channel list.

11 From this first CDMA Channel list, the mobile station shall select the second CDMA
12 Channel list as follows:

- 13 • If RC_QPCH_SEL_INCL_T is equal to '1' and the mobile station is capable of RC greater
14 than 2 or capable of supporting QPCH, the mobile station shall select those CDMA
15 channels with RC_QPCH_HASH_IND_S set to '1' for the second CDMA Channel list for
16 CDMA channel hashing while preserving the order. If this list is empty, the mobile
17 station shall use the first CDMA Channel list as the second CDMA Channel list for
18 CDMA channel hashing.
- 19 • Otherwise, the mobile station shall use the first CDMA Channel list as the second
20 CDMA Channel list for CDMA channel hashing.

21 From this second CDMA Channel list, the mobile station shall select the third CDMA
22 Channel listsubset as follows:

- 23 • If CDMA_FREQ_WEIGHT_INCL_T is equal to '0', the mobile station shall set the third
24 CDMA Channel list to be equal to the second CDMA Channel list
- 25 • If CDMA_FREQ_WEIGHT_INCL_T is equal to '1', starting with an empty third CDMA
26 Channel list, for each entry "E" in the second CDMA Channel list in the order they
27 appear, the mobile station shall append N consecutive entries "E" at the end of the
28 third CDMA Channel, where N is the weight of "E" and equals
29 CDMA_FREQ_WEIGHT_S+1.

30 The mobile station shall determine the band class for its Primary Broadcast Control
31 Channel as follows:

- 32 • The mobile station shall generate a CDMA band list as follows. Starting with an empty
33 CDMA band list, for each channel in the third CDMA Channel list in the order they
34 appear, the mobile station shall append an entry equal to the band class of that
35 channel, at the end of the CDMA band list
- 36 • The mobile station shall use the hash algorithm specified in 2.6.7.1 and the size of the
37 CDMA band list to compute the band class for its Primary Broadcast Control Channel.

38 After the band class has been selected, the mobile station shall determine the CDMA
39 Channel (Frequency Assignment) for its Primary Broadcast Control Channel as follows:

- 1 • The mobile station shall eliminate those channels which are not in the computed band
2 class from the third CDMA Channel list to generate the final CDMA Channel list.
- 3 • If the final CDMA Channel list is empty, the mobile station shall proceed with the
4 processing of the *Extended CDMA Channel List message*.
- 5 • The mobile station shall then use the hash algorithm specified in 2.6.7.1 with the
6 number of channels in the final CDMA Channel list to determine the CDMA Channel
7 (Frequency Assignment) for its Primary Broadcast Control Channel.

8 If the CDMA Frequency Assignment has changed but the band class is the same (the
9 computed CDMA Channel is different from CDMACH_s but the computed CDMA band class
10 is CDMABAND_s), the mobile station shall perform the following:

- 11 • Set CDMACH_s to the new CDMA Channel.
- 12 • Set REVCDMACH_s to the new Reverse CDMA Channel.
- 13 • Set CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s,
14 UNI_NGHBR_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
15 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
16 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
17 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and PRI_NGHBR_LST_MSG_SEQ_s,
18 GAPM_SEQ_s and ACC_MSG_SEQ_s to NULL. The mobile station shall keep the
19 parameters associated with the current overhead messages until they are updated on
20 the new Primary Broadcast Control Channel⁴².
- 21 • If the mobile station is operating in the Spreading Rate 1:
 - 22 - If the assigned CDMA channel supports transmit diversity, the mobile station shall
23 set the following fields corresponding to the assigned CDMA channel:
 - 24 + SR1_TD_POWER_LEVEL_s = TD_POWER_LEVEL_r.
 - 25 + SR1_TD_MODE_s = TD_MODE_r.
 - 26 + BRAT_s = SR1_BRAT_TD_s.
 - 27 + BCCH_CODE_RATE_s = SR1_CRAT_TD_s.
 - 28 + BCCH_s = BCCH_CODE_CHAN_TD_s.
 - 29 - Otherwise, the mobile station shall set the following fields corresponding to the
30 assigned CDMA channel:
 - 31 + BRAT_s = SR1_BRAT_NON_TD_s,
 - 32 + BCCH_CODE_RATE_s = SR1_CRAT_NON_TD_s,

⁴² This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1 + BCCHs = BCCH_CODE_CHAN_NON_TD_s,
- 2 • Tune to the new CDMA Channel
- 3 If the band class has changed (the computed CDMA band class is different than
4 CDMABAND_s), the mobile station shall perform the following actions:
- 5 • If BYPASS_SYS_DET_IND_s is equal to '0' for this CDMA channel, the mobile station
6 shall perform the following:
- 7 - Set NEW_BAND_RECORD.NEW_BAND_CLASS to the computed band class.
- 8 - Set NEW_BAND_RECORD.NEW_FREQ to the computed CDMA Channel.
- 9 - The mobile station shall enter the *System Determination Substate* of the *Mobile*
10 *Station Initialization State* with a new band indication.
- 11 • If BYPASS_SYS_DET_IND_s is equal to '1' for this CDMA channel, the mobile station
12 shall perform the following:
- 13 - Set CDMACH_s to the new CDMA Channel.
- 14 - Set REVCDMACH_s to the new Reverse CDMA Channel.
- 15 - Set CDMABAND_s to the new band class.
- 16 - Set CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s,
17 UNI_NGHBR_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
18 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, and
19 PRI_NGHBR_LST_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
20 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
21 ATIM_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s to NULL. The mobile station
22 shall keep the parameters associated with the current overhead messages until they
23 are updated on the new Primary Broadcast Control Channel⁴³.
- 24 - If the mobile station is operating in the Spreading Rate 1:
- 25 + If the assigned CDMA channel supports transmit diversity, the mobile station
26 shall set the following fields corresponding to the assigned CDMA channel:
- 27 ○ SR1_TD_POWER_LEVEL_s = TD_POWER_LEVEL_r.
- 28 ○ SR1_TD_MODE_s = TD_MODE_r.
- 29 ○ BRAT_s = SR1_BRAT_TD_s.
- 30 ○ BCCH_CODE_RATE_s = SR1_CRAT_TD_s.
- 31 ○ BCCH_s = BCCH_CODE_CHAN_TD_s.

⁴³ This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1 - Otherwise, the mobile station shall set the following fields corresponding to the
2 assigned CDMA channel:
3 + BRATs = SR1_BRAT_NON_TDs,
4 + BCCH_CODE_RATEs = SR1_CRAT_NON_TDs,
5 + BCCHs = BCCH_CODE_CHAN_NON_TDs,
6 - Tune to the new CDMA Channel

7 2.6.2.2.24 Alternative Technologies Information Message

8 Whenever a *Alternative Technologies Information Message* is received on the Paging Channel
9 or the Primary Broadcast Control Channel, the configuration message sequence number,
10 CONFIG_MSG_SEQ_r, shall be compared to that stored in ATIM_MSG_SEQ_s. If the
11 comparison results in a match, the mobile station may ignore the message. If the
12 comparison results in a mismatch, then the mobile station shall process the remaining
13 fields in the message as follows.

14 The mobile station shall store the following parameters:

- 15 • Configuration message sequence number
16 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
17 ATIM_MSG_SEQ_s = CONFIG_MSG_SEQ_r)

18 The mobile station shall store all the Radio Interface records contained in the *Alternative
19 Technologies Information Message*.

20 2.6.2.2.25 Frequent General Overhead Information Message

21 Whenever a *Frequent General Overhead Information Message* is received on the Paging
22 Channel or the Primary Broadcast Control Channel, the configuration message sequence
23 number, CONFIG_MSG_SEQ_r, shall be compared to that stored in FREQ_GOI_MSG_SEQ_s.
24 If the comparison results in a match, the mobile station may ignore the message. If the
25 comparison results in a mismatch, then the mobile station shall process the remaining
26 fields in the message as follows.

27 The mobile station shall store the following parameters:

- 28 • Configuration message sequence number
29 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
30 FREQ_GOI_MSG_SEQ_s = CONFIG_MSG_SEQ_r)

31 For each of the General Overhead Information record contained in the *Frequent General
32 Overhead Information Message*, the mobile station shall perform the following:

- 33 • Set the FREQ_GOI_REC_TYPE_s[i] to the GOI_REC_TYPE field of the *i*th occurrence of
34 GOI_REC_TYPE_r.
- 35 • Set the FREQ_GOI_REC_s[i] to the GOI_REC field of the *i*th occurrence of GOI_REC_r.

36 If the mobile station supports the processing of GOI_REC_TYPE value of '00000010' in the
37 General Overhead Information record and receives a General Overhead Information record

1 with GOI_REC_TYPE of '00000010', the mobile station shall process the General Overhead
2 Information as follows:

- 3 • The mobile station should use the information in the GOI_REC_TYPE of '00000010' to
4 search for preferred networks⁴⁴. If the General Overhead Information record with
5 GOI_REC_TYPE of '00000010' includes the MCC and MNC⁴⁵, the mobile station should
6 attempt to acquire the home system if all of the following conditions are met:
 - 7 - The mobile station is currently not on the home system.
 - 8 - The MCC and MNC values contained in the General Overhead Information record
9 match the home system of the mobile station.
 - 10 - The user has not directed the mobile station to stay on the current system.

11 If the mobile station is unable to acquire the home system, the mobile station may return
12 and acquire the current system and continue to stay on this system⁴⁶.

13 2.6.2.2.26 Generic Access Parameters Message

14 Whenever a *Generic Access Parameters Message* is received on the f-csch, the sequence
15 number, ACC_MSG_SEQ_r, shall be compared to GAPM_SEQ_s. If GAPM_SEQ_s equals
16 ACC_MSG_SEQ_r, the mobile station may ignore the message. Otherwise, the mobile station
17 shall process the remaining fields in the message as follows.

18 The mobile station shall store the following parameters:

- 19 • *Generic Access Parameters Message* sequence number (GAPM_SEQ_s = ACC_MSG_SEQ_r)
- 20 • Network overload indicator (NET_OVRLD_INDICATOR_s = NET_OVRLD_INDICATOR_r)
- 21 • Network access priority (NETWORK_ACCESS_PRIORITY_s =
22 NETWORK_ACCESS_PRIORITY_r)
- 23 • Selective Acknowledgement supported indicator (SACK_SUPPORTED_INDICATOR_s =
24 SACK_SUPPORTED_INDICATOR_r)
- 25 • Low rate Enhanced Access Channel support indicator (LOW_RATE_EACH_SUPPORT_s =
26 LOW_RATE_EACH_SUPPORT_r)
- 27 • Persistence related parameters:
 - 28 - Store USE_APM_PSIST_PARMS_s = USE_APM_PSIST_PARMS_r. If
29 USE_APM_PSIST_PARMS_s is equal to '1', then the mobile station shall use

⁴⁴ For example, mobile station that is roaming may use this information to search for a home network if the home network is listed in the GOI_REC. Procedures for search is beyond the scope of this specification.

⁴⁵ MNC is IMSI_11_12 when IMSI_10 is not included or concatenation of IMSI_11_12 and IMSI_10 when IMSI_10 is included.

⁴⁶ The system selection procedure for this scenario is beyond the scope of this specification.

- 1 persistence parameters included in *Access Parameters Message*.
- 2 - If PSIST_PARMS_INCL is included and is equal to '1', store the following:
- 3 + Persistence parameter number according to the following rule:
- 4 o If the mobile station's access overload class is in the range 0-9 inclusive,
- 5 set PSIST_s equal to PSIST(0-9)_EACH_r;
- 6 o If the mobile station's access overload class is in the range 10-12, set
- 7 PSIST_s equal to PSIST(n)_EACH_r, where n is equal to the mobile station
- 8 access overload class;
- 9 o If the mobile station's access overload class is 14, it shall set
- 10 ◇ PSIST_{M_s} = PSIST(0-9)_EACH_r, if the last digit of the associated
- 11 decimal representation of its IMSI_M by a decimal to binary
- 12 conversion as specified in Table 2.3.5-1 is in the range 0-9.
- 13 ◇ PSIST14_s = PSIST(14)_EACH_r;
- 14 ◇ PSIST15_s = PSIST(15)_EACH_r.
- 15 + Persistence modifier for Enhanced Access Channel attempts for registrations
- 16 which are not responses to the *Registration Request Order*
- 17 (REG_PSIST_s = REG_PSIST_EACH_r).
- 18 + Persistence modifier for Enhanced Access Channel attempts for message
- 19 transmissions (MSG_PSIST_s = MSG_PSIST_EACH_r).
- 20 - If PSIST_PARMS_INCL_r is included and is equal to '0', store the following:
- 21 + Set PSIST_s to 0 for Enhanced Access Channel attempts.
- 22 + Persistence modifier for Enhanced Access Channel attempts for message
- 23 transmissions (MSG_PSIST_s = '000').
- 24 + Persistence modifier for Enhanced Access Channel attempts for registrations
- 25 which are not responses to the *Registration Request Order* (REG_PSIST_s = '000').
- 26 - If PSIST_EMG_INCL_r is equal to '1', store the following:
- 27 + Persistence modifier for emergency calls by the mobile stations in access
- 28 overload classes 0 to 9 (PSIST_EMG_s = PSIST_EMG_r).
- 29 - If PSIST_EMG_INCL_r is equal to '0', store the following:
- 30 + Persistence modifier for emergency calls by the mobile stations in access
- 31 overload classes 0 to 9 (PSIST_EMG_s = PSIST_EMG_r in *Access Parameters*
- 32 *Message* or '000').
- 33 • Link Access Control related parameters:
- 34 - If USE_APM_ACC_TMO_r is equal to '1' then Acknowledgment timeout
- 35 (EACH_ACC_TMO_s = ACC_TMO_r in *Access Parameters Message*); otherwise,
- 36 (EACH_ACC_TMO_s = ACC_TMO_r)
- 37 - If USE_APM_MAX_ACC_SEQ_r is equal to '1', then

- 1 + Maximum number of probe sequences for an Enhanced Access Channel request
2 (MAX_REQ_SEQ_S = MAX_REQ_SEQ_R in *Access Parameters Message*)
- 3 + Maximum number of probe sequences for an Enhanced Access Channel
4 response (MAX_RSP_SEQ_S = MAX_RSP_SEQ_R in *Access Parameters Message*)
- 5 - If USE_APM_MAX_ACC_SEQ_R is equal to '0', then
- 6 + Maximum number of probe sequences for an Enhanced Access Channel request
7 (MAX_REQ_SEQ_S = MAX_REQ_SEQ_R)
- 8 + Maximum number of probe sequences for an Enhanced Access Channel
9 response (MAX_RSP_SEQ_S = MAX_RSP_SEQ_R)
- 10 • Mode selection related parameters:
- 11 - NUM_MODE_SELECTION_ENTRIES_S = 1
- 12 - MODE_SELECTION_S[1].ACCESS_MODE = 0
- 13 - MODE_SELECTION_S[1].ACCESS_MODE_MIN_DURATION =
14 (Access_Mode_Min_Duration_R + 1) × 4
- 15 - MODE_SELECTION_S[1].ACCESS_MODE_MAX_DURATION =
16 (Access_Mode_Max_Duration_R + 1) × 16
- 17 • Reverse gain adjustment of the Enhanced Access Channel or Reverse Common Control
18 Channel relative to the Reverse Pilot Channel (RLGAIN_COMMON_PILOT_S =
19 RLGAIN_COMMON_PILOT_R)
- 20 • The threshold level at which the interference correction begins to be applied
21 (IC_THRESH_S = - IC_THRESH_R)
- 22 • The maximum interference correction that can be applied (IC_MAX_S = IC_MAX_R)
- 23 • Mode-specific parameters for the Enhanced Access Channel:
- 24 - Nominal transmit power offset on the Enhanced Access Channel
25 (EACH_NOM_PWR_S = EACH_NOM_PWR_R)
- 26 - Initial power offset for access on the Enhanced Access Channel
27 (EACH_INIT_PWR_S = EACH_INIT_PWR_R)
- 28 - Power increment on the Enhanced Access Channel
29 (EACH_PWR_STEP_S = EACH_PWR_STEP_R)
- 30 - Number of access probes on the Enhanced Access Channel
31 (EACH_NUM_STEP_S = EACH_NUM_STEP_R)
- 32 - Preamble enabled indicator on the Enhanced Access Channel
33 (EACH_PREAMBLE_ENABLED_S = EACH_PREAMBLE_ENABLED_R)
- 34 - Number of preamble fractions sent on the Enhanced Access Channel if
35 EACH_PREAMBLE_ENABLED_R is equal to '1'
36 (EACH_PREAMBLE_NUM_FRAC_S = EACH_PREAMBLE_NUM_FRAC_R)
- 37 - Fractional preamble duration on the Enhanced Access Channel if

- 1 EACH_PREAMBLE_ENABLED_r is equal to '1'
2 (EACH_PREAMBLE_FRAC_DURATION_s = EACH_PREAMBLE_FRAC_DURATION_r)
3
- 4 – Preamble gated-off duration on the Enhanced Access Channel if
5 EACH_PREAMBLE_ENABLED_r is equal to '1'
6 (EACH_PREAMBLE_OFF_DURATION_s = EACH_PREAMBLE_OFF_DURATION_r)
7
- 8 – Additional preamble duration on the Enhanced Access Channel if
9 EACH_PREAMBLE_ENABLED_r is equal to '1'
10 (EACH_PREAMBLE_ADD_DURATION_s =
11 EACH_PREAMBLE_ADD_DURATION_r)
- 12 – Enhanced Access Channel probe backoff range (EACH_PROBE_BKOFF_s =
13 EACH_PROBE_BKOFF_r)
- 14 – Enhanced Access Channel probe sequence backoff range (EACH_BKOFF_s =
15 EACH_BKOFF_r)
- 16 – Enhanced Access Channel slot (EACH_SLOT_s = 1 + EACH_SLOT_r)
- 17 – Enhanced Access Channel first slot offset
18 (EACH_SLOT_OFFSET1_s = EACH_SLOT_OFFSET1_r)
- 19 – Enhanced Access Channel second slot offset
20 (EACH_SLOT_OFFSET2_s = EACH_SLOT_OFFSET2_r)
- 21 • Additional parameters for the Basic Access Mode:
22 Store the following parameters:
- 23 – Basic Access Mode supported indicator (BA_SUPPORTED_s = '1')
- 24 – Number of Enhanced Access Channels (NUM_EACH_BA_s = (NUM_EACH_BA_r +
25 1))
- 26 – Rate words supported on the Enhanced Access Channels
27 (EACH_BA_RATES_SUPPORTED_s = EACH_BA_RATES_SUPPORTED_r)
- 28 • The pilot reporting indicator (PILOT_REPORT_s = PILOT_REPORT_r)
- 29 • Access Handoff related parameters:
- 30 – If USE_ESPM_ACC_HO_PARAMS_r is equal to '1', and CCH_INFO_INCL_r in
31 *Extended System Parameters Message* is equal to '1', then
- 32 + ACC_ENT_HO_ORDER_s = ACC_ENT_HO_ORDER_r in *Extended System*
33 *Parameters Message*
- 34 + ACCESS_HO_s = ACCESS_HO_r in *Extended System Parameters Message*
- 35 + If ACCESS_HO_s is set to '1',
36 ACCESS_HO_MSG_RSP_s = ACCESS_HO_MSG_RSP_r in *Extended System*
37 *Parameters Message*
- 38 + ACCESS_PROBE_HO_s = ACCESS_PROBE_HO_r in *Extended System Parameters*

Message

- 1 + If ACCESS_PROBE_HO_s is equal to '1',
 - 2 ○ ACC_HO_LIST_UPD_s = ACC_HO_LIST_UPD_r in *Extended System*
 - 3 Parameters Message
 - 4 ○ ACC_PROBE_HO_OTHER_MSG_s = ACC_PROBE_HO_OTHER_MSG_r in
 - 5 Extended System Parameters Message
 - 6 ○ MAX_NUM_PROBE_HO_s = MAX_NUM_PROBE_HO_r in *Extended System*
 - 7 Parameters Message
- 8 - If USE_ESPM_ACC_HO_PARAMS_r is equal to '0', and CCH_INFO_INCL_r in
- 9 Extended System Parameters Message is equal to '1', then
 - 10 + ACC_ENT_HO_ORDER_s = ACC_ENT_HO_ORDER_r
 - 11 + ACCESS_HO_s = ACCESS_HO_r
 - 12 + If ACCESS_HO_r is equal to '1',
 - 13 ACCESS_HO_MSG_RSP_s = ACCESS_HO_MSG_RSP_r
 - 14 + ACCESS_PROBE_HO_s = ACCESS_PROBE_HO_r
 - 15 + If ACCESS_PROBE_HO_r is equal to '1',
 - 16 ○ ACC_HO_LIST_UPD_s = ACC_HO_LIST_UPD_r
 - 17 ○ ACC_PROBE_HO_OTHER_MSG_s = ACC_PROBE_HO_OTHER_MSG_r
 - 18 ○ MAX_NUM_PROBE_HO_s = MAX_NUM_PROBE_HO_r

19 The mobile station shall set CURR_ACC_MSG_SEQ equal to ACC_MSG_SEQ_r.

20 2.6.2.2.27HDP Parameters Message

21 Whenever a *HDP Parameters Message* is received on the Paging Channel, the configuration

22 message sequence number, CONFIG_MSG_SEQ_r, shall be compared to that stored in

23 HDPPM_MSG_SEQ_s. If the comparison results in a match, the mobile station may ignore

24 the message. If the comparison results in a mismatch, then the mobile station shall

25 process the remaining fields in the message as follows.

26 The mobile station shall store the following parameters:

- 27 • Configuration message sequence number
- 28 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
- 29 HDPPM_MSG_SEQ_s = CONFIG_MSG_SEQ_r)

30 If mobile station supports HDP, the mobile station shall store ~~HDP_PARAMETERS~~ [the following parameters](#) received in the message.

- 31 • [HDP period \(HDP_PERIOD_s = HDP_PERIOD_r\)](#)
- 32 • [HDP signal Walsh Cover \(HDP_WALSH_COVER_s = HDP_WALSH_COVER_r\)](#).
- 33 • [HDP transmission offset \(HDP_OFFSET_s = HDP_OFFSET_r\)](#).

- 1 • Number of sectors to detect HDP from ($HDP_SECTOR_COUNT_s =$
2 $HDP_SECTOR_COUNT_r$)The mobile station shall perform the following for each
3 occurrence of the HDP_SECTOR_s record
 - 4 - The HDP PN offset of the HDP transmission. ($HDP_PILOT_PN_s =$
5 $HDP_PILOT_PN_r$).
 - 6 - $PLANNED_OR_RANDOM_COLORING_s = PLANNED_OR_RANDOM_COLORING_r$.
 - 7 - If $PLANNED_OR_RANDOM_COLORING_s$ is '0',
 - 8 + Color offset of the HDP ($HDP_COLOR_OFFSET_s = HDP_COLOR_OFFSET_r$).
 - 9 - If $PLANNED_OR_RANDOM_COLORING_s$ is '1', read the following parameters
10 control the random coloring of HDP Pilots
 - 11 + $SEED_SAME_AS_PREVIOUS$ shows if the same random seed is used as in
12 the previous record ($SEED_SAME_AS_PREVIOUS_s =$
13 $SEED_SAME_AS_PREVIOUS_r$).
 - 14 + If $SEED_SAME_AS_PREVIOUS_s$ is '0',
 - 15 ○ $CELL_SEED_PN_SAME_AS_THIS_PN$ which indicates if the
16 $HDP_CELL_SEED_PN$ is the same as HDP_PILOT_PN
17 ($CELL_SEED_PN_SAME_AS_THIS_PN_s =$
18 $CELL_SEED_PN_SAME_AS_THIS_PN_r$).
 - 19 ○ If $CELL_SEED_PN_SAME_AS_THIS_PN_s$ is '1', $HDP_CELL_SEED_PN_s =$
20 $HDP_PILOT_PN_s$. Otherwise, $HDP_CELL_SEED_PN_s =$
21 $HDP_CELL_SEED_PN_r$.
 - 22 + If $SEED_SAME_AS_PREVIOUS_s$ is '0', $HDP_CELL_SEED_EXTRA_s =$
23 $HDP_CELL_SEED_EXTRA_r$.
 - 24 + If $PLANNED_OR_RANDOM_COLORING_s$ field is set to '1' and
25 $HDP_CELL_SEED_PN_s$ is the same as $HDP_PILOT_PN_s$,
26 $HDP_SECTOR_INDEX_s = HDP_SECTOR_INDEX_r$. Otherwise,
27 $HDP_SECTOR_INDEX_s = 0$.

29 2.6.2.3 Mobile Station Page Match Operation

30 The *Mobile Station Page Match Operation* is performed whenever the mobile station receives
31 a mobile-station-addressed page or a broadcast page. If the mobile station receives a
32 mobile-station-addressed page that contains the IMSI or TMSI assigned to the mobile
33 station (see [4]) on the Paging Channel, the mobile station transmits a *Page Response*
34 *Message* on the Access Channel or Enhanced Access Channel. If the mobile station
35 receives a mobile-station-addressed page that contains the IMSI or TMSI assigned to the
36 mobile station (see [4]) on the Forward Common Control Channel, the mobile station
37 transmits a *Page Response Message* on the r-csch. If the mobile station is configured to
38 receive broadcast messages and it receives a *General Page Message* that contains a burst
39 type and broadcast address that the mobile station has been configured to receive (see [4])
40 on the Paging Channel, the mobile station performs the broadcast page procedures as

1 described in 2.6.2.1.1.3.4. If the mobile station is configured to receive broadcast
 2 messages and it receives a *General Page Message* or a *Universal Page Message* that
 3 contains a burst type and broadcast address that the mobile station has been configured to
 4 receive (see [4]) on the Forward Common Control Channel, the mobile station performs the
 5 enhanced broadcast page procedures as described in 2.6.2.1.1.3.6.

6 When the mobile station receives a page message, it shall compare the configuration
 7 message sequence number, CONFIG_MSG_SEQ_r, to CONFIG_MSG_SEQ_s. If the
 8 comparison results in a mismatch, then the mobile station shall set CONFIG_MSG_SEQ_s to
 9 CONFIG_MSG_SEQ_r. If the mobile station supports GAPM and GAPM_IND_s = 1, it shall
 10 compare GAPM_SEQ_s with ACC_MSG_SEQ_r in the *Generic Access Parameters Message*.
 11 Otherwise, it shall compare the *Access Parameters Message* or the *Enhanced Access*
 12 *Parameters Message* sequence number, ACC_MSG_SEQ_r, with that stored in
 13 ACC_MSG_SEQ_s. If the comparison results in a mismatch in any of these cases, then the
 14 mobile station shall set ACC_MSG_SEQ_s and GAPM_SEQ_s to NULL (see 2.6.2.2). The
 15 mobile station shall set CURR_ACC_MSG_SEQ to ACC_MSG_SEQ_r.

16 The mobile station shall process each record for which it declares a page match (see [4]).

17 If the mobile station receives a broadcast page that contains a burst type and broadcast
 18 address that the mobile station has been configured to receive on the Paging Channel, the
 19 mobile station should perform the broadcast page procedures described in 2.6.2.1.1.3.4. If
 20 the mobile station receives a broadcast page that contains a burst type and broadcast
 21 address that the mobile station has been configured to receive on the Forward Common
 22 Control Channel, the mobile station should perform the enhanced broadcast page
 23 procedures as described in 2.6.2.1.1.3.6.

24 If a page match is declared, the mobile station shall perform the following:

- 25 • The mobile station shall enter the *Update Overhead Information Substate* of the
 26 *System Access State* (see 2.6.3.2) with a page response indication within T_{33m}
 27 seconds after the page message is received.
- 28 • .

29 If a page match is declared and the mobile station determines that it should be monitoring
 30 a neighboring base station, the mobile station may perform an access entry handoff to the
 31 neighboring base station, if all of the following conditions hold:

- 32 • The neighboring base station is listed in NGHBR_REC.
- 33 • The ACCESS_ENTRY_HO field of the NGHBR_REC corresponding to the neighboring
 34 base station is equal to '1'.
- 35 • If the mobile station performs an access entry handoff on the Access Channel, none
 36 of CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
 37 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
 38 CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
 39 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
 40 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
 41 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
 42 PRI_NGHBR_LST_MSG_SEQ_s are equal to NULL.

- 1 • If the mobile station performs an access entry handoff on the Enhanced Access
2 Channel, none of CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s,
3 MC_RR_PAR_MSG_SEQ_s, UNI_NGHR_LST_MSG_SEQ_s,
4 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
5 USER_ZONE_ID_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
6 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
7 ATIM_MSG_SEQ_s and PRI_NGHR_LST_MSG_SEQ_s are equal to NULL.

8 Otherwise, the mobile station shall not perform an access entry handoff to the neighboring
9 base station.

10 The mobile station need not perform an access entry handoff to a base station operating on
11 another frequency.

12 If the mobile station performs an access entry handoff, it shall follow the procedures
13 specified in 2.6.2.1.4.2 and shall perform the access entry handoff before entering the
14 *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2).

15 If PACA is enabled, and if the mobile station performs an access entry handoff, the mobile
16 station shall respond to the mobile-station-addressed page first and shall then re-originate
17 the PACA call on the new base station.

18 2.6.2.4 Mobile Station Order and Message Processing Operation

19 During the *Mobile Station Order and Message Processing Operation*, the mobile station
20 processes all messages except overhead messages (see 2.6.2.2) and page messages (see
21 2.6.2.3).

22 The mobile station shall set CURR_ACC_MSG_SEQ to NULL.

23 The mobile station shall perform address matching as described in [4].

24 If Layer 3 receives a message that requires acknowledgment, the mobile station shall enter
25 the *Update Overhead Information Substate* of the *System Access State* with an
26 order/message response indication within T_{33m} seconds, unless otherwise specified for a
27 particular message.

28 If Layer 3 receives a message that does not require acknowledgment, the mobile station
29 shall transmit a response only if it is required by the message or order. If a response is
30 required, the mobile station shall enter the *Update Overhead Information Substate* of the
31 *System Access State* with an order/message response indication within T_{33m} seconds,
32 unless otherwise specified for a particular message.

33 If the mobile station is to enter the *Update Overhead Information Substate* of the *System*
34 *Access State* with an order/message response indication and the mobile station determines
35 that it should be monitoring a neighboring base station, the mobile station may perform an
36 access entry handoff to the neighboring base station, if all of the following conditions hold:

- 37 • The neighboring base station is listed in NGHBR_REC.
- 38 • The ACCESS_ENTRY_HO field of the NGHBR_REC corresponding to the neighboring
39 base station is equal to '1'.
- 40 • ACC_ENT_HO_ORDER_s is equal to '1'.

- 1 • If the mobile station performs an access entry handoff on the Access Channel, none
2 of CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
3 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
4 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
5 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s, and
6 EXT_SYS_PAR_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
7 ATIM_MSG_SEQ_s are equal to NULL.
- 8 • If the mobile station performs an access entry handoff on the Enhanced Access
9 Channel, none of CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s,
10 MC_RR_PAR_MSG_SEQ_s, UNI_NGHBR_LST_MSG_SEQ_s,
11 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
12 USER_ZONE_ID_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
13 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
14 ATIM_MSG_SEQ_s and PRI_NGHBR_LST_MSG_SEQ_s are equal to NULL.

15 Otherwise, the mobile station shall not perform an access entry handoff to the neighboring
16 base station.

17 The mobile station need not perform an access entry handoff to a base station operating on
18 another frequency.

19 If the mobile station performs an access entry handoff, it shall follow the procedures
20 specified in 2.6.2.1.4.2 and shall perform the access entry handoff before entering the
21 *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2). If PACA is
22 enabled and the mobile station performs an access entry handoff, the mobile station shall
23 respond to the order/message first and then re-originate the PACA call in the new base
24 station.

25 The following directed messages and orders can be received. If any field value of the
26 message or order is outside its permissible range, the mobile station shall send a *Mobile*
27 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 28 1. *Abbreviated Alert Order*: The mobile station may alert the user.
- 29 2. *Audit Order*
- 30 3. *Authentication Challenge Message*: The mobile station shall process the message
31 and shall respond with an *Authentication Challenge Response Message* as specified
32 in 2.3.12.1.4, regardless of the value of AUTH_s. The mobile station shall enter the
33 *Update Overhead Information Substate* of the *System Access State* with an
34 order/message response indication within T_{32m} seconds.
- 35 4. *Authentication Request Message*: The mobile station shall process the message and
36 shall respond as specified in 2.3.12.5.2. The mobile station shall enter the *Update*
37 *Overhead Information Substate* of the *System Access State* with an order/message
38 response indication within T_{32m} seconds.
- 39 5. *Base Station Challenge Confirmation Order*: The mobile station shall process the
40 message and shall respond with an *SSD Update Confirmation Order* or *SSD Update*
41 *Rejection Order* as specified in 2.3.12.1.5. The mobile station shall enter the

1 *Update Overhead Information Substate* of the *System Access State* with an
 2 order/message response indication within T_{32m} seconds.

- 3 6. *Base Station Reject Order*: The mobile station shall perform the procedures as
 4 specified in 2.6.11.5.
- 5 7. *Channel Assignment Message*: The mobile station shall process the message as
 6 follows:
- 7 • If ASSIGN_MODE_r equals '001', the mobile station shall perform the following
 8 actions:
 - 9 - If the message requires acknowledgment, the mobile station shall wait until
 10 Layer 3 receives an indication from Layer 2 that the acknowledgment to the
 11 message has been sent and acknowledged.
 - 12 - If a CDMA channel (CDMA_FREQ) is specified in the assignment, the mobile
 13 station shall set CDMACH_s = CDMA_FREQ_r, tune to the new Frequency
 14 Assignment, and measure the strength of each pilot listed in the
 15 assignment using the Neighbor Set search procedures specified in 2.6.6.2.1
 16 and 2.6.6.2.2.
 - 17 - The mobile station shall set CONFIG_MSG_SEQ_s, GAPM_SEQ_s and
 18 ACC_MSG_SEQ_s to NULL (see 2.6.2.2) and shall set PILOT_PN_s to the pilot
 19 PN sequence offset of the strongest pilot in the list (PILOT_PN_r).
 - 20 - If the mobile station has not stored configuration parameters for the Primary
 21 Paging Channel of the new base station, or if the stored information is not
 22 current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_s,
 23 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
 24 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
 25 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
 26 EXT_SYS_PAR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
 27 PRI_NGHBR_LST_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s, and
 28 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
 29 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
 30 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s to NULL.
 31 The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
 32 Primary Paging Channel. The mobile station shall then begin monitoring
 33 the Primary Paging Channel of the selected base station.
 - 34 • If ASSIGN_MODE_r equals '101' and FREQ_INCL_r equals '0', the mobile station
 35 shall perform the following actions:
 - 36 • If the message requires acknowledgment, the mobile station shall wait until
 37 Layer 3 receives an indication from Layer 2 that the acknowledgment to the
 38 message has been sent and acknowledged.
 - 39 - The mobile station shall measure the strength of each pilot listed in the
 40 assignment using the Neighbor Set search procedures specified in 2.6.6.2.1
 41 and 2.6.6.2.2, set PILOT_PN_s to the pilot PN sequence offset of the strongest

- 1 pilot in the list (PILOT_PN_r), and set CONFIG_MSG_SEQ_s, GAPM_SEQ_s and
2 ACC_MSG_SEQ_s to NULL (see 2.6.2.2).
- 3 - If the mobile station has not stored configuration parameters for the Primary
4 Paging Channel of the new base station, or if the stored information is not
5 current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_s,
6 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
7 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
8 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
9 EXT_SYS_PAR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
10 PRI_NGHBR_LST_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s, and
11 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
12 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
13 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s to NULL.
14 The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
15 Primary Paging Channel. The mobile station shall then begin monitoring
16 the Primary Paging Channel of the selected base station.
- 17 • If ASSIGN_MODE_r equals '101', FREQ_INCL_r equals '1', and the band class is
18 not supported by the mobile station, the mobile station shall enter the *Update*
19 *Overhead Information Substate* of the *System Access State* with an
20 order/message response indication within T_{33m} seconds and send a *Mobile*
21 *Station Reject Order* with ORDQ field set to '00000110' (capability not supported
22 by the mobile station).
 - 23 • If ASSIGN_MODE_r equals '101', FREQ_INCL_r equals '1', and the band class is
24 supported by the mobile station, the mobile station shall perform the following
25 actions:
 - 26 • If the message requires acknowledgment, the mobile station shall wait until
27 Layer 3 receives an indication from Layer 2 that the acknowledgment to the
28 message has been sent and acknowledged.
 - 29 - The mobile station shall set CDMACH_s = CDMA_FREQ_r and CDMABAND_s =
30 BAND_CLASS_r. Then the mobile station shall tune to the new Frequency
31 Assignment, measure the strength of each pilot listed in the assignment
32 using the Neighbor Set search procedures specified in 2.6.6.2.1 and
33 2.6.6.2.2, set PILOT_PN_s to the pilot PN sequence offset of the strongest
34 pilot in the list (PILOT_PN_r), and set CONFIG_MSG_SEQ_s, GAPM_SEQ_s and
35 ACC_MSG_SEQ_s to NULL (see 2.6.2.2).
 - 36 - If the mobile station has not stored configuration parameters for the Primary
37 Paging Channel of the new base station, or if the stored information is not
38 current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_s,
39 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
40 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
41 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
42 EXT_SYS_PAR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
43 PRI_NGHBR_LST_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s, and

1 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
 2 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
 3 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s to NULL.
 4 The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
 5 Primary Paging Channel. The mobile station shall then begin monitoring
 6 the Primary Paging Channel of the selected base station.

- 7 • If ASSIGN_MODE_r is not equal to '001' or '101', the mobile station shall enter
 8 the *Update Overhead Information Substate* of the *System Access State* with an
 9 order/message response indication within T_{33m} seconds and send a *Mobile*
 10 *Station Reject Order* with ORDQ field set to '0000010' (message not accepted in
 11 this state).

12 8. *Data Burst Message*

13 9. *Extended Channel Assignment Message*: The mobile station shall process the
 14 message as follows:

- 15 • If ASSIGN_MODE_r equals '001', FREQ_INCL_r equals '0', the mobile station shall
 16 perform the following actions:
 - 17 - If the message requires acknowledgment, the mobile station shall wait until
 18 Layer 3 receives an indication from Layer 2 that the acknowledgment to the
 19 message has been sent and acknowledged.
 - 20 - The mobile station shall measure the strength of each pilot listed in the
 21 assignment using the Neighbor Set search procedures specified in 2.6.6.2.1
 22 and 2.6.6.2.2 set PILOT_PN_s to the pilot PN sequence offset of the strongest
 23 pilot in the list (PILOT_PN_r), and set CONFIG_MSG_SEQ_s, GAPM_SEQ_s and
 24 ACC_MSG_SEQ_s to NULL (see 2.6.2.2).
 - 25 - If the mobile station has not stored configuration parameters for the Primary
 26 Paging Channel of the new base station, or if the stored information is not
 27 current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_s,
 28 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
 29 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
 30 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
 31 EXT_SYS_PAR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
 32 PRI_NGHBR_LST_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s, and
 33 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
 34 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
 35 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s to NULL.
 36 The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
 37 Primary Paging Channel. If the mobile station was monitoring Forward
 38 Common Control Channel, the mobile station shall set the PRAT_s to '00'.
 39 The mobile station shall then begin monitoring the Primary Paging Channel
 40 of the selected base station.
- 41 • If ASSIGN_MODE_r equals '001', FREQ_INCL_r equals '1', and the band class is
 42 not supported by the mobile station, the mobile station shall enter the *Update*

1 *Overhead Information Substate* of the *System Access State* with an
 2 order/message response indication within T_{33m} seconds and send a *Mobile*
 3 *Station Reject Order* with ORDQ field set to '00000110' (capability not supported
 4 by the mobile station).

- 5 • If ASSIGN_MODE_r equals '001', FREQ_INCL_r equals '1', and the band class is
 6 supported by the mobile station, the mobile station shall perform the following
 7 actions:
 - 8 - If the message requires acknowledgment, the mobile station shall wait until
 9 Layer 3 receives an indication from Layer 2 that the acknowledgment to the
 10 message has been sent and acknowledged.
 - 11 - The mobile station shall set CDMACH_s = CDMA_FREQ_r and CDMABAND_s =
 12 BAND_CLASS_r. The mobile station shall set CONFIG_MSG_SEQ_s,
 13 GAPM_SEQ_s and ACC_MSG_SEQ_s to NULL (see 2.6.2.2). Then the mobile
 14 station shall tune to the new Frequency Assignment, measure the strength
 15 of each pilot listed in the assignment using the Neighbor Set search
 16 procedures specified in 2.6.6.2.1 and 2.6.6.2.2, and set PILOT_PN_s to the
 17 pilot PN sequence offset of the strongest pilot in the list (PILOT_PN_r).
 - 18 - If the mobile station has not stored configuration parameters for the Primary
 19 Paging Channel of the new base station, or if the stored information is not
 20 current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_s,
 21 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
 22 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
 23 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
 24 EXT_SYS_PAR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
 25 PRI_NGHBR_LST_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s,
 26 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
 27 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s,
 28 HDPPM_MSG_SEQ_s and EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
 29 The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
 30 Primary Paging Channel. If the mobile station was monitoring Forward
 31 Common Control Channel, the mobile station shall set the PRAT_s to '00'.
 32 The mobile station shall then begin monitoring the Primary Paging Channel
 33 of the selected base station.
- 34 • If ASSIGN_MODE_r equals '100' or '101' and the mobile station has reported
 35 DCA_SUPPORTED = '1' through the *General Extension Message*, the mobile
 36 station shall enter the *Traffic Channel Initialization Substate* using the channel
 37 information provided.
- 38 • If ASSIGN_MODE_r equals '100' or '101' and the mobile station has not reported
 39 DCA_SUPPORTED = '1' through the *General Extension Message*, the mobile
 40 station shall perform the following actions:
 - 41 - If DIRECT_CH_ASSIGN_IND_r is included and is set to '1', the mobile station
 42 shall process the message as defined below in the order specified:
 - 43 + The mobile station shall set CONFIG_MSG_SEQ_s to CONFIG_MSG_SEQ_r.

- 1 + If RESPOND_IND_r is equal to '1', the mobile station shall process the
2 message as specified in section 2.6.3.3⁴⁷; otherwise, the mobile station
3 shall enter the *Update Overhead Information Substate* of the *System*
4 *Access State* with a direct channel assignment update overhead
5 indication within T_{33m} seconds.
- 6 - Otherwise, the mobile station shall enter the *Update Overhead Information*
7 *Substate* of the *System Access State* with an order/message response
8 indication within T_{33m} seconds and send a *Mobile Station Reject Order* with
9 ORDQ field set to '00000010' (message not accepted in this state).
- 10 • If ASSIGN_MODE_r is not equal to '001', '100' or '101', the mobile station shall
11 enter the *Update Overhead Information Substate* of the *System Access State* with
12 an order/message response indication within T_{33m} seconds and send a *Mobile*
13 *Station Reject Order* with ORDQ field set to '00000010' (message not accepted in
14 this state).

15 10. *Feature Notification Message*

16 11. *Local Control Order*

17 12. *Lock Until Power-Cycled Order*: The mobile station shall record the reason for the
18 *Lock Until Power-Cycled Order* in the mobile station's semi-permanent memory
19 (LCKRSN_P_{s-p} equals the least significant four bits of ORDQ_r). After a mobile
20 station receives this order, it shall not enter the *System Access State* (see 2.6.3)
21 until it has received an *Unlock Order* or until after power-cycling the mobile station
22 (i.e., after the next mobile station power-up). This requirement shall take
23 precedence over any other mobile station requirement specifying entry to the
24 *System Access State*. The mobile station should notify the user of the locked
25 condition. The mobile station shall exit the *Mobile Station Idle State* and enter the
26 *System Determination Substate* of the *Mobile Station Initialization State* with a lock
27 indication (see 2.6.1.1). This allows the mobile station to operate in an alternate
28 operating mode while locked.

29 13. *Maintenance Required Order*: The mobile station shall record the reason for the
30 *Maintenance Required Order* in the mobile station's semi-permanent memory
31 (MAINTRSN_{s-p} equals the least significant four bits of ORDQ_r). If the mobile
32 station has previously received a *Lock Until Power-Cycled Order*, it shall remain in
33 the locked condition; otherwise the mobile station shall remain in the unlocked
34 condition. The mobile station should notify the user of the maintenance required
35 condition.

36 14. *PACA Message*: If P_REV_IN_USE_s is less than or equal to four, and if the mobile
37 station does not support PACA capability, the mobile station shall send a *Mobile*

⁴⁷ The mobile station processes the message as defined in section 2.6.3.3, but no requirements other than the *Extended Channel Assignment Message* processing requirements in section 2.6.3.3 are applicable.

1 *Station Reject Order* with the ORDQ field set to '00000110' (message requires a
 2 capability that is not supported by the mobile station); otherwise, the mobile
 3 station shall process the message as follows:

- 4 • If PACA_s is equal to disabled, the mobile station shall enter the *Update Overhead*
 5 *Information Substate* of the *System Access State* with an order/message response
 6 indication within T_{33m} seconds and shall send a *Mobile Station Reject Order* with
 7 the ORDQ field set to '00000010' (message not accepted in this state).
 - 8 • If PACA_s is equal to enabled, the mobile station shall perform the following:
 - 9 - If the purpose of the message is to respond to an *Origination Message*
 10 (PURPOSE_r is equal to '0000'), the mobile station shall enter the *Update*
 11 *Overhead Information Substate* of the *System Access State* with an
 12 order/message response indication within T_{33m} seconds and send a *Mobile*
 13 *Station Reject Order* with the ORDQ field set to '00000010' (message not
 14 accepted in this state).
 - 15 - If the purpose of the message is to provide the queue position of the PACA
 16 call (PURPOSE_r is equal to '0001'), the mobile station shall set the PACA
 17 state timer to the duration shown in Table 3.7.2.3.2.20-2, corresponding to
 18 the value of PACA_TIMEOUT_s, should indicate to the user that the PACA call
 19 is still queued, and should indicate the current queue position (Q_POS_r) of
 20 the call.
 - 21 - If the purpose of the message is to instruct the mobile station to re-originate
 22 the PACA call (PURPOSE_r is equal to '0010'), the mobile station shall set the
 23 PACA state timer to the duration shown in Table 3.7.2.3.2.20-2
 24 corresponding to the value of PACA_TIMEOUT_s, and the mobile station shall
 25 enter the *Update Overhead Information Substate* of the *System Access State*
 26 (see 2.6.3) with a PACA response indication within T_{33m} seconds to re-
 27 originate the PACA call.
 - 28 - If the purpose of the message is to cancel the PACA call (PURPOSE_r is equal
 29 to '0011'), the mobile station shall set PACA_s to disabled and PACA_CANCEL
 30 to '0', shall disable the PACA state timer, and should indicate to the user
 31 that the PACA call has been canceled.
- 32 15. *Registration Accepted Order*: The mobile station shall perform the procedures as
 33 specified in 2.6.11.1.
- 34 16. *Registration Rejected Order*: This order indicates that normal service is not
 35 available on this system. The mobile station shall disable the full-TMSI timer. If
 36 the received order specifies to delete the TMSI (ORDQ = '00000100'), the mobile
 37 station shall set all the bits of the TMSI_CODE_{s-p} to '1'. The mobile station shall
 38 enter the *System Determination Substate* of the *Mobile Station Initialization State* with
 39 a registration rejected indication (see 2.6.1.1).
- 40 17. *Registration Request Order*: The mobile station shall process the message and
 41 perform registration procedures as specified in 2.6.5.5.2.3.

- 1 18. *Security Mode Command Message*: The mobile station shall perform the procedures
2 as specified in 2.6.11.4.
- 3 19. *Service Redirection Message*: The mobile station shall process the message as
4 follows:
- 5 • If the mobile station is directed to an unsupported operation mode or band
6 class, the mobile station shall respond with a *Mobile Station Reject Order* with
7 ORDQ equal to '00000110' (message requires a capability that is not supported
8 by the mobile station).
 - 9 • If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of
10 TMSI_CODE_{s-p} to '1'. The mobile station shall disable the full-TMSI timer.
 - 11 • The mobile station shall set RETURN_IF_FAIL_s = RETURN_IF_FAIL_r.
 - 12 • If RECORD_TYPE_r is equal to '00000000', the mobile station shall enter the
13 *System Determination Substate* of the *Mobile Station Initialization State* with an
14 NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the
15 redirection record received in the message as REDIRECT_REC_s and shall enter
16 the *System Determination Substate* of the *Mobile Station Initialization State* with a
17 redirection indication (see 2.6.1.1).
- 18 20. *Retry Order*: The mobile station shall process the message as follows:
- 19 • If RETRY_TYPE_r is equal to '000', the mobile station shall set
20 RETRY_DELAY_s[RETRY_TYPE] to 0, where RETRY_TYPE is equal to '001', '010',
21 '011', '100', or '101'.
 - 22 • If RETRY_TYPE_r is equal to '001', '100', or '101', the mobile station shall
23 perform the following:
 - 24 - If RETRY_DELAY_r is equal to '00000000', then the mobile station shall set
25 RETRY_DELAY_s[RETRY_TYPE_r] to 0.
 - 26 - If RETRY_DELAY_r is not equal to '00000000', the mobile station shall set
27 RETRY_DELAY_s[RETRY_TYPE_r] as follows:
 - 28 + If the most significant bit of the RETRY_DELAY_r is '0', set
29 RETRY_DELAY_UNIT_s to 1000ms. If the most significant bit of the
30 RETRY_DELAY_r is '1', set RETRY_DELAY_UNIT_s to 60000ms.
 - 31 + The mobile station shall set RETRY_DELAY_VALUE_s to the seven least
32 significant bits of RETRY_DELAY_r.
 - 33 + The mobile station shall store the next system time 80 ms boundary +
34 RETRY_DELAY_VALUE_s × RETRY_DELAY_UNIT_s ms as
35 RETRY_DELAY_s[RETRY_TYPE_r].
- 36 21. *Slotted Mode Order*: After receiving this order, the mobile station shall set
37 SLOTTED_s to YES. The mobile station shall disable the TMS_Slotted timer.
- 38 22. *SSD Update Message*: The mobile station shall process the message and shall
39 respond with a *Base Station Challenge Order* as specified in 2.3.12.1.5. The mobile

1 station shall enter the *Update Overhead Information Substate* of the *System Access*
 2 *State* with an order/message response indication within T_{32m} seconds.

3 23. *Status Request Message*: The mobile station shall process the message. If
 4 $P_REV_IN_USE_s$ is less than or equal to three, the mobile station shall respond
 5 with a *Status Response Message*. If $P_REV_IN_USE_s$ is greater than three, the
 6 mobile station shall respond with an *Extended Status Response Message*. The
 7 mobile station shall enter the *Update Overhead Information Substate* of the *System*
 8 *Access State* with an order/message response indication within T_{33m} seconds. If
 9 the message does not specify any qualification information ($QUAL_INFO_TYPE_r$ is
 10 equal to '00000000'), the mobile station shall include the requested information
 11 records in the response. If the message specifies a band class ($QUAL_INFO_TYPE_r$
 12 is equal to '00000001'), the mobile station shall only include the requested
 13 information records for the specified band class ($BAND_CLASS_r$) in the response.
 14 If the message specifies a band class and an operating mode ($QUAL_INFO_TYPE_r$ is
 15 equal to '00000010'), the mobile station shall only include the requested
 16 information records for the specified band class ($BAND_CLASS_r$) and operating
 17 mode (OP_MODE_r) in the response. If the message specifies a band class or a
 18 band class and an operating mode which is not supported by the mobile station,
 19 the mobile station shall send a *Mobile Station Reject Order* with $ORDQ$ set to
 20 '00000110' (message requires a capability that is not supported by the mobile
 21 station). If the response to this message exceeds the allowable length, the mobile
 22 station shall send a *Mobile Station Reject Order* with $ORDQ$ set to '00001000'
 23 (response message would exceed the allowable length). If the message specifies an
 24 information record which is not supported by the mobile station for the specified
 25 band class and operating mode, the mobile station shall send a *Mobile Station*
 26 *Reject Order* with $ORDQ$ set to '00001001' (information record is not supported for
 27 the specified band class and operating mode).

28 24. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code
 29 as follows:

- 30 • The mobile station shall store the length of the TMSI zone field by setting
 31 $ASSIGNING_TMSI_ZONE_LEN_{s-p}$ to $TMSI_ZONE_LEN_r$,
- 32 • The mobile station shall store the assigning TMSI zone number by setting the
 33 $ASSIGNING_TMSI_ZONE_LEN_{s-p}$ least significant octets of
 34 $ASSIGNING_TMSI_ZONE_{s-p}$ to $TMSI_ZONE_r$, and
- 35 • The mobile station shall store the TMSI code by setting $TMSI_CODE_{s-p}$ to
 36 $TMSI_CODE_r$.

37 The mobile station shall set the TMSI expiration time by setting $TMSI_EXP_TIME_{s-p}$
 38 to $TMSI_EXP_TIME_r$. The mobile station shall disable the full-TMSI timer. The
 39 mobile station shall then respond with a *TMSI Assignment Completion Message*
 40 within T_{56m} seconds.

41 25. *Unlock Order*: After receiving this order, the mobile station is no longer locked.
 42 The mobile station should notify the user that the locked condition has been

1 removed. The mobile station shall enter the *System Determination Substate of the*
2 *Mobile Station Initialization State* with an *unlock indication* (see 2.6.1.1).

3 26. User Zone Reject Message

4 27. Fast Call Setup Order:

- 5 • If $ORDQ_R$ is equal to '00000000', the mobile station shall process the message
6 and respond with a *Fast Call Setup Order* as specified in 2.6.12.1. The mobile
7 station shall enter the *Update Overhead Information Substate* of the *System*
8 *Access State* with an order/message response indication within T_{32m} seconds.
- 9 • If $ORDQ_R$ is equal to '00000001', the mobile station shall process the message
10 as specified in 2.6.12.1.

11 28. General Extension Message: The mobile station shall process this message as
12 specified in section 2.6.18.

13 The mobile station shall ignore all other messages and orders.

14 2.6.2.5 Mobile Station Origination Operation

15 The *Mobile Station Origination Operation* is performed when the mobile station is directed by
16 the user to initiate a call, or if the *Mobile Station Idle State* is entered with $NDSS_ORIG_S$
17 enabled.

18 If the mobile station is directed by the user to initiate a call, the mobile station shall
19 perform the following:

- 20 • If $PACA_S$ is equal to enabled, the mobile station shall set $PACA_S$ to disabled and
21 $PACA_CANCEL$ to '0', shall disable the $PACA$ state timer, and should indicate to the
22 user that the $PACA$ call has been canceled.
- 23 • The mobile station shall set $CURR_ACC_MSG_SEQ$ to NULL.

24 The mobile station shall enter the *Update Overhead Information Substate* of the *System*
25 *Access State* (see 2.6.3) with an origination indication within T_{33m} seconds.

26 2.6.2.6 Mobile Station Message Transmission Operation

27 Support of this operation is optional. If the mobile station supports the *Mobile Station*
28 *Message Transmission Operation*, the operation is performed when the user directs the
29 mobile station to transmit a *Data Burst Message*, or when the mobile station detects a
30 change in hook status since the last time when the mobile station sent hook status
31 information and the mobile station supports the *Device Information Message* on the r-csch,
32 or when the mobile station determines that a *Radio Environment Message* is to be
33 transmitted on the r-csch, or when the mobile station requests to operate in reduced slot
34 cycle mode.

35 If the mobile station supports this operation, the mobile station shall set
36 $CURR_ACC_MSG_SEQ$ to NULL.

37 If the mobile station supports this operation and the operation is performed when the user
38 directs the mobile station to transmit a *Data Burst Message*, the mobile station shall enter

1 the *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2) with a
2 message transmission indication within T_{33m} seconds.

3 If the mobile station supports this operation and the operation is performed when the
4 mobile station detects a change in hook status since the last time when the mobile station
5 sent hook status information, the mobile station shall enter the *Update Overhead*
6 *Information Substate* of the *System Access State* (see 2.6.3.2) with a hook status indication
7 within T_{33m} seconds.

8 If the mobile station supports this operation and the operation is performed when the
9 mobile station determines that a *Radio Environment Message* is to be transmitted on the r-
10 csch, the mobile station shall perform the following:

- 11 • If RER_MODE_ENABLED is set to YES, the mobile station shall enter the *Update*
12 *Overhead Information Substate* of the *System Access State* (see 2.6.3.2) with a radio
13 environment report indication within T_{33m} seconds.
- 14 • Otherwise, if TKZ_MODE_ENABLED is set to YES, the mobile station shall enter the
15 *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2) with a
16 tracking zone indication within T_{33m} seconds.

17 If the mobile station supports this operation and the operation is performed when the
18 mobile station requests to operate in reduced slot cycle mode, the mobile station shall
19 enter the *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2)
20 with a fast call setup indication within T_{33m} seconds.

21 2.6.2.7 Mobile Station Power-Down Operation

22 The *Mobile Station Power-Down Operation* is performed when the user directs the mobile
23 station to power down.

24 The mobile station shall update stored parameters and perform other registration
25 procedures as specified in 2.6.5.5.2.4.

26 If no power-down registration is performed (see 2.6.5.5.2.4), the mobile station may power
27 down.

28 2.6.2.8 Mobile Station PACA Cancel Operation

29 The *Mobile Station PACA Cancel Operation* is performed when the user directs the mobile
30 station to cancel a PACA call.

31 If $PACA_s$ is equal to enabled, the mobile station shall perform the following:

- 32 • The mobile station shall set $PACA_s$ to disabled.
- 33 • The mobile station shall set PACA_CANCEL to '0', if PACA_CANCEL is equal to '1'.
- 34 • The mobile station shall disable the PACA state timer.
- 35 • The mobile station should indicate to the user that the PACA call has been
36 canceled.
- 37 • The mobile station shall set CURR_ACC_MSG_SEQ to NULL.

- The mobile station shall enter the *Update Overhead Information Substate* of the *System Access State* (see 2.6.3) with a PACA cancel indication within T_{33m} seconds.

2.6.3 System Access State

In this state, the mobile station sends messages to the base station on the r-csch and receives messages from the base station on the f-csch.

As illustrated in Figure 2.6.3-1, the *System Access State* consists of the following substates:

- *Update Overhead Information Substate* - In this substate, if the base station supports the Primary Broadcast Control Channel for Spreading Rate 1 or if both the base station and mobile station supports the Primary Broadcast Control Channel for Spreading Rate 3 and if the protocol revision level in use is greater than six, the mobile station will monitor the Primary Broadcast Control Channel until it has received a current set of overhead messages; otherwise, the mobile station will monitor the Paging Channel until it has a current set of overhead messages.
- *Mobile Station Origination Attempt Substate* - In this substate, the mobile station sends an *Origination Message*, *Call Recovery Request Message* or a *Reconnect Message* (with ORIG_IND set to '1') to the base station.
- *Page Response Substate* - In this substate, the mobile station sends a *Page Response Message* or a *Reconnect Message* (with ORIG_IND set to '0') to the base station.
- *Mobile Station Order/Message Response Substate* - In this substate, the mobile station sends a response to a message received from the base station.
- *Registration Access Substate* - In this substate, the mobile station sends a *Registration Message* to the base station.
- *Mobile Station Message Transmission Substate* - In this substate, the mobile station sends a *Data Burst Message* or a *Device Information Message* to the base station.
- *PACA Cancel Substate* - In this substate, the mobile station sends a *PACA Cancel Message* to the base station.

28

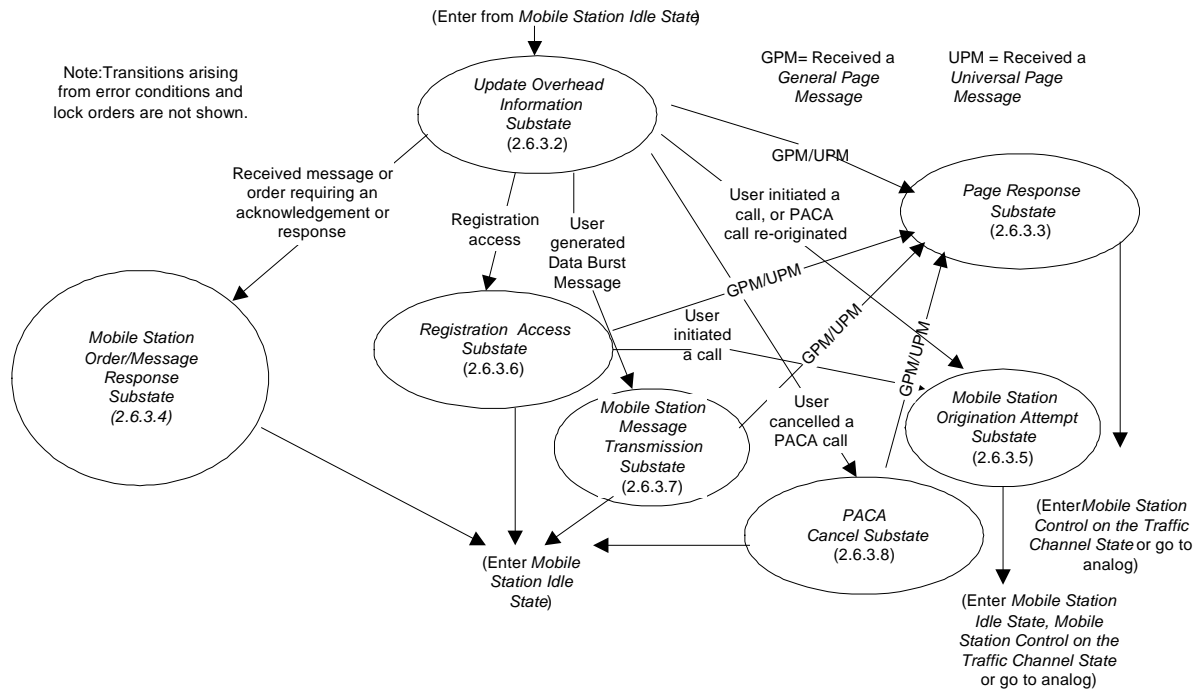

Figure 2.6.3-1. System Access State

2.6.3.1 Access Procedures

2.6.3.1.1 Access Attempts

If the mobile station monitors the Paging Channel, then:

- If the base station does not transmit the *Generic Access Parameters Message* or the mobile station does not support Enhanced Access Channel, then the mobile station transmits on the Access Channel using a random access procedure. Many parameters of the random access procedure are supplied by the base station in the Access Parameters Message. The random access procedure is described in [4] and [3].
- If the base station does transmit the *Generic Access Parameters Message* and the mobile station supports Enhanced Access Channel, then the mobile station shall transmit on the Enhanced Access Channel using a random access procedure. Many parameters of the random access procedure are supplied by the base station in the *Generic Access Parameters Message*. The random access procedure is described in [4] and [3].

If a mobile station is assigned to ACCOLC 14, then

- If the mobile station has non-delay-tolerant data to send, it shall set $PSIST_s = PSIST_{Ms}/4$ and then perform the random access procedure as described in [4] and [3];

- 1 • Otherwise, it shall check $NET_OVRLD_INDICATOR_s$ before initiating its access
2 attempt.
- 3 ○ If $NET_OVRLD_INDICATOR_s$ is not included in the *Access Parameters*
4 *Message* or *Generic Access Parameters Message*, it shall set $PSIST_s =$
5 $PSIST_M_s/4$ and then proceed to the random access procedure;
- 6 ○ If $NET_OVRLD_INDICATOR_s = '0'$, the mobile station shall set $PSIST_s$ to
7 $PSIST14_s$ and then proceed to the random access procedure;
- 8 ○ If $NET_OVRLD_INDICATOR_s = '1'$, the mobile station shall first compare its
9 DAP_p with $NETWORK_ACCESS_PRIORITY_s$.
- 10 ▪ If its $DAP_p < NETWORK_ACCESS_PRIORITY_s$, it shall hold its access
11 attempt and try again when the *Access Parameters Message* or
12 *Generic Access Parameters Message* has changed;
- 13 ▪ If its $DAP_p = NETWORK_ACCESS_PRIORITY_s$, it shall set $PSIST_s =$
14 $PSIST15_s$ and then proceed to the random access procedure;
- 15 ▪ If its $DAP_p > NETWORK_ACCESS_PRIORITY_s$, it shall set $PSIST_s =$
16 $PSIST14_s$ and then proceed to the random access procedure.
17

18 If the mobile station monitors the Forward Common Control Channel/ Primary Broadcast
19 Control Channel, the mobile station transmits on the Enhanced Access Channel using a
20 random access procedure. Many parameters of the random access procedure are supplied
21 by the base station in the *Enhanced Access Parameters Message*.

22 If Layer 3 receives an indication from Layer 2 that the system access is denied, the mobile
23 station shall update its registration variables using SID_s , NID_s , REG_ZONE_s , and
24 $ZONE_TIMER_s$ that were stored from the first base station to which the mobile station sent
25 an Access Probe, as specified in 2.6.5.5.3.2, and enter the *System Determination Substate* of
26 the *Mobile Station Initialization State* with an access denied indication (see 2.6.1.1).

27 If Layer 3 receives an indication from Layer 2 that the system is lost, the mobile station
28 shall update its registration variables using SID_s , NID_s , REG_ZONE_s , and $ZONE_TIMER_s$
29 that were stored from the first base station to which the mobile station transmitted an
30 Access Probe, as specified in 2.6.5.5.3.2 and enter the *System Determination Substate* of the
31 *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1)

32 2.6.3.1.2 Reserved

33 2.6.3.1.3 Handoffs

34 While in the *System Access State*, the mobile station shall continue its pilot search
35 (see 2.6.3.1.3.1), and may perform access handoffs (see 2.6.3.1.3.2) and/or access probe
36 handoffs (see 2.6.3.1.3.3).

37 If the mobile station performs access handoffs and/or access probe handoffs, the mobile
38 station shall maintain the following variables:

- 39 • $CURRENT_ACTIVE_PILOT_s$
40 • $PREVIOUS_ACTIVE_PILOT_s$

1 • FIRST_ACTIVE_PILOT_s

2 Upon entering the *System Access State* the mobile station shall set
3 CURRENT_ACTIVE_PILOT_s, PREVIOUS_ACTIVE_PILOT_s and FIRST_ACTIVE_PILOT_s to
4 NULL. Prior to starting an access attempt, the mobile station shall set
5 CURRENT_ACTIVE_PILOT_s and PREVIOUS_ACTIVE_PILOT_s to NULL. When the mobile
6 station selects a base station for transmission of an access probe, the mobile station shall
7 proceed as follows:

- 8 • If CURRENT_ACTIVE_PILOT_s is not the same as the pilot of the selected base
9 station, the mobile station shall set PREVIOUS_ACTIVE_PILOT_s to the value of
10 CURRENT_ACTIVE_PILOT_s.
- 11 • The mobile station shall set CURRENT_ACTIVE_PILOT_s to the identity of the pilot
12 corresponding to the selected base station.
- 13 • If FIRST_ACTIVE_PILOT_s is NULL, the mobile station shall set
14 FIRST_ACTIVE_PILOT_s to the value of CURRENT_ACTIVE_PILOT_s.

15 Before the mobile station transmits an access probe to a new base station on the Access
16 Channel, the mobile station shall update parameters based on the *System Parameters*
17 *Message*, the *Access Parameters Message* and the *Extended System Parameters Message* on
18 the associated new Paging Channel and process parameters from the messages (see
19 2.6.2.2.1, 2.6.2.2.2, and 2.6.2.2.5).

20 Before the mobile station transmits an access probe to a new base station on the Enhanced
21 Access Channel, if the mobile station is monitoring Primary Broadcast Control Channel,
22 the mobile station shall update parameters based on the *ANSI-41 System Parameters*
23 *Message*, the *Enhanced Access Parameters Message*, and the *MC-RR Parameters Message* on
24 the associated new Primary Broadcast Control Channel and process parameters from the
25 messages (see 2.6.2.2.13, 2.6.2.2.14, and 2.6.2.2.15).

26 Before the mobile station transmits an access probe to a new base station on the Enhanced
27 Access Channel, if the mobile station is monitoring Paging Channel, the mobile station
28 shall update parameters based on the *System Parameters Message*, the *Access Parameters*
29 *Message*, *Generic Access Parameters Message* and the *Extended System Parameters*
30 *Message* on the associated Paging Channel and process parameters from the messages (see
31 2.6.2.2.1, 2.6.2.2.2, and 2.6.2.2.5).

32 If the mobile station monitors the Paging Channel, the mobile station shall update
33 parameters based on the *Neighbor List Message*, the *Extended Neighbor List Message*, or the
34 *General Neighbor List Message* on the associated new Paging Channel and process
35 parameters from the message (see 2.6.2.2.3, 2.6.2.2.7, and 2.6.2.2.8).

36 If the mobile station monitors the Forward Common Control Channel/ Primary Broadcast
37 Control Channel, the mobile station shall update parameters based on the *Universal*
38 *Neighbor List Message* on the associated new Primary Broadcast Control Channel and
39 process parameters from the message (see 2.6.2.2.17).

40 If the mobile station receives the *User Zone Identification Message* or the *Private Neighbor*
41 *List Message*, the mobile station shall update parameters based on these messages on the
42 associated new Paging Channel or Primary Broadcast Control Channel and process

1 parameters from the messages (see 2.6.2.2.9 and 2.6.2.2.10). If the mobile station receives
 2 a *Global Service Redirection Message* (see 2.6.2.2.6) which directs the mobile station away
 3 from the new base station, the mobile station shall not access the new base station. If the
 4 mobile station receives an *Extended Global Service Redirection Message* (see 2.6.2.2.11)
 5 which directs the mobile station away from the new base station, the mobile station shall
 6 not access the new base station. The mobile station shall process these messages only
 7 once after each access handoff.

8 2.6.3.1.3.1 Pilot Search

9 The following sets of pilot offsets are defined for a mobile station in the *System Access*
 10 *State*. Each pilot offset is a member of only one set.

- 11 • Active Set: The pilot offset of the Forward CDMA Channel whose Paging Channel or
 12 Forward Common Control Channel/ Primary Broadcast Control Channel is being
 13 monitored.
- 14 • Neighbor Set: The pilots that are not currently in the Active Set and are likely
 15 candidates for access handoff or access probe handoff. The members of the
 16 Neighbor Set are specified in the *Neighbor List Message*, the *Extended Neighbor List*
 17 *Message*, and the *General Neighbor List Message on the Paging Channel*. The
 18 members of the Neighbor Set are specified in the *Universal Neighbor List Message* on
 19 the Primary Broadcast Control Channel.
- 20 • Remaining Set: The set of all possible pilot offsets in the current system (integer
 21 multiples of $PILOT_INC_S$) on the current CDMA Frequency Assignment, excluding
 22 the pilots in the Neighbor Set and the Active Set.

23 2.6.3.1.3.2 Access Handoff

24 The mobile station is permitted to perform an access handoff to use the Paging Channel
 25 with the best pilot strength and an associated Access Channel or Enhanced Access
 26 Channel. The mobile station is permitted to perform an access handoff to use the Forward
 27 Common Control Channel or the Paging Channel with the best pilot strength and an
 28 associated Enhanced Access Channel. The mobile station is permitted to perform an
 29 access handoff when waiting for a response from the base station or before sending a
 30 response to the base station. An access handoff is permitted after an access attempt while
 31 the mobile station is in the *Page Response Substate* or the *Mobile Station Origination Attempt*
 32 *Substate*.

33 When the mobile station declares a loss of the Paging Channel or the Forward Common
 34 Control Channel while waiting for a response from the base station in the *Page Response*
 35 *Substate* or in the *Mobile Station Origination Attempt Substate*, the mobile station shall
 36 perform an access handoff, if all of the following conditions hold:

- 37 • The pilot corresponding to the new base station is in the list ACCESS_HO_LIST,
- 38 • ACCESS_HO_S is equal to '1', and
- 39 • The mobile station is not already in the process of performing an access attempt.

1 When the mobile station declares a loss of the Paging Channel or the Forward Common
 2 Control Channel, after receiving a message but before responding to that message while in
 3 the *Page Response Substate* or in the *Mobile Station Origination Attempt Substate*, the mobile
 4 station shall perform an access handoff if the following conditions hold:

- 5 • The pilot corresponding to the new base station is in the list ACCESS_HO_LIST,
- 6 • ACCESS_HO_s is equal to '1',
- 7 • ACCESS_HO_MSG_RSP_s is equal to '1', and
- 8 • The mobile station is not already in the process of performing an access attempt.

9 When the mobile station declares an insufficiency of the Paging Channel⁴⁸ or the Forward
 10 Common Control Channel, while waiting for a response from the base station in the *Page*
 11 *Response Substate* or in the *Mobile Station Origination Attempt Substate*, the mobile station
 12 may perform an access handoff if all of the following conditions hold:

- 13 • The pilot corresponding to the new base station is in the list ACCESS_HO_LIST,
- 14 • ACCESS_HO_s is equal to '1', and
- 15 • The mobile station is not already in the process of performing an access attempt.

16 When the mobile station declares an insufficiency of the Paging Channel⁴⁹ or the Forward
 17 Common Control Channel, after receiving a message but before responding to that message
 18 while in the *Page Response Substate* or in the *Mobile Station Origination Attempt Substate*,
 19 the mobile station may perform an access handoff if all of the following conditions hold:

- 20 • The pilot corresponding to the new base station is in the list ACCESS_HO_LIST,
- 21 • ACCESS_HO_s is equal to '1',
- 22 • ACCESS_HO_MSG_RSP_s is equal to '1', and
- 23 • The mobile station is not already in the process of performing an access attempt.

24 If ACCESS_PROBE_HO_s is equal to '0' and ACCESS_HO_s is equal to '1', and the mobile
 25 station declares a loss of the Paging Channel or the Forward Common Control Channel
 26 during an access attempt, after sending at least one complete access probe, the mobile
 27 station may monitor other Paging Channels or the Forward Common Control Channels
 28 which are in ACCESS_HO_LIST for T_{42m} seconds after the loss of the Paging Channel or
 29 the Forward Common Control Channel on which the access attempt was made⁵⁰.

⁴⁸ Insufficiency of the Paging Channel and the Forward Common Control Channel is implementor-defined.

⁴⁹ Insufficiency of the Paging Channel and the Forward Common Control Channel is implementor-defined.

⁵⁰ The mobile station would be waiting for a response to the message transmitted in the access probe.

1 2.6.3.1.3.3 Access Probe Handoff

2 The mobile station is permitted to perform an access probe handoff when the mobile
3 station is in the *Page Response Substate* or the *Mobile Station Origination Attempt Substate*.

4 The mobile station may perform an access probe handoff during an access attempt to a
5 pilot in ACCESS_HO_LIST when the message being sent is the *Origination Message*,
6 *Reconnect Message*, *Call Recovery Request Message* or the *Page Response Message*, if all of
7 the following conditions hold:

- 8 • ACCESS_PROBE_HO_s is equal to '1',
- 9 • The mobile station is in the *Page Response Substate* or the *Mobile Station Origination*
10 *Attempt Substate*,
- 11 • The mobile station has performed fewer than (MAX_NUM_PROBE_HO_s + 1) access
12 probe handoffs during the current access attempt, and
- 13 • If the mobile station is not in the Selective Retransmission Mode⁵¹.

14 The mobile station may also perform an access probe handoff during an access attempt to
15 a pilot in ACCESS_HO_LIST when the message being sent is a message other than the
16 *Origination Message*, *Reconnect Message*, *Call Recovery Request Message* or the *Page*
17 *Response Message*, if all of the preceding conditions hold and
18 ACC_PROBE_HO_OTHER_MSG_s is equal to '1'.

19 The mobile station may also perform an access probe handoff during an access attempt to
20 a pilot not in ACCESS_HO_LIST when the message being sent is the *Origination Message*,
21 *Reconnect Message*, *Call Recovery Request Message* or the *Page Response Message*, if all of
22 the following conditions hold:

- 23 • ACC_HO_LIST_UPD_s is equal to '1',
- 24 • ACCESS_PROBE_HO_s is equal to '1',
- 25 • The new pilot is stronger than any pilot in ACCESS_HO_LIST,
- 26 • The new pilot has the corresponding ACCESS_HO_ALLOWED field in the
27 NGHBR_REC equal to '1',
- 28 • Inclusion of the new pilot in ACCESS_HO_LIST does not cause the Access Channel
29 or Enhanced Access Channel message to exceed the maximum capsule size,
- 30 • Inclusion of the new pilot in ACCESS_HO_LIST does not cause the number of
31 members to exceed N_{13m},
- 32 • The mobile station is in the *Page Response Substate* or the *Mobile Station Origination*
33 *Attempt Substate*,

⁵¹ To perform an access probe handoff when the mobile station is in the Selective Retransmission Mode, the mobile station may first exit the Selective Retransmission Mode and then restart the access attempt on the new pilot (*i.e.* starting with the first probe of the first probe sequence of the access sub-attempt).

- 1 • The mobile station has performed fewer than (MAX_NUM_PROBE_HO_s +1) access
2 probe handoffs during the current access attempt, and
- 3 • If the mobile station is not in the Selective Retransmission Mode⁵¹.

4 The mobile station may also perform an access probe handoff during an access attempt to
5 a pilot not in ACCESS_HO_LIST when the message being sent is a message other than the
6 *Origination Message, Reconnect Message, Call Recovery Request Message* or the *Page*
7 *Response Message*, if all of the preceding conditions hold and
8 ACC_PROBE_HO_OTHER_MSG_s is equal to '1'.

9 If the above conditions are met, the mobile station may perform an access probe handoff
10 when the mobile station declares a loss of the Paging Channel or Forward Common Control
11 Channel (see 2.6.3.1.8); the mobile station may also perform an access probe handoff after
12 getting an indication that the TA timer expired (see [4]) and the mobile station declares an
13 insufficiency of the Paging Channel⁵² or the Forward Common Control Channel.

14 If the mobile station performs an access probe handoff, the mobile station shall suspend
15 the access attempt on the old pilot and shall restart the access attempt on the new pilot
16 (*i.e.* starting with the first probe of the first probe sequence of the access sub-attempt), as
17 specified in [4]. The mobile station shall record the identity of the pilots to which access
18 probes have been transmitted within the current access attempt.

19 The mobile station shall not reset its access probe handoff count until the access attempt
20 ends.

21 Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to cancel the access
22 attempt if the length of the message to be sent exceeds MAX_CAP_SIZE of the new base
23 station. The mobile station may monitor other Paging Channels or Forward Common
24 Control Channels which are in ACCESS_HO_LIST for T_{42m} seconds after aborting the
25 access attempt⁵³.

26 2.6.3.1.4 System Access State Exit Procedures

27 Upon exiting the *System Access State*, the mobile station shall direct Layer 2 to cancel (see
28 [4]) any access attempt in progress and discard the associated message. The mobile station
29 shall then disable the *System Access State* timer.

⁵² Insufficiency of the Paging Channel and the Forward Common Control Channel is implementor-defined.

⁵³ The mobile station would be waiting for a response to the message transmitted in the access probe.

1 2.6.3.1.5 Reserved

2 2.6.3.1.6 Full-TMSI Timer

3 Whenever the mobile station sends its full TMSI, the mobile station enables a timer, called
4 the full-TMSI timer. If the full-TMSI timer expires, the mobile station deletes the TMSI by
5 setting all of the bits in the TMSI_CODE_{s-p} field to '1'.

6 The mobile station shall maintain the full-TMSI timer. The mobile station shall provide a
7 means for enabling or disabling the full-TMSI timer.

8 If the mobile station sends a message with an address including the
9 ASSIGNING_TMSI_ZONE_{s-p} and the full-TMSI timer is disabled, the mobile station shall
10 enable the full-TMSI timer with a duration equal to $T_{69m} + 2.56 \times 2^i$ seconds where i is
11 equal to SLOT_CYCLE_INDEX_s.

12 2.6.3.1.7 Monitoring Pilots

13 The mobile station assists the base station in the Traffic Channel assignment process by
14 monitoring and reporting (see [4]) the pilot strength of the pilot in the mobile station's
15 Paging Channel or Forward Common Control Channel Active Set (see 2.6.3.1.3.1). The
16 mobile station can also monitor and report (see [4]) other pilots on the same frequency; in
17 such cases, the mobile station shall create ACCESS_HO_LIST and
18 OTHER_REPORTED_LIST and shall monitor the pilots on those lists, if any.

19 For each monitored pilot, the mobile station shall record the pilot PN phase and the pilot
20 strength PS, using the most recent measurements from the searcher element (see [2]), as
21 they become available. The mobile station shall identify each pilot through its pilot PN
22 phase (the phase of the pilot PN sequence, in units of one chip, relative to the zero offset
23 pilot PN sequence of the pilot (see 2.6.6.2.4)). The mobile station shall determine the pilot
24 strength, PS, as specified in 2.6.6.2.2.

25 2.6.3.1.7.1 Generation of the Initial Access Handoff List

26 ACCESS_HO_LIST is created immediately before transmitting the first access probe after
27 entering the *System Access State*. When it is created, ACCESS_HO_LIST is defined as a set
28 of at most N_{13m} pilots, having the greatest pilot strength in comparison with other
29 qualifying pilots and for which all of the following apply:

- 30 • The strength of each member exceeds T_{ADD_s} .
- 31 • Each member, other than the Active Set pilot, has the corresponding
32 ACCESS_HO_ALLOWED field in the NGHBR_REC equal to '1'.
- 33 • The Active Set pilot that the mobile station monitors when the mobile station enters
34 the *System Access State* is a member.
- 35 • All members can be contained in the Access Channel or Enhanced Access Channel
36 message without exceeding the maximum capsule size.

37 2.6.3.1.7.2 Update of the Access Handoff List

38 When the mobile station performs an access probe handoff to a pilot which was not
39 previously included in ACCESS_HO_LIST (see 2.6.3.1.3.3), it adds the pilot to
40 ACCESS_HO_LIST.

1 If ACC_HO_LIST_UPD_S is equal to '1', the mobile station can update ACCESS_HO_LIST, as
2 follows:

- 3 • The mobile station can add one or more new pilots other than the Active Set pilot to
4 ACCESS_HO_LIST before transmitting an access probe.
- 5 • The mobile station can also drop from ACCESS_HO_LIST pilots to which access
6 probes have not been transmitted since entering the *System Access State* and whose
7 strength have fallen below T_ADD_S.

8 When it is updated before transmitting a subsequent access probe, ACCESS_HO_LIST is
9 defined as a set of at most N_{13m} pilots, having the greatest pilot strength in comparison
10 with other qualifying pilots and for which all of the following apply:

- 11 • The strength of each member to which access probes have not been transmitted
12 exceeds T_ADD_S.
- 13 • Each member other than the pilot to which the first access probe in the System
14 Access State was transmitted has the corresponding ACCESS_HO_ALLOWED field
15 in the NGHBR_REC equal to '1'.
- 16 • The Active Set pilot to which the next access probe is to be transmitted is a
17 member.
- 18 • All pilots to which access probes have been transmitted since entering the *System*
19 *Access State* are members.
- 20 • All members can be contained in the Access Channel or Enhanced Access Channel
21 message without exceeding the maximum capsule size.

22 2.6.3.1.7.3 Generation of the Other Reported List

23 OTHER_REPORTED_LIST (specified by NUM_ADD_PILOTS and NUM_AUX_PILOTS, see [4])
24 is defined as a set of no more than N_{13m} minus the number of pilots in ACCESS_HO_LIST
25 pilots, having the greatest pilot strength in comparison with other qualifying pilots and for
26 which all of the following apply:

- 27 • The strength of each member exceeds T_ADD_S.
- 28 • No member is included in ACCESS_HO_LIST.
- 29 • All members can be contained in the Access Channel or Enhanced Access Channel
30 message without exceeding the maximum capsule size.

31 2.6.3.1.7.4 Update of OTHER_REPORTED_LIST

32 Before transmitting each access probe, the mobile station shall generate
33 OTHER_REPORTED_LIST according to section 2.6.3.1.7.3, using the most recent pilot
34 strength information available from its searcher element (see [2]). If the mobile station
35 updates ACCESS_HO_LIST before transmitting an access probe, it shall update
36 OTHER_REPORTED_LIST after updating ACCESS_HO_LIST.

1 2.6.3.1.8 Paging Channel and Forward Common Control Channel/ Primary Broadcast
2 Control Channel Monitoring

3 When in the *System Access State*, the mobile station shall monitor the Paging Channel or
4 the Forward Common Control Channel/ Primary Broadcast Control Channel at all times.

5 The mobile station shall set a timer for T_{72m} seconds, when it begins to monitor the Paging
6 Channel or the Forward Common Control Channel/ Primary Broadcast Control Channel
7 and whenever it gets an indication that a valid message was received on the Paging
8 Channel or the Forward Common Control Channel/ Primary Broadcast Control Channel,
9 whether addressed to the mobile station or not (see [4]).

10 If the T_{72m} timer expires:

- 11 • The mobile station shall first finish transmitting the access probe in progress, if
12 any.
- 13 • If by declaring a loss of the Paging Channel or the Forward Common Control
14 Channel, the eligibility requirements for performing access handoff are met (see
15 2.6.3.1.3.2), then the mobile station shall declare a loss of the Paging Channel or
16 the Forward Common Control Channel, and perform an access handoff. If by
17 declaring a loss of the Paging Channel or the Forward Common Control Channel,
18 the eligibility requirements for performing access probe handoff are met (see
19 2.6.3.1.3.3), then the mobile station may declare a loss of the Paging Channel or the
20 Forward Common Control Channel, and perform an access probe handoff. If the
21 mobile station performs an access handoff or an access probe handoff, the mobile
22 station restarts the Paging Channel or the Forward Common Control Channel/
23 Primary Broadcast Control Channel monitoring procedure for the new base station.
- 24 • If an access attempt was in progress when the timer expired and that access
25 attempt had already been suspended and resumed previously (see below), the
26 mobile station shall declare a loss of the Paging Channel⁵⁴ or the Forward Common
27 Control Channel and shall disable its transmitter.
- 28 • If an access attempt was in progress when the timer expired and that access
29 attempt had not been suspended and resumed before and the mobile station does
30 not perform access probe handoff, the mobile station shall declare a temporary loss
31 of the Paging Channel or the Forward Common Control Channel, shall direct Layer
32 2 to suspend the access attempt (see [4]), and shall perform the following:
 - 33 - The mobile station shall set the timer to $(T_{40m}-T_{72m})$ seconds.
 - 34 - If the mobile station receives an indication that a valid message on the Paging
35 Channel or the Forward Common Control Channel, whether addressed to the
36 mobile station or not, was received (see [4]) prior to the expiration of the $(T_{40m}-$
37 $T_{72m})$ timer, the mobile station shall re-enable the transmitter, shall direct

⁵⁴ Requirements for processing the loss of Paging Channel are given separately for each substate of the *System Access State*, in the sections describing the substates.

1 Layer 2 to resume operation from the beginning of the interrupted access probe
 2 sequence of the access sub-attempt (see [4]), and shall transmit the first probe
 3 of the new access probe sequence immediately after re-enabling the transmitter.

4 - If the (T_{40m} - T_{72m}) timer expires, the mobile station shall direct Layer 2 to
 5 cancel any access attempt (see [4]) and shall declare a loss of the Paging
 6 Channel or the Forward Common Control Channel.

7 • If an access attempt was not in progress when the timer expired and the mobile
 8 station does not perform access handoff, the mobile station shall perform the
 9 following:

10 - The mobile station shall set the timer to (T_{40m} - T_{72m}) seconds.

11 - If the (T_{40m} - T_{72m}) timer expires, the mobile station shall declare a loss of the
 12 Paging Channel or the Forward Common Control Channel/ Primary Broadcast
 13 Control Channel.

14 2.6.3.2 Update Overhead Information Substate

15 In this substate, if the base station supports the Primary Broadcast Control Channel for
 16 Spreading Rate 1, or if both the mobile station and base station support Spreading Rate 3
 17 on the common channels, then the mobile station shall monitor the Primary Broadcast
 18 Control Channel until it has received the current configuration messages; otherwise, the
 19 mobile station shall monitor the Paging Channel until it has received the current
 20 configuration messages. The mobile station compares sequence numbers to determine
 21 whether all of the configuration messages are up-to-date. To make sure it has the latest
 22 access parameters, the mobile station receives at least one message containing the
 23 ACC_MSG_SEQ field (except in case where the mobile station enters this substate with a
 24 page response indication, since the initiating page contains ACC_MSG_SEQ), and waits, if
 25 necessary, for an *Access Parameters Message*, *Generic Access Parameters Message* or an
 26 *Enhanced Access Parameters Message*. In addition, if the mobile station is monitoring the
 27 Primary Broadcast Control Channel and $SENDING_RAND_S$ is equal to '1', then it shall also
 28 wait for an *ANSI-41 RAND Message*.

29 Upon entering the *Update Overhead Information Substate*, the mobile station shall set

- 30 • the *System Access State* timer to a value of T_{41m} seconds;
- 31 • PAGED to NO;
- 32 • $RL_UNDERLOAD_INDICATOR_S = 0$, unless it entered the substate with a page
 33 response indication.

34 If the *System Access State* timer expires while in this substate, the mobile station shall
 35 enter the *System Determination Substate* of the *Mobile Station Initialization State* with a
 36 system lost indication (see 2.6.1.1).

37 If the mobile station declares a loss of the Paging Channel or the Primary Broadcast
 38 Control Channel (see 2.6.3.1.8), the mobile station shall perform the following:

- 1 • If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and
2 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
3 user that the PACA call has been canceled.
- 4 • The mobile station shall declare an access attempt failure and update its
5 registration variables as specified in 2.6.5.5.3.2.
- 6 • The mobile station shall enter the *Mobile Station Idle State*.

7 If PACA_S is equal to enabled, the mobile station shall set PACA_CANCEL to '1' when the
8 user directs the mobile station to cancel a PACA call.

9 If the mobile station receives any of the following messages, it shall process the message as
10 follows:

- 11 1. *System Parameters Message*: The mobile station shall process the parameters from
12 the message (see 2.6.2.2.1).
- 13 2. *Access Parameters Message*: The mobile station shall process the parameters from
14 the message (see 2.6.2.2.2).
- 15 3. *Neighbor List Message*: The mobile station shall process the parameters from the
16 message (see 2.6.2.2.3).
- 17 4. *CDMA Channel List Message*: The mobile station shall process the parameters from
18 the message (see 2.6.2.2.4).
- 19 5. *Extended System Parameters Message*: The mobile station shall process the
20 parameters from the message (see 2.6.2.2.5).
- 21 6. *Global Service Redirection Message*: The mobile station shall process the
22 parameters from the message (see 2.6.2.2.6).
- 23 7. *Extended Neighbor List Message*: The mobile station shall process the parameters
24 from the message (see 2.6.2.2.7).
- 25 8. *General Neighbor List Message*: The mobile station shall process the parameters
26 from the message (see 2.6.2.2.8).
- 27 9. *Lock Until Power-Cycled Order*: The mobile station shall record the reason for the
28 *Lock Until Power-Cycled Order* in the mobile station's semi-permanent memory
29 (LCKRSN_P_{S-p} equals the least-significant four bits of ORDQ_r). The mobile station
30 should notify the user of the locked condition. The mobile station shall then enter
31 the *System Determination Substate* of the *Mobile Station Initialization State* with a
32 lock indication (see 2.6.1.1), and shall not enter the *System Access State* again until
33 after the next mobile station power-up or until it has received an *Unlock Order*.
34 This requirement shall take precedence over any other mobile station requirement
35 specifying entry to the *System Access State*.
- 36 10. *General Page Message* or *Universal Page Message*: If CURR_ACC_MSG_SEQ is
37 equal to NULL, the mobile station shall set CURR_ACC_MSG_SEQ to
38 ACC_MSG_SEQ_r. The mobile station shall compare CONFIG_MSG_SEQ_S to
39 CONFIG_MSG_SEQ_r. If the comparison results in a mismatch, the mobile station

1 shall set CONFIG_MSG_SEQ_s to CONFIG_MSG_SEQ_r. The mobile station may
2 ignore the rest of the message. If this substate was not entered with an origination
3 indication, page response indication, direct channel assignment update overhead
4 indication, direct channel assignment respond indication, or direct channel
5 assignment failure indication, the mobile station may also determine whether there
6 is a page match. If the mobile station attempts to determine whether there is a
7 page match, it shall use the procedure as defined in 2.6.2.3. If a match is
8 declared, the mobile station shall set PAGED to YES.

- 9 11. *User Zone Identification Message*: The mobile station shall process the parameters
10 from the message (see 2.6.2.2.9).
- 11 12. *Private Neighbor List Message*: The mobile station shall process the parameters
12 from the message (see 2.6.2.2.10).
- 13 13. *Extended Global Service Redirection Message*: The mobile station shall process the
14 parameters from the message (see 2.6.2.2.11).
- 15 14. *Extended CDMA Channel List Message*: The mobile station shall process the
16 parameters from the message (see 2.6.2.2.12).
- 17 15. *ANSI-41 System Parameters Message*: The mobile station shall process the
18 parameters from the message (see 2.6.2.2.13).
- 19 16. *MC-RR Parameters Message*: The mobile station shall process the parameters from
20 the message (see 2.6.2.2.14).
- 21 17. *Enhanced Access Parameters Message*: The mobile station shall process the
22 parameters from the message (see 2.6.2.2.15).
- 23 18. *ANSI-41 RAND Message*: The mobile station shall process the parameters from the
24 message (see 2.6.2.2.16).
- 25 19. *Universal Neighbor List Message*: The mobile station shall process the parameters
26 from the message (see 2.6.2.2.17).
- 27 20. *Extended Channel Assignment Message*: If this substate was entered with an
28 origination indication, or a direct channel assignment update overhead indication,
29 or a direct channel assignment respond indication, or a direct channel assignment
30 failure indication, or if the DIRECT_CH_ASSIGN_IND_r is not included, or the
31 DIRECT_CH_ASSIGN_IND_r is included and is set to '0', the mobile station shall
32 ignore this message. Otherwise, the mobile station shall process the message as
33 follows:
- 34 • If RESPOND_IND_r is equal to '0', the mobile station shall perform the following
35 in the order specified:
 - 36 - The mobile station shall set CONFIG_MSG_SEQ_s to CONFIG_MSG_SEQ_r.
 - 37 - The mobile station shall wait till stored configuration parameters are current
38 (see 2.6.2.2).
 - 39 - Once the stored configuration parameters are current, the mobile station
40 shall disable the System Access State timer and process the message as

specified in section 2.6.3.3.

- If RESPOND_IND_r is equal to '1', the mobile station shall perform the following in the order specified:
 - The mobile station shall set CONFIG_MSG_SEQ_s to CONFIG_MSG_SEQ_r.
 - When all of the following conditions are met:
 - + the stored configuration parameters are current (see 2.6.2.2)
 - + CURR_ACC_MSG_SEQ_s and ACC_MSG_SEQ_s are equal and are not NULL if MS does not support GAPM; or CURR_ACC_MSG_SEQ_s and GAPM_SEQ_s are equal and are not NULL if MS supports GAPM,
 - + if the mobile station is monitoring the Primary Broadcast Control Channel and SENDING_RAND_s is equal to '1', the *ANSI-41 RAND Message* has been received,
- the mobile station shall disable the System Access State timer and process the message as specified in section 2.6.3.3.

21. *General Extension Message*: The mobile station shall process this message as specified in section 2.6.18.

22. *Generic Access Parameters Message*: The mobile station shall process the parameters from the message (see 2.6.2.2.26).

23. *HDP Parameters Message*: The mobile station shall process the parameters from the message (see 2.6.2.2.27).

If the mobile station receives a message which is not included in the above list, the mobile station shall ignore the message.

If this substate was entered with a direct channel assignment update overhead indication, the mobile station shall perform the following in the order specified:

- The mobile station shall wait till the stored configuration parameters are current (see 2.6.2.2).
- Once the stored configuration parameters are current, the mobile station shall perform the following:
 - The mobile station shall disable the System Access State timer.
 - The mobile station shall process the *Extended Channel Assignment Message* received in *Mobile Station Idle State* as specified in section 2.6.3.3.

When all of the following conditions are met:

- The stored configuration parameters are current (see 2.6.2.2)
- CURR_ACC_MSG_SEQ_s and ACC_MSG_SEQ_s are equal and are not NULL if MS does not support GAPM; or CURR_ACC_MSG_SEQ_s and GAPM_SEQ_s are equal and are not NULL if MS supports GAPM, and

- 1 • If the mobile station is monitoring the Primary Broadcast Control Channel and
2 SENDING_RAND_s is equal to '1', the *ANSI-41 RAND Message* has been received,
3 then the mobile station shall disable the System Access State timer and shall perform one
4 of the following:
- 5 • If PAGED is equal to YES, the mobile station shall determine whether the message
6 resulting in the page match was received on the current Paging Channel or Forward
7 Common Control Channel. If the message was received on the current Paging
8 Channel or Forward Common Control Channel, the mobile station shall enter the
9 *Page Response Substate*; otherwise, the mobile station shall enter the *Mobile Station*
10 *Idle State*.
 - 11 • If this substate was entered with a page response indication, direct channel
12 assignment respond indication, or direct channel assignment failure indication, and
13 the mobile station has not performed an access entry handoff, the mobile station
14 shall determine whether the message resulting in the page response was received
15 on the current Paging Channel or Forward Common Control Channel. If the
16 message was received on the current Paging Channel or Forward Common Control
17 Channel, the mobile station shall enter the *Page Response Substate*; otherwise, the
18 mobile station shall enter the *Mobile Station Idle State* with the corresponding
19 indication.
 - 20 • If this substate was entered with a page response indication, direct channel
21 assignment respond indication, or direct channel assignment failure indication, and
22 the mobile station has performed an access entry handoff, the mobile station shall
23 enter the *Page Response Substate* with the corresponding indication.
 - 24 • If this substate was entered with a page response retransmission indication, the
25 mobile station shall enter the *Page Response Substate*.
 - 26 • If this substate was entered with an origination indication, the mobile station shall
27 enter the *Mobile Station Origination Attempt Substate* with an origination indication.
 - 28 • If this substate was entered with a PACA response indication, the mobile station
29 shall enter the *Mobile Station Origination Attempt Substate* with a PACA response
30 indication.
 - 31 • If this substate was entered with an order/message response indication and the
32 mobile station has not performed an access entry handoff, the mobile station shall
33 determine whether the message resulting in the response was received on the
34 current Paging Channel or Forward Common Control Channel. If the message was
35 received on the current Paging Channel or Forward Common Control Channel, the
36 mobile station shall enter the *Mobile Station Order/Message Response Substate*;
37 otherwise, the mobile station shall discard the response and enter the *Mobile Station*
38 *Idle State*.
 - 39 • If this substate was entered with an order/message response indication and the
40 mobile station has performed an access entry handoff, the mobile station shall enter
41 the *Mobile Station Order/Message Response Substate*.

- 1 • If this substate was entered with a registration indication, the mobile station shall
2 enter the *Registration Access Substate*.
- 3 • If this substate was entered with a message transmission indication, the mobile
4 station shall enter the *Mobile Station Message Transmission Substate* with a message
5 transmission indication.
- 6 • If this substate was entered with a hook status indication, the mobile station shall
7 enter the *Mobile Station Message Transmission Substate* with a hook status
8 indication.
- 9 • If this substate was entered with a PACA cancel indication, the mobile station shall
10 enter the *PACA Cancel Substate*.
- 11 • If this substate was entered with a radio environment report indication, the mobile
12 station shall enter the *Mobile Station Message Transmission Substate* with a radio
13 environment report indication.
- 14 • If this substate was entered with a tracking zone indication, the mobile station shall
15 enter the *Mobile Station Message Transmission Substate* with a tracking zone
16 indication.
- 17 • If this substate was entered with a fast call setup indication, the mobile station
18 shall enter the *Mobile Station Message Transmission Substate* with a fast call setup
19 indication.

20 2.6.3.3 Page Response Substate

21 In this substate, the mobile station sends a *Page Response Message* or a *Reconnect*
22 *Message* in response to a mobile-station-addressed page or direct channel assignment from
23 a base station. If the mobile station sends a *Reconnect Message*, it shall set the ORIG_IND
24 field of the message to '0'.

25 If the mobile station supports DEVICE_CHARACTERISTIC_p and
26 CAPABILITY_GEM_ALLOWED_s = '1', the mobile station shall perform the following:

- 27 • If REGISTERED_s is equal to NO, the mobile station shall send a *Page Response*
28 *Message* including the information in DEVICE_CHARACTERISTIC_p via *General*
29 *Extension Message (GEM)*.
- 30 • If REGISTERED_s is equal to YES, the mobile station may refrain from including the
31 information in DEVICE_CHARACTERISTIC_p together with a *Page Response Message*
32 via *General Extension Message*.

33 If directed by the user to transmit a message, the mobile station may perform either of the
34 following:

- 35 • The mobile station may transmit a *Data Burst Message* to the base station in this
36 substate if all of the following conditions are true:
 - 37 - The mobile station has received confirmation of delivery of the *Page Response*
38 *Message* or a *Reconnect Message*, and
 - 39 - ACCT is not enabled for the service option number associated with the *Data*
40 *Burst Message* as follows:

- 1 + The service option number associated with the *Data Burst Message* is not
2 equal to any ACCT_SO entry in ACCT_SO_LIST, and
- 3 + The service option group number of the service option associated with the
4 *Data Burst Message* is not equal to any ACCT_SO_GRP entry in
5 ACCT_SO_GRP_LIST.
- 6 • If the mobile station sends a *Reconnect Message* in assured mode in this substate,
7 the mobile station may include a Short Data Burst (see ~~30~~[53]) in the *Reconnect*
8 *Message* by setting the SDB_INCL field to '1', if all of the following conditions are
9 true:
- 10 - SDB_SUPPORTED_s and SDB_IN_RCNM_IND_s are equal to '1', and
- 11 - ACCT is not enabled for the service option number associated with the Short
12 Data Burst as follows:
- 13 + The service option number associated with the Short Data Burst is not equal
14 to any ACCT_SO entry in ACCT_SO_LIST, and
- 15 + The service option group number of the service option associated with the
16 Short Data Burst is not equal to any ACCT_SO_GRP entry in
17 ACCT_SO_GRP_LIST.

18 The mobile station shall not send the *Reconnect Message* if RECONNECT_MSG_IND_s equals
19 '0' or if this message is not being sent to reconnect a dormant packet data service instance.

20 If a base station responds to the *Page Response Message* or the *Reconnect Message* with an
21 authentication request, the mobile station responds in this substate.

22 If a message received from the base station requires a Layer 2 acknowledgment and does
23 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is
24 outstanding (see [4]).

25 If a message received from the base station requires a Layer 2 acknowledgment and also a
26 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

27 When transmitting a response to a message received from the base station, Layer 3 shall
28 indicate to Layer 2 that the type of the message is a response (see [4]).

29 When transmitting an autonomous message (i.e., a message that is not sent as a response
30 to a message received from the base station) other than the *Data Burst Message*, Layer 3
31 shall indicate to Layer 2 that the type of the message is a request other than a registration
32 request or a message transmission request (see [4]).

33 When transmitting an autonomous *Data Burst Message*, Layer 3 shall indicate to Layer 2
34 that the type of the message is a message transmission request (see [4]).

35 If the mobile station has a stored service configuration (that is, parameters conveyed by
36 both the Service Configuration information record and the Non-negotiable Service
37 Configuration information record) and corresponding SYNC_ID with associated SID and
38 NID that are equal to the SID_s and NID_s respectively, and USE_SYNC_ID_s is equal to '1',
39 the mobile station may include the SYNC_ID field in the *Page Response Message* or the
40 *Reconnect Message* and, if included, shall set it to the SYNC_ID corresponding to the stored

1 service configuration. If the mobile station includes SYNC_ID field in the *Page Response*
 2 *Message* or the *Reconnect Message*, the mobile station shall store the value of the SYNC_ID
 3 field in SYNC_ID_s.

4 If the mobile station enters the *Page Response Substate* with a direct channel assignment
 5 respond indication, the mobile station shall perform the following:

- 6 • The mobile station shall send a *Page Response Message* or a *Reconnect Message* in
 7 unassured mode, and shall then enter the *Traffic Channel Initialization Substate* of
 8 the *Mobile Station Control on the Traffic Channel State*,
- 9 • While in the *Page Response Substate*, the mobile station shall ignore all received
 10 messages, and
- 11 • The mobile station shall not perform any other procedures in this section.
- 12 • Upon entering the *Page Response Substate* for any reason other than with a direct
 13 channel assignment respond indication, the mobile station shall perform the
 14 following:
 - 15 - Set RLGAIN_ADJ_s to '0000'.
 - 16 - If P_REV_IN_USE_s is less than 11, set PLCM_TYPE_s to '0000'; otherwise set
 17 PLCM_TYPE_s to '0100'.
 - 18 - Send a *Page Response Message* or a *Reconnect Message*.

19 While in this substate, the mobile station shall monitor the Paging Channel or the Forward
 20 Common Control Channel. The mobile station may perform an access probe handoff or
 21 access handoff as described in 2.6.3.1.3.2 and 2.6.3.1.3.3. If the mobile station declares a
 22 loss of the Paging Channel or the Forward Common Control Channel (see 2.6.3.1.8) during
 23 an access attempt, the mobile station may perform an access probe handoff; otherwise, it
 24 shall declare an access attempt failure and shall perform the following actions:

- 25 • The mobile station shall update its registration variables as specified in 2.6.5.5.3.2,
- 26 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
 27 SYS_PAR_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s to NULL,
- 28 • If the mobile station is monitoring the Forward Common Control Channel, the
 29 mobile station shall set MC_RR_PAR_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s
 30 to NULL.
- 31 • If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled and
 32 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
 33 user that the PACA call has been canceled.
- 34 • The mobile station shall disable its transmitter, and
- 35 • The mobile station shall enter the *Mobile Station Idle State*.

36 If the mobile station receives confirmation of delivery of any message sent by the mobile
 37 station in this substate, the mobile station shall perform an access handoff if all of the
 38 following conditions hold:

- 1 • The mobile station declares a loss of the Paging Channel or the Forward Common
2 Control Channel, and
- 3 • The mobile station is permitted to perform an access handoff (see 2.6.3.1.3.2), and
4 there are pilots other than the active pilot in the access handoff list (see
5 2.6.3.1.3.2).

6 If the mobile station declares a loss of the Paging Channel or the Forward Common Control
7 Channel and does not perform an access handoff, the mobile station shall perform the
8 following:

- 9 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
10 SYS_PAR_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s to NULL.
- 11 • If the mobile station is monitoring the Forward Common Control Channel, the
12 mobile station shall set MC_RR_PAR_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s
13 to NULL.
- 14 • If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled and
15 PACA_CANCEL to 0, shall disable the PACA state timer, and should indicate to the
16 user that the PACA call has been canceled,
- 17 • The mobile station shall disable its transmitter, and
- 18 • The mobile station shall enter the *Mobile Station Idle State*.

19 If PACA_s is equal to enabled, the mobile station shall set PACA_CANCEL to '1' when the
20 user directs the mobile station to cancel a PACA call.

21 If the mobile station receives confirmation of delivery of the *Page Response Message* or the
22 *Reconnect Message* sent in this substate, the mobile station shall update its registration
23 variables with respect to the base station to which the first access probe was transmitted
24 after entering the *System Access State*, as specified in 2.6.5.5.3.1.

25 If the *System Access State* timer expires while in this substate, the mobile station shall
26 perform the following:

- 27 • If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled and
28 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
29 user that the PACA call has been canceled.
- 30 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
31 SYS_PAR_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s to NULL, and shall enter
32 the *Mobile Station Idle State*.
- 33 • If the mobile station is monitoring the Forward Common Control Channel, the
34 mobile station shall set MC_RR_PAR_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s
35 to NULL and enter the *Mobile Station Idle State*.

36 The mobile station shall set and disable the *System Access State* timer as follows:

- 37 • The mobile station shall disable the timer whenever it begins an access attempt.
- 38 • The mobile station shall set the timer to T_{42m} seconds whenever it ends an access
39 attempt.

1 • The mobile station shall disable the timer whenever it exits the *System Access State*.
 2 If the mobile station receives a *Channel Assignment Message* or the *Extended Channel*
 3 *Assignment Message*, Layer 3 shall send a *dedicated channel assignment* indication to Layer
 4 2 (see [4]). If the mobile station has not received confirmation of delivery of the *Page*
 5 *Response Message* or the *Reconnect Message*, before receiving the *Channel Assignment*
 6 *Message* or the *Extended Channel Assignment Message*, the mobile station shall update its
 7 registration variables with respect to the base station to which the first access probe was
 8 transmitted after entering the *System Access State*, as specified in 2.6.5.5.3.1. If the mobile
 9 station has not received confirmation of delivery of a *Data Burst Message* before receiving
 10 the *Channel Assignment Message* or the *Extended Channel Assignment Message*, Layer 3
 11 shall send an L2-Supervision.Request primitive to Layer 2 to abort any access attempt in
 12 progress and the mobile station may store the *Data Burst Message* for later transmission on
 13 the r-dsch.

14 If the mobile station is to exit the *System Access State* as a result of processing Layer 3
 15 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*
 16 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to
 17 the message has been sent and acknowledged.

18 If Layer 3 receives a message other than a *Channel Assignment Message* or an *Extended*
 19 *Channel Assignment Message* with an indication from Layer 2 that an access attempt for a
 20 message being transmitted was not terminated as a result of processing the Layer 2 fields
 21 of the received message, the mobile station shall ignore the received message.

22 The following directed messages and orders can be received. If any field value of the
 23 message or order is outside its permissible range, the mobile station may send a *Mobile*
 24 *Station Reject Order* with ORDQ equal to '0000100' (message field not in valid range).

25 1. *Authentication Challenge Message*: The mobile station shall respond to the message
 26 as specified in 2.3.12.1.4, regardless of the value of AUTH_S.

27 2. *Authentication Request Message*: The mobile station shall process the message and
 28 shall respond as specified in 2.3.12.5.2.

29 3. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the
 30 message as specified in 2.3.12.1.5.

31 4. *Base Station Reject Order*: The mobile station shall perform the procedures as
 32 specified in 2.6.11.5.

33 5. *Channel Assignment Message*: The mobile station shall process the message as
 34 follows:

- 35 • If ASSIGN_MODE_T equals '000', the mobile station shall perform the following
 36 actions:
 - 37 - The mobile station shall set CH_IND_S to '01'.
 - 38 - The mobile station shall store the frame offset (FRAME_OFFSET_S =
 39 FRAME_OFFSET_T), the message encryption mode indicator
 40 (ENCRYPT_MODE_S = ENCRYPT_MODE_T), and, if FREQ_INCL_T equals '1', the
 41 Frequency Assignment (CDMACH_S = CDMA_FREQ_T).

- 1 - The mobile station shall set SERV_NEG_S to disabled.
- 2 - If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled
3 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
4 indicate to the user that the PACA call has been canceled.
- 5 - The mobile station shall initialize CODE_CHAN_LIST as described in 2.6.8.
- 6 - If the mobile station is currently monitoring the Paging Channel, the mobile
7 station shall set IDLE_BCCH_CHAN to '0'; otherwise, the mobile station
8 shall set IDLE_BCCH_CHAN to '1'. The mobile station shall set
9 IDLE_CDMA_CHAN to CDMACH_S, IDLE_CDMABAND to CDMABAND_S,
10 IDLE_SID to SID_S, IDLE_NID to NID_S, and IDLE_P_REV to P_REV_S.
- 11 - The mobile station shall enter the *Traffic Channel Initialization Substate* of
12 the *Mobile Station Control on the Traffic Channel State*.
- 13 • If ASSIGN_MODE_T equals '001', the mobile station shall perform the following
14 actions:
- 15 - If FREQ_INCL_T equals '1', the mobile station shall perform the following:
- 16 + If the message requires acknowledgment, the mobile station shall wait
17 until Layer 3 receives an indication from Layer 2 that the
18 acknowledgment to the message has been sent and acknowledged.
- 19 + The mobile station shall set CDMACH_S to CDMA_FREQ_T, tune to the new
20 Frequency Assignment, and measure the strength of each pilot listed in
21 the assignment using the Neighbor Set search procedures specified in
22 2.6.6.2.1 and 2.6.6.2.2.
- 23 - The mobile station shall set CONFIG_MSG_SEQ_S, GAPM_SEQ_S and
24 ACC_MSG_SEQ_S to NULL (see 2.6.2.2) and shall set PILOT_PN_S to the pilot
25 PN sequence offset of the strongest pilot in the list (PILOT_PN_T).
- 26 - If the mobile station has not stored configuration parameters for the Primary
27 Paging Channel of the new base station, or if the stored information is not
28 current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_S,
29 NGHBR_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S,
30 GEN_NGHBR_LST_MSG_SEQ_S, USER_ZONE_ID_MSG_SEQ_S,
31 PRI_NGHBR_LST_MSG_SEQ_S, CHAN_LST_MSG_SEQ_S,
32 EXT_CHAN_LST_MSG_SEQ_S, FD_CHAN_LST_MSG_SEQ_S EQ_S,
33 EXT_SYS_PAR_MSG_SEQ_S, GLOB_SERV_REDIR_MSG_SEQ_S,
34 AP_PILOT_INFO_MSG_SEQ_S, AP_IDT_MSG_SEQ_S, AP_ID_TEXT_MSG_SEQ_S,
35 GOI_MSG_SEQ_S, FREQ_GOI_MSG_SEQ_S, ATIM_MSG_SEQ_S,
36 HDPPM_MSG_SEQ_S and EXT_GLOB_SERV_REDIR_MSG_SEQ_S to NULL.
- 37 - The mobile station shall set PAGE_CHAN_S to '1' and PAGECH_S to the
38 Primary Paging Channel. The mobile station shall then begin monitoring
39 the Primary Paging Channel of the selected base station.

- 1 - If RESPOND_r is equal to '1', the mobile station shall enter the *Update*
2 *Overhead Information Substate* with a page response retransmission
3 indication within T_{34m} seconds after receiving the *Channel Assignment*
4 *Message*.
- 5 - If RESPOND_r is equal to '0', the mobile station shall enter the *Mobile Station*
6 *Idle State* within T_{34m} seconds after receiving the *Channel Assignment*
7 *Message*.
- 8 • If ASSIGN_MODE_r equals '100', the mobile station shall perform the following
9 actions:
- 10 - The mobile station shall set CH_IND_s to '01'.
- 11 - If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled
12 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
13 indicate to the user that the PACA call has been canceled.
- 14 - If GRANTED_MODE_r equals '00', and the multiplex option and radio
15 configuration combination specified in the DEFAULT_CONFIG field is not
16 supported by the mobile station, the mobile station shall send a *Mobile*
17 *Station Reject Order* with ORDQ field set to '00000110' (capability not
18 supported by the mobile station) and remain in the *Page Response Substate*.
- 19 - If FREQ_INCL_r equals '0', the mobile station shall perform the following
20 actions:
- 21 + The mobile station shall store the frame offset (FRAME_OFFSET_s =
22 FRAME_OFFSET_r), the message encryption mode indicator
23 (ENCRYPT_MODE_s = ENCRYPT_MODE_r), the granted mode
24 (GRANTED_MODE_s = GRANTED_MODE_r), and default configuration
25 (DEFAULT_CONFIG_s = DEFAULT_CONFIG_r).
- 26 + The mobile station shall set SERV_NEG_s to enabled.
- 27 + If the mobile station is currently monitoring the Paging Channel, the
28 mobile station shall set IDLE_BCCH_CHAN to '0'; otherwise, the mobile
29 station shall set IDLE_BCCH_CHAN to '1'. The mobile station shall set
30 IDLE_CDMA_CHAN to CDMACH_s, IDLE_CDMABAND to CDMABAND_s,
31 IDLE_SID to SID_s, IDLE_NID to NID_s, and IDLE_P_REV to P_REV_s.
- 32 + The mobile station shall initialize CODE_CHAN_LIST as described in
33 2.6.8 and shall then enter the *Traffic Channel Initialization Substate* of
34 the *Mobile Station Control on the Traffic Channel State*.
- 35 - If FREQ_INCL_r equals '1', the mobile station shall perform the following
36 actions:
- 37 + If the band class is not supported by the mobile station, the mobile
38 station shall send a *Mobile Station Reject Order* with ORDQ field set to
39 '00000110' (capability not supported by the mobile station) and shall
40 remain in the *Page Response Substate*.

- 1 + If the band class is supported by the mobile station, the mobile station
2 shall perform the following actions:
- 3 ○ The mobile station shall store the frame offset ($FRAME_OFFSET_S =$
4 $FRAME_OFFSET_T$), the message encryption mode indicator
5 ($ENCRYPT_MODE_S = ENCRYPT_MODE_T$), the bypass indicator
6 ($BYPASS_ALERT_ANSWER_S = BYPASS_ALERT_ANSWER_T$), the
7 granted mode ($GRANTED_MODE_S = GRANTED_MODE_T$), the default
8 configuration ($DEFAULT_CONFIG_S = DEFAULT_CONFIG_T$), the idle
9 Frequency Assignment ($IDLE_CDMA_CHAN = CDMACH_S$), the idle
10 band class ($IDLE_CDMABAND = CDMABAND_S$), the band class
11 ($CDMABAND_S = BAND_CLASS_T$), and the Frequency Assignment
12 ($CDMACH_S = CDMA_FREQ_T$).
- 13 ○ The mobile station shall initialize $CODE_CHAN_LIST$ as described in
14 2.6.8, and shall set $SERV_NEG_S$ to enabled.
- 15 ○ If the mobile station is currently monitoring the Paging Channel, the
16 mobile station shall set $IDLE_BCCH_CHAN$ to '0'; otherwise, the
17 mobile station shall set $IDLE_BCCH_CHAN$ to '1'. The mobile
18 station shall set $IDLE_SID$ to SID_S , $IDLE_NID$ to NID_S , and
19 $IDLE_P_REV$ to P_REV_S .
- 20 ○ The mobile station shall then tune to the new Frequency Assignment
21 and shall enter the *Traffic Channel Initialization Substate* of the
22 *Mobile Station Control on the Traffic Channel State*.
- 23 • If $ASSIGN_MODE_T$ equals '101', the mobile station shall perform the following
24 actions:
- 25 - If $FREQ_INCL_T$ equals '0', the mobile station shall perform the following
26 actions:
- 27 + If the message requires acknowledgment, the mobile station shall wait
28 until Layer 3 receives an indication from Layer 2 that the
29 acknowledgment to the message has been sent and acknowledged.
- 30 + The mobile station shall set $CONFIG_MSG_SEQ_S$, $GAPM_SEQ_S$ and
31 $ACC_MSG_SEQ_S$ to NULL (see 2.6.2.2) and shall set $PILOT_PN_S$ to the
32 pilot PN sequence offset of the strongest pilot in the list ($PILOT_PN_T$).

- 1 + If the mobile station has not stored configuration parameters for the
2 Primary Paging Channel of the new base station, or if the stored
3 information is not current (see 2.6.2.2), the mobile station shall set
4 SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
5 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
6 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s
7 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
8 FD_CHAN_LST_MSG_SEQ_s EXT_SYS_PAR_MSG_SEQ_s,
9 GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
10 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
11 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s and
12 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 13 + The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
14 Primary Paging Channel. The mobile station shall then begin
15 monitoring the Primary Paging Channel of the selected base station.
- 16 + If RESPOND_r is equal to '1', the mobile station shall perform the
17 following:
18 o If the *Channel Assignment Message* does not require an
19 acknowledgment, the mobile station shall enter the *Update Overhead*
20 *Information Substate* with a page response retransmission indication
21 within T_{34m} seconds after receiving the *Channel Assignment*
22 *Message*.
- 23 o If the *Channel Assignment Message* requires an acknowledgment, the
24 mobile station shall enter the *Update Overhead Information Substate*
25 with a page response retransmission indication within T_{34m} seconds
26 after Layer 3 receives an indication from Layer 2 that the
27 acknowledgment to the *Channel Assignment Message* has been sent
28 and acknowledged.
- 29 + If RESPOND_r is equal to '0', the mobile station shall perform the
30 following:
31 o If the *Channel Assignment Message* does not require an
32 acknowledgment, the mobile station shall enter the *Mobile Station*
33 *Idle State* within T_{34m} seconds after receiving the *Channel*
34 *Assignment Message*.
- 35 o If the *Channel Assignment Message* requires an acknowledgment, the
36 mobile station shall enter the *Mobile Station Idle State* within T_{34m}
37 seconds after Layer 3 receives an indication from Layer 2 that the
38 acknowledgment to the *Channel Assignment Message* has been sent
39 and acknowledged.
- 40 - If FREQ_INCL_r equals '1', the mobile station shall perform the following
41 actions:

- 1 + If the band class is not supported by the mobile station, the mobile
2 station shall send a *Mobile Station Reject Order* with ORDQ field set to
3 ‘00000110’ (capability not supported by the mobile station) and shall
4 remain in the *Page Response Substate*.
- 5 + If the band class is supported by the mobile station, the mobile station
6 shall perform the following actions:
- 7 ○ If the message requires acknowledgment, the mobile station shall
8 wait until Layer 3 receives an indication from Layer 2 that the
9 acknowledgment to the message has been sent and acknowledged.
- 10 ○ The mobile station shall set CDMACH_s to CDMA_FREQ_r and
11 CDMABAND_s to BAND_CLASS_r. Then the mobile station shall tune
12 to the new Frequency Assignment, measure the strength of each
13 pilot listed in the assignment using the Neighbor Set search
14 procedures specified in 2.6.6.2.1 and 2.6.6.2.2, set PILOT_PN_s to the
15 pilot PN sequence offset of the strongest pilot in the list (PILOT_PN_r),
16 and set CONFIG_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s to
17 NULL (see 2.6.2.2).
- 18 ○ If the mobile station has not stored configuration parameters for the
19 Primary Paging Channel of the new base station, or if the stored
20 information is not current (see 2.6.2.2), the mobile station shall set
21 SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
22 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
23 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s,
24 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
25 FD_CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
26 GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
27 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
28 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s and
29 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 30 ○ The mobile station shall set PAGE_CHAN_s to ‘1’ and PAGECH_s to the
31 Primary Paging Channel. The mobile station shall then begin
32 monitoring the Primary Paging Channel of the selected base station.
- 33 ○ If RESPOND_r is equal to ‘1’, the mobile station shall perform the
34 following:
- 35 ◇ If the *Channel Assignment Message* does not require an
36 acknowledgment, the mobile station shall enter the *Update*
37 *Overhead Information Substate* with a page response
38 retransmission indication within T_{34m} seconds after receiving
39 the *Channel Assignment Message*.

- 1 ◇ If the *Channel Assignment Message* requires an acknowledgment,
 2 the mobile station shall enter the *Update Overhead Information*
 3 *Substate* with a page response retransmission indication within
 4 T_{34m} seconds after Layer 3 receives an indication from Layer 2
 5 that the acknowledgment to the *Channel Assignment Message*
 6 has been sent and acknowledged.
- 7 ○ If RESPOND_r is equal to '0', the mobile station perform the following:
- 8 ◇ If the *Channel Assignment Message* does not require an
 9 acknowledgment, the mobile station shall enter the *Mobile*
 10 *Station Idle State* within T_{34m} seconds after receiving the *Channel*
 11 *Assignment Message* .
- 12 ◇ If the *Channel Assignment Message* requires an acknowledgment,
 13 the mobile station shall enter the *Mobile Station Idle State* within
 14 T_{34m} seconds after Layer 3 receives an indication from Layer 2
 15 that the acknowledgment to the *Channel Assignment Message*
 16 has been sent and acknowledged.

17 6. *Data Burst Message*

18 7. *Extended Channel Assignment Message*: The mobile station shall process the
 19 message as follows:

- 20 • If the *Extended Channel Assignment Message* requires an acknowledgment and
 21 the mobile station is to enter the *Mobile Station Control on the Traffic Channel*
 22 *State* as a result of processing Layer 3 fields of this message, the mobile station
 23 shall enter the *Mobile Station Control on the Traffic Channel State* only after Layer
 24 3 receives an indication from Layer 2 that the acknowledgment to the message
 25 has been sent and acknowledged.
- 26 • The mobile station shall set RTC_NOM_PWR_USE_IND to '0'.
- 27 • The mobile station shall set DIRECT_CH_ASSIGN_RECOVER_IND_s to '0'.
- 28 • If the mobile station is in *Page Response Substate* and has sent⁵⁵ a *Page*
 29 *Response Message* or a *Reconnect Message* the mobile station shall set
 30 RESPOND_IND_s to '0'; otherwise the mobile station shall set RESPOND_IND_s to
 31 RESPOND_IND_r.
- 32 • If ASSIGN_MODE_r equals '000', the mobile station shall perform the following
 33 actions:
- 34 - The mobile station shall set CH_IND_s to '01'.

⁵⁵ A message is considered sent when the mobile station transmits the message at least once, no matter whether the L2 acknowledgment is received or not.

- 1 - If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled
2 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
3 indicate to the user that the PACA call has been canceled.
- 4 - If GRANTED_MODE_r equals '00', and the multiplex option and radio
5 configuration specified in the DEFAULT_CONFIG field are not supported by
6 the mobile station, the mobile station shall send a *Mobile Station Reject Order*
7 with ORDQ field set to '00000110' (capability not supported by the mobile
8 station) and shall remain in the current state⁵⁶.
- 9 - If GRANTED_MODE_r is equal to '00' and DEFAULT_CONFIG_r is not equal to
10 '100', the mobile station shall send a *Mobile Station Reject Order* with ORDQ
11 field set to '00001110' (RC does not match with DEFAULT_CONFIG_r) and
12 shall remain in the current state if any of the following conditions is true:
- 13 + FOR_FCH_RC_r is not equal to the RC associated with
14 DEFAULT_CONFIG_r (see Table 3.7.2.3.2.21-2).
- 15 + REV_FCH_RC_r is not equal to the RC associated with
16 DEFAULT_CONFIG_r (see Table 3.7.2.3.2.21-2).
- 17 - If the mobile station does not support either of the Fundamental Channel
18 Radio Configurations (FOR_FCH_RC or REV_FCH_RC), the mobile shall send
19 a *Mobile Station Reject Order* with the ORDQ field set to '00000110'
20 (capability not supported by the mobile station) and remain in the current
21 state.
- 22 - If PLCM_TYPE_r equals '0010' and IMSI_O is derived from IMSI_T, or if
23 PLCM_TYPE_r equals '0011' and IMSI_O is derived from IMSI_M, the mobile
24 station shall send a *Mobile Station Reject Order* with the ORDQ field
25 set to '00011100' (PLCM_TYPE mismatch) and remain in the current state.
- 26 - If P_REV_IN_USE_s is equal to or greater than 6, the mobile station shall
27 store the Forward Fundamental Channel Radio Configuration
28 (FOR_FCH_RC_s = FOR_FCH_RC_r) and the Reverse Fundamental Channel
29 Radio Configuration (REV_FCH_RC_s = REV_FCH_RC_r).
- 30 - If FREQ_INCL_r equals '0', and the band class is supported by the mobile
31 station, the mobile station shall perform the following actions:

⁵⁶ The current state may be *Page Response Substate* or *Mobile Station Idle State*. The mobile station remains in the state in which *Extended Channel Assignment Message* is received.

- 1 + The mobile station shall store the frame offset ($FRAME_OFFSET_S =$
2 $FRAME_OFFSET_T$); the message encryption mode indicator
3 ($ENCRYPT_MODE_S = ENCRYPT_MODE_T$); the bypass indicator
4 ($BYPASS_ALERT_ANSWER_S = BYPASS_ALERT_ANSWER_T$); the granted
5 mode ($GRANTED_MODE_S = GRANTED_MODE_T$); the default
6 configuration ($DEFAULT_CONFIG_S = DEFAULT_CONFIG_T$); and the
7 occurrences of PILOT_PN and PWR_COMB for each included member of
8 the Active Set.
- 9 + The mobile station shall perform the procedures in 2.6.11.2.
- 10 + If C_SIG_ENCRYPT_MODE is included, the mobile station shall set
11 C_SIG_ENCRYPT_MODE_S to C_SIG_ENCRYPT_MODE_T.
- 12 + The mobile station shall initialize CODE_CHAN_LIST as described in
13 2.6.8, and shall set SERV_NEG_S to enabled.
- 14 + The mobile station shall set FPC_FCH_INIT_SETPT_S to
15 FPC_FCH_INIT_SETPT_T, FPC_FCH_CURR_SETPT_S to
16 FPC_FCH_INIT_SETPT_S, FPC_FCH_FER_S to FPC_FCH_FER_T,
17 FPC_FCH_MIN_SETPT_S to FPC_FCH_MIN_SETPT_T,
18 FPC_FCH_MAX_SETPT_S to FPC_FCH_MAX_SETPT_T, and FPC_PRI_CHAN_S
19 to '0' if the mobile station supports any Radio Configuration greater than
20 2.
- 21 + The mobile station shall set FPC_SUBCHAN_GAIN_S to
22 FPC_SUBCHAN_GAIN_T.
- 23 + The mobile station shall set RLGAIN_ADJ_S to RLGAIN_ADJ_T.
- 24 + The mobile station shall set REV_FCH_GATING_MODE_S to
25 REV_FCH_GATING_MODE_T.
- 26 + The mobile station shall set REV_PWR_CNTL_DELAY_S to
27 REV_PWR_CNTL_DELAY_T if REV_PWR_CNTL_DELAY_INCL_T is equal to
28 '1'.
- 29 + The mobile station shall set PLCM_TYPE_S to PLCM_TYPE_T if
30 PLCM_TYPE_INCL_T is equal to '1'; otherwise, the mobile station shall set
31 PLCM_TYPE_S as follows:
- 32 ○ If P_REV_IN_USE_S is less than 11, set PLCM_TYPE_S to '0000';
33 otherwise set PLCM_TYPE_S to '0100'.
- 34 + The mobile station shall set PLCM_39_S to PLCM_39_T if PLCM_TYPE_T is
35 equal to '0001'.
- 36 + If the mobile station is currently monitoring the Paging Channel, the
37 mobile station shall set IDLE_BCCH_CHAN to '0'; otherwise, the mobile
38 station shall set IDLE_BCCH_CHAN to '1'. The mobile station shall set
39 IDLE_CDMA_CHAN to CDMACH_S, IDLE_CDMABAND to CDMABAND_S,
40 IDLE_SID to SID_S, IDLE_NID to NID_S, and IDLE_P_REV to P_REV_S.

- 1 + The mobile station shall then enter the *Traffic Channel Initialization*
2 *Substate of the Mobile Station Control on the Traffic Channel State.*
- 3 - If $FREQ_INCL_T$ equals '1', and the band class is not supported by the mobile
4 station, the mobile station shall send a *Mobile Station Reject Order* with
5 ORDQ field set to '00000110' (capability not supported by the mobile
6 station) and remain in the current state.
- 7 - If $FREQ_INCL_T$ equals '1', and the band class is supported by the mobile
8 station, the mobile station shall perform the following actions:
- 9 + The mobile station shall store the frame offset ($FRAME_OFFSET_S =$
10 $FRAME_OFFSET_T$); the message encryption mode indicator
11 ($ENCRYPT_MODE_S = ENCRYPT_MODE_T$); the bypass indicator
12 ($BYPASS_ALERT_ANSWER_S = BYPASS_ALERT_ANSWER_T$); the granted
13 mode ($GRANTED_MODE_S = GRANTED_MODE_T$); the default
14 configuration ($DEFAULT_CONFIG_S = DEFAULT_CONFIG_T$); the idle
15 Frequency Assignment ($IDLE_CDMA_CHAN = CDMACH_S$); the idle band
16 class ($IDLE_CDMABAND = CDMABAND_S$); the band class ($CDMABAND_S$
17 = $BAND_CLASS_T$); the Frequency Assignment
18 ($CDMACH_S = CDMA_FREQ_T$); and the occurrences of PILOT_PN and
19 PWR_COMB_IND for each included member of the Active Set.
- 20 + The mobile station shall perform the procedures in 2.6.11.2.
- 21 + The mobile station shall set $FPC_FCH_INIT_SETPT_S$ to
22 $FPC_FCH_INIT_SETPT_T$, $FPC_FCH_CURR_SETPT_S$ to
23 $FPC_FCH_INIT_SETPT_S$, $FPC_FCH_FER_S$ to $FPC_FCH_FER_T$,
24 $FPC_FCH_MIN_SETPT_S$ to $FPC_FCH_MIN_SETPT_T$,
25 $FPC_FCH_MAX_SETPT_S$ to $FPC_FCH_MAX_SETPT_T$, and $FPC_PRI_CHAN_S$
26 to '0' if the mobile station supports any Radio Configuration greater than
27 2.
- 28 + The mobile station shall set $FPC_SUBCHAN_GAIN_S$ to
29 $FPC_SUBCHAN_GAIN_T$.
- 30 + The mobile station shall set $RLGAIN_ADJ_S$ to $RLGAIN_ADJ_T$.
- 31 + The mobile station shall set $REV_FCH_GATING_MODE_S$ to
32 $REV_FCH_GATING_MODE_T$.
- 33 + The mobile station shall set $REV_PWR_CNTL_DELAY_S$ to
34 $REV_PWR_CNTL_DELAY_T$ if $REV_PWR_CNTL_DELAY_INCL_T$ is equal to
35 '1'.
- 36 + The mobile station shall set $PLCM_TYPE_S$ to $PLCM_TYPE_T$ if
37 $PLCM_TYPE_INCL_T$ is equal to '1'; otherwise, the mobile station shall set
38 $PLCM_TYPE_S$ as follows:
- 39 ○ If $P_REV_IN_USE_S$ is less than 11, set $PLCM_TYPE_S$ to '0000';
40 otherwise set $PLCM_TYPE_S$ to '0100'.

- 1 + The mobile station shall set $PLCM_39_s$ to $PLCM_39_r$ if $PLCM_TYPE_r$ is
2 equal to '0001'.
- 3 + The mobile station shall initialize $CODE_CHAN_LIST$ as described in
4 2.6.8, and shall set $SERV_NEG_s$ to enabled.
- 5 + If the mobile station is currently monitoring the Paging Channel, the
6 mobile station shall set $IDLE_BCCH_CHAN$ to '0'; otherwise, the mobile
7 station shall set $IDLE_BCCH_CHAN$ to '1'. The mobile station shall set
8 $IDLE_SID$ to SID_s , $IDLE_NID$ to NID_s , and $IDLE_P_REV$ to P_REV_s .
- 9 + The mobile station shall then tune to the new Frequency Assignment and
10 shall enter the *Traffic Channel Initialization Substate* of the *Mobile Station*
11 *Control on the Traffic Channel State*.
- 12 • If $ASSIGN_MODE_r$ equals '001', the mobile station shall perform the following
13 actions:
- 14 - If $FREQ_INCL_r$ equals '0', the mobile station shall perform the following
15 actions:
- 16 + If the message requires acknowledgment, the mobile station shall wait
17 until Layer 3 receives an indication from Layer 2 that the
18 acknowledgment to the message has been sent and acknowledged.
- 19 + The mobile station shall set $CONFIG_MSG_SEQ_s$, $GAPM_SEQ_s$ and
20 $ACC_MSG_SEQ_s$ to NULL (see 2.6.2.2) and shall set $PILOT_PN_s$ to the
21 pilot PN sequence offset of the strongest pilot in the list ($PILOT_PN_r$).
- 22 + If the mobile station has not stored configuration parameters for the
23 Primary Paging Channel of the new base station, or if the stored
24 information is not current (see 2.6.2.2), the mobile station shall set
25 $SYS_PAR_MSG_SEQ_s$, $NGHBR_LST_MSG_SEQ_s$,
26 $EXT_NGHBR_LST_MSG_SEQ_s$, $GEN_NGHBR_LST_MSG_SEQ_s$,
27 $USER_ZONE_ID_MSG_SEQ_s$, $PRI_NGHBR_LST_MSG_SEQ_s$,
28 $CHAN_LST_MSG_SEQ_s$, $EXT_CHAN_LST_MSG_SEQ_s$,
29 $FD_CHAN_LST_MSG_SEQ_s$, $EXT_SYS_PAR_MSG_SEQ_s$,
30 $GLOB_SERV_REDIR_MSG_SEQ_s$, $AP_PILOT_INFO_MSG_SEQ_s$,
31 $AP_IDT_MSG_SEQ_s$, $AP_ID_TEXT_MSG_SEQ_s$, $GOI_MSG_SEQ_s$,
32 $FREQ_GOI_MSG_SEQ_s$, $ATIM_MSG_SEQ_s$, $HDPPM_MSG_SEQ_s$ and
33 $EXT_GLOB_SERV_REDIR_MSG_SEQ_s$ to NULL.
- 34 + The mobile station shall set $PAGE_CHAN_s$ to '1' and $PAGECH_s$ to the
35 Primary Paging Channel. If the mobile station was monitoring the
36 Forward Common Control Channel, the mobile station shall set the
37 $PRAT_s$ to '00'. The mobile station shall then begin monitoring the
38 Primary Paging Channel of the selected base station.
- 39 + If $RESPOND_r$ is equal to '1', the mobile station shall perform the
40 following:

- 1 ○ If the *Extended Channel Assignment Message* does not require an
2 acknowledgment, the mobile station shall enter the *Update Overhead*
3 *Information Substate* with a page response retransmission indication
4 within T_{34m} seconds after receiving the *Extended Channel*
5 *Assignment Message*.
- 6 ○ If the *Extended Channel Assignment Message* requires an
7 acknowledgment, the mobile station shall enter the *Update Overhead*
8 *Information Substate* with a page response retransmission indication
9 within T_{34m} seconds after Layer 3 receives an indication from Layer
10 2 that the acknowledgment to the *Extended Channel Assignment*
11 *Message* has been sent and acknowledged.
- 12 + If $RESPOND_r$ is equal to '0', the mobile station shall perform the
13 following:
- 14 ○ If the *Extended Channel Assignment Message* does not require an
15 acknowledgment, the mobile station shall enter the *Mobile Station Idle*
16 *State* within T_{34m} seconds after receiving the *Extended Channel*
17 *Assignment Message*.
- 18 ○ If the *Extended Channel Assignment Message* requires an
19 acknowledgment, the mobile station shall enter the *Mobile Station Idle*
20 *State* within T_{34m} seconds after Layer 3 receives an indication from
21 Layer 2 that the acknowledgment to the *Extended Channel*
22 *Assignment Message* has been sent and acknowledged.
- 23 - If $FREQ_INCL_r$ equals '1', and the band class is not supported by the mobile
24 station, the mobile station shall send a *Mobile Station Reject Order* with
25 ORDQ field set to '0000110' (capability not supported by the mobile
26 station) and remain in the current state.
- 27 - If $FREQ_INCL_r$ equals '1', and the band class is supported by the mobile
28 station, the mobile station shall perform the following actions:
- 29 + If the message requires acknowledgment, the mobile station shall wait
30 until Layer 3 receives an indication from Layer 2 that the
31 acknowledgment to the message has been sent and acknowledged.
- 32 + The mobile station shall set $CDMACH_s$ to $CDMA_FREQ_r$ and
33 $CDMABAND_s$ to $BAND_CLASS_r$. Then the mobile station shall tune to
34 the new Frequency Assignment, measure the strength of each pilot listed
35 in the assignment using the Neighbor Set search procedures specified in
36 2.6.6.2.1 and 2.6.6.2.2, set $PILOT_PN_s$ to the pilot PN sequence offset of
37 the strongest pilot in the list ($PILOT_PN_r$), and set $CONFIG_MSG_SEQ_s$,
38 $GAPM_SEQ_s$ and $ACC_MSG_SEQ_s$ to NULL (see 2.6.2.2).

- 1 + If the mobile station has not stored configuration parameters for the
2 Primary Paging Channel of the new base station, or if the stored
3 information is not current (see 2.6.2.2), the mobile station shall set
4 SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
5 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
6 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s
7 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
8 FD_CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
9 GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
10 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
11 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s and
12 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 13 + The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
14 Primary Paging Channel. If the mobile station was monitoring Forward
15 Common Control Channel, the mobile station shall set the PRAT_s to '00'.
16 The mobile station shall then begin monitoring the Primary Paging
17 Channel of the selected base station.
- 18 + If RESPOND_r is equal to '1', the mobile station shall perform the
19 following:
- 20 ○ If the *Extended Channel Assignment Message* does not require an
21 acknowledgment, the mobile station shall enter the *Update Overhead*
22 *Information Substate* with a page response retransmission indication
23 within T_{34m} seconds after receiving the *Extended Channel*
24 *Assignment Message*.
- 25 ○ If the *Extended Channel Assignment Message* requires an
26 acknowledgment, the mobile station shall enter the *Update Overhead*
27 *Information Substate* with a page response retransmission indication
28 within T_{34m} seconds after Layer 3 receives an indication from Layer
29 2 that the acknowledgment to the *Extended Channel Assignment*
30 *Message* has been sent and acknowledged.
- 31 + If RESPOND_r is equal to '0', the mobile station shall perform the
32 following:
- 33 ○ If the *Extended Channel Assignment Message* does not require an
34 acknowledgment, the mobile station shall enter the *Mobile Station Idle*
35 *State* within T_{34m} seconds after receiving the *Extended Channel*
36 *Assignment Message*.
- 37 ○ If the *Extended Channel Assignment Message* requires an
38 acknowledgment, the mobile station shall enter the *Mobile Station Idle*
39 *State* within T_{34m} seconds after Layer 3 receives an indication from
40 Layer 2 that the acknowledgment to the *Extended Channel*
41 *Assignment Message* has been sent and acknowledged.
- 42 • If ASSIGN_MODE_r equals '100', the mobile station shall perform the following
43 actions:

- 1 - If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled
2 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
3 indicate to the user that the PACA call has been canceled.
- 4 - If GRANTED_MODE_R equals '00' and the multiplex option and radio
5 configuration specified in the DEFAULT_CONFIG_R field are not supported by
6 the mobile station, the mobile station shall send a *Mobile Station Reject Order*
7 with ORDQ field set to '00000110' (capability not supported by the mobile
8 station) and shall remain in the current state.
- 9 - If GRANTED_MODE_R equals '11', P_REV_IN_USE_S is less than 11, and the
10 mobile station did not include a SYNC_ID field in the *Page Response*
11 *Message* or *Reconnect Message* that was transmitted in this substate, the
12 mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to
13 '00000110' (capability not supported by the mobile station) and shall remain
14 in the current state.
- 15 - If SYNC_ID_INCL_R is included and equals '1', and the mobile station does not
16 have a stored service configuration corresponding to SYNC_ID_R for the
17 current SID_S and NID_S pair, the mobile station shall send a *Mobile Station*
18 *Reject Order* with ORDQ field set to '00011011' (Requested stored service
19 configuration is not available) and shall remain in the current state.
- 20 - If GRANTED_MODE_R equals '11', SR_ID_RESTORE_R is not equal to '111', and
21 a service option connection record corresponding to SR_ID_RESTORE_R is not
22 contained in the stored service configuration, the mobile station shall send a
23 *Mobile Station Reject Order* with ORDQ field set to '00000110' (capability not
24 supported by the mobile station) and shall remain in the current state.
- 25 - If GRANTED_MODE_R equals '00' and DEFAULT_CONFIG_R is not equal to
26 '100', the mobile station shall send a *Mobile Station Reject Order* with ORDQ
27 field set to '00001110' (RC does not match with DEFAULT_CONFIG) and
28 shall remain in the current state if one of the following conditions is true:
- 29 + FOR_RC_R is not equal to the RC associated with DEFAULT_CONFIG_R as
30 specified in Table 3.7.2.3.2.21-2.
- 31 + REV_RC_R is not equal to the RC associated with DEFAULT_CONFIG_R as
32 specified in Table 3.7.2.3.2.21-2.
- 33 - If the mobile station does not support either of the Radio Configurations
34 (FOR_RC or REV_RC), the mobile station shall send a *Mobile Station Reject*
35 *Order* with the ORDQ field set to '00000110' (capability not supported by the
36 mobile station) and remain in the current state.
- 37 - If CH_IND_R = '01' and the mobile station does not support Fundamental
38 Channel, the mobile station shall send a *Mobile Station Reject Order* with the
39 ORDQ field set to '00000110' (capability not supported by the mobile
40 station) and remain in the current state.
- 41 - If CH_IND_R = '10' and the mobile station does not support the Dedicated
42 Control Channel, the mobile station shall send a *Mobile Station Reject Order*

- 1 with the ORDQ field set to '00000110' (capability not supported by the
2 mobile station) and remain in the current state.
- 3 - If CH_IND_r = '11' and the mobile station does not support the Dedicated
4 Control
5 Channel and Fundamental Channel concurrently, the mobile station shall
6 send a *Mobile Station Reject Order* with the ORDQ field set to '00000110'
7 (capability not supported by the mobile station) and remain in the current
8 state.
 - 9 - If FREQ_INCL_r equals '1' and if the band class (BAND_CLASS_r) is not
10 supported by the mobile station, the mobile station shall send a *Mobile*
11 *Station Reject Order* with ORDQ field set to '00000110' (capability not
12 supported by the mobile station) and remain in the current state.
 - 13 - If PLCM_TYPE_r equals '0010' and IMSI_O is derived from IMSI_T, or if
14 PLCM_TYPE_r equals '0011' and IMSI_O is derived from IMSI_M, the mobile
15 station shall send a *Mobile Station Reject Order* with the ORDQ field set to
16 '00011100' (PLCM_TYPE mismatch) and remain in the current state.
 - 17 - If FUNDICATED_BCNC_IND_r equals '1', and the mobile station does not
18 support BCNC reception on the Forward Fundicated Channels assigned in
19 this message, the mobile station shall send a *Mobile Station Reject Order* with
20 the ORDQ field set to '00000110' (capability not supported by the mobile
21 station) and remain in the current state.
 - 22 - If the mobile station does not send a *Mobile Station Reject Order* as specified
23 above, it shall continue to perform the actions specified below.
 - 24 - The mobile station shall set
 - 25 + IDLE_CDMABAND = CDMABAND_s
 - 26 + IDLE_CDMACH = CDMACH_s
 - 27 - If FREQ_INCL_r equals '1', the mobile station shall set
 - 28 + CDMABAND_s = BAND_CLASS_r
 - 29 + CDMACH_s = CDMA_FREQ_r
 - 30 - The mobile station shall store the bypass indicator
31 (BYPASS_ALERT_ANSWER_s = BYPASS_ALERT_ANSWER_r).
 - 32 - The mobile station shall store granted mode (GRANTED_MODE_s =
33 GRANTED_MODE_r). If GRANTED_MODE_r equals '11', the mobile station
34 shall perform the following:
 - 35 + The mobile station shall store the service reference to be restored
36 (SR_ID_RESTORE_s = SR_ID_RESTORE_r).
 - 37 + If SR_ID_RESTORE_r equals '000', the mobile station shall store bitmap of
38 service reference identifiers to be restored (SR_ID_RESTORE_BITMAP_s =
39 SR_ID_RESTORE_BITMAP_r).

- 1 + If SYNC_ID_INCL_T is included and equals '1', the mobile station shall
2 store the service configuration synchronization identifier (SYNC_ID_S =
3 SYNC_ID_T).
- 4 - The mobile station shall store the default configuration (DEFAULT_CONFIG_S
5 = DEFAULT_CONFIG_T).
- 6 - The mobile station shall store the Forward Traffic Channel Radio
7 Configuration (FOR_RC_S = FOR_RC_T) and the Reverse Traffic Channel Radio
8 Configuration (REV_RC_S = REV_RC_T).
- 9 - The mobile station shall store the frame offset (FRAME_OFFSET_S =
10 FRAME_OFFSET_T).
- 11 - The mobile station shall store the message encryption mode indicator
12 (ENCRYPT_MODE_S = ENCRYPT_MODE_T).
- 13 - The mobile station shall perform the procedures in 2.6.11.2.
- 14 - The mobile station shall store the Forward power control subchannel relative
15 gain [FPC_SUBCHAN_GAIN_S = FPC_SUBCHAN_GAIN_T].
- 16 - The mobile station shall set RLGAIN_ADJ_S to RLGAIN_ADJ_T.
- 17 - The mobile station shall set PLCM_TYPE_S to PLCM_TYPE_T if
18 PLCM_TYPE_INCL_T is equal to '1'; otherwise, the mobile station shall set
19 PLCM_TYPE_S as follows:
- 20 + If P_REV_IN_USE_S is less than 11, set PLCM_TYPE_S to '0000'; otherwise
21 set PLCM_TYPE_S to '0100'.
- 22 - The mobile station shall set PLCM_39_S to PLCM_39_T if PLCM_TYPE_T is equal
23 to '0001'.
- 24 - If FIXED_PREAMBLE_TRANSMIT_IND_T is included, the mobile station shall
25 set FIXED_PREAMBLE_TRANSMIT_IND_S to
26 FIXED_PREAMBLE_TRANSMIT_IND_T; otherwise, the mobile station shall set
27 FIXED_PREAMBLE_TRANSMIT_IND_S to '0'. If
28 FIXED_PREAMBLE_TRANSMIT_IND_S equals '1', the mobile station shall set
29 FIXED_NUM_PREAMBLE_S to FIXED_NUM_PREAMBLE_T.
- 30 - The mobile station shall set REV_FCH_GATING_MODE_S to
31 REV_FCH_GATING_MODE_T.
- 32 - The mobile station shall set REV_PWR_CNTL_DELAY_S to
33 REV_PWR_CNTL_DELAY_T if REV_PWR_CNTL_DELAY_INCL_T is equal to '1'.
- 34 - If 3XFL_1XRL_INCL_T is equal to '1', the mobile station shall set
35 1XRL_FREQ_OFFSET_S to 1XRL_FREQ_OFFSET_T.
- 36 - If DIRECT_CH_ASSIGN_IND_T is equal to '1', the mobile station shall perform
37 the following:
- 38 + The mobile station shall set RTC_NOM_PWR_S to RTC_NOM_PWR_T.

- 1 + If the mobile station has not received confirmation of delivery of the *Page*
2 *Response Message* or the *Reconnect Message* sent in this substate, the
3 mobile station shall perform the following:
- 4 o Set RTC_NOM_PWR_USE_IND to '1'.
5 o Set DIRECT_CH_ASSIGN_RECOVER_IND_s to
6 DIRECT_CH_ASSIGN_RECOVER_IND_r
- 7 - The mobile station shall set EARLY_RL_TRANSMIT_IND_s to
8 EARLY_RL_TRANSMIT_IND_r.
- 9 - If TX_PWR_LIMIT_INCL_r is set to '1', the mobile station shall perform the
10 following:
- 11 + If the mobile station is being assigned to operate in the 1915MHz –
12 1920MHz block of the PCS band, the mobile station shall store the
13 transmit power limit TX_PWR_LIMIT_s = (TX_PWR_LIMIT_r - 30dB);
- 14 + Otherwise, the mobile station shall set TX_PWR_LIMIT_s to the limit
15 defined in [11] for the target base station.
- 16 - The mobile station shall store the channel indicator (CH_IND_s = CH_IND_r)
17 and the mobile station shall perform the following actions:
- 18 + If CH_IND_r equals '01', the mobile station shall set
19 FPC_FCH_INIT_SETPT_s to FPC_FCH_INIT_SETPT_r,
20 FPC_FCH_CURR_SETPT_s to FPC_FCH_INIT_SETPT_s, FPC_FCH_FER_s to
21 FPC_FCH_FER_r, FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r,
22 FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r, and FPC_PRI_CHAN_s
23 to '0' if the mobile station supports any Radio Configuration greater than
24 2. Then for each included member of the Active Set, the mobile station
25 shall store the following:
- 26 o Set the PILOT_PN field to PILOT_PN_r.
27 o Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC_INCL_r. If
28 ADD_PILOT_REC_INCL_r equals '1', the mobile station shall store the
29 following:
- 30 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
31 PILOT_REC_TYPE_r.
- 32 ◇ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
33 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r
34 and set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 35 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall.
36 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
37 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
38 AUX_PILOT_WALSH_r with the Walsh Code length specified by
39 WALSH_LENGTH_r.

- 1 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
- 2 — Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
- 3 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
- 4 AUX_WALSH_r with the Walsh Code length specified by
- 5 WALSH_LENGTH_r.
- 6 — Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
- 7 AUX_TD_POWER_LEVEL_r.
- 8 — Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
- 9 ◇ If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
- 10 — Set the SR3_PRIMARY_PILOT field of PILOT_REC to
- 11 SR3_PRIMARY_PILOT_r.
- 12 — Set the SR3_PILOT_POWER1 field of PILOT_REC to
- 13 SR3_PILOT_POWER1_r.
- 14 — Set the SR3_PILOT_POWER2 field of PILOT_REC to
- 15 SR3_PILOT_POWER2_r.
- 16 ◇ If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
- 17 — Set the SR3_PRIMARY_PILOT field of PILOT_REC to
- 18 SR3_PRIMARY_PILOT_r.
- 19 — Set the SR3_PILOT_POWER1 field of PILOT_REC to
- 20 SR3_PILOT_POWER1_r.
- 21 — Set the SR3_PILOT_POWER2 field of PILOT_REC to
- 22 SR3_PILOT_POWER2_r.
- 23 — Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 24 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
- 25 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 26 WALSH_LENGTH_r.
- 27 — If ADD_INFO_INCL1_r is equal to '1', set the AUX_PILOT_QOF1
- 28 field of PILOT_REC to QOF1_r and set the
- 29 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
- 30 AUX_PILOT_WALSH1_r with the Walsh Code length specified
- 31 by WALSH_LENGTH1_r.
- 32 — Otherwise, set the AUX_PILOT_QOF1 field of PILOT_REC to
- 33 QOF_r and set the AUX_PILOT_WALSH_CODE1 field of
- 34 PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code
- 35 length specified by WALSH_LENGTH_r.

- 1 – If ADD_INFO_INCL_{2r} is equal to ‘1’, set the AUX_PILOT_QOF2
2 field of PILOT_REC to QOF_{2r} and set the
3 AUX_PILOT_WALSH_CODE₂ field of PILOT_REC to
4 AUX_PILOT_WALSH_{2r} with the Walsh Code length specified
5 by WALSH_LENGTH_{2r}.
- 6 – Otherwise, set the AUX_PILOT_QOF₂ field of PILOT_REC to
7 QOF_r and set the AUX_PILOT_WALSH_CODE₂ field of
8 PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code
9 length specified by WALSH_LENGTH_r.
- 10 ○ Set the PWR_COMB_IND field to PWR_COMB_IND_r.
- 11 ○ Set the CODE_CHAN_FCH field to CODE_CHAN_FCH_r.
- 12 ○ Set the QOF_MASK_ID_FCH field to QOF_MASK_ID_FCH_r.
- 13 + If CH_IND_r equals ‘01’ and 3X_FCH_INFO_INCL_r equals ‘1’, for each
14 included member of the Active Set, the mobile station store the following:
- 15 ○ If 3X_FCH_LOW_INCL_r equals ‘1’, set the QOF_MASK_ID_FCH_LOW
16 field to QOF_MASK_ID_FCH_LOW_r and the CODE_CHAN_FCH_LOW
17 field to CODE_CHAN_FCH_LOW_r. Otherwise, set the
18 QOF_MASK_ID_FCH_LOW field to QOF_MASK_ID_FCH_r and the
19 CODE_CHAN_FCH_LOW to CODE_CHAN_FCH_r.
- 20 ○ If 3X_FCH_HIGH_INCL_r equals ‘1’, set the QOF_MASK_ID_FCH_HIGH
21 field to QOF_MASK_ID_FCH_HIGH_r and the
22 CODE_CHAN_FCH_HIGH field to CODE_CHAN_FCH_HIGH_r.
23 Otherwise, set the QOF_MASK_ID_FCH_HIGH field to
24 QOF_MASK_ID_FCH_r and the CODE_CHAN_FCH_HIGH to
25 CODE_CHAN_FCH_r.
- 26 + If CH_IND_r equals ‘10’, the mobile station shall set
27 FPC_DCCH_INIT_SETPT_s to FPC_DCCH_INIT_SETPT_r,
28 FPC_DCCH_CURR_SETPT_s to FPC_DCCH_INIT_SETPT_s,
29 FPC_DCCH_FER_s to FPC_DCCH_FER_r, FPC_DCCH_MIN_SETPT_s to
30 FPC_DCCH_MIN_SETPT_r, FPC_DCCH_MAX_SETPT_s to
31 FPC_DCCH_MAX_SETPT_r, FUNDICATED_BCMC_IND_s to
32 FUNDICATED_BCMC_IND_r, and FPC_PRI_CHAN_s to ‘1’ if the mobile
33 station supports any Radio Configuration greater than 2. Then for each
34 included member of the Active Set, the mobile station shall store the
35 following:
- 36 ○ Set the PILOT_PN to PILOT_PN_r.
- 37 ○ Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC_INCL_r. If
38 ADD_PILOT_REC_INCL is equal to ‘1’, the mobile station shall store
39 the following:
- 40 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
41 PILOT_REC_TYPE_r.

- 1 ◇ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
2 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r
3 and set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 4 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall.
5 — Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
6 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
7 AUX_PILOT_WALSH_r with the Walsh Code length specified by
8 WALSH_LENGTH_r.
- 9 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
10 — Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
11 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
12 AUX_WALSH_r with the Walsh Code length specified by
13 WALSH_LENGTH_r.
14 — Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
15 AUX_TD_POWER_LEVEL_r.
16 — Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 17 ◇ If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
18 — Set the SR3_PRIMARY_PILOT field of PILOT_REC to
19 SR3_PRIMARY_PILOT_r.
20 — Set the SR3_PILOT_POWER1 field of PILOT_REC to
21 SR3_PILOT_POWER1_r.
22 — Set the SR3_PILOT_POWER2 field of PILOT_REC to
23 SR3_PILOT_POWER2_r.
- 24 ◇ If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
25 — Set the SR3_PRIMARY_PILOT field of PILOT_REC to
26 SR3_PRIMARY_PILOT_r.
27 — Set the SR3_PILOT_POWER1 field of PILOT_REC to
28 SR3_PILOT_POWER1_r.
29 — Set the SR3_PILOT_POWER2 field of PILOT_REC to
30 SR3_PILOT_POWER2_r.
31 — Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
32 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
33 AUX_PILOT_WALSH_r with the Walsh Code length specified by
34 WALSH_LENGTH_r.

- 1 – If ADD_INFO_INCL1_r is equal to ‘1’, set the AUX_PILOT_QOF1
2 field of PILOT_REC to QOF1_r and set the
3 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
4 AUX_PILOT_WALSH1_r with the Walsh Code length specified
5 by WALSH_LENGTH1_r.
- 6 – Otherwise, set the AUX_PILOT_QOF1 field of PILOT_REC to
7 QOF_r and set the AUX_PILOT_WALSH_CODE1 field of
8 PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code
9 length specified by WALSH_LENGTH_r.
- 10 – If ADD_INFO_INCL2_r is equal to ‘1’, set the AUX_PILOT_QOF2
11 field of PILOT_REC to QOF2_r and set the
12 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
13 AUX_PILOT_WALSH2_r with the Walsh Code length specified
14 by WALSH_LENGTH2_r.
- 15 – Otherwise, set the AUX_PILOT_QOF2 field of PILOT_REC to
16 QOF_r and set the AUX_PILOT_WALSH_CODE2 field of
17 PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code
18 length specified by WALSH_LENGTH_r.
- 19 ○ Set the PWR_COMB_IND field to PWR_COMB_IND_r.
- 20 ○ Set the CODE_CHAN_FCH field to CODE_CHAN_FCH_r.
- 21 ○ Set the QOF_MASK_ID_FCH field to QOF_MASK_ID_FCH_r.
- 22 ○ Set the DCCH_INCL field to DCCH_INCL_r. If DCCH_INCL_r equals ‘1’,
23 the mobile station shall store the following:
- 24 ◇ Set the CODE_CHAN_DCCH field to CODE_CHAN_DCCH_r.
- 25 ◇ Set the QOF_MASK_ID_DCCH field to QOF_MASK_ID_DCCH_r.
- 26 + If CH_IND_r equals ‘10’ and 3X_DCCH_INFO_INCL_r equals ‘1’, for each
27 included member of the Active Set, the mobile station store the following:
- 28 ○ If 3X_DCCH_LOW_INCL_r equals ‘1’, set the
29 QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_DCCH_LOW_r
30 and the CODE_CHAN_DCCH_LOW field to
31 CODE_CHAN_DCCH_LOW_r. Otherwise, set the
32 QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_FCH_r and the
33 CODE_CHAN_DCCH_LOW to CODE_CHAN_FCH_r.
- 34 ○ If 3X_DCCH_HIGH_INCL_r equals ‘1’, set the
35 QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_DCCH_HIGH_r
36 and the CODE_CHAN_DCCH_HIGH field to
37 CODE_CHAN_DCCH_HIGH_r. Otherwise, set the
38 QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_FCH_r and the
39 CODE_CHAN_DCCH_HIGH to CODE_CHAN_FCH_r.

- 1 + If CH_IND_r equals '10', and FUNDICATED_BCMC_IND_r equals '1', for
2 each included member of the Active Set, the mobile station shall store
3 the following:
- 4 ○ Set FOR_CPCCH_WALSH_s to FOR_CPCCH_WALSH_r.
 - 5 ○ Set FOR_CPCSCH_s to FOR_CPCSCH_r.
- 6 + If CH_IND_r equals '11', the mobile station shall set
7 FPC_FCCH_INIT_SETPT_s to FPC_FCH_INIT_SETPT_r,
8 FPC_FCH_CURR_SETPT_s to FPC_FCH_INIT_SETPT_s, FPC_FCH_FER_s to
9 FPC_FCH_FER_r, FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r,
10 FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r,
11 FPC_DCCH_INIT_SETPT_s to FPC_DCCH_INIT_SETPT_r,
12 FPC_DCCH_CURR_SETPT_s to FPC_DCCH_INIT_SETPT_s,
13 FPC_DCCH_FER_s to FPC_DCCH_FER_r, FPC_DCCH_MIN_SETPT_s to
14 FPC_DCCH_MIN_SETPT_r, FPC_DCCH_MAX_SETPT_s to
15 FPC_DCCH_MAX_SETPT_r, FPC_PRI_CHAN_s to FPC_PRI_CHAN_r, and
16 FUNDICATED_BCMC_IND_s to FUNDICATED_BCMC_IND_r. Then for each
17 included member of the Active Set, the mobile station shall store the
18 following:
- 19 ○ Set the PILOT_PN to PILOT_PN_r.
 - 20 ○ Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC. If
21 ADD_PILOT_REC_INCL is equal to '1', the mobile station shall store
22 the following:
 - 23 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
24 PILOT_REC_TYPE_r.
 - 25 ◇ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
26 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r
27 and set the TD_MODE field of PILOT_REC to TD_MODE_r.
 - 28 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
 - 29 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
 - 30 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
31 AUX_PILOT_WALSH_r with the Walsh Code length specified by
32 WALSH_LENGTH_r.
 - 33 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
 - 34 – Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
 - 35 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
36 AUX_WALSH_r with the Walsh Code length specified by
37 WALSH_LENGTH_r.
 - 38 – Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
39 AUX_TD_POWER_LEVEL_r.

- 1 – Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 2 ◇ If PILOT_REC_TYPE_r is equal to ‘011’, the mobile station shall:
 - 3 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
 - 4 SR3_PRIMARY_PILOT_r.
 - 5 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
 - 6 SR3_PILOT_POWER1_r.
 - 7 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
 - 8 SR3_PILOT_POWER2_r.
 - 9 ◇ If PILOT_REC_TYPE_r is equal to ‘100’, the mobile station shall:
 - 10 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
 - 11 SR3_PRIMARY_PILOT_r.
 - 12 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
 - 13 SR3_PILOT_POWER1_r.
 - 14 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
 - 15 SR3_PILOT_POWER2_r.
 - 16 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
 - 17 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
 - 18 AUX_PILOT_WALSH_r with the Walsh Code length specified by
 - 19 WALSH_LENGTH_r.
 - 20 – If ADD_INFO_INCL1_r is equal to ‘1’, set the AUX_PILOT_QOF1
 - 21 field of PILOT_REC to QOF1_r and set the
 - 22 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
 - 23 AUX_PILOT_WALSH1_r with the Walsh Code length specified
 - 24 by WALSH_LENGTH1_r.
 - 25 – Otherwise, set the AUX_PILOT_QOF1 field of PILOT_REC to
 - 26 QOF_r and set the AUX_PILOT_WALSH_CODE1 field of
 - 27 PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code
 - 28 length specified by WALSH_LENGTH_r.
 - 29 – If ADD_INFO_INCL2_r is equal to ‘1’, set the AUX_PILOT_QOF2
 - 30 field of PILOT_REC to QOF2_r and set the
 - 31 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
 - 32 AUX_PILOT_WALSH2_r with the Walsh Code length specified
 - 33 by WALSH_LENGTH2_r.
 - 34 – Otherwise, set the AUX_PILOT_QOF2 field of PILOT_REC to
 - 35 QOF_r and set the AUX_PILOT_WALSH_CODE2 field of
 - 36 PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code
 - 37 length specified by WALSH_LENGTH_r.
 - 38 ○ Set the PWR_COMB_IND field to PWR_COMB_IND_r.
 - 39 ○ Set the CODE_CHAN_FCH field to CODE_CHAN_FCH_r.

- 1 ○ Set the QOF_MASK_ID_FCH field to QOF_MASK_ID_FCH_r.
- 2 ○ Set the CODE_CHAN_DCCH field to CODE_CHAN_DCCH_r.
- 3 ○ Set the QOF_MASK_ID_DCCH field to QOF_MASK_ID_DCCH.
- 4 + If CH_IND_r equals '11' and 3X_FCH_INFO_INCL_r equals '1', for each
- 5 included member of the Active Set, the mobile station store the following:
- 6 ○ If 3X_FCH_LOW_INCL_r equals '1', set the QOF_MASK_ID_FCH_LOW
- 7 field to QOF_MASK_ID_FCH_LOW_r and the CODE_CHAN_FCH_LOW
- 8 field to CODE_CHAN_FCH_LOW_r. Otherwise, set the
- 9 QOF_MASK_ID_FCH_LOW field to QOF_MASK_ID_FCH_r and the
- 10 CODE_CHAN_FCH_LOW to CODE_CHAN_FCH_r.
- 11 ○ If 3X_FCH_HIGH_INCL_r equals '1', set the QOF_MASK_ID_FCH_HIGH
- 12 field to QOF_MASK_ID_FCH_HIGH_r and the
- 13 CODE_CHAN_FCH_HIGH field to CODE_CHAN_FCH_HIGH_r.
- 14 Otherwise, set the QOF_MASK_ID_FCH_HIGH field to
- 15 QOF_MASK_ID_FCH_r and the CODE_CHAN_FCH_HIGH to
- 16 CODE_CHAN_FCH_r.
- 17 + If CH_IND_r equals '11' and 3X_DCCH_INFO_INCL_r equals '1', for each
- 18 included member of the Active Set, the mobile station store the following:
- 19 ○ If 3X_DCCH_LOW_INCL_r equals '1', set the
- 20 QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_DCCH_LOW_r
- 21 and the CODE_CHAN_DCCH_LOW field to
- 22 CODE_CHAN_DCCH_LOW_r. Otherwise, set the
- 23 QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_FCH_r and the
- 24 CODE_CHAN_DCCH_LOW to CODE_CHAN_FCH_r.
- 25 ○ If 3X_DCCH_HIGH_INCL_r equals '1', set the
- 26 QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_DCCH_HIGH_r
- 27 and the CODE_CHAN_DCCH_HIGH field to
- 28 CODE_CHAN_DCCH_HIGH_r. Otherwise, set the
- 29 QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_FCH_r and the
- 30 CODE_CHAN_DCCH_HIGH to CODE_CHAN_FCH_r.
- 31 + If CH_IND_r equals '11' and FUNDICATED_BCNC_IND_r equals '1', the
- 32 mobile station shall store the following:
- 33 ○ Set REV_FCH_ASSIGNED_s to REV_FCH_ASSIGNED_r.
- 34 + If CH_IND_r equals '11' and FUNDICATED_BCNC_IND_r equals '1', the
- 35 mobile station shall set FCH_BCNC_IND to '1'; otherwise, the mobile
- 36 station shall set FCH_BCNC_IND to '0'.
- 37 + If CH_IND_r equals '11' and FUNDICATED_BCNC_IND_r equals '1' and
- 38 FOR_CPCCH_INFO_INCL_r is included and is set to '1', for each included
- 39 member of the Active Set, the mobile station shall store the following:
- 40 ○ Set FOR_CPCCH_WALSH_s to FOR_CPCCH_WALSH_r.

- 1 ○ Set FOR_CPCSCH_S to FOR_CPCSCH_T.
- 2 + If CH_IND_T equals '11' and FUNDICATED_BCNC_IND_T equals '1' and
- 3 ADD_PLCM_FOR_FCH_INCL_T is included and is set to '1', the mobile
- 4 station shall store the following:
- 5 ○ Set ADD_PLCM_FOR_FCH_TYPE_S to ADD_PLCM_FOR_FCH_TYPE_T.
- 6 ○ Set ADD_PLCM_FOR_FCH_39_S to ADD_PLCM_FOR_FCH_39_T if
- 7 ADD_PLCM_FOR_FCH_TYPE_T is equal to '1'.
- 8 - The mobile station shall initialize CODE_CHAN_LIST as described in 2.6.8,
- 9 and shall set SERV_NEG_S to enabled.
- 10 - If the mobile station is currently monitoring the Paging Channel, the mobile
- 11 station shall set IDLE_BCCH_CHAN to '0'; otherwise, the mobile station shall
- 12 set IDLE_BCCH_CHAN to '1'. The mobile station shall set IDLE_SID to SID_S,
- 13 IDLE_NID to NID_S, and IDLE_P_REV to P_REV_S.
- 14 - If FREQ_INCL_T equals '1', the mobile station shall then tune to the new
- 15 frequency assignment.
- 16 - If DIRECT_CH_ASSIGN_IND_T is equal to '1' and RESPOND_IND_T is equal to
- 17 '1', the mobile station shall perform the following:
- 18 + If the mobile station is in *Mobile Station Idle State*, then the mobile
- 19 station shall enter the *Update Overhead Information Substate* of the
- 20 *System Access State* (see 2.6.3.2) with a direct channel assignment
- 21 respond indication within T_{33m} seconds after the *Extended Channel*
- 22 *Assignment Message* is received; otherwise, the mobile station shall enter
- 23 the *Page Response Substate* with a direct channel assignment respond
- 24 indication.
- 25 Otherwise, the mobile station shall enter the *Traffic Channel Initialization*
- 26 *Substate* of the *Mobile Station Control on the Traffic Channel State*.
- 27 • If ASSIGN_MODE_T equals '101', the mobile station shall perform the following
- 28 actions:
- 29 - If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled
- 30 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
- 31 indicate to the user that the PACA call has been canceled.
- 32 - If GRANTED_MODE_T equals '11', P_REV_IN_USE_S is less than 11, and the
- 33 mobile station did not include a SYNC_ID field in the *Page Response*
- 34 *Message* or *Reconnect Message* that was transmitted in this substate, the
- 35 mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to
- 36 '00000110' (capability not supported by the mobile station) and shall remain
- 37 in this state.
- 38 - If GRANTED_MODE_T equals '11', SR_ID_RESTORE_T is not equal to '111', and
- 39 a service option connection record corresponding to SR_ID_RESTORE_T or
- 40 SR_ID_RESTORE_BITMAP_T is not contained in the stored service

1 configuration, the mobile station shall send a *Mobile Station Reject Order*
2 with ORDQ field set to '00000110' (capability not supported by the mobile
3 station) and shall remain in the current state,.

- 4 - If SYNC_ID_INCL_r is included and equals '1', and the mobile station does not
5 have stored service configuration corresponding to SYNC_ID_r for the current
6 SID_s and NID_s pair, the mobile station shall send a *Mobile Station Reject*
7 *Order* with ORDQ field set to '00011011' (Requested stored service
8 configuration is not available) and shall remain in the current state.
- 9 - If the mobile station does not support any of the specified Radio
10 Configurations (FOR_PDCH_RC, FOR_FCH_DCCH_RC or
11 REV_FCH_DCCH_RC), the mobile station shall send a *Mobile Station Reject*
12 *Order* with the ORDQ field set to '00000110' (capability not supported by the
13 mobile station) and remain in the current state.
- 14 - If EXT_CH_IND_r signals the allocation of a F-FCH or R-FCH and the mobile
15 station does not support the Fundamental Channel, the mobile station shall
16 send a *Mobile Station Reject Order* with the ORDQ field set to '00000110'
17 (capability not supported by the mobile station) and remain in the current
18 state.
- 19 - If EXT_CH_IND_r signals the allocation of a F-DCCH or R-DCCH and the
20 mobile station does not support the Dedicated Control Channel, the mobile
21 station shall send a *Mobile Station Reject Order* with the ORDQ field set to
22 '00000110' (capability not supported by the mobile station) and remain in
23 the current state.
- 24 - If FREQ_INCL_r equals '1' and if the band class (BAND_CLASS_r) is not
25 supported by the mobile station, the mobile station shall send a *Mobile*
26 *Station Reject Order* with ORDQ field set to '00000110' (capability not
27 supported by the mobile station) and remain in the current state.
- 28 - If PLCM_TYPE_r equals '0010' and IMSI_O is derived from IMSI_T, or if
29 PLCM_TYPE_r equals '0011' and IMSI_O is derived from IMSI_M, the mobile
30 station shall send a *Mobile Station Reject Order* with the ORDQ field set to
31 '00011100' (PLCM_TYPE mismatch) and remain in the current state.
- 32 - If FUNDICATED_BCNC_IND_r equals '1', and the mobile station does not
33 support BCNC reception on the Forward Fundicated Channels assigned in
34 this message, the mobile station shall send a *Mobile Station Reject Order* with
35 the ORDQ field set to '00000110' (capability not supported by the mobile
36 station) and remain in the current state.
- 37 - If the mobile station does not send a *Mobile Station Reject Order* as specified
38 above, it shall continue to perform the actions specified below.
- 39 - Layer 3 shall send SIG-HandoffPDCH.Indication (handoff_type = ASSIGN) to
40 the MAC layer.
- 41 - If FREQ_INCL_r equals '1', the mobile station shall set

- 1 + CDMABAND_S = BAND_CLASS_T
- 2 + CDMACH_S = CDMA_FREQ_T
- 3 - The mobile station shall store the bypass indicator
4 (BYPASS_ALERT_ANSWER_S = BYPASS_ALERT_ANSWER_T).
- 5 - The mobile station shall store the granted mode indicator
6 (GRANTED_MODE_S = GRANTED_MODE_T). Furthermore, if
7 GRANTED_MODE_T equals '11', the mobile station shall store service
8 reference to be restored (SR_ID_RESTORE_S = SR_ID_RESTORE_T).
- 9 - If SR_ID_RESTORE_T equals '000', the mobile station shall store bitmap of
10 service reference identifiers to be restored (SR_ID_RESTORE_BITMAP_S =
11 SR_ID_RESTORE_BITMAP_T).
- 12 - If SYNC_ID_INCL_T is included and equals '1', the mobile station shall store
13 the service configuration synchronization identifier (SYNC_ID_S = SYNC_ID_T).
- 14 - The mobile station shall store the frame offset (FRAME_OFFSET_S =
15 FRAME_OFFSET_T).
- 16 - The mobile station shall store the message encryption mode indicator
17 (ENCRYPT_MODE_S = ENCRYPT_MODE_T).
- 18 - The mobile station shall perform the following procedures in the order listed
19 below:
- 20 + If D_SIG_ENCRYPT_MODE_T is included, the mobile station shall perform
21 the following:
- 22 ○ If D_SIG_ENCRYPT_MODE_T is equal to '000', the mobile station shall
23 set D_SIG_ENCRYPT_MODE_S to C_SIG_ENCRYPT_MODE_S;
24 otherwise, the mobile station shall set D_SIG_ENCRYPT_MODE_S to
25 D_SIG_ENCRYPT_MODE_T, ENC_KEY_S to the most recently generated
26 CMEAKEY in the mobile station associated with AUTHR of the *Page*
27 *Response Message*, and EXT_ENCRYPT_SEQ[0] and
28 EXT_ENCRYPT_SEQ[1] to 256 × ENC_SEQ_H (the ENC_SEQ_H field
29 in the *Page Response Message*).
- 30 + If ENC_KEY_SIZE_T is included, the mobile station shall set
31 ENC_KEY_SIZE_S to ENC_KEY_SIZE_T.
- 32 + If C_SIG_ENCRYPT_MODE is included, the mobile station shall set
33 C_SIG_ENCRYPT_MODE_S to C_SIG_ENCRYPT_MODE_T.
- 34 - The mobile station shall set EXT_CH_IND_S to EXT_CH_IND_T.
- 35 - The mobile station shall set CH_IND_S to '00'.
- 36 - If EXT_CH_IND_T signals the allocation of a F-FCH or a F-DCCH, the mobile
37 station shall store the Forward power control subchannel relative gain
38 [FPC_SUBCHAN_GAIN_S = FPC_SUBCHAN_GAIN_T].
- 39 - The mobile station shall set RLGAIN_ADJ_S to RLGAIN_ADJ_T.

- 1 - The mobile station shall set $PLCM_TYPE_S$ to $PLCM_TYPE_T$ if
2 $PLCM_TYPE_INCL_T$ is equal to '1'; otherwise, the mobile station shall set
3 $PLCM_TYPE_S$ as follows:
- 4 + If $P_REV_IN_USE_S$ is less than 11, set $PLCM_TYPE_S$ to '0000'; otherwise
5 set $PLCM_TYPE_S$ to '0100'.
- 6 - The mobile station shall set $PLCM_39_S$ to $PLCM_39_T$ if $PLCM_TYPE_T$ is equal
7 to '0001'.
- 8 - The mobile station shall set $FUNDICATED_BCMC_IND_S$ to
9 $FUNDICATED_BCMC_IND_T$. If $FUNDICATED_BCMC_IND_T$ equals '1' and the
10 $EXT_CH_IND_T$ signals the allocation of a F-FCH, the mobile station shall set
11 FCH_BCMC_IND to '1'; otherwise, the mobile station shall set
12 FCH_BCMC_IND to '0'.
- 13 - If $FUNDICATED_BCMC_IND_T$ equals '1' and $ADD_PLCM_FOR_FCH_INCL_T$ is
14 included and is set to '1', the mobile station shall store the following:
- 15 + Set $ADD_PLCM_FOR_FCH_TYPE_S$ to $ADD_PLCM_FOR_FCH_TYPE_T$.
- 16 + Set $ADD_PLCM_FOR_FCH_39_S$ to $ADD_PLCM_FOR_FCH_39_T$ if
17 $ADD_PLCM_FOR_FCH_TYPE_T$ is equal to '1'.
- 18 - If $EXT_CH_IND_T$ signals the allocation of R-FCH, the mobile station shall set
19 $REV_FCH_GATING_MODE_S$ to $REV_FCH_GATING_MODE_T$.
- 20 - The mobile station shall set $REV_PWR_CNTL_DELAY_S$ to
21 $REV_PWR_CNTL_DELAY_T$ if $REV_PWR_CNTL_DELAY_INCL_T$ is equal to '1'.
- 22 - The mobile station shall set $FULL_CI_FEEDBACK_IND_S$ to
23 $FULL_CI_FEEDBACK_IND_T$.
- 24 - If $EXT_CH_IND_T$ equals '01000', the mobile station shall set
25 $FOR_CPCCH_RATE_S$ to $FOR_CPCCH_RATE_T$, and
26 $FOR_CPCCH_UPDATE_RATE_S$ to $FOR_CPCCH_UPDATE_RATE_T$; otherwise,
27 the mobile station shall set $FOR_CPCCH_RATE_S$ to '00', and
28 $FOR_CPCCH_UPDATE_RATE_S$ to '00'.
- 29 - The mobile station shall set $REV_CQICH_FRAME_OFFSET_S$ to
30 $REV_CQICH_FRAME_OFFSET_T$.
- 31 - The mobile station shall set $REV_CQICH_REPS_S$ to $REV_CQICH_REPS_T$.
- 32 - The mobile station shall set $REV_ACKCH_REPS_S$ to $REV_ACKCH_REPS_T$.
- 33 - The mobile station shall set $FOR_PDCH_RC_S$ to $FOR_PDCH_RC_T$.
- 34 - If $EXT_CH_IND_T$ signals the allocation of a R-PDCH, the mobile station shall
35 set $REV_PDCH_RC_S$ to $REV_PDCH_RC_T$.
- 36 - If $EXT_CH_IND_T$ signals the allocation of a F-FCH, the mobile station shall
37 set $FOR_FCH_RC_S$ to $FOR_FCH_DCCH_RC_T$.
- 38 - If $EXT_CH_IND_T$ signals the allocation of a F-DCCH, the mobile station shall
39 set $FOR_DCCH_RC_S$ to $FOR_FCH_DCCH_RC_T$.

- 1 - If EXT_CH_IND_r signals the allocation of a R-FCH, the mobile station shall
2 set REV_FCH_RC_s to REV_FCH_DCCH_RC_r.
- 3 - If EXT_CH_IND_r signals the allocation of a R-DCCH, the mobile station shall
4 set REV_DCCH_RC_s to REV_FCH_DCCH_RC_r.
- 5 - If EXT_CH_IND_r signals the allocation of a F-FCH and a F-DCCH, the mobile
6 station shall set FPC_PRI_CHAN_s to FPC_PRI_CHAN_r.
- 7 - If EXT_CH_IND_r signals the allocation of a F-FCH, the mobile station shall
8 set FPC_FCH_INIT_SETPT_s to FPC_FCH_INIT_SETPT_r,
9 FPC_FCH_CURR_SETPT_s to FPC_FCH_INIT_SETPT_s, FPC_FCH_FER_s to
10 FPC_FCH_FER_r, FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r,
11 FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r.
- 12 - If EXT_CH_IND_r signals the allocation of a F-DCCH, the mobile station shall
13 set FPC_DCCH_INIT_SETPT_s to FPC_DCCH_INIT_SETPT_r,
14 FPC_DCCH_CURR_SETPT_s to FPC_DCCH_INIT_SETPT_s, FPC_DCCH_FER_s to
15 FPC_DCCH_FER_r, FPC_DCCH_MIN_SETPT_s to FPC_DCCH_MIN_SETPT_r,
16 FPC_DCCH_MAX_SETPT_s to FPC_DCCH_MAX_SETPT_r.
- 17 - If EARLY_RL_TRANSMIT_IND_r is included, the mobile station shall set
18 EARLY_RL_TRANSMIT_IND_s to EARLY_RL_TRANSMIT_IND_r; otherwise, the
19 mobile station shall set EARLY_RL_TRANSMIT_IND_s to '0'.
- 20 - If the FIXED_PREAMBLE_TRANSMIT_IND_r is included, the mobile station
21 shall set FIXED_PREAMBLE_TRANSMIT_IND_s to
22 FIXED_PREAMBLE_TRANSMIT_IND_r; otherwise, the mobile station shall set
23 FIXED_PREAMBLE_TRANSMIT_IND_s to '0'. If
24 FIXED_PREAMBLE_TRANSMIT_IND_s equals '1', the mobile station shall
25 store FIXED_NUM_PREAMBLE_s to FIXED_NUM_PREAMBLE_r.
- 26 - If TX_PWR_LIMIT_INCL_r is set to '1', the mobile station shall perform the
27 following:
- 28 + If the mobile station is being assigned to operate in the 1915MHz –
29 1920MHz block of the PCS band, the mobile station shall store the
30 transmit power limit TX_PWR_LIMIT_s = (TX_PWR_LIMIT_r - 30dB);
- 31 + Otherwise, the mobile station shall set TX_PWR_LIMIT_s to the limit
32 defined in [11] for the target base station.
- 33 - If FOR_PDCH_PARAMS_INCL_r is equal to '1', the mobile station shall set
34 FOR_PDCH_COMMON_PARAMS_s = '0'; otherwise, if
35 FOR_PDCH_COMMON_PARAMS_s is equal to '0', the mobile station shall send
36 a *Mobile Station Reject Order* with ORDQ equal to '00000011' (message
37 structure not acceptable) and remain in the current state.
- 38 - If FOR_PDCH_RLGAIN_INCL_r is included and equal to '1', the mobile station
39 shall set RLGAIN_ACKCH_PILOT_s to RLGAIN_ACKCH_PILOT_r, and
40 RLGAIN_CQICH_PILOT_s to RLGAIN_CQICH_PILOT_r.

- 1 - If FOR_PDCH_PARMS_INCL_T is equal to '1', the mobile station shall set
2 NUM_SOFT_SWITCHING_FRAMES_S to NUM_SOFT_SWITCHING_FRAMES_T +
3 1, and NUM_SOFT_SWITCHING_FRAMES_S to
4 NUM_SOFT_SWITCHING_FRAMES_T + 1.
- 5 - If CHM_SWITCHING_PARMS_INCL_T is included and equal to '1', the mobile
6 station shall set NUM_SOFT_SWITCHING_FRAMES_CHM_S to
7 NUM_SOFT_SWITCHING_FRAMES_CHM_T + 1, and
8 NUM_SOFT_SWITCHING_FRAMES_CHM_S to
9 NUM_SOFT_SWITCHING_FRAMES_CHM_T + 1.
- 10 - If CHM_SWITCHING_PARMS_INCL_T is included and equal to '0', the mobile
11 station shall set NUM_SOFT_SWITCHING_FRAMES_CHM_S to
12 NUM_SOFT_SWITCHING_FRAMES_T + 1, and
13 NUM_SOFT_SWITCHING_FRAMES_CHM_S to
14 NUM_SOFT_SWITCHING_FRAMES_T + 1.
- 15 - If FOR_PDCH_PARMS_INCL_T is equal to '1', the mobile station shall set
16 NUM_SOFT_SWITCHING_SLOTS_S according to Table 3.7.2.3.2.21-9 based
17 on the value of NUM_SOFT_SWITCHING_SLOTS_T.
- 18 - If FOR_PDCH_PARMS_INCL_T is equal to '1', the mobile station shall set
19 NUM_SOFT_SWITCHING_SLOTS_S according to Table 3.7.2.3.2.21-9 based
20 on the value of NUM_SOFT_SWITCHING_SLOTS_T.
- 21 - If CHM_SWITCHING_PARMS_INCL_T is included and equal to '1', the mobile
22 station shall:
- 23 + Set NUM_SOFT_SWITCHING_SLOTS_CHM_S according to Table
24 3.7.2.3.2.21-9 based on the value of
25 NUM_SOFT_SWITCHING_SLOTS_CHM_T.
- 26 + Set NUM_SOFT_SWITCHING_SLOTS_CHM_S according to Table
27 3.7.2.3.2.21-9 based on the value of
28 NUM_SOFT_SWITCHING_SLOTS_CHM_T.
- 29 - If CHM_SWITCHING_PARMS_INCL_T is included and equal to '0', the mobile
30 station shall:
- 31 + Set NUM_SOFT_SWITCHING_SLOTS_CHM_S according to Table
32 3.7.2.3.2.21-9 based on the value of NUM_SOFT_SWITCHING_SLOTS_T.
- 33 + Set NUM_SOFT_SWITCHING_SLOTS_CHM_S according to Table
34 3.7.2.3.2.21-9 based on the value of
35 NUM_SOFT_SWITCHING_SLOTS_T.
- 36 - If FOR_PDCH_PARMS_INCL_T is equal to '1', the mobile station shall set
37 PDCH_SOFT_SWITCHING_DELAY_S to PDCH_SOFT_SWITCHING_DELAY_T +
38 1, and PDCH_SOFT_SWITCHING_DELAY_S to
39 PDCH_SOFT_SWITCHING_DELAY_T + 1.
- 40 - If TX_DISABLED_TIMER_INCL_T is equal to '1', the mobile station shall set
41 TX_DISABLED_TIMER_S to TX_DISABLED_TIMER_T; otherwise, the mobile
42 station shall set TX_DISABLED_TIMER_S to T_{81m}.

- 1 - If EXT_CH_IND_r signals the allocation of a R-PDCH, the mobile station shall:
- 2 + Set FOR_GCH_ASSIGNED_s to FOR_GCH_ASSIGNED_r.
- 3 + Set FOR_RCCH_ASSIGNED_s to FOR_RCCH_ASSIGNED_r.
- 4 + If FOR_RCCH_ASSIGNED_s is equal to '1', the mobile station shall:
- 5 ○ Set FOR_RCCH_DRC_MODE_s to FOR_RCCH_DRC_MODE_r.
- 6 ○ Set FOR_RCCH_REPETITION_s to FOR_RCCH_REPETITION_r.
- 7 ○ Set FOR_RCCH_UPDATE_RATE_s to FOR_RCCH_UPDATE_RATE_r.
- 8 + If FOR_ACKCH_ASSIGNED_r is equal to '1', the mobile station shall set
- 9 FOR_ACKCH_MODE_s to FOR_ACKCH_MODE_r.
- 10 + If FOR_ACKCH_COMB_SEL_r is included, the mobile station shall set
- 11 FOR_ACKCH_COMB_SEL_s to FOR_ACKCH_COMB_SEL_r; otherwise, the
- 12 mobile station shall set FOR_ACKCH_COMB_SEL_s to '0'.
- 13 + If REV_PDCH_RLGAIN_INCL_r is included and equal to '1', the mobile
- 14 station shall perform the following:
- 15 ○ The mobile station shall set RLGAIN_SPICH_PILOT_s to
- 16 RLGAIN_SPICH_PILOT_r.
- 17 ○ The mobile station shall set RLGAIN_REQCH_PILOT_s to
- 18 RLGAIN_REQCH_PILOT_r.
- 19 ○ The mobile station shall set RLGAIN_PDCCH_PILOT_s to
- 20 RLGAIN_PDCCH_PILOT_r.
- 21 + If REV_PDCH_PARAMS_1_INCL_r is included and equal to '1', the mobile
- 22 station shall perform the following:
- 23 ○ The mobile station shall set REV_PDCH_TABLE_SEL_s to
- 24 REV_PDCH_TABLE_SEL_r.
- 25 ○ The mobile station shall set REV_PDCH_MAX_AUTO_TPR_s to
- 26 REV_PDCH_MAX_AUTO_TPR_r.
- 27 - Otherwise, the mobile station shall:
- 28 + Set FOR_GCH_ASSIGNED_s to NULL.
- 29 + Set FOR_RCCH_ASSIGNED_s to NULL.
- 30 - For each included member of the Active Set, the mobile station shall store
- 31 the following:
- 32 + Set the PILOT_PN field to PILOT_PN_r.
- 33 + Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC_INCL_r. If
- 34 ADD_PILOT_REC_INCL_r equals '1', the mobile station shall store the
- 35 following:
- 36 ○ Set the PILOT_REC_TYPE field of PILOT_REC to PILOT_REC_TYPE_r.

- 1 ○ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
2 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r and
3 set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 4 ○ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
- 5 ◇ Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 6 ◇ Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
7 AUX_PILOT_WALSH_r with the Walsh Code length specified by
8 WALSH_LENGTH_r.
- 9 ○ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
- 10 ◇ Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
- 11 ◇ Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
12 AUX_WALSH_r with the Walsh Code length specified by
13 WALSH_LENGTH_r.
- 14 ◇ Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
15 AUX_TD_POWER_LEVEL_r.
- 16 ◇ Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
- 17 ○ Set FOR_PDCH_INCL_s to FOR_PDCH_INCL_r.
- 18 ○ If FOR_PDCH_INCL_r is equal to '1', the mobile station shall perform
19 the following:
- 20 ◇ If FOR_PDCH_PARAMS_INCL_r is equal to '1', the mobile station
21 shall store the following parameters:
- 22 — The mobile station shall set WALSH_TABLE_ID_s to
23 WALSH_TABLE_ID_r.
- 24 — The mobile station shall set NUM_PDCCH_s to NUM_PDCCH_r.
- 25 — The mobile station shall store FOR_PDCCH_WALSH_s[i] to the
26 ith occurrence of FOR_PDCCH_WALSH_r.
- 27 ◇ The mobile station shall set MAC_ID_s to MAC_ID_r.
- 28 ◇ The mobile station shall set REV_CQICH_COVER_s to
29 REV_CQICH_COVER_r.
- 30 ◇ If EXT_CH_IND_r signals the allocation of a F-CPCCH, the mobile
31 station shall set FOR_CPCCH_WALSH_s to FOR_CPCCH_WALSH_r,
32 and, FOR_CPCSCH_s to FOR_CPCSCH_r.
- 33 ◇ The mobile station shall store FOR_PDCCH_WALSH_s[i] to the ith
34 occurrence of FOR_PDCCH_WALSH_r.
- 35 ○ The mobile station shall set PWR_COMB_IND_s to PWR_COMB_IND_r.
- 36 ○ If PDCH_GROUP_IND_INCL_r is equal to '1', the mobile station shall
37 set PDCH_GROUP_IDENTIFIER_s as follows:

- 1 ◇ If this is the first pilot in the list that has a F-PDCH assignment,
2 the mobile station shall perform the following:
- 3 ○ The mobile station shall set PDCH_GROUP_IDENTIFIERS_s to '000';
- 4 ◇ Otherwise, the mobile station shall perform the following:
- 5 - If PDCH_GROUP_IND_r is set to '1', the mobile station shall set
6 PDCH_GROUP_IDENTIFIERS_s to the same value as that of the previous pilot
7 in the list that has a F-PDCH assigned; otherwise, the mobile station shall
8 set PDCH_GROUP_IDENTIFIERS_s to the value one greater than that of the
9 previous pilot in the list that has a F-PDCH assigned.
- 10 + Otherwise, the mobile station shall perform the following:
- 11 ○ If this is the first pilot in the list that has a F-PDCH assignment, the
12 mobile station shall perform the following:
- 13 ◇ The mobile station shall set PDCH_GROUP_IDENTIFIERS_s to '000';
- 14 ○ Otherwise, the mobile station shall perform the following:
- 15 ◇ If F-PDCH is assigned for this pilot, the mobile station shall
16 perform the following:
- 17 — If PWR_COMB_IND_r is set to '1', and there are no pilots
18 between this pilot and the previous pilot in the list that has a
19 F-PDCH assigned, the mobile station shall set
20 PDCH_GROUP_IDENTIFIERS_s to the same value as that of the
21 previous pilot in the list that has a F-PDCH assigned.
- 22 — If PWR_COMB_IND_r is set to '1', and all pilots between this
23 pilot and the previous pilot in the list that has a F-PDCH
24 assigned have PWR_COMB_IND set to '1', the mobile station
25 shall set PDCH_GROUP_IDENTIFIERS_s to the same value as
26 that of the previous pilot in the list that has a F-PDCH
27 assigned.
- 28 — Otherwise, the mobile station shall set
29 PDCH_GROUP_IDENTIFIERS_s to the value one greater than
30 that of the previous pilot in the list.
- 31 ◇ Otherwise, the mobile station shall set
32 PDCH_GROUP_IDENTIFIERS_s to NULL.
- 33 + If EXT_CH_IND_r signals the allocation of a F-FCH, the mobile station
34 shall set CODE_CHAN_FCH_s = CODE_CHAN_FCH_r, and
35 QOF_MASK_ID_FCH_s = QOF_MASK_ID_FCH_r.
- 36 + If EXT_CH_IND_r signals the allocation of a F-DCCH, the mobile station
37 shall set CODE_CHAN_DCCH_s = CODE_CHAN_DCCH_r, and
38 QOF_MASK_ID_DCCH_s = QOF_MASK_ID_DCCH_r.

- 1 + If FOR_PDCH_INCL_T is equal to '1', EXT_CH_IND_T signals the allocation
2 of a R-PDCH, and FOR_ACKCH_ASSIGNED_T is equal to '1', the mobile
3 station shall set FOR_ACKCH_WALSH_INDEX_S to
4 FOR_ACKCH_WALSH_INDEX_T, and FOR_ACKSCH_INDEX_S to
5 FOR_ACKSCH_INDEX_T.
- 6 + If FOR_RCCH_INCL_T is included and set to '1', the mobile station shall do
7 the following:
8 ○ Set FOR_RCCH_WALSH_INDEX_S to FOR_RCCH_WALSH_INDEX_T.
9 ○ Set FOR_RCSCH_INDEX_S to FOR_RCSCH_INDEX_T.
- 10 + If FOR_PDCH_INCL_T is equal to '1', and if FOR_GCH_ASSIGNED_T is
11 included and set to '1', the mobile station shall perform the following;
12 ○ Set NUM_FOR_GCH_S to NUM_FOR_GCH_T, and
13 ○ For each of the NUM_FOR_GCH_S occurrences of
14 FOR_GCH_WALSH_INDEX_T, the mobile station shall set
15 FOR_GCH_WALSH_INDEX_S[j] to FOR_GCH_WALSH_INDEX_T[j].
- 16 + Otherwise, the mobile station shall perform the following:
17 ○ Set NUM_FOR_GCH_S to 0, and
18 ○ Set FOR_GCH_WALSH_INDEX_S to NULL.
- 19 - The mobile station shall initialize CODE_CHAN_LIST as described in 2.6.8,
20 and shall set SERV_NEG_S to enabled.
- 21 - If DIRECT_CH_ASSIGN_IND_T is equal to '1', the mobile station shall perform
22 the following:
23 + The mobile station shall set RTC_NOM_PWR_S to RTC_NOM_PWR_T.
24 + If the mobile station has not received confirmation of delivery of the *Page*
25 *Response Message* or the *Reconnect Message* sent in this substate, the
26 mobile station shall perform the following:
27 ○ Set RTC_NOM_PWR_USE_IND to '1'.
28 ○ Set DIRECT_CH_ASSIGN_RECOVER_IND_S to
29 DIRECT_CH_ASSIGN_RECOVER_IND_T
- 30 - If FREQ_INCL_T equals '1', the mobile station shall then tune to the new
31 frequency assignment.
- 32 - If DIRECT_CH_ASSIGN_IND_T is equal to '1' and RESPOND_IND_T is equal to
33 '1', the mobile station shall perform the following:
34 + If the mobile station is in *Mobile Station Idle State*, then the mobile
35 station shall enter the *Update Overhead Information Substate* of the
36 *System Access State* (see 2.6.3.2) with a direct channel assignment
37 respond indication within T_{33m} seconds after the *Extended Channel*
38 *Assignment Message* is received; otherwise, the mobile station shall enter

1 the *Page Response Substate* with a direct channel assignment respond
2 indication.

3 + Otherwise, the mobile station shall enter the *Traffic Channel Initialization*
4 *Substate* of the *Mobile Station Control on the Traffic Channel State*.

5 8. *Fast Call Setup Order:*

- 6 • If $ORDQ_R$ is equal to '00000000', the mobile station shall process the message
7 and respond with a *Fast Call Setup Order* as specified in 2.6.12.1.
- 8 • If $ORDQ_R$ is equal to '00000001', the mobile station shall process the message
9 as specified in 2.6.12.1.

10 9. *Feature Notification Message*

11 10. *Local Control Order*

12 11. *Lock Until Power-Cycled Order:* The mobile station shall disable its transmitter and
13 record the reason for the *Lock Until Power-Cycled Order* in the mobile station's
14 semi-permanent memory ($LCKRSN_{S-p}$ equals the least significant four bits of
15 $ORDQ_R$). The mobile station should notify the user of the locked condition. The
16 mobile station shall enter the *System Determination Substate* of the *Mobile Station*
17 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the
18 *System Access State* again until after the next mobile station power-up or until it
19 has received an *Unlock Order*. This requirement shall take precedence over any
20 other mobile station requirement specifying entry to the *System Access State*.

21 12. *Maintenance Required Order:* The mobile station shall record the reason for the
22 *Maintenance Required Order* in the mobile station's semi-permanent memory
23 ($MAINTRSN_{S-p}$ equals the least significant four bits of $ORDQ_R$). The mobile station
24 shall remain in the unlocked condition. The mobile station should notify the user
25 of the maintenance required condition.

26 13. *Registration Accepted Order:* The mobile station shall perform the procedures as
27 specified in 2.6.11.1.

28 14. *Registration Rejected Order:* This order indicates that normal service is not
29 available on this system. The mobile station shall disable the full-TMSI timer. If
30 the received order specifies to delete the TMSI ($ORDQ = '00000100'$), the mobile
31 station shall set all the bits of the $TMSI_CODE_{S-p}$ to '1'. The mobile station shall
32 enter the *System Determination Substate* of the *Mobile Station Initialization State* with
33 a registration rejected indication (see 2.6.1.1).

34 15. *Release Order:* If $NDSS_ORIG_S$ is equal to enabled, the mobile station shall set
35 $NDSS_ORIG_S$ to disabled, and should indicate to the user that the call origination
36 has been canceled. The mobile station shall enter the *Mobile Station Idle State* or
37 the *System Determination Substate* of the *Mobile Station Initialization State* with a
38 release indication (see 2.6.1.1). If the mobile station enters the *Mobile Station Idle*
39 *State*, and if $PACA_S$ is equal to enabled, the mobile station shall set $PACA_S$ to

1 disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and should
2 indicate to the user that the PACA call has been canceled.

3 16. *Retry Order*: The mobile station shall process the message as follows:

- 4 • If RETRY_TYPE_r is equal to '000', the mobile station shall set
5 RETRY_DELAY_s[RETRY_TYPE] to 0, where RETRY_TYPE is equal to '001', '010',
6 '011', '100', or '101'.
- 7 • If RETRY_TYPE_r is equal to '001', '100', or '101', the mobile station shall perform
8 the following:
 - 9 - If RETRY_DELAY_r is equal to '00000000', then the mobile station shall set
10 RETRY_DELAY_s[RETRY_TYPE_r] to 0.
 - 11 - If RETRY_DELAY_r is not equal to '00000000', the mobile station shall set
12 RETRY_DELAY_s[RETRY_TYPE_r] as follows:
 - 13 + If the most significant bit of the RETRY_DELAY_r is '0', set
14 RETRY_DELAY_UNIT_s to 1000ms. If the most significant bit of the
15 RETRY_DELAY_r is '1', set RETRY_DELAY_UNIT_s to 60000ms.
 - 16 + The mobile station shall set RETRY_DELAY_VALUE_s to the seven least
17 significant bits of RETRY_DELAY_r.
 - 18 + The mobile station shall store the next system time 80 ms boundary +
19 RETRY_DELAY_VALUE_s × RETRY_DELAY_UNIT_s ms as
20 RETRY_DELAY_s[RETRY_TYPE_r].

21 17. *Security Mode Command Message*: The mobile station shall perform the procedures
22 as specified in 2.6.11.4.

23 18. *Service Redirection Message*: The mobile station shall process the message as
24 follows:

- 25 • If the mobile station is directed to an unsupported operation mode or band
26 class, the mobile station shall respond with a *Mobile Station Reject Order* with
27 ORDQ equal to '00000110' (message requires a capability that is not supported
28 by the mobile station).
- 29 • If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of
30 TMSI_CODE_{s-p} to '1'. The mobile station shall disable the full-TMSI timer.
- 31 • The mobile station shall set RETURN_IF_FAIL_s = RETURN_IF_FAIL_r.
- 32 • If RECORD_TYPE_r is equal to '00000000', the mobile station shall enter the
33 *System Determination Substate* of the *Mobile Station Initialization State* with an
34 NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the
35 redirection record received in the message as REDIRECT_REC_s and shall enter
36 the *System Determination Substate* of the *Mobile Station Initialization State* with a
37 redirection indication (see 2.6.1.1).

38 19. *SSD Update Message*: The mobile station shall respond to the message as specified
39 in 2.3.12.1.5.

1 20. *Status Request Message*: The mobile station shall disable the *System Access State*
 2 timer and respond to the message. If $P_REV_IN_USE_s$ is less than or equal to
 3 three, the mobile station shall respond with a *Status Response Message*. If
 4 $P_REV_IN_USE_s$ is greater than three, the mobile station shall respond with an
 5 *Extended Status Response Message*. If the message does not specify any
 6 qualification information ($QUAL_INFO_TYPE_r$ is equal to '00000000'), the mobile
 7 station shall include the requested information records in the response. If the
 8 message specifies a band class ($QUAL_INFO_TYPE_r$ is equal to '00000001'), the
 9 mobile station shall only include the requested information records for the
 10 specified band class ($BAND_CLASS_r$) in the response. If the message specifies a
 11 band class and an operating mode ($QUAL_INFO_TYPE_r$ is equal to '00000010'), the
 12 mobile station shall only include the requested information records for the
 13 specified band class ($BAND_CLASS_r$) and operating mode (OP_MODE_r) in the
 14 response. If the message specifies a band class or a band class and an operating
 15 mode which is not supported by the mobile station, the mobile station shall send a
 16 *Mobile Station Reject Order* with $ORDQ$ set to '00000110' (message requires a
 17 capability that is not supported by the mobile station). If the response to this
 18 message exceeds the allowable length, the mobile station shall send a *Mobile*
 19 *Station Reject Order* with $ORDQ$ set to '00001000' (response message would exceed
 20 the allowable length). If the message specifies an information record which is not
 21 supported by the mobile station for the specified band class and operating mode,
 22 the mobile station shall send a *Mobile Station Reject Order* with $ORDQ$ set to
 23 '00001001' (information record is not supported for the specified band class and
 24 operating mode).

25 21. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code
 26 as follows:

- 27 • The mobile station shall store the length of the TMSI zone field by setting
 28 $ASSIGNING_TMSI_ZONE_LEN_{s-p}$ to $TMSI_ZONE_LEN_r$;
- 29 • The mobile station shall store the assigning TMSI zone number by setting the
 30 $ASSIGNING_TMSI_ZONE_LEN_{s-p}$ least significant octets of
 31 $ASSIGNING_TMSI_ZONE_{s-p}$ to $TMSI_ZONE_r$, and
- 32 • The mobile station shall store the TMSI code by setting $TMSI_CODE_{s-p}$ to
 33 $TMSI_CODE_r$.

34 The mobile station shall set the TMSI expiration time by setting $TMSI_EXP_TIME_{s-p}$
 35 to $TMSI_EXP_TIME_r$. The mobile station shall disable the full-TMSI timer. The
 36 mobile station shall then respond with a *TMSI Assignment Completion Message*
 37 within T_{56m} seconds.

38 22. *User Zone Reject Message*

39 23. *General Extension Message*: The mobile station shall process this message as
 40 specified in section 2.6.18.

41 24. *EACH Selective Acknowledgment Order*: The mobile station shall set $SACK_CODE_s$
 42 to $ORDQ_r$, and set $SELECTIVE_ACK_BIT_MASK_s$ to the N most significant bits of
 43 $SELECTIVE_ACK_BIT_MASK_r$, where N is number of frames transmitted in the last

1 enhanced access probe, and then process this order as specified in 2.1.3.5.3 of
2 [2]⁵⁷.

3 25. *Any other message*: If the mobile station receives any other message specified in
4 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all
5 other messages.

6 If the mobile station performs an access probe handoff or access handoff and receives any
7 of the following messages, it shall process the message as specified in 2.6.3.1.3:

- 8 • If the mobile station is currently monitoring the Paging Channel:
 - 9 1. *System Parameters Message*
 - 10 2. *Access Parameters Message*
 - 11 3. *Neighbor List Message*
 - 12 4. *Extended System Parameters Message*
 - 13 5. *Extended Neighbor List Message*
 - 14 6. *General Neighbor List Message*
 - 15 7. *Global Service Redirection Message*
 - 16 8. *Extended Global Service Redirection Message*
- 17 • 9. *Generic Access Parameters Message* If the mobile station is currently monitoring
18 the Primary Broadcast Control Channel:
 - 19 1. *ANSI-41 System Parameters Message*
 - 20 2. *Enhanced Access Parameters Message*
 - 21 3. *Universal Neighbor List Message*
 - 22 4. *MC-RR Parameters Message*
 - 23 5. *Extended Global Service Redirection Message*

24 2.6.3.4 Mobile Station Order/Message Response Substate

25 In this substate, the mobile station sends a message that is a response to a message
26 received from the base station. If the base station responds to the mobile station's message
27 with an authentication request, the mobile station responds in this substate.

28 If a message received from the base station requires a Layer 2 acknowledgment and does
29 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is
30 outstanding (see [4]).

⁵⁷ If the number of Enhanced Access Channel data frames in the access probe is larger than 64, the 64 MSB's of SELECTIVE_ACK_BIT_MASK_s are set to SELECTIVE_ACK_BIT_MASK_r, and the remaining bits of SELECTIVE_ACK_BIT_MASK_s are set to 0.

1 If a message received from the base station requires a Layer 2 acknowledgment and also a
2 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

3 When transmitting a response to a message received from the base station, Layer 3 shall
4 indicate to Layer 2 that the type of the message is a response (see [4]).

5 When transmitting an autonomous message (i.e., a message that is not sent as a response
6 to a message received from the base station), Layer 3 shall indicate to Layer 2 that the type
7 of the message is a request other than a registration request or a message transmission
8 request (see [4]).

9 Upon entering the *Mobile Station Order/Message Response Substate*, the mobile station
10 shall send the response message.

11 While in this substate, the mobile station shall monitor the Paging Channel or the Forward
12 Common Control Channel. If the mobile station declares a loss of the Paging Channel or
13 the Forward Common Control Channel (see 2.6.3.1.8), the mobile station shall perform the
14 following:

- 15 • If $PACA_S$ is equal to enabled, the mobile station shall set $PACA_S$ to disabled and
16 $PACA_CANCEL$ to '0', shall disable the PACA state timer, and should indicate to the
17 user that the PACA call has been canceled.
- 18 • The mobile station shall declare an access attempt failure and update its
19 registration variables as specified in 2.6.5.5.3.2.
- 20 • The mobile station shall disable its transmitter.
- 21 • The mobile station shall enter the *Mobile Station Idle State*.

22 If the mobile station receives confirmation of delivery of any message sent by the mobile
23 station in this substate, it shall send a response in this substate if required, and shall then
24 enter the *Mobile Station Idle State*.

25 If $PACA_S$ is equal to enabled, the mobile station shall set $PACA_CANCEL$ to '1' when the
26 user directs the mobile station to cancel a PACA call.

27 If the mobile station is to exit the *System Access State* as a result of processing Layer 3
28 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*
29 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to
30 the message has been sent and acknowledged.

31 If Layer 3 receives a message with an indication from Layer 2 that an access attempt for a
32 message being transmitted was not terminated as a result of processing the Layer 2 fields
33 of the received message, the mobile station shall ignore the received message.

34 The following directed messages and orders can be received. If any field value of the
35 message or order is outside its permissible range, the mobile station may send a *Mobile*
36 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 37 1. *Authentication Challenge Message*: The mobile station shall respond to the message
38 as specified in 2.3.12.1.4, regardless of the value of $AUTH_S$.

- 1 2. *Authentication Request Message*: The mobile station shall process the message and
2 shall respond as specified in 2.3.12.5.2.
- 3 3. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the
4 message as specified in 2.3.12.1.5.
- 5 4. *Base Station Reject Order*: The mobile station shall perform the procedures as
6 specified in 2.6.11.5.
- 7 5. *Data Burst Message*
- 8 6. *Fast Call Setup Order*:
9
 - 10 • If $ORDQ_R$ is equal to '00000000', the mobile station shall process the message
11 and respond with a *Fast Call Setup Order* as specified in 2.6.12.1.
 - 12 • If $ORDQ_R$ is equal to '00000001', the mobile station shall process the message
13 as specified in 2.6.12.1.
- 14 7. *Feature Notification Message*
- 15 8. *Local Control Order*
- 16 9. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and
17 record the reason for the *Lock Until Power-Cycled Order* in the mobile station's
18 semi-permanent memory ($LCKRSN_{S-P}$ equals the least significant four bits of
19 $ORDQ_R$). The mobile station should notify the user of the locked condition. The
20 mobile station shall enter the *System Determination Substate* of the *Mobile Station*
21 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the
22 *System Access State* again until after the next mobile station power-up or until it
23 has received an *Unlock Order*. This requirement shall take precedence over any
24 other mobile station requirement specifying entry to the *System Access State*.
- 25 10. *Maintenance Required Order*: The mobile station shall record the reason for the
26 *Maintenance Required Order* in the mobile station's semi-permanent memory
27 ($MAINTRSN_{S-P}$ equals the least significant four bits of $ORDQ_R$). The mobile station
28 shall remain in the unlocked condition. The mobile station should notify the user
29 of the maintenance required condition.
- 30 11. *Registration Accepted Order*: The mobile station shall perform the procedures as
31 specified in 2.6.11.1.
- 32 12. *Registration Rejected Order*: This order indicates that normal service is not
33 available on this system. The mobile station shall disable the full-TMSI timer. If
34 the received order specifies to delete the TMSI ($ORDQ = '00000100'$), the mobile
35 station shall set all the bits of the $TMSI_CODE_{S-P}$ to '1'. The mobile station shall
36 enter the *System Determination Substate* of the *Mobile Station Initialization State* with
37 a registration rejected indication (see 2.6.1.1).
- 38 13. *Retry Order*: The mobile station shall process the message as follows:
39
 - 40 • If $RETRY_TYPE_R$ is equal to '000', the mobile station shall set
 $RETRY_DELAY_S[RETRY_TYPE]$ to 0, where $RETRY_TYPE$ is equal to '001', '010',
 '011', '100, or '101'.

- 1 • If RETRY_TYPE_R is equal to '001', '100', or '101', the mobile station shall perform
2 the following:
 - 3 - If RETRY_DELAY_R is equal to '00000000', then the mobile station shall set
4 $\text{RETRY_DELAY}_S[\text{RETRY_TYPE}_R]$ to 0.
 - 5 - If RETRY_DELAY_R is not equal to '00000000', the mobile station shall set
6 $\text{RETRY_DELAY}_S[\text{RETRY_TYPE}_R]$ as follows:
 - 7 + If the most significant bit of the RETRY_DELAY_R is '0', set
8 $\text{RETRY_DELAY_UNIT}_S$ to 1000ms. If the most significant bit of the
9 RETRY_DELAY_R is '1', set $\text{RETRY_DELAY_UNIT}_S$ to 60000ms.
 - 10 + The mobile station shall set $\text{RETRY_DELAY_VALUE}_S$ to the seven least
11 significant bits of RETRY_DELAY_R .
 - 12 + The mobile station shall store the next system time 80 ms boundary +
13 $\text{RETRY_DELAY_VALUE}_S \times \text{RETRY_DELAY_UNIT}_S$ ms as
14 $\text{RETRY_DELAY}_S[\text{RETRY_TYPE}_R]$.

15 14. *Security Mode Command Message*: The mobile station shall perform the procedures
16 as specified in 2.6.11.4.

17 15. *Service Redirection Message*: The mobile station shall process the message as
18 follows:

- 19 • If the mobile station is directed to an unsupported operation mode or band
20 class, the mobile station shall respond with a *Mobile Station Reject Order* with
21 ORDQ equal to '00000110' (message requires a capability that is not supported
22 by the mobile station).
- 23 • If DELETE_TMSI_R is equal to '1', the mobile station shall set all the bits of
24 TMSI_CODE_{S-p} to '1'. The mobile station shall disable the full-TMSI timer.
- 25 • The mobile station shall set $\text{RETURN_IF_FAIL}_S = \text{RETURN_IF_FAIL}_R$.
- 26 • If RECORD_TYPE_R is equal to '00000000', the mobile station shall enter the
27 *System Determination Substate* of the *Mobile Station Initialization State* with an
28 NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the
29 redirection record received in the message as REDIRECT_REC_S and shall enter
30 the *System Determination Substate* of the *Mobile Station Initialization State* with a
31 redirection indication (see 2.6.1.1).

32 16. *SSD Update Message*: The mobile station shall respond to the message as specified
33 in 2.3.12.1.5.

34 17. *Status Request Message*: The mobile station shall disable the *System Access State*
35 timer and respond to the message. If P_REV_IN_USE_S is less than or equal to
36 three, the mobile station shall respond with a *Status Response Message*. If
37 P_REV_IN_USE_S is greater than three, the mobile station shall respond with an
38 *Extended Status Response Message*. If the message does not specify any
39 qualification information (QUAL_INFO_TYPE_R is equal to '00000000'), the mobile
40 station shall include the requested information records in the response. If the

1 message specifies a band class (QUAL_INFO_TYPE_r is equal to '00000001'), the
 2 mobile station shall only include the requested information records for the
 3 specified band class (BAND_CLASS_r) in the response. If the message specifies a
 4 band class and an operating mode (QUAL_INFO_TYPE_r is equal to '00000010'), the
 5 mobile station shall only include the requested information records for the
 6 specified band class (BAND_CLASS_r) and operating mode (OP_MODE_r) in the
 7 response. If the message specifies a band class or a band class and an operating
 8 mode which is not supported by the mobile station, the mobile station shall send a
 9 *Mobile Station Reject Order* with ORDQ set to '00000110' (message requires a
 10 capability that is not supported by the mobile station). If the response to this
 11 message exceeds the allowable length, the mobile station shall send a *Mobile*
 12 *Station Reject Order* with ORDQ set to '00001000' (response message would exceed
 13 the allowable length). If the message specifies an information record which is not
 14 supported by the mobile station for the specified band class and operating mode,
 15 the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to
 16 '00001001' (information record is not supported for the specified band class and
 17 operating mode).

18 18. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code
 19 as follows:

- 20 • The mobile station shall store the length of the TMSI zone field by setting
 21 ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r,
- 22 • The mobile station shall store the assigning TMSI zone number by setting the
 23 ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
 24 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- 25 • The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
 26 TMSI_CODE_r.

27 The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p}
 28 to TMSI_EXP_TIME_r. The mobile station shall disable the full-TMSI timer. The
 29 mobile station shall then respond with a *TMSI Assignment Completion Message*
 30 within T_{56m} seconds.

31 19. *User Zone Reject Message*

32 20. *EACH Selective Acknowledgement Order*: The mobile station shall process this order
 33 as specified in 2.6.3.3.

34 21. *Any other message*: If the mobile station receives any other message specified in
 35 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all
 36 other messages.

37 2.6.3.5 Mobile Station Origination Attempt Substate

38 In this substate, the mobile station sends an *Origination Message*, *Call Recovery Request*
 39 *Message* or a *Reconnect Message*. If the mobile station sends a *Reconnect Message*, it shall
 40 set the ORIG_IND field of the message to '1'.

41 If the mobile station supports DEVICE_CHARACTERISTIC_p and
 42 CAPABILITY_GEM_ALLOWED_s = '1', the mobile station shall perform the following:

- 1 • If REGISTERED_s is equal to NO, the mobile station shall send an *Origination Message*
2 including the information in DEVICE_CHARACTERISTIC_p via *General Extension*
3 *Message (GEM)*.
- 4 • If REGISTERED_s is equal to YES, the mobile station may refrain from including the
5 information in DEVICE_CHARACTERISTIC_p together with an *Origination Message* via
6 *General Extension Message*.

7 If directed by the user to transmit a Short Data Burst (see [30][53]) and the mobile station
8 sends a *Reconnect Message* in assured mode in this substate, the mobile station may
9 include a Short Data Burst in the *Reconnect Message* by setting the SDB_INCL field to '1', if
10 all of the following conditions are true:

- 11 • SDB_SUPPORTED_s and SDB_IN_RCNM_IND_s are equal to '1', and
- 12 • ACCT is not enabled for the service option number associated with the Short Data
13 Burst as follows:
 - 14 - The service option number associated with the Short Data Burst is not equal to
15 any ACCT_SO entry in ACCT_SO_LIST, and
 - 16 - The service option group number of the service option associated with the Short
17 Data Burst is not equal to any ACCT_SO_GRP entry in ACCT_SO_GRP_LIST.

18 The mobile station shall not send the *Reconnect Message* if RECONNECT_MSG_IND_s equals
19 '0', if this message is not being sent to reconnect a dormant packet data service instance,
20 or the information that needs to be conveyed to the base station for the dormant packet
21 data reconnection (PREV_SID, PREV_NID, PREV_PZID. See [42] for details) can not be
22 carried in a *Reconnect Message*.

23 The mobile station shall not send the *Call Recovery Request Message* if CRRM_MSG_IND_s
24 equals '0'.

25 If P_REV_IN_USE_s is greater than or equal to 11 and the *Origination Message* is being sent
26 to perform packet data dormant handoff, the mobile station shall include all dormant
27 packet data service instances (see [42]) up to the limit specified by
28 MAX_ADD_SERV_INSTANCE_s.

29 If the base station responds to the *Origination Message*, *Call Recovery Request Message* or
30 the *Reconnect Message* with an authentication request, the mobile station responds in this
31 substate.

32 If a message received from the base station requires a Layer 2 acknowledgment and does
33 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is
34 outstanding (see [4]).

35 If a message received from the base station requires a Layer 2 acknowledgment and also a
36 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

37 When transmitting a response to a message received from the base station, Layer 3 shall
38 indicate to Layer 2 that the type of the message is a response (see [4]).

39 When transmitting an autonomous message (i.e., a message that is not sent as a response
40 to a message received from the base station), Layer 3 shall indicate to Layer 2 that the type

1 of the message is a request other than a registration request or a message transmission
2 request (see [4]).

3 Upon entering the *Mobile Station Origination Attempt Substate*, the mobile station shall set
4 $RLGAIN_ADJ_s$ to '0000', and perform the following:

- 5 • If $P_REV_IN_USE_s$ is less than 11, set $PLCM_TYPE_s$ to '0000'; otherwise set
6 $PLCM_TYPE_s$ to '0100'.
- 7 • The mobile station shall exit the *Mobile Station Origination Attempt Substate*, shall
8 enter either the *Mobile Station Idle State* or the *System Determination Substate* with
9 an ACCT blocked indication, and should indicate to the user that the call has
10 terminated if all of the following conditions are true:
 - 11 - $P_REV_IN_USE_s$ is greater than six,
 - 12 - $ACCT_INCL_EMG_s$ is equal to '1' or the mobile station determines that the call is
13 not an emergency call,
 - 14 - ACCT is enabled for the requested service option number, due to either of the
15 following two conditions:
 - 16 + the requested service option number is equal to an ACCT_SO entry in
17 ACCT_SO_LIST, or
 - 18 + the service option group number of the requested service option is equal to
19 an ACCT_SO_GRP entry in ACCT_SO_GRP_LIST.
- 20 • If the substate was entered with an origination indication, the mobile station shall
21 send the *Origination Message*, *Call Recovery Request Message* or the *Reconnect*
22 *Message* as an r-csch request.
- 23 • If the substate was entered with a PACA response indication, the mobile station
24 shall send the *Origination Message* as an r-csch response using the access
25 procedures specified in 2.6.3.1. The mobile station shall include the dialed digits (if
26 any) from the previous origination attempt in the *Origination Message*.
- 27 • If the origination is a result of $NDSS_ORIG_s$ being equal to enabled, the mobile
28 station shall include in the *Origination Message* the dialed digits (if any) recorded
29 from the previous origination attempt.
- 30 • If the mobile station has a stored service configuration (that is, parameters
31 conveyed by both the Service Configuration information record and the Non-
32 negotiable Service Configuration information record) and corresponding SYNC_ID
33 with associated SID and NID that are equal to the SID_s and NID_s respectively, and
34 $USE_SYNC_ID_s$ is equal to '1', the mobile station may include the SYNC_ID field in
35 the *Origination Message* or the *Reconnect Message* and, if included, shall perform
36 the following:
 - 37 - The mobile station shall set it to the SYNC_ID corresponding to the stored
38 service configuration. The mobile station shall store the value of the SYNC_ID
39 field in $SYNC_ID_s$.

- 1 - The mobile station shall set the SR_ID field of the *Origination Message* or the
2 *Reconnect Message* as follows:
- 3 + If the mobile station requests the restoration of a single service option
4 connection from the stored service configuration, the mobile station shall set
5 this field to the corresponding service reference identifier.
- 6 + Otherwise (that is, the mobile station requests the restoration of all the
7 service option connections from the stored service configuration), the mobile
8 station shall set this field to '111'.
- 9 • The mobile station shall include in the *Origination Message* as many of the dialed
10 digits as possible without exceeding the message capsule size. When calculating
11 the number of dialed digits to be included in the *Origination Message*, the mobile
12 station shall assume the following if P_REV_IN_USE_s is greater than three:
- 13 - The number of additional reported pilots (NUM_ADD_PILOTS) is equal to five
14 (see 2.6.3.1.7 and 2.7.1.3.1.3) so that up to five additional pilots may be
15 reported in any access probe, and
- 16 - The number of alternative service option numbers (NUM_ALT_SO) is less than or
17 equal to the maximum alternative service option numbers
18 (MAX_NUM_ALT_SO_s).
- 19 • If PACA_s is equal to enabled, the mobile station shall set the PACA_REORIG field of
20 the *Origination Message* to '1'; otherwise, the mobile station shall set the field to '0'.

21 While in this substate, the mobile station shall monitor the Paging Channel or the Forward
22 Common Control Channel. The mobile station may perform an access probe handoff or an
23 access handoff as described in 2.6.3.1.3.2 and 2.6.3.1.3.3. If the mobile station declares a
24 loss of the Paging Channel or the Forward Common Control Channel (see 2.6.3.1.8) during
25 an access attempt, the mobile station may perform an access probe handoff; otherwise, it
26 shall declare an access attempt failure and shall perform the following:

- 27 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
28 SYS_PAR_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s to NULL.
- 29 • If the mobile station is monitoring the Forward Common Control Channel, the
30 mobile station shall set MC_RR_PAR_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s
31 to NULL.
- 32 • If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled and
33 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
34 user that the PACA call has been canceled.
- 35 • If NDSS_ORIG_s is equal to enabled, the mobile station shall set NDSS_ORIG_s to
36 disabled, and should indicate to the user that the call origination is canceled.
- 37 • The mobile station shall update its registration variables as specified in 2.6.5.5.3.2.
- 38 • The mobile station shall disable its transmitter and enter the *Mobile Station Idle*
39 *State*.

1 If the mobile station receives confirmation of delivery of any message sent by the mobile
 2 station in this substate, the mobile station shall perform an access handoff if all of the
 3 following conditions hold:

- 4 • The mobile station declares a loss of the Paging Channel or the Forward Common
 5 Control Channel,
- 6 • The mobile station is permitted to perform an access handoff (see 2.6.3.1.3.2) and
 7 there are pilots other than the active pilot in the access handoff list (see
 8 2.6.3.1.3.2).

9 If the mobile station declares a loss of the Paging Channel or the Forward Common Control
 10 Channel and does not perform an access handoff, the mobile station shall perform the
 11 following:

- 12 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
 13 SYS_PAR_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s to NULL.
- 14 • If the mobile station is monitoring the Forward Common Control Channel, the
 15 mobile station shall set MC_RR_PAR_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s
 16 to NULL.
- 17 • If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled and
 18 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
 19 user that the PACA call has been canceled.
- 20 • If NDSS_ORIG_s is equal to enabled, the mobile station shall set NDSS_ORIG_s to
 21 disabled and should indicate to the user that the call origination is canceled.
- 22 • The mobile station shall disable its transmitter and enter the *Mobile Station Idle*
 23 *State*.

24 If the mobile station receives confirmation of delivery of the *Origination Message*, *Call*
 25 *Recovery Request Message* or the *Reconnect Message*, the mobile station shall update its
 26 registration variables with respect to the base station to which the first access probe was
 27 transmitted after entering the *System Access State* as specified in 2.6.5.5.3.1.

28 The mobile station shall set and disable the *System Access State* timer as follows:

- 29 • The mobile station shall disable the timer whenever it begins an access attempt.
- 30 • The mobile station shall set the timer to T_{42m} seconds whenever it ends an access
 31 attempt.
- 32 • The mobile station shall disable the timer whenever it exits the *System Access State*.

33 If the *System Access State* timer expires while in this substate, the mobile station shall
 34 perform the following:

- 35 • If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled and
 36 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
 37 user that the PACA call has been canceled.
- 38 • If NDSS_ORIG_s is equal to enabled, the mobile station shall set NDSS_ORIG_s to
 39 disabled, and should indicate to the user that the call origination is canceled.

- 1 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
2 SYS_PAR_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s to NULL and enter the
3 *Mobile Station Idle State*.
- 4 • If the mobile station is monitoring the Forward Common Control Channel, the
5 mobile station shall set MC_RR_PAR_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s
6 to NULL and enter the *Mobile Station Idle State*.

7 If the mobile station is directed by the user to disconnect the call, the mobile station shall
8 perform the following actions:

- 9 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
10 access attempt in progress.
- 11 • The mobile station shall send the *Release Order* (normal release) in assured mode
12 requiring confirmation of delivery.
- 13 • After receiving confirmation of delivery of the *Release Order*, the mobile station shall
14 enter the *Mobile Station Idle State* (see 2.6.2.2) or the *System Determination Substate*
15 of the *Mobile Station Initialization State* with a release indication (see 2.6.1.1).

16 If the mobile station is directed by the user to power off, the mobile station shall perform
17 the following actions:

- 18 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
19 access attempt in progress.
- 20 • The mobile station shall send the *Release Order* (with power-down indication) in
21 assured mode requiring confirmation of delivery.
- 22 • After receiving confirmation of delivery of the *Release Order*, the mobile station shall
23 perform power-down registration procedures (see 2.6.5.1.2).
- 24 • The mobile station may power off.

25 If the mobile station receives a *Channel Assignment Message* or the *Extended Channel*
26 *Assignment Message*, Layer 3 shall send a *dedicated channel assignment* indication to Layer
27 2 (see [4]). If the mobile station has not received confirmation of delivery of the *Origination*
28 *Message*, *Call Recovery Request Message* or the *Reconnect Message* before receiving the
29 *Channel Assignment Message* or the *Extended Channel Assignment Message*, the mobile
30 station shall update its registration variables with respect to the base station to which the
31 first access probe was transmitted after entering the *System Access State*, as specified in
32 2.6.5.5.3.1.

33 If the mobile station is to exit the *System Access State* as a result of processing Layer 3
34 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*
35 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to
36 the message has been sent and acknowledged.

37 If Layer 3 receives a message other than messages listed below:

- 38 • a *Channel Assignment Message*, or
- 39 • *Extended Channel Assignment Message* with either DIRECT_CH_ASSIGN_IND field

1 not included, or DIRECT_CH_ASSIGN_IND field included and set to '0'
 2 with an indication from Layer 2 that an access attempt for a message being transmitted
 3 was not terminated as a result of processing the Layer 2 fields of the received message, the
 4 mobile station shall ignore the received message.

5 The following directed messages and orders can be received. If any field value of the
 6 message or order is outside its permissible range, the mobile station may send a *Mobile*
 7 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 8 1. *Authentication Challenge Message*: The mobile station shall respond to the
 9 message as specified in 2.3.12.1.4, regardless of the value of AUTH_S.
- 10 2. *Authentication Request Message*: The mobile station shall process the message
 11 and shall respond as specified in 2.3.12.5.2.
- 12 3. *Base Station Challenge Confirmation Order*: The mobile station shall respond to
 13 the message as specified in 2.3.12.1.5.
- 14 4. *Base Station Reject Order*: The mobile station shall perform the procedures as
 15 specified in 2.6.11.5.
- 16 5. *Channel Assignment Message*: The mobile station shall process the message as
 17 follows:
 - 18 • If ASSIGN_MODE_T equals '000', the mobile station shall perform the following
 19 actions:
 - 20 - The mobile station shall set CH_IND_S to '01'.
 - 21 - The mobile station shall store the frame offset (FRAME_OFFSET_S =
 22 FRAME_OFFSET_T), the message encryption mode indicator
 23 (ENCRYPT_MODE_S = ENCRYPT_MODE_T), and, if FREQ_INCL_T equals '1', the
 24 Frequency Assignment (CDMACH_S = CDMA_FREQ_T).
 - 25 - If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled
 26 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
 27 indicate to the user that the PACA call is proceeding.
 - 28 - If the mobile station is currently monitoring the Paging Channel, the mobile
 29 station shall set IDLE_BCCH_CHAN to '0'; otherwise, the mobile station shall
 30 set IDLE_BCCH_CHAN to '1'. The mobile station shall set
 31 IDLE_CDMA_CHAN to CDMACH_S, IDLE_CDMABAND to CDMABAND_S,
 32 IDLE_SID to SID_S, IDLE_NID to NID_S, and IDLE_P_REV to P_REV_S.
 - 33 - The mobile station shall initialize the CODE_CHAN_LIST as described in
 34 2.6.8, shall set SERV_NEG_S to disabled, and shall enter the *Traffic Channel*
 35 *Initialization Substate* of the *Mobile Station Control on the Traffic Channel*
 36 *State*.
 - 37 • If ASSIGN_MODE_T equals '001', the mobile station shall perform the following
 38 actions:

- 1 - If the message requires acknowledgment, the mobile station shall wait until
2 Layer 3 receives an indication from Layer 2 that the acknowledgment to the
3 message has been sent and acknowledged.
- 4 - If a CDMA channel (CDMA_FREQ) is specified in the assignment, the mobile
5 station shall set CDMACH_s = CDMA_FREQ_r, tune to the new Frequency
6 Assignment, and measure the strength of each pilot listed in the assignment
7 using the Neighbor Set search procedures specified in 2.6.6.2.1 and
8 2.6.6.2.2.
- 9 - The mobile station shall set CONFIG_MSG_SEQ_s, GAPM_SEQ_s and
10 ACC_MSG_SEQ_s to NULL (see 2.6.2.2) and shall set PILOT_PN_s to the pilot
11 PN sequence offset of the strongest pilot in the list.
- 12 - If the mobile station has not stored configuration parameters for the Primary
13 Paging Channel of the new base station, or if the stored information is not
14 current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_s,
15 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
16 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
17 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
18 EXT_SYS_PAR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
19 PRI_NGHBR_LST_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s,
20 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
21 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s,
22 HDPPM_MSG_SEQ_s and EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 23 - The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
24 Primary Paging Channel. The mobile station shall then begin monitoring the
25 Primary Paging Channel of the selected base station.
- 26 - If RESPOND_r is equal to '1', the mobile station shall enter the *Update*
27 *Overhead Information Substate* with an origination indication.
- 28 • If ASSIGN_MODE_r equals '100', the mobile station shall perform the following
29 actions:
- 30 - The mobile station shall set CH_IND_s to '01'.
- 31 - If GRANTED_MODE_r equals '00', and the multiplex option or radio
32 configuration specified in the DEFAULT_CONFIG field is not supported by
33 the mobile station, the mobile station shall send a *Mobile Station Reject Order*
34 with ORDQ field set to '00000110' (capability not supported by the mobile
35 station) and remain in *Mobile Station Origination Attempt Substate*.
- 36 - If FREQ_INCL_r equals '0', the mobile station shall perform the following
37 actions:
- 38 + The mobile station shall store the frame offset (FRAME_OFFSET_s =
39 FRAME_OFFSET_r), the message encryption mode indicator
40 (ENCRYPT_MODE_s = ENCRYPT_MODE_r), the granted mode
41 (GRANTED_MODE_s = GRANTED_MODE_r), and the default configuration
42 (DEFAULT_CONFIG_s = DEFAULT_CONFIG_r).

- 1 + The mobile station shall set $SERV_NEG_S$ to enabled.
- 2 + If $PACA_S$ is equal to enabled, the mobile station shall set $PACA_S$ equal to
3 disabled and $PACA_CANCEL$ to '0', shall disable the PACA state timer,
4 and should indicate to the user that the PACA call is proceeding.
- 5 + The mobile station shall initialize $CODE_CHAN_LIST$ as described in
6 2.6.8.
- 7 + If the mobile station is currently monitoring the Paging Channel, the
8 mobile station shall set $IDLE_BCCH_CHAN$ to '0'; otherwise, the mobile
9 station shall set $IDLE_BCCH_CHAN$ to '1'. The mobile station shall set
10 $IDLE_CDMA_CHAN$ to $CDMACH_S$, $IDLE_CDMABAND$ to $CDMABAND_S$,
11 $IDLE_SID$ to SID_S , $IDLE_NID$ to NID_S , and $IDLE_P_REV$ to P_REV_S .
- 12 + The mobile station shall then enter the *Traffic Channel Initialization*
13 *Substate* of the *Mobile Station Control on the Traffic Channel State*.
- 14 - If $FREQ_INCL_T$ equals '1', the mobile station shall perform the following
15 actions:
- 16 + If the band class is not supported by the mobile station, the mobile
17 station shall send a *Mobile Station Reject Order* with $ORDQ$ field set to
18 '00000110' (capability not supported by the mobile station) and remain
19 in the *Mobile Station Origination Attempt Substate*.
- 20 + If the band class is supported by the mobile station, the mobile station
21 shall perform the following actions:
- 22 ○ The mobile station shall store the frame offset ($FRAME_OFFSET_S =$
23 $FRAME_OFFSET_T$), the message encryption mode indicator
24 ($ENCRYPT_MODE_S = ENCRYPT_MODE_T$), the granted mode
25 ($GRANTED_MODE_S = GRANTED_MODE_T$), the default configuration
26 ($DEFAULT_CONFIG_S = DEFAULT_CONFIG_T$), the idle Frequency
27 Assignment ($IDLE_CDMA_CHAN = CDMACH_S$), the idle band class
28 ($IDLE_CDMABAND = CDMABAND_S$), the band class ($CDMABAND_S =$
29 $BAND_CLASS_T$), and the Frequency Assignment
30 ($CDMACH_S = CDMA_FREQ_T$).
- 31 ○ The mobile station shall set $SERV_NEG_S$ to enabled.
- 32 ○ If $PACA_S$ is equal to enabled, the mobile station shall set $PACA_S$ to
33 disabled and $PACA_CANCEL$ to '0', shall disable the PACA state
34 timer, and should indicate to the user that the PACA call is
35 proceeding.
- 36 ○ The mobile station shall initialize the $CODE_CHAN_LIST$ as described
37 in 2.6.8.

- 1 ○ If the mobile station is currently monitoring the Paging Channel, the
2 mobile station shall set IDLE_BCCH_CHAN to '0'; otherwise, the
3 mobile station shall set IDLE_BCCH_CHAN to '1'. The mobile station
4 shall set IDLE_SID to SID_s, IDLE_NID to NID_s, and IDLE_P_REV to
5 P_REV_s.
- 6 ○ The mobile station shall then tune to the new Frequency Assignment
7 and enter the *Traffic Channel Initialization Substate* of the *Mobile*
8 *Station Control on the Traffic Channel State*.
- 9 • If ASSIGN_MODE_r equals '101', the mobile station shall perform the following
10 actions:
- 11 - If FREQ_INCL_r equals '0', the mobile station shall perform the following
12 actions:
- 13 + If the message requires acknowledgment, the mobile station shall wait
14 until Layer 3 receives an indication from Layer 2 that the
15 acknowledgment to the message has been sent and acknowledged.
- 16 + The mobile station shall set CONFIG_MSG_SEQ_s, GAPM_SEQ_s and
17 ACC_MSG_SEQ_s to NULL (see 2.6.2.2) and shall set PILOT_PN_s to the
18 pilot PN sequence offset of the strongest pilot in the list (PILOT_PN_r).
- 19 + If the mobile station has not stored configuration parameters for the
20 Primary Paging Channel of the new base station, or if the stored
21 information is not current (see 2.6.2.2), the mobile station shall set
22 SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
23 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
24 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
25 FD_CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
26 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s,
27 GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
28 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
29 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s and
30 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 31 + The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
32 Primary Paging Channel. The mobile station shall then begin monitoring
33 the Primary Paging Channel of the selected base station.
- 34 + If RESPOND_r is equal to '1', the mobile station shall perform the
35 following:
- 36 ○ If the *Channel Assignment Message* does not require an
37 acknowledgment, the mobile station shall enter the *Update Overhead*
38 *Information Substate* with an origination indication within T_{34m}
39 seconds after receiving the *Channel Assignment Message*.

- 1 ○ If the *Channel Assignment Message* requires an acknowledgment, the
2 mobile station shall enter the *Update Overhead Information Substate*
3 with a page response retransmission indication within T_{34m} seconds
4 after Layer 3 receives an indication from Layer 2 that the
5 acknowledgment to the *Channel Assignment Message* has been sent
6 and acknowledged.
- 7 + If $RESPOND_r$ is equal to '0', the mobile station shall perform the
8 following:
- 9 ○ If the *Channel Assignment Message* does not require an
10 acknowledgment, the mobile station shall enter the *Mobile Station Idle*
11 *State* within T_{34m} seconds after receiving the *Channel Assignment*
12 *Message*.
- 13 ○ If the *Channel Assignment Message* requires an acknowledgment, the
14 mobile station shall enter the *Mobile Station Idle State* within T_{34m}
15 seconds after Layer 3 receives an indication from Layer 2 that the
16 acknowledgment to the *Channel Assignment Message* has been sent
17 and acknowledged.
- 18 - If $FREQ_INCL_r$ equals '1', the mobile station shall perform the following
19 actions:
- 20 + If the band class is not supported by the mobile station, the mobile
21 station shall send a *Mobile Station Reject Order* with ORDQ field set to
22 '00000110' (capability not supported by the mobile station) and remain
23 in the *Mobile Station Origination Attempt Substate*.
- 24 + If the band class is supported by the mobile station, the mobile station
25 shall perform the following actions:
- 26 ○ If the message requires acknowledgment, the mobile station shall
27 wait until Layer 3 receives an indication from Layer 2 that the
28 acknowledgment to the message has been sent and acknowledged.
- 29 ○ The mobile station shall set $CDMACH_s$ to $CDMA_FREQ_r$ and
30 $CDMABAND_s$ to $BAND_CLASS_r$. Then the mobile station shall tune
31 to the new Frequency Assignment, measure the strength of each pilot
32 listed in the assignment using the Neighbor Set search procedures
33 specified in 2.6.6.2.1 and 2.6.6.2.2, set $PILOT_PN_s$ to the pilot PN
34 sequence offset of the strongest pilot in the list ($PILOT_PN_r$), and set
35 $CONFIG_MSG_SEQ_s$, $GAPM_SEQ_s$ and $ACC_MSG_SEQ_s$ to NULL (see
36 2.6.2.2).

- 1 ○ If the mobile station has not stored configuration parameters for the
2 Primary Paging Channel of the new base station, or if the stored
3 information is not current (see 2.6.2.2), the mobile station shall set
4 SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
5 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
6 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
7 FD_CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
8 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s,
9 GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
10 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
11 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s and
12 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 13 ○ The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
14 Primary Paging Channel. The mobile station shall then begin
15 monitoring the Primary Paging Channel of the selected base station.
- 16 ○ If RESPOND_r is equal to '1', the mobile station shall perform the
17 following:
- 18 ◇ If the *Channel Assignment Message* does not require an
19 acknowledgment, the mobile station shall enter the *Update*
20 *Overhead Information Substate* with a page response
21 retransmission indication within T_{34m} seconds after receiving the
22 *Channel Assignment Message*.
- 23 ◇ If the *Channel Assignment Message* requires an acknowledgment,
24 the mobile station shall enter the *Update Overhead Information*
25 *Substate* with a page response retransmission indication within
26 T_{34m} seconds after Layer 3 receives an indication from Layer 2
27 that the acknowledgment to the *Channel Assignment Message* has
28 been sent and acknowledged.
- 29 ○ If RESPOND_r is equal to '0', the mobile station shall perform the
30 following:
- 31 ◇ If the *Channel Assignment Message* does not require an
32 acknowledgment, the mobile station shall enter the *Mobile Station*
33 *Idle State* within T_{34m} seconds after receiving the *Channel*
34 *Assignment Message*.
- 35 ◇ If the *Channel Assignment Message* requires an acknowledgment,
36 the mobile station shall enter the *Mobile Station Idle State* within
37 T_{34m} seconds after Layer 3 receives an indication from Layer 2
38 that the acknowledgment to the *Channel Assignment Message* has
39 been sent and acknowledged.

40 6. Data Burst Message

1 7. *Extended Channel Assignment Message*: If P_REV_IN_USE_S is greater than or equal
2 to 11, and DIRECT_CH_ASSIGN_IND_R equals '1', the mobile station shall ignore the
3 message. Otherwise, the mobile station shall process the message as follows:

- 4 • The mobile station shall set RTC_NOM_PWR_USE_IND to '0'.
- 5 • The mobile station shall set DIRECT_CH_ASSIGN_RECOVER_IND_S to '0'.
- 6 • If ASSIGN_MODE_R equals '000', the mobile station shall perform the following
7 actions:
 - 8 - If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled
9 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
10 indicate to the user that the PACA call has been canceled.
 - 11 - If GRANTED_MODE_R equals '00', and the multiplex option and radio
12 configuration specified in the DEFAULT_CONFIG field are not supported by
13 the mobile station, the mobile station shall send a *Mobile Station Reject Order*
14 with ORDQ field set to '00000110' (capability not supported by the mobile
15 station) and shall remain in the *Mobile Station Origination Attempt Substate*.
 - 16 - If GRANTED_MODE_R is equal to '00' and DEFAULT_CONFIG_R is not equal to
17 '100', the mobile station shall send a *Mobile Station Reject Order* with ORDQ
18 field set to '00001110' (RC does not match with DEFAULT_CONFIG_R) and
19 shall remain in the *Mobile Station Origination Attempt Substate* if any of the
20 following conditions is true:
 - 21 + FOR_FCH_RC_R is not equal to the RC associated with
22 DEFAULT_CONFIG_R (see Table 3.7.2.3.2.21-2).
 - 23 + REV_FCH_RC_R is not equal to the RC associated with
24 DEFAULT_CONFIG_R (see Table 3.7.2.3.2.21-2).
 - 25 - If the mobile station does not support either of the Fundamental
26 Channel Radio Configurations (FOR_FCH_RC or REV_FCH_RC), the
27 mobile shall send a *Mobile Station Reject Order* with the ORDQ field set to
28 '00000110' (capability not supported by the mobile station) and remain
29 in the *Mobile Station Origination Attempt Substate*.
 - 30 - If PLCM_TYPE_R equals '0010' and IMSI_O is derived from IMSI_T, or if
31 PLCM_TYPE_R equals '0011' and IMSI_O is derived from IMSI_M, the
32 mobile station shall send a *Mobile Station Reject Order* with the ORDQ
33 field set to '00011100' (PLCM_TYPE mismatch) and remain in the *Mobile*
34 *Station Origination Attempt Substate*.
 - 35 - The mobile station shall set CH_IND_S to '01'.
 - 36 - If P_REV_IN_USE_S is equal to or greater than six, the mobile station shall
37 store the Forward Fundamental Channel Radio Configuration
38 (FOR_FCH_RC_S = FOR_FCH_RC_R) and the Reverse Fundamental Channel
39 Radio Configuration (REV_FCH_RC_S = REV_FCH_RC_R)

- 1 - If $FREQ_INCL_T$ equals '0', the mobile station shall perform the following
2 actions:
- 3 + The mobile station shall store the frame offset ($FRAME_OFFSET_S =$
4 $FRAME_OFFSET_T$), the message encryption mode indicator
5 ($ENCRYPT_MODE_S = ENCRYPT_MODE_T$), the bypass indicator
6 ($BYPASS_ALERT_ANSWER_S = BYPASS_ALERT_ANSWER_T$), the
7 granted mode ($GRANTED_MODE_S = GRANTED_MODE_T$), the default
8 configuration ($DEFAULT_CONFIG_S = DEFAULT_CONFIG_T$), and the
9 occurrences of $PILOT_PN$ and PWR_COMB for each included member
10 of the Active Set.
- 11 + If $C_SIG_ENCRYPT_MODE$ is included, the mobile station shall set
12 $C_SIG_ENCRYPT_MODE_S$ to $C_SIG_ENCRYPT_MODE_T$.
- 13 + The mobile station shall perform the procedures in 2.6.11.2.
- 14 + The mobile station shall set $SERV_NEG_S$ to enabled.
- 15 + If $PACA_S$ is equal to enabled, the mobile station shall set $PACA_S$ equal
16 to disabled and $PACA_CANCEL$ to '0', shall disable the $PACA$ state
17 timer, and should indicate to the user that the $PACA$ call is
18 proceeding.
- 19 + The mobile station shall initialize $CODE_CHAN_LIST$ as described in
20 2.6.8.
- 21 + The mobile station shall set $FPC_FCH_INIT_SETPT_S$ to
22 $FPC_FCH_INIT_SETPT_T$, $FPC_FCH_CURR_SETPT_S$ to
23 $FPC_FCH_INIT_SETPT_S$, $FPC_FCH_FER_S$ to $FPC_FCH_FER_T$,
24 $FPC_FCH_MIN_SETPT_S$ to $FPC_FCH_MIN_SETPT_T$,
25 $FPC_FCH_MAX_SETPT_S$ to $FPC_FCH_MAX_SETPT_T$, and
26 $FPC_PRI_CHAN_S$ to '0' if the mobile station supports any Radio
27 Configuration greater than 2.
- 28 + The mobile station shall set $FPC_SUBCHAN_GAIN_S$ to
29 $FPC_SUBCHAN_GAIN_T$.
- 30 + The mobile station shall set $REV_FCH_GATING_MODE_S$ to
31 $REV_FCH_GATING_MODE_T$.
- 32 + The mobile station shall set $REV_PWR_CNTL_DELAY_S$ to
33 $REV_PWR_CNTL_DELAY_T$ if $REV_PWR_CNTL_DELAY_INCL_T$ is equal
34 to '1'.
- 35 + The mobile station shall set $RLGAIN_ADJ_S$ to $RLGAIN_ADJ_T$.
- 36 + The mobile station shall set $PLCM_TYPE_S$ to $PLCM_TYPE_T$ if
37 $PLCM_TYPE_INCL_T$ is equal to '1'; otherwise, the mobile station shall
38 set $PLCM_TYPE_S$ as follows:
- 39 ○ If $P_REV_IN_USE_S$ is less than 11, set $PLCM_TYPE_S$ to '0000';
40 otherwise set $PLCM_TYPE_S$ to '0100'.

- 1 + The mobile station shall set $PLCM_39_s$ to $PLCM_39_r$ if $PLCM_TYPE_r$
2 is equal to '0001'.
- 3 + If the mobile station is currently monitoring the Paging Channel, the
4 mobile station shall set $IDLE_BCCH_CHAN$ to '0'; otherwise, the
5 mobile station shall set $IDLE_BCCH_CHAN$ to '1'. The mobile station
6 shall set $IDLE_CDMA_CHAN$ to $CDMACH_s$, $IDLE_CDMABAND$ to
7 $CDMABAND_s$, $IDLE_SID$ to SID_s , $IDLE_NID$ to NID_s , and
8 $IDLE_P_REV$ to P_REV_s .
- 9 + The mobile station shall then enter the *Traffic Channel Initialization*
10 *Substate* of the *Mobile Station Control on the Traffic Channel State*.
- 11 - If $FREQ_INCL_r$ equals '1', the mobile station shall perform the following
12 actions:
- 13 + If the band class is not supported by the mobile station, the mobile
14 station shall send a *Mobile Station Reject Order* with $ORDQ$ field set to
15 '00000110' (capability not supported by the mobile station) and
16 remain in the *Mobile Station Origination Attempt Substate*.
- 17 + If the band class is supported by the mobile station, the mobile
18 station shall perform the following actions:
- 19 o The mobile station shall store the frame offset ($FRAME_OFFSET_s$
20 = $FRAME_OFFSET_r$); the message encryption mode indicator
21 ($ENCRYPT_MODE_s$ = $ENCRYPT_MODE_r$); the bypass indicator
22 ($BYPASS_ALERT_ANSWER_s$ = $BYPASS_ALERT_ANSWER_r$); the
23 granted mode ($GRANTED_MODE_s$ = $GRANTED_MODE_r$); the
24 default configuration ($DEFAULT_CONFIG_s$ =
25 $DEFAULT_CONFIG_r$); the idle Frequency Assignment
26 ($IDLE_CDMA_CHAN$ = $CDMACH_s$); the idle band class
27 ($IDLE_CDMABAND$ = $CDMABAND_s$); the band class
28 ($CDMABAND_s$ = $BAND_CLASS_r$); the Frequency Assignment
29 ($CDMACH_s$ = $CDMA_FREQ_r$); and the occurrences of $PILOT_PN$
30 and PWR_COMB_IND for each included member of the Active Set.
- 31 o The mobile station shall perform the procedures in 2.6.11.2.
- 32 o The mobile station shall set $SERV_NEG_s$ to enabled.
- 33 o The mobile station shall initialize $CODE_CHAN_LIST$ as described
34 in 2.6.8.
- 35 o The mobile station shall set $FPC_FCH_INIT_SETPT_s$ to
36 $FPC_FCH_INIT_SETPT_r$, $FPC_FCH_CURR_SETPT_s$ to
37 $FPC_FCH_INIT_SETPT_s$, $FPC_FCH_FER_s$ to $FPC_FCH_FER_r$,
38 $FPC_FCH_MIN_SETPT_s$ to $FPC_FCH_MIN_SETPT_r$,
39 $FPC_FCH_MAX_SETPT_s$ to $FPC_FCH_MAX_SETPT_r$, and
40 $FPC_PRI_CHAN_s$ to '0' if the mobile station supports any Radio
41 Configuration greater than 2.

- 1 ○ The mobile station shall set FPC_SUBCHAN_GAIN_S to
2 FPC_SUBCHAN_GAIN_T.
- 3 ○ The mobile station shall set RLGAIN_ADJ_S to RLGAIN_ADJ_T.
- 4 ○ The mobile station shall set REV_FCH_GATING_MODE_S to
5 REV_FCH_GATING_MODE_T.
- 6 ○ The mobile station shall set REV_PWR_CNTL_DELAY_S to
7 REV_PWR_CNTL_DELAY_T if REV_PWR_CNTL_DELAY_INCL_T is
8 equal to '1'.
- 9 ○ The mobile station shall set PLCM_TYPE_S to PLCM_TYPE_T if
10 PLCM_TYPE_INCL_T is equal to '1'; otherwise, the mobile station
11 shall set PLCM_TYPE_S as follows:
- 12 ○ If P_REV_IN_USE_S is less than 11, set PLCM_TYPE_S to '0000';
13 otherwise set PLCM_TYPE_S to '0100'.
- 14 ○ The mobile station shall set PLCM_39_S to PLCM_39_T if
15 PLCM_TYPE_T is equal to '0001'.
- 16 ○ If the mobile station is currently monitoring the Paging Channel,
17 the mobile station shall set IDLE_BCCH_CHAN to '0'; otherwise,
18 the mobile station shall set IDLE_BCCH_CHAN to '1'. The mobile
19 station shall set IDLE_SID to SID_S, IDLE_NID to NID_S,
20 IDLE_P_REV to P_REV_S.
- 21 ○ The mobile station shall then tune to the new Frequency
22 Assignment and enter the *Traffic Channel Initialization Substate* of
23 the *Mobile Station Control on the Traffic Channel State*.
- 24 • If ASSIGN_MODE_T equals '001', the mobile station shall perform the following
25 actions:
- 26 - If FREQ_INCL_T equals '0', the mobile station shall perform the following
27 actions:
- 28 + If the message requires acknowledgment, the mobile station shall wait
29 until Layer 3 receives an indication from Layer 2 that the
30 acknowledgment to the message has been sent and acknowledged.
- 31 + The mobile station shall set CONFIG_MSG_SEQ_S, GAPM_SEQ_S and
32 ACC_MSG_SEQ_S to NULL (see 2.6.2.2) and shall set PILOT_PN_S to the
33 pilot PN sequence offset of the strongest pilot in the list (PILOT_PN_T).

- 1 + If the mobile station has not stored configuration parameters for the
2 Primary Paging Channel of the new base station, or if the stored
3 information is not current (see 2.6.2.2), the mobile station shall set
4 SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
5 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
6 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
7 FD_CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
8 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s,
9 GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
10 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
11 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s and
12 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 13 + The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
14 Primary Paging Channel. If the mobile station was monitoring Forward
15 Common Control Channel, the mobile station shall set the PRAT_s to '00'.
16 The mobile station shall then begin monitoring the Primary Paging
17 Channel of the selected base station.
- 18 + If RESPOND_r is equal to '1', the mobile station shall perform the
19 following:
- 20 ○ If the *Extended Channel Assignment Message* does not require an
21 acknowledgment, the mobile station shall enter the *Update Overhead*
22 *Information Substate* with an origination indication within T_{34m}
23 seconds after receiving the *Extended Channel Assignment Message*.
- 24 ○ If the *Extended Channel Assignment Message* requires an
25 acknowledgment, the mobile station shall enter the *Update Overhead*
26 *Information Substate* with an origination indication within T_{34m}
27 seconds after Layer 3 receives an indication from Layer 2 that the
28 acknowledgment to the *Extended Channel Assignment Message* has
29 been sent and acknowledged.
- 30 - If FREQ_INCL_r equals '1', the mobile station shall perform the following
31 actions:
- 32 + If the band class is not supported by the mobile station, the mobile
33 station shall send a *Mobile Station Reject Order* with ORDQ field set to
34 '00000110' (capability not supported by the mobile station) and remain
35 in the *Mobile Station Origination Attempt Substate*.
- 36 + If the band class is supported by the mobile station, the mobile station
37 shall perform the following actions:
- 38 ○ If the message requires acknowledgment, the mobile station shall
39 wait until Layer 3 receives an indication from Layer 2 that the
40 acknowledgment to the message has been sent and acknowledged.

- 1 ○ The mobile station shall set CDMACH_s to CDMA_FREQ_r and
2 CDMABAND_s to BAND_CLASS_r. Then the mobile station shall tune
3 to the new Frequency Assignment, measure the strength of each pilot
4 listed in the assignment using the Neighbor Set search procedures
5 specified in 2.6.6.2.1 and 2.6.6.2.2, set PILOT_PN_s to the pilot PN
6 sequence offset of the strongest pilot in the list (PILOT_PN_r), and set
7 CONFIG_MSG_SEQ_s, GAPM_SEQ_s and ACC_MSG_SEQ_s to NULL (see
8 2.6.2.2).
- 9 ○ If the mobile station has not stored configuration parameters for the
10 Primary Paging Channel of the new base station, or if the stored
11 information is not current (see 2.6.2.2), the mobile station shall set
12 SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
13 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
14 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
15 FD_CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
16 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s,
17 GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
18 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
19 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s and
20 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 21 ○ The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
22 Primary Paging Channel. If the mobile station was monitoring
23 Forward Common Control Channel, the mobile station shall set the
24 PRAT_s to '00'. The mobile station shall then begin monitoring the
25 Primary Paging Channel of the selected base station.
- 26 ○ If RESPOND_r is equal to '1', the mobile station shall perform the
27 following:
- 28 ◇ If the *Extended Channel Assignment Message* does not require an
29 acknowledgment, the mobile station shall enter the *Update*
30 *Overhead Information Substate* with an origination indication
31 within T_{34m} seconds after receiving the *Extended Channel*
32 *Assignment Message*.
- 33 ◇ If the *Extended Channel Assignment Message* requires an
34 acknowledgment, the mobile station shall enter the *Update*
35 *Overhead Information Substate* with an origination indication
36 within T_{34m} seconds after Layer 3 receives an indication from
37 Layer 2 that the acknowledgment to the *Extended Channel*
38 *Assignment Message* has been sent and acknowledged.
- 39 ● If ASSIGN_MODE_r equals '100', the mobile station shall perform the following
40 actions:
41 - If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled
42 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
43 indicate to the user that the PACA call has been canceled.

- 1 - If GRANTED_MODE_r equals '00' and the multiplex option and radio
2 configuration specified in the DEFAULT_CONFIG_r field are not supported by
3 the mobile station, the mobile station shall send a *Mobile Station Reject Order*
4 with ORDQ field set to '00000110' (capability not supported by the mobile
5 station) and shall remain in the *Mobile Station Origination Attempt Substate*.
- 6 - If GRANTED_MODE_r equals '11', P_REV_IN_USE_s is less than 11, and the
7 mobile station did not include a SYNC_ID field in the *Origination Message* or
8 the *Reconnect Message* that was transmitted in this substate, the mobile
9 station shall send a *Mobile Station Reject Order* with ORDQ field set to
10 '00000110' (capability not supported by the mobile station) and shall remain
11 in the *Mobile Station Origination Attempt Substate*.
- 12 - If SYNC_ID_INCL_r is included and equals '1' and the mobile station does not
13 have stored service configuration corresponding to SYNC_ID_r for the current
14 SID_s and NID_s pair, the mobile station shall send a *Mobile Station Reject*
15 *Order* with ORDQ field set to '00011011' (Requested stored service
16 configuration is not available) and shall remain in the *Mobile Station*
17 *Origination Attempt Substate*.
- 18 - If GRANTED_MODE_r equals '11', SR_ID_RESTORE_r is not equal to '111',
19 and a service option connection record corresponding to SR_ID_RESTORE_r
20 is not contained in the stored service configuration, the mobile station shall
21 send a *Mobile Station Reject Order* with ORDQ field set to '00000110'
22 (capability not supported by the mobile station) and shall remain in the
23 *Mobile Station Origination Attempt Substate*.
- 24 - If GRANTED_MODE_r equals '00' and DEFAULT_CONFIG_r is not equal to
25 '100', the mobile station shall send a *Mobile Station Reject Order* with ORDQ
26 field set to '00001110' (RC does not match with DEFAULT_CONFIG) and
27 shall remain in the *Mobile Station Origination Attempt Substate* if one of the
28 following conditions is true:
- 29 + FOR_RC_r is not equal to the Radio Configuration associated with
30 DEFAULT_CONFIG_r as specified in Table 3.7.2.3.2.21-2.
- 31 + REV_RC_r is not equal to the Radio Configuration associated with
32 DEFAULT_CONFIG_r as specified in Table 3.7.2.3.2.21-2.
- 33 - If the mobile station does not support either of the Radio Configurations
34 (FOR_RC or REV_RC), the mobile station shall send a *Mobile Station Reject*
35 *Order* with the ORDQ field set to '00000110' (capability not supported by the
36 mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
- 37 - If CH_IND_r = '01' and the mobile station does not support the Fundamental
38 Channel, the mobile station shall send a *Mobile Station Reject Order* with the
39 ORDQ field set to '00000110' (capability not supported by the mobile
40 station) and remain in the *Mobile Station Origination Attempt Substate*.
- 41 - If CH_IND_r = '10' and the mobile station does not support the Dedicated
42 Control Channel, the mobile station shall send a *Mobile Station Reject Order*

- 1 with the ORDQ field set to '00000110' (capability not supported by the
 2 mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
- 3 - If CH_IND_T = '11' and the mobile station does not support the Dedicated
 4 Control Channel and Fundamental Channel concurrently, the mobile station
 5 shall send a *Mobile Station Reject Order* with the ORDQ field set to
 6 '00000110' (capability not supported by the mobile station) and remain in
 7 the *Mobile Station Origination Attempt Substate*.
 - 8 - If FREQ_INCL_T equals '1' and if the band class (BAND_CLASS_T) is not
 9 supported by the mobile station, the mobile station shall send a *Mobile*
 10 *Station Reject Order* with ORDQ field set to '00000110' (capability not
 11 supported by the mobile station) and remain in the *Mobile Station Origination*
 12 *Attempt Substate*.
 - 13 - If PLCM_TYPE_T equals '0010' and IMSI_O is derived from IMSI_T, or if
 14 PLCM_TYPE_T equals '0011' and IMSI_O is derived from IMSI_M, the mobile
 15 station shall send a *Mobile Station Reject Order* with the ORDQ field set to
 16 '00011100' (PLCM_TYPE mismatch) and remain in the *Mobile Station*
 17 *Origination Attempt Substate*.
 - 18 - If FUNDICATED_BCNC_IND_T is included and set to 1, and the mobile
 19 station does not support the BCNC reception on the Forward Fundicated
 20 Channels assigned in this message, the mobile station shall send a *Mobile*
 21 *Station Reject Order* with the ORDQ field set to '00000110' (capability not
 22 supported by the mobile station) and remain in the *Mobile Station Origination*
 23 *Attempt Substate*.
 - 24 - If the mobile station does not send a Mobile Station Reject Order as specified
 25 above, it shall continue to perform the actions specified below.
 - 26 - The mobile station shall set
 - 27 + IDLE_CDMABAND = CDMABAND_S
 - 28 + IDLE_CDMACH = CDMACH_S
 - 29 - If FREQ_INCL_T equals '1', the mobile station shall set
 - 30 + CDMABAND_S = BAND_CLASS_T
 - 31 + CDMACH_S = CDMA_FREQ_T
 - 32 - The mobile station shall store the bypass indicator
 33 (BYPASS_ALERT_ANSWER_S = BYPASS_ALERT_ANSWER_T).
 - 34 - The mobile station shall store granted mode (GRANTED_MODE_S =
 35 GRANTED_MODE_T). If GRANTED_MODE_T equals '11', the mobile station
 36 shall perform the following:
 - 37 + The mobile station shall store service reference identifier to be restored
 38 (SR_ID_RESTORE_S = SR_ID_RESTORE_T).

- 1 + If SR_ID_RESTORE_T equals '000', the mobile station shall store bitmap of
2 service reference identifiers to be restored (SR_ID_RESTORE_BITMAP_S =
3 SR_ID_RESTORE_BITMAP_T).
- 4 - If SYNC_ID_INCL_T is included and equals '1', the mobile station shall store
5 the service configuration synchronization identifier (SYNC_ID_S = SYNC_ID_T).
- 6 - The mobile station shall store the default configuration (DEFAULT_CONFIG_S
7 = DEFAULT_CONFIG_T).
- 8 - The mobile station shall store the Forward Traffic Channel Radio
9 Configuration (FOR_RC_S = FOR_RC_T) and the Reverse Traffic Channel Radio
10 Configuration (REV_RC_S = REV_RC_T).
- 11 - The mobile station shall store the frame offset (FRAME_OFFSET_S =
12 FRAME_OFFSET_T).
- 13 - The mobile station shall store the message encryption mode indicator
14 (ENCRYPT_MODE_S = ENCRYPT_MODE_T).
- 15 - The mobile station shall perform the procedures in 2.6.11.2.
- 16 - The mobile station shall store the Forward power control subchannel relative
17 gain (FPC_SUBCHAN_GAIN_S = FPC_SUBCHAN_GAIN_T).
- 18 - The mobile station shall set RLGAIN_ADJ_S to RLGAIN_ADJ_T.
- 19 - The mobile station shall set REV_FCH_GATING_MODE_S to
20 REV_FCH_GATING_MODE_T.
- 21 - The mobile station shall set REV_PWR_CNTL_DELAY_S to
22 REV_PWR_CNTL_DELAY_T if REV_PWR_CNTL_DELAY_INCL_T is equal to '1'.
- 23 - If 3XFL_1XRL_INCL_T is equal to '1', the mobile station shall set
24 1XRL_FREQ_OFFSET_S to 1XRL_FREQ_OFFSET_T.
- 25 - The mobile station shall set PLCM_TYPE_S to PLCM_TYPE_T if
26 PLCM_TYPE_INCL_T is equal to '1'; otherwise, the mobile station shall set
27 PLCM_TYPE_S as follows:
- 28 + If P_REV_IN_USE_S is less than 11, set PLCM_TYPE_S to '0000'; otherwise
29 set PLCM_TYPE_S to '0100'.
- 30 - The mobile station shall set PLCM_39_S to PLCM_39_T if PLCM_TYPE_T is equal
31 to '0001'.
- 32 - The mobile station shall set EARLY_RL_TRANSMIT_IND_S to
33 EARLY_RL_TRANSMIT_IND_T.
- 34 - If FIXED_PREAMBLE_TRANSMIT_IND_T is included, the mobile station shall
35 set FIXED_PREAMBLE_TRANSMIT_IND_S to
36 FIXED_PREAMBLE_TRANSMIT_IND_T; otherwise, the mobile station shall set
37 FIXED_PREAMBLE_TRANSMIT_IND_S to '0'. If
38 FIXED_PREAMBLE_TRANSMIT_IND_S equals '1', the mobile station shall set
39 FIXED_NUM_PREAMBLE_S to FIXED_NUM_PREAMBLE_T.

- 1 - If TX_PWR_LIMIT_INCL_r is set to '1', the mobile station shall perform the
2 following:
- 3 + If the mobile station is being assigned to operate in the 1915MHz –
4 1920MHz block of the PCS band, the mobile station shall store the
5 transmit power limit TX_PWR_LIMIT_s = (TX_PWR_LIMIT_r - 30dB);
- 6 + Otherwise, the mobile station shall set TX_PWR_LIMIT_s to the limit
7 defined in [11] for the target base station.
- 8 - The mobile station shall store the channel indicator (CH_IND_s = CH_IND_r)
9 and the mobile station shall perform the following actions:
- 10 + If CH_IND_r equals '01', the mobile station shall set
11 FPC_FCH_INIT_SETPT_s to FPC_FCH_INIT_SETPT_r,
12 FPC_FCH_CURR_SETPT_s to FPC_FCH_INIT_SETPT_s, FPC_FCH_FER_s to
13 FPC_FCH_FER_r, FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r,
14 FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r, and FPC_PRI_CHAN_s
15 to '0' if the mobile station supports any Radio Configuration greater than
16 2. Then for each included member of the Active Set, the mobile station
17 shall store the following:
- 18 o Set the PILOT_PN field to PILOT_PN_r.
- 19 o Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC_INCL_r. If
20 ADD_PILOT_REC_INCL_r equals '1', the mobile station shall store the
21 following:
- 22 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
23 PILOT_REC_TYPE_r.
- 24 ◇ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
25 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r
26 and set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 27 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall
28 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 29 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
30 AUX_PILOT_WALSH_r with the Walsh Code length specified by
31 WALSH_LENGTH_r.
- 32 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
33 – Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
- 34 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
35 AUX_WALSH_r with the Walsh Code length specified by
36 WALSH_LENGTH_r.
- 37 – Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
38 AUX_TD_POWER_LEVEL_r.
- 39 – Set the TD_MODE field of PILOT_REC to TD_MODE_r.

- 1 ◇ If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
- 2 — Set the SR3_PRIMARY_PILOT field of PILOT_REC to
- 3 SR3_PRIMARY_PILOT_r.
- 4 — Set the SR3_PILOT_POWER1 field of PILOT_REC to
- 5 SR3_PILOT_POWER1_r.
- 6 — Set the SR3_PILOT_POWER2 field of PILOT_REC to
- 7 SR3_PILOT_POWER2_r.
- 8 ◇ If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
- 9 — Set the SR3_PRIMARY_PILOT field of PILOT_REC to
- 10 SR3_PRIMARY_PILOT_r.
- 11 — Set the SR3_PILOT_POWER1 field of PILOT_REC to
- 12 SR3_PILOT_POWER1_r.
- 13 — Set the SR3_PILOT_POWER2 field of PILOT_REC to
- 14 SR3_PILOT_POWER2_r.
- 15 — Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 16 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
- 17 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 18 WALSH_LENGTH_r.
- 19 — If ADD_INFO_INCL1_r is equal to '1', set the AUX_PILOT_QOF1
- 20 field of PILOT_REC to QOF1_r and set the
- 21 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
- 22 AUX_PILOT_WALSH1_r with the Walsh Code length specified
- 23 by WALSH_LENGTH1_r; otherwise, set the AUX_PILOT_QOF1
- 24 field of PILOT_REC to QOF_r and set the
- 25 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
- 26 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 27 WALSH_LENGTH_r.
- 28 — If ADD_INFO_INCL2_r is equal to '1', set the AUX_PILOT_QOF2
- 29 field of PILOT_REC to QOF2_r and set the
- 30 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
- 31 AUX_PILOT_WALSH2_r with the Walsh Code length specified
- 32 by WALSH_LENGTH2_r; otherwise, set the AUX_PILOT_QOF2
- 33 field of PILOT_REC to QOF_r and set the
- 34 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
- 35 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 36 WALSH_LENGTH_r.
- 37 ○ Set the PWR_COMB_IND field to PWR_COMB_IND_r.
- 38 ○ Set the CODE_CHAN_FCH field to CODE_CHAN_FCH_r.
- 39 ○ Set the QOF_MASK_ID_FCH field to QOF_MASK_ID_FCH_r.

- 1 + If CH_IND_r equals '01' and 3X_FCH_INFO_INCL_r equals '1', for each
 2 included member of the Active Set, the mobile station store the following:
- 3 ○ If 3X_FCH_LOW_INCL_r equals '1', set the QOF_MASK_ID_FCH_LOW
 4 field to QOF_MASK_ID_FCH_LOW_r and the CODE_CHAN_FCH_LOW
 5 field to CODE_CHAN_FCH_LOW_r. Otherwise, set the
 6 QOF_MASK_ID_FCH_LOW field to QOF_MASK_ID_FCH_r and the
 7 CODE_CHAN_FCH_LOW to CODE_CHAN_FCH_r.
- 8 ○ If 3X_FCH_HIGH_INCL_r equals '1', set the QOF_MASK_ID_FCH_HIGH
 9 field to QOF_MASK_ID_FCH_HIGH_r and the
 10 CODE_CHAN_FCH_HIGH field to CODE_CHAN_FCH_HIGH_r.
 11 Otherwise, set the QOF_MASK_ID_FCH_HIGH field to
 12 QOF_MASK_ID_FCH_r and the CODE_CHAN_FCH_HIGH to
 13 CODE_CHAN_FCH_r.
- 14 + If CH_IND_r equals '10', the mobile station shall set
 15 FPC_DCCH_INIT_SETPT_s to FPC_DCCH_INIT_SETPT_r,
 16 FPC_DCCH_CURR_SETPT_s to FPC_DCCH_INIT_SETPT_s,
 17 FPC_DCCH_FER_s to FPC_DCCH_FER_r, FPC_DCCH_MIN_SETPT_s to
 18 FPC_DCCH_MIN_SETPT_r, FPC_DCCH_MAX_SETPT_s to
 19 FPC_DCCH_MAX_SETPT_r, FUNDICATED_BCMC_IND_s to
 20 FUNDICATED_BCMC_IND_r, and FPC_PRI_CHAN_s to '1' if the mobile
 21 station supports any Radio Configuration greater than 2. Then for each
 22 included member of the Active Set, the mobile station shall store the
 23 following:
- 24 ○ Set the PILOT_PN to PILOT_PN_r.
- 25 ○ Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC_INCL. If
 26 ADD_PILOT_REC_INCL is equal to '1', the mobile station shall store
 27 the following:
- 28 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
 29 PILOT_REC_TYPE_r.
- 30 ◇ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
 31 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r
 32 and set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 33 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall
 34 — Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 35 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
 36 AUX_PILOT_WALSH_r with the Walsh Code length specified by
 37 WALSH_LENGTH_r.
- 38 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
 39 — Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.

- 1 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
2 AUX_WALSH_r with the Walsh Code length specified by
3 WALSH_LENGTH_r.
- 4 – Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
5 AUX_TD_POWER_LEVEL_r.
- 6 – Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 7 ◇ If PILOT_REC_TYPE_r is equal to ‘011’, the mobile station shall:
8 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
9 SR3_PRIMARY_PILOT_r.
- 10 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
11 SR3_PILOT_POWER1_r.
- 12 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
13 SR3_PILOT_POWER2_r.
- 14 ◇ If PILOT_REC_TYPE_r is equal to ‘100’, the mobile station shall:
15 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
16 SR3_PRIMARY_PILOT_r.
- 17 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
18 SR3_PILOT_POWER1_r.
- 19 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
20 SR3_PILOT_POWER2_r.
- 21 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 22 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
23 AUX_PILOT_WALSH_r with the Walsh Code length specified by
24 WALSH_LENGTH_r.
- 25 – If ADD_INFO_INCL1_r is equal to ‘1’, set the AUX_PILOT_QOF1
26 field of PILOT_REC to QOF1_r and set the
27 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
28 AUX_PILOT_WALSH1_r with the Walsh Code length specified
29 by WALSH_LENGTH1_r; otherwise, set the AUX_PILOT_QOF1
30 field of PILOT_REC to QOF_r and set the
31 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
32 AUX_PILOT_WALSH_r with the Walsh Code length specified by
33 WALSH_LENGTH_r.

- 1 – If $ADD_INFO_INCL2_r$ is equal to '1', set the AUX_PILOT_QOF2
2 field of $PILOT_REC$ to $QOF2_r$ and set the
3 $AUX_PILOT_WALSH_CODE2$ field of $PILOT_REC$ to
4 $AUX_PILOT_WALSH2_r$ with the Walsh Code length specified
5 by $WALSH_LENGTH2_r$; otherwise, set the AUX_PILOT_QOF2
6 field of $PILOT_REC$ to QOF_r and set the
7 $AUX_PILOT_WALSH_CODE2$ field of $PILOT_REC$ to
8 $AUX_PILOT_WALSH_r$ with the Walsh Code length specified by
9 $WALSH_LENGTH_r$.
- 10 ○ Set the PWR_COMB_IND field to $PWR_COMB_IND_r$.
- 11 ○ Set the $CODE_CHAN_FCH$ field to $CODE_CHAN_FCH_r$.
- 12 ○ Set the $QOF_MASK_ID_FCH$ field to $QOF_MASK_ID_FCH_r$.
- 13 ○ Set the $DCCH_INCL$ field to $DCCH_INCL_r$. If $DCCH_INCL_r$ equals '1',
14 the mobile station shall store the following:
- 15 ○ Set the $CODE_CHAN_DCCH$ field to $CODE_CHAN_DCCH_r$.
- 16 ◇ Set the $QOF_MASK_ID_DCCH$ field to $QOF_MASK_ID_DCCH_r$.
- 17 + If CH_IND_r equals '10' and $3X_DCCH_INFO_INCL_r$ equals '1', for each
18 included member of the Active Set, the mobile station shall store the
19 following:
- 20 ○ If $3X_DCCH_LOW_INCL_r$ equals '1', set the
21 $QOF_MASK_ID_DCCH_LOW$ field to $QOF_MASK_ID_DCCH_LOW_r$
22 and the $CODE_CHAN_DCCH_LOW$ field to
23 $CODE_CHAN_DCCH_LOW_r$. Otherwise, set the
24 $QOF_MASK_ID_DCCH_LOW$ field to $QOF_MASK_ID_FCH_r$ and the
25 $CODE_CHAN_DCCH_LOW$ to $CODE_CHAN_FCH_r$.
- 26 ○ If $3X_DCCH_HIGH_INCL_r$ equals '1', set the
27 $QOF_MASK_ID_DCCH_HIGH$ field to $QOF_MASK_ID_DCCH_HIGH_r$
28 and the $CODE_CHAN_DCCH_HIGH$ field to
29 $CODE_CHAN_DCCH_HIGH_r$. Otherwise, set the
30 $QOF_MASK_ID_DCCH_HIGH$ field to $QOF_MASK_ID_FCH_r$ and the
31 $CODE_CHAN_DCCH_HIGH$ to $CODE_CHAN_FCH_r$.
- 32 + If CH_IND_r equals '10', and $FUNDICATED_BCMC_IND_r$ equals '1', for
33 each included member of the Active Set, the mobile station shall store
34 the following:
- 35 ○ Set $FOR_CPCCH_WALSH_s$ to $FOR_CPCCH_WALSH_r$.
- 36 ○ Set FOR_CPCSCH_s to FOR_CPCSCH_r .

- 1 + If CH_IND_r equals '11', the mobile station shall set
2 FPC_FCCH_INIT_SETPT_s to FPC_FCH_INIT_SETPT_r,
3 FPC_FCH_CURR_SETPT_s to FPC_FCH_INIT_SETPT_s, FPC_FCH_FER_s to
4 FPC_FCH_FER_r, FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r,
5 FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r,
6 FPC_DCCH_INIT_SETPT_s to FPC_DCCH_INIT_SETPT_r,
7 FPC_DCCH_CURR_SETPT_s to FPC_DCCH_INIT_SETPT_s,
8 FPC_DCCH_FER_s to FPC_DCCH_FER_r, FPC_DCCH_MIN_SETPT_s to
9 FPC_DCCH_MIN_SETPT_r, FPC_DCCH_MAX_SETPT_s to
10 FPC_DCCH_MAX_SETPT_r, FPC_PRI_CHAN_s to FPC_PRI_CHAN_r, and
11 FUNDICATED_BCMC_IND_s to FUNDICATED_BCMC_IND_r. Then for each
12 included member of the Active Set, the mobile station shall store the
13 following:
- 14 ○ Set the PILOT_PN to PILOT_PN_r.
 - 15 ○ Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC. If
16 ADD_PILOT_REC_INCL is equal to '1', the mobile station shall store
17 the following:
 - 18 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
19 PILOT_REC_TYPE_r.
 - 20 ◇ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
21 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r
22 and set the TD_MODE field of PILOT_REC to TD_MODE_r.
 - 23 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall
 - 24 — Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
 - 25 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
26 AUX_PILOT_WALSH_r with the Walsh Code length specified by
27 WALSH_LENGTH_r.
 - 28 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
 - 29 — Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
 - 30 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
31 AUX_WALSH_r with the Walsh Code length specified by
32 WALSH_LENGTH_r.
 - 33 — Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
34 AUX_TD_POWER_LEVEL_r.
 - 35 — Set the TD_MODE field of PILOT_REC to TD_MODE_r.
 - 36 ◇ If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
 - 37 — Set the SR3_PRIMARY_PILOT field of PILOT_REC to
38 SR3_PRIMARY_PILOT_r.

- 1 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
2 SR3_PILOT_POWER1_r.
- 3 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
4 SR3_PILOT_POWER2_r.
- 5 ◇ If PILOT_REC_TYPE_r is equal to ‘100’, the mobile station shall:
- 6 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
7 SR3_PRIMARY_PILOT_r.
- 8 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
9 SR3_PILOT_POWER1_r.
- 10 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
11 SR3_PILOT_POWER2_r.
- 12 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 13 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
14 AUX_PILOT_WALSH_r with the Walsh Code length specified by
15 WALSH_LENGTH_r.
- 16 – If ADD_INFO_INCL1_r is equal to ‘1’, set the AUX_PILOT_QOF1
17 field of PILOT_REC to QOF1_r and set the
18 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
19 AUX_PILOT_WALSH1_r with the Walsh Code length specified
20 by WALSH_LENGTH1_r; otherwise, set the AUX_PILOT_QOF1
21 field of PILOT_REC to QOF_r and set the
22 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
23 AUX_PILOT_WALSH_r with the Walsh Code length specified by
24 WALSH_LENGTH_r.
- 25 – If ADD_INFO_INCL2_r is equal to ‘1’, set the AUX_PILOT_QOF2
26 field of PILOT_REC to QOF2_r and set the
27 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
28 AUX_PILOT_WALSH2_r with the Walsh Code length specified
29 by WALSH_LENGTH2_r; otherwise, set the AUX_PILOT_QOF2
30 field of PILOT_REC to QOF_r and set the
31 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
32 AUX_PILOT_WALSH_r with the Walsh Code length specified by
33 WALSH_LENGTH_r.
- 34 ○ Set the PWR_COMB_IND field to PWR_COMB_IND_r
- 35 ○ Set the CODE_CHAN_FCH field to CODE_CHAN_FCH_r.
- 36 ○ Set the QOF_MASK_ID_FCH field to QOF_MASK_ID_FCH_r.
- 37 ○ Set the CODE_CHAN_DCCH field to CODE_CHAN_DCCH_r.
- 38 ○ Set the QOF_MASK_ID_DCCH field to QOF_MASK_ID_DCCH_r.
- 39 + If CH_IND_r equals ‘11’ and 3X_FCH_INFO_INCL_r equals ‘1’, for each
40 included member of the Active Set, the mobile station store the following:

- 1 ○ If 3X_FCH_LOW_INCL_T equals '1', set the QOF_MASK_ID_FCH_LOW
2 field to QOF_MASK_ID_FCH_LOW_T and the CODE_CHAN_FCH_LOW
3 field to CODE_CHAN_FCH_LOW_T. Otherwise, set the
4 QOF_MASK_ID_FCH_LOW field to QOF_MASK_ID_FCH_T and the
5 CODE_CHAN_FCH_LOW to CODE_CHAN_FCH_T.
- 6 ○ If 3X_FCH_HIGH_INCL_T equals '1', set the QOF_MASK_ID_FCH_HIGH
7 field to QOF_MASK_ID_FCH_HIGH_T and the
8 CODE_CHAN_FCH_HIGH field to CODE_CHAN_FCH_HIGH_T.
9 Otherwise, set the QOF_MASK_ID_FCH_HIGH field to
10 QOF_MASK_ID_FCH_T and the CODE_CHAN_FCH_HIGH to
11 CODE_CHAN_FCH_T.
- 12 + If CH_IND_T equals '11' and FUNDICATED_BCMC_IND_T equals '1', the
13 mobile station shall:
- 14 ○ Set REV_FCH_ASSIGNED_S to REV_FCH_ASSIGNED_T.
- 15 + If CH_IND_T equals '11' and FUNDICATED_BCMC_IND_T equals '1', the
16 mobile station shall set FCH_BCMC_IND to '1'; otherwise, the mobile
17 station shall set FCH_BCMC_IND to '0'.
- 18 + If CH_IND_T equals '11', FUNDICATED_BCMC_IND_T equals '1', and
19 FOR_CPCCH_INFO_INCL_T is included and is set to '1', for each included
20 member of the Active Set, the mobile station shall store the following:
- 21 ○ Set FOR_CPCCH_WALSH_S to FOR_CPCCH_WALSH_T.
- 22 ○ Set FOR_CPCSCH_S to FOR_CPCSCH_T.
- 23 + If CH_IND_T equals '11', FUNDICATED_BCMC_IND_T equals '1', and
24 ADD_PLCM_FOR_FCH_INCL_T is included and is set to '1', the mobile
25 station shall store the following:
- 26 ○ Set ADD_PLCM_FOR_FCH_TYPE_S to ADD_PLCM_FOR_FCH_TYPE_T.
- 27 ○ Set ADD_PLCM_FOR_FCH_39_S to ADD_PLCM_FOR_FCH_39_T if
28 ADD_PLCM_FOR_FCH_TYPE_T is equal to '1'.
- 29 + If CH_IND_T equals '11' and 3X_DCCH_INFO_INCL_T equals '1', for each
30 included member of the Active Set, the mobile station store the following:
- 31 ○ If 3X_DCCH_LOW_INCL_T equals '1', set the
32 QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_DCCH_LOW_T
33 and the CODE_CHAN_DCCH_LOW field to
34 CODE_CHAN_DCCH_LOW_T. Otherwise, set the
35 QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_FCH_T and the
36 CODE_CHAN_DCCH_LOW to CODE_CHAN_FCH_T.

- 1 ○ If 3X_DCCH_HIGH_INCL_T equals '1', set the
2 QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_DCCH_HIGH_T
3 and the CODE_CHAN_DCCH_HIGH field to
4 CODE_CHAN_DCCH_HIGH_T. Otherwise, set the
5 QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_FCH_T and the
6 CODE_CHAN_DCCH_HIGH to CODE_CHAN_FCH_T.
- 7 - The mobile station shall initialize CODE_CHAN_LIST as described in 2.6.8,
8 and shall set SERV_NEG_S to enabled.
- 9 - If the mobile station is currently monitoring the Paging Channel, the mobile
10 station shall set IDLE_BCCH_CHAN to '0'; otherwise, the mobile station shall
11 set IDLE_BCCH_CHAN to '1'. The mobile station shall set IDLE_SID to SID_S,
12 IDLE_NID to NID_S, and IDLE_P_REV to P_REV_S.
- 13 - If FREQ_INCL_T equals '1', the mobile station shall then tune to the new
14 frequency assignment.
- 15 - The mobile station shall then enter the *Traffic Channel Initialization Substate*
16 of the *Mobile Station Control on the Traffic Channel State*.
- 17 • If ASSIGN_MODE_T equals '101', the mobile station shall perform the following
18 actions:
- 19 - If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled
20 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
21 indicate to the user that the PACA call has been canceled.
- 22 - If GRANTED_MODE_T equals '11', P_REV_IN_USE_S is less than 11, and the
23 mobile station did not include a SYNC_ID field in the *Origination Message* or
24 the *Reconnect Message* that was transmitted in this substate, the mobile
25 station shall send a *Mobile Station Reject Order* with ORDQ field set to
26 '00000110' (capability not supported by the mobile station) and shall remain
27 in the *Mobile Station Origination Attempt Substate*.
- 28 - If SYNC_ID_INCL_T is included and equals '1' and the mobile station does not
29 have stored service configuration corresponding to SYNC_ID_T for the current
30 SID_S and NID_S pair, the mobile station shall send a *Mobile Station Reject*
31 *Order* with ORDQ field set to '00011011' (Requested stored service
32 configuration is not available) and shall remain in the *Mobile Station*
33 *Origination Attempt Substate*.
- 34 - If GRANTED_MODE_T equals '11', SR_ID_RESTORE_T is not equal to '111', and
35 a service option connection record corresponding to SR_ID_RESTORE_T is not
36 contained in the stored service configuration, the mobile station shall send a
37 *Mobile Station Reject Order* with ORDQ field set to '00000110' (capability not
38 supported by the mobile station) and shall remain in the *Mobile Station*
39 *Origination Attempt Substate*.
- 40 - If the mobile station does not support any of the specified Radio
41 Configurations (FOR_PDCH_RC, FOR_FCH_DCCH_RC or
42 REV_FCH_DCCH_RC), the mobile station shall send a *Mobile Station Reject*

- 1 *Order* with the ORDQ field set to '00000110' (capability not supported by the
2 mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
- 3 - If EXT_CH_IND_r signals the allocation of a F-FCH or R-FCH and the mobile
4 station does not support Fundamental Channel, the mobile station shall
5 send a *Mobile Station Reject Order* with the ORDQ field set to '00000110'
6 (capability not supported by the mobile station) and remain in the *Mobile*
7 *Station Origination Attempt Substate*.
- 8 - If EXT_CH_IND_r signals the allocation of a F-DCCH or R-DCCH and the
9 mobile station does not support the Dedicated Control Channel, the mobile
10 station shall send a *Mobile Station Reject Order* with the ORDQ field set to
11 '00000110' (capability not supported by the mobile station) and remain in
12 the *Mobile Station Origination Attempt Substate*.
- 13 - If FREQ_INCL_r equals '1' and if the band class (BAND_CLASS_r) is not
14 supported by the mobile station, the mobile station shall send a *Mobile*
15 *Station Reject Order* with ORDQ field set to '00000110' (capability not
16 supported by the mobile station) and remain in the *Mobile Station Origination*
17 *Attempt Substate*.
- 18 - If PLCM_TYPE_r equals '0010' and IMSI_O is derived from IMSI_T, or if
19 PLCM_TYPE_r equals '0011' and IMSI_O is derived from IMSI_M, the mobile
20 station shall send a *Mobile Station Reject Order* with the ORDQ field set to
21 '00011100' (PLCM_TYPE mismatch) and remain in the *Mobile Station*
22 *Origination Attempt Substate*.
- 23 - If FUNDICATED_BCNC_IND_r is included and set to 1, and the mobile
24 station does not support BCNC reception on the Forward Fundicated
25 Channels assigned in this message, the mobile station shall send a *Mobile*
26 *Station Reject Order* with the ORDQ field set to '00000110' (capability not
27 supported by the mobile station) and remain in the *Mobile Station Origination*
28 *Attempt Substate*.
- 29 - If the mobile station does not send a *Mobile Station Reject Order* as specified
30 above, it shall continue to perform the actions specified below.
- 31 - Layer 3 shall send SIG-HandoffPDCH.Indication (handoff_type = ASSIGN) to
32 the MAC layer.
- 33 - If FREQ_INCL_r equals '1', the mobile station shall set
- 34 + CDMABAND_s = BAND_CLASS_r
- 35 + CDMACH_s = CDMA_FREQ_r
- 36 - The mobile station shall store the bypass indicator
37 (BYPASS_ALERT_ANSWER_s = BYPASS_ALERT_ANSWER_r).
- 38 - The mobile station shall store the granted mode indicator
39 (GRANTED_MODE_s = GRANTED_MODE_r). If GRANTED_MODE_r equals '11',
40 the mobile station shall perform the following:

- 1 + The mobile station shall store the service reference identifier to be
2 restored ($SR_ID_RESTORE_S = SR_ID_RESTORE_T$).
- 3 + If $SR_ID_RESTORE_T$ equals '000', the mobile station shall store bitmap of
4 service reference identifiers to be restored ($SR_ID_RESTORE_BITMAP_S =$
5 $SR_ID_RESTORE_BITMAP_T$).
- 6 + If $SYNC_ID_INCL_T$ is included and equals '1', the mobile station shall
7 store the service configuration synchronization identifier ($SYNC_ID_S =$
8 $SYNC_ID_T$).
- 9 - The mobile station shall store the frame offset ($FRAME_OFFSET_S =$
10 $FRAME_OFFSET_T$).
- 11 - The mobile station shall store the message encryption mode indicator
12 ($ENCRYPT_MODE_S = ENCRYPT_MODE_T$).
- 13 - The mobile station shall perform the following procedures in the order listed
14 below:
- 15 + If $D_SIG_ENCRYPT_MODE_T$ is included, the mobile station shall perform
16 the following:
- 17 o If $D_SIG_ENCRYPT_MODE_T$ is equal to '000', the mobile station shall
18 set $D_SIG_ENCRYPT_MODE_S$ to $C_SIG_ENCRYPT_MODE_S$;
19 otherwise, the mobile station shall set $D_SIG_ENCRYPT_MODE_S$ to
20 $D_SIG_ENCRYPT_MODE_T$, ENC_KEY_S to the most recently generated
21 CMEAKEY in the mobile station associated with AUTHR of the
22 *Origination Message*, and $EXT_ENCRYPT_SEQ[0]$ and
23 $EXT_ENCRYPT_SEQ[1]$ to $256 \times ENC_SEQ_H$ (the ENC_SEQ_H field
24 in the *Origination Message*).
- 25 + If $ENC_KEY_SIZE_T$ is included, the mobile station shall set
26 $ENC_KEY_SIZE_S$ to $ENC_KEY_SIZE_T$.
- 27 + If $C_SIG_ENCRYPT_MODE$ is included, the mobile station shall set
28 $C_SIG_ENCRYPT_MODE_S$ to $C_SIG_ENCRYPT_MODE_T$.
- 29 - The mobile station shall set $EXT_CH_IND_S$ to $EXT_CH_IND_T$.
- 30 - The mobile station shall set CH_IND_S to '00'.
- 31 - If $EXT_CH_IND_T$ signals the allocation of a F-FCH or a F-DCCH, the mobile
32 station shall store the Forward power control subchannel relative gain
33 [$FPC_SUBCHAN_GAIN_S = FPC_SUBCHAN_GAIN_T$].
- 34 - The mobile station shall set $RLGAIN_ADJ_S$ to $RLGAIN_ADJ_T$.
- 35 - The mobile station shall set $PLCM_TYPE_S$ to $PLCM_TYPE_T$ if
36 $PLCM_TYPE_INCL_T$ is equal to '1'; otherwise, the mobile station shall set
37 $PLCM_TYPE_S$ as follows:
- 38 + If $P_REV_IN_USE_S$ is less than 11, set $PLCM_TYPE_S$ to '0000'; otherwise
39 set $PLCM_TYPE_S$ to '0100'.

- 1 - The mobile station shall set $PLCM_{39s}$ to $PLCM_{39r}$ if $PLCM_TYPE_r$ is equal
2 to '0001'.
- 3 - The mobile station shall set $FUNDICATED_BCMC_IND_s$ to
4 $FUNDICATED_BCMC_IND_r$. If $FUNDICATED_BCMC_IND_r$ equals '1' and the
5 $EXT_CH_IND_r$ signals the allocation of a F-FCH, the mobile station shall set
6 FCH_BCMC_IND to '1'; otherwise, the mobile station shall set
7 FCH_BCMC_IND to '0'.
- 8 - If $FUNDICATED_BCMC_IND_r$ equals '1' and $ADD_PLCM_FOR_FCH_INCL_r$ is
9 included and is set to '1', the mobile station shall store the following:
10 + Set $ADD_PLCM_FOR_FCH_TYPE_s$ to $ADD_PLCM_FOR_FCH_TYPE_r$.
11 + Set $ADD_PLCM_FOR_FCH_{39s}$ to $ADD_PLCM_FOR_FCH_{39r}$ if
12 $ADD_PLCM_FOR_FCH_TYPE_r$ is equal to '1'.
- 13 - The mobile station shall set $REV_FCH_GATING_MODE_s$ to
14 $REV_FCH_GATING_MODE_r$.
- 15 - The mobile station shall set $REV_PWR_CNTL_DELAY_s$ to
16 $REV_PWR_CNTL_DELAY_r$ if $REV_PWR_CNTL_DELAY_INCL_r$ is equal to '1'.
- 17 - The mobile station shall set $FULL_CI_FEEDBACK_IND_s$ to
18 $FULL_CI_FEEDBACK_IND_r$.
- 19 - If $EXT_CH_IND_r$ equals '01000', the mobile station shall set
20 $FOR_CPCCH_RATE_s$ to $FOR_CPCCH_RATE_r$, and
21 $FOR_CPCCH_UPDATE_RATE_s$ to $FOR_CPCCH_UPDATE_RATE_r$; otherwise,
22 the mobile station shall set $FOR_CPCCH_RATE_s$ to '00', and
23 $FOR_CPCCH_UPDATE_RATE_s$ to '00'.
- 24 - The mobile station shall set $REV_CQICH_FRAME_OFFSET_s$ to
25 $REV_CQICH_FRAME_OFFSET_r$.
- 26 - The mobile station shall set $REV_CQICH_REPS_s$ to $REV_CQICH_REPS_r$.
- 27 - The mobile station shall set $REV_ACKCH_REPS_s$ to $REV_ACKCH_REPS_r$.
- 28 - The mobile station shall set $FOR_PDCH_RC_s$ to $FOR_PDCH_RC_r$.
- 29 - If $EXT_CH_IND_r$ signals the allocation of a R-PDCH, the mobile station shall
30 set $REV_PDCH_RC_s$ to $REV_PDCH_RC_r$.
- 31 - If $EXT_CH_IND_r$ signals the allocation of a F-FCH, the mobile station shall
32 set $FOR_FCH_RC_s$ to $FOR_FCH_DCCH_RC_r$.
- 33 - If $EXT_CH_IND_r$ signals the allocation of a F-DCCH, the mobile station shall
34 set $FOR_DCCH_RC_s$ to $FOR_FCH_DCCH_RC_r$.
- 35 - If $EXT_CH_IND_r$ signals the allocation of a R-FCH, the mobile station shall
36 set $REV_FCH_RC_s$ to $REV_FCH_DCCH_RC_r$.
- 37 - If $EXT_CH_IND_r$ signals the allocation of a R-DCCH, the mobile station shall
38 set $REV_DCCH_RC_s$ to $REV_FCH_DCCH_RC_r$.

- 1 - If EXT_CH_IND_r signals the allocation of a F-FCH and a F-DCCH, the mobile
2 station shall set FPC_PRI_CHAN_s to FPC_PRI_CHAN_r.
- 3 - If EXT_CH_IND_r signals the allocation of a F-FCH, the mobile station shall
4 set FPC_FCH_INIT_SETPT_s to FPC_FCH_INIT_SETPT_r,
5 FPC_FCH_CURR_SETPT_s to FPC_FCH_INIT_SETPT_s, FPC_FCH_FER_s to
6 FPC_FCH_FER_r, FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r,
7 FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r.
- 8 - If EXT_CH_IND_r signals the allocation of a F-DCCH, the mobile station shall
9 set FPC_DCCH_INIT_SETPT_s to FPC_DCCH_INIT_SETPT_r,
10 FPC_DCCH_CURR_SETPT_s to FPC_DCCH_INIT_SETPT_s, FPC_DCCH_FER_s to
11 FPC_DCCH_FER_r, FPC_DCCH_MIN_SETPT_s to FPC_DCCH_MIN_SETPT_r,
12 FPC_DCCH_MAX_SETPT_s to FPC_DCCH_MAX_SETPT_r.
- 13 - If EARLY_RL_TRANSMIT_IND_r is included, the mobile station shall set
14 EARLY_RL_TRANSMIT_IND_s to EARLY_RL_TRANSMIT_IND_r; otherwise, the
15 mobile station shall set EARLY_RL_TRANSMIT_IND_s to '0'.
- 16 - If FIXED_PREAMBLE_TRANSMIT_IND_r is included, the mobile station shall
17 set FIXED_PREAMBLE_TRANSMIT_IND_s to
18 FIXED_PREAMBLE_TRANSMIT_IND_r; otherwise, the mobile station shall set
19 FIXED_PREAMBLE_TRANSMIT_IND_s to '0'. If
20 FIXED_PREAMBLE_TRANSMIT_IND_s equals '1', the mobile station shall set
21 FIXED_NUM_PREAMBLE_s to FIXED_NUM_PREAMBLE_r.
- 22 - If TX_PWR_LIMIT_INCL_r is set to '1', the mobile station shall perform the
23 following:
- 24 + If the mobile station is being assigned to operate in the 1915MHz –
25 1920MHz block of the PCS band, the mobile station shall store the
26 transmit power limit TX_PWR_LIMIT_s = (TX_PWR_LIMIT_r - 30dB);
- 27 + Otherwise, the mobile station shall set TX_PWR_LIMIT_s to the limit
28 defined in [11] for the target base station.
- 29 - If FOR_PDCH_PARMS_INCL_r is equal to '1', the mobile station shall set
30 FOR_PDCH_COMMON_PARMS_s = '0'; otherwise, if
31 FOR_PDCH_COMMON_PARMS_s is equal to '0', the mobile station shall send
32 a *Mobile Station Reject Order* with ORDQ equal to '00000011' (message
33 structure not acceptable) and remain in the current state.
- 34 - If FOR_PDCH_RLGAIN_INCL_r is included and equal to '1', the mobile station
35 shall set RLGAIN_ACKCH_PILOT_s to RLGAIN_ACKCH_PILOT_r, and
36 RLGAIN_CQICH_PILOT_s to RLGAIN_CQICH_PILOT_r.
- 37 - If FOR_PDCH_PARMS_INCL_r is equal to '1', the mobile station shall set
38 NUM_SOFT_SWITCHING_FRAMES_s to NUM_SOFT_SWITCHING_FRAMES_r +
39 1, and NUM_SOFTER_SWITCHING_FRAMES_s to
40 NUM_SOFTER_SWITCHING_FRAMES_r + 1.

- 1 - If CHM_SWITCHING_PARMS_INCL_T is included and equal to '1', the mobile
2 station shall set NUM_SOFT_SWITCHING_FRAMES_CHM_S to
3 NUM_SOFT_SWITCHING_FRAMES_CHM_T + 1, and
4 NUM_SOFT_SWITCHING_FRAMES_CHM_S to
5 NUM_SOFT_SWITCHING_FRAMES_CHM_T + 1.
- 6 - If CHM_SWITCHING_PARMS_INCL_T is included and equal to '0', the mobile
7 station shall set NUM_SOFT_SWITCHING_FRAMES_CHM_S to
8 NUM_SOFT_SWITCHING_FRAMES_T + 1, and
9 NUM_SOFT_SWITCHING_FRAMES_CHM_S to
10 NUM_SOFT_SWITCHING_FRAMES_T + 1.
- 11 - If FOR_PDCH_PARMS_INCL_T is equal to '1', the mobile station shall set
12 NUM_SOFT_SWITCHING_SLOTS_S according to Table 3.7.2.3.2.21-9 based on
13 the value of NUM_SOFT_SWITCHING_SLOTS_T.
- 14 - If FOR_PDCH_PARMS_INCL_T is equal to '1', the mobile station shall set
15 NUM_SOFT_SWITCHING_SLOTS_S according to Table 3.7.2.3.2.21-9 based
16 on the value of NUM_SOFT_SWITCHING_SLOTS_T.
- 17 - If CHM_SWITCHING_PARMS_INCL_T is included and equal to '1', the mobile
18 station shall:
- 19 + Set NUM_SOFT_SWITCHING_SLOTS_CHM_S according to Table
20 3.7.2.3.2.21-9 based on the value of
21 NUM_SOFT_SWITCHING_SLOTS_CHM_T.
- 22 + Set NUM_SOFT_SWITCHING_SLOTS_CHM_S according to Table
23 3.7.2.3.2.21-9 based on the value of
24 NUM_SOFT_SWITCHING_SLOTS_CHM_T.
- 25 - If CHM_SWITCHING_PARMS_INCL_T is included and equal to '0', the mobile
26 station shall:
- 27 + Set NUM_SOFT_SWITCHING_SLOTS_CHM_S according to Table
28 3.7.2.3.2.21-9 based on the value of NUM_SOFT_SWITCHING_SLOTS_T.
- 29 + Set NUM_SOFT_SWITCHING_SLOTS_CHM_S according to Table
30 3.7.2.3.2.21-9 based on the value of
31 NUM_SOFT_SWITCHING_SLOTS_T.
- 32 - If FOR_PDCH_PARMS_INCL_T is equal to '1', the mobile station shall set
33 PDCH_SOFT_SWITCHING_DELAY_S to PDCH_SOFT_SWITCHING_DELAY_T +
34 1, and PDCH_SOFT_SWITCHING_DELAY_S to
35 PDCH_SOFT_SWITCHING_DELAY_T + 1.
- 36 - If TX_DISABLED_TIMER_INCL_T is equal to '1', the mobile station shall set
37 TX_DISABLED_TIMER_S to TX_DISABLED_TIMER_T; otherwise, the mobile
38 station shall set TX_DISABLED_TIMER_S to T_{81m}.
- 39 - If EXT_CH_IND_T signals the allocation of a R-PDCH, the mobile station shall:
- 40 + Set FOR_GCH_ASSIGNED_S to FOR_GCH_ASSIGNED_T.
- 41 + Set FOR_RCCH_ASSIGNED_S to FOR_RCCH_ASSIGNED_T.

- 1 + If FOR_RCCH_ASSIGNED_s is equal to '1', the mobile station shall:
- 2 ○ Set FOR_RCCH_DRC_MODE_s to FOR_RCCH_DRC_MODE_r.
- 3 ○ Set FOR_RCCH_REPETITION_s to FOR_RCCH_REPETITION_r.
- 4 ○ Set FOR_RCCH_UPDATE_RATE_s to FOR_RCCH_UPDATE_RATE_r.
- 5 + If FOR_ACKCH_ASSIGNED_r is equal to '1', the mobile station shall set
- 6 FOR_ACKCH_MODE_s to FOR_ACKCH_MODE_r.
- 7 + If FOR_ACKCH_COMB_SEL_r is included, the mobile station shall set
- 8 FOR_ACKCH_COMB_SEL_s to FOR_ACKCH_COMB_SEL_r; otherwise, the
- 9 mobile station shall set FOR_ACKCH_COMB_SEL_s to '0'.
- 10 + If REV_PDCH_RLGAIN_INCL_r is included and equal to '1', the mobile
- 11 station shall perform the following:
- 12 ○ The mobile station shall set RLGAIN_SPICH_PILOT_s to
- 13 RLGAIN_SPICH_PILOT_r.
- 14 ○ The mobile station shall set RLGAIN_REQCH_PILOT_s to
- 15 RLGAIN_REQCH_PILOT_r.
- 16 ○ The mobile station shall set RLGAIN_PDCCH_PILOT_s to
- 17 RLGAIN_PDCCH_PILOT_r.
- 18 + If REV_PDCH_PARAMS_1_INCL_r is included and equal to '1', the mobile
- 19 station shall perform the following:
- 20 ○ The mobile station shall set REV_PDCH_TABLE_SEL_s to
- 21 REV_PDCH_TABLE_SEL_r.
- 22 ○ The mobile station shall set REV_PDCH_MAX_AUTO_TPR_s to
- 23 REV_PDCH_MAX_AUTO_TPR_r.
- 24 - Otherwise, the mobile station shall:
- 25 + Set FOR_GCH_ASSIGNED_s to NULL.
- 26 + Set FOR_RCCH_ASSIGNED_s to NULL.
- 27 - For each included member of the Active Set, the mobile station shall store
- 28 the following:
- 29 + Set the PILOT_PN field to PILOT_PN_r.
- 30 + Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC_INCL_r. If
- 31 ADD_PILOT_REC_INCL_r equals '1', the mobile station shall store the
- 32 following:
- 33 ○ Set the PILOT_REC_TYPE field of PILOT_REC to PILOT_REC_TYPE_r.
- 34 ○ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
- 35 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r and
- 36 set the TD_MODE field of PILOT_REC to TD_MODE_r.

- 1 ○ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall.
2 Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
3 Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
4 AUX_PILOT_WALSH_r with the Walsh Code length specified by
5 WALSH_LENGTH_r.
- 6 ○ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
7 Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
8 Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
9 AUX_WALSH_r with the Walsh Code length specified by
10 WALSH_LENGTH_r.
11 Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
12 AUX_TD_POWER_LEVEL_r.
13 Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
- 14 ○ Set FOR_PDCH_INCL_s to FOR_PDCH_INCL_r.
- 15 ○ If FOR_PDCH_INCL_r is equal to '1', the mobile station shall perform
16 the following:
17 ◇ If FOR_PDCH_PARMS_INCL_r is equal to '1', the mobile station
18 shall store the following parameters:
19 — The mobile station shall set WALSH_TABLE_ID_s to
20 WALSH_TABLE_ID_r.
21 — The mobile station shall set NUM_PDCCH_s to NUM_PDCCH_r.
22 — The mobile station shall set FOR_PDCCH_WALSH_s[i] to the ith
23 occurrence of FOR_PDCCH_WALSH_r.
24 ◇ The mobile station shall set MAC_ID_s to MAC_ID_r.
25 ◇ The mobile station shall set REV_CQICH_COVER_s to
26 REV_CQICH_COVER_r.
27 ◇ If EXT_CH_IND_r signals the allocation of a F-CPCCH, the mobile
28 station shall set FOR_CPCCH_WALSH_s to
29 FOR_CPCCH_WALSH_r, and FOR_CPCSCH_s to FOR_CPCSCH_r.
30 ◇ The mobile station shall store FOR_PDCCH_WALSH_s[i] to the ith
31 occurrence of FOR_PDCCH_WALSH_r.
- 32 ○ The mobile station shall set PWR_COMB_IND_s to PWR_COMB_IND_r.
- 33 ○ If PDCH_GROUP_IND_INCL_r is equal to '1', the mobile station shall
34 set PDCH_GROUP_IDENTIFIER_s as follows:
35 ◇ If this is the first pilot in the list that has a F-PDCH assignment,
36 the mobile station shall perform the following:

- 1 – The mobile station shall set PDCH_GROUP_IDENTIFIERS_s to
2 ‘000’;
- 3 ◇ Otherwise, the mobile station shall perform the following:
- 4 – If PDCH_GROUP_IND_r is set to ‘1’, the mobile station shall set
5 PDCH_GROUP_IDENTIFIERS_s to the same value as that of the
6 previous pilot in the list that has a F-PDCH assigned;
7 otherwise, the mobile station shall set
8 PDCH_GROUP_IDENTIFIERS_s to the value one greater than
9 that of the previous pilot in the list that has a F-PDCH
10 assigned.
- 11 ○ Otherwise, the mobile station shall perform the following:
- 12 ◇ If this is the first pilot in the list that has a F-PDCH assignment,
13 the mobile station shall perform the following:
- 14 – The mobile station shall set PDCH_GROUP_IDENTIFIERS_s to
15 ‘000’;
- 16 ◇ Otherwise, the mobile station shall perform the following:
- 17 – If F-PDCH is assigned for this pilot, the mobile station shall
18 perform the following:
- 19 a. If PWR_COMB_IND_r is set to ‘1’, and there are no pilots
20 between this pilot and the previous pilot in the list that
21 has a F-PDCH assigned, the mobile station shall set
22 PDCH_GROUP_IDENTIFIERS_s to the same value as that of
23 the previous pilot in the list that has a F-PDCH assigned.
- 24 b. If PWR_COMB_IND_r is set to ‘1’, and all pilots between
25 this pilot and the previous pilot in the list that has a F-
26 PDCH assigned have PWR_COMB_IND set to ‘1’, the
27 mobile station shall set PDCH_GROUP_IDENTIFIERS_s to
28 the same value as that of the previous pilot in the list that
29 has a F-PDCH assigned.
- 30 c. Otherwise, the mobile station shall set
31 PDCH_GROUP_IDENTIFIERS_s to the value one greater than
32 that of the previous pilot in the list.
- 33 – Otherwise, the mobile station shall set
34 PDCH_GROUP_IDENTIFIERS_s to NULL.
- 35 ○ If EXT_CH_IND_r signals the allocation of a F-FCH, the mobile station
36 shall set CODE_CHAN_FCH_s to CODE_CHAN_FCH_r, and
37 QOF_MASK_ID_FCH_s to QOF_MASK_ID_FCH_r.
- 38 ○ If EXT_CH_IND_r signals the allocation of a F-DCCH, the mobile
39 station shall set CODE_CHAN_DCCH_s to CODE_CHAN_DCCH_r, and
40 QOF_MASK_ID_DCCH_s to QOF_MASK_ID_DCCH_r.

- 1 ○ If FOR_PDCH_INCL_T is equal to '1', EXT_CH_IND_T signals the
2 allocation of a R-PDCH, and FOR_ACKCH_ASSIGNED_T is equal to '1',
3 the mobile station shall set FOR_ACKCH_WALSH_INDEX_S to
4 FOR_ACKCH_WALSH_INDEX_T, and FOR_ACKSCH_INDEX_S to
5 FOR_ACKSCH_INDEX_T.
- 6 ○ If FOR_RCCH_INCL_T is included and set to '1', the mobile station
7 shall do the following:
8 ◇ Set FOR_RCCH_WALSH_INDEX_S to FOR_RCCH_WALSH_INDEX_T.
9 ◇ Set FOR_RCSCH_INDEX_S to FOR_RCSCH_INDEX_T.
- 10 ○ If FOR_PDCH_INCL_T is equal to '1', and if FOR_GCH_ASSIGNED_T is
11 included and set to '1', the mobile station shall perform the following;
12 ◇ Set NUM_FOR_GCH_S to NUM_FOR_GCH_T, and
13 ◇ For each of the NUM_FOR_GCH_S occurrences of
14 FOR_GCH_WALSH_INDEX_T, the mobile station shall set
15 FOR_GCH_WALSH_INDEX_S[j] to FOR_GCH_WALSH_INDEX_T[j].
- 16 ○ Otherwise, the mobile station shall perform the following:
17 ◇ Set NUM_FOR_GCH_S to 0, and
18 ◇ Set FOR_GCH_WALSH_INDEX_S to NULL.
- 19 - The mobile station shall initialize CODE_CHAN_LIST as described in 2.6.8,
20 and shall set SERV_NEG_S to enabled.
- 21 - If FREQ_INCL_T equals '1', the mobile station shall then tune to the new
22 frequency assignment.
- 23 - The mobile station shall then enter the *Traffic Channel Initialization Substate*
24 of the *Mobile Station Control on the Traffic Channel State*.
- 25 8. *Feature Notification Message*: If RELEASE_T is equal to '1', the mobile station shall
26 enter the *Mobile Station Idle State* or the *System Determination Substate* of the *Mobile*
27 *Station Initialization State* with a release indication (see 2.6.1.1).
- 28 9. *Intercept Order*: The mobile station shall enter the *Mobile Station Idle State*.
- 29 10. *Local Control Order*
- 30 11. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and
31 record the reason for the *Lock Until Power-Cycled Order* in the mobile station's semi-
32 permanent memory (LCKRSN_P_{S-p} equals the least significant four bits of ORDQ_T).
33 The mobile station should notify the user of the locked condition. The mobile
34 station shall enter the *System Determination Substate* of the *Mobile Station*
35 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System*
36 *Access State* again until after the next mobile station power-up or until it has
37 received an *Unlock Order*. This requirement shall take precedence over any other
38 mobile station requirement specifying entry to the *System Access State*.

- 1 12. *Maintenance Required Order*: The mobile station shall record the reason for the
 2 *Maintenance Required Order* in the mobile station's semi-permanent memory
 3 (MAINTRSN_{S-p} equals the least significant four bits of ORDQ_r). The mobile station
 4 shall remain in the unlocked condition. The mobile station should notify the user of
 5 the maintenance required condition.
- 6 13. *PACA Message*: If P_REV_IN_USE_s is less than or equal to four and the mobile
 7 station does not support PACA capability, the mobile station shall send a *Mobile*
 8 *Station Reject Order* with the ORDQ field set to '00000110' (message requires a
 9 capability that is not supported by the mobile station); otherwise, the mobile station
 10 shall process the message as follows:
- 11 • If PACA_s is equal to disabled, the mobile station shall perform the following
 12 actions:
 - 13 - If the purpose of the message is to respond to an *Origination Message*
 14 (PURPOSE_r is equal to '0000'), the mobile station shall perform the following
 15 actions:
 - 16 + The mobile station shall set PACA_s to enabled and shall set PACA_SID_s
 17 to SID_s.
 - 18 + The mobile station shall set the PACA state timer to the duration shown
 19 in Table 3.7.2.3.2.20-2 corresponding to the value of PACA_TIMEOUT_s.
 - 20 + The mobile station should indicate to the user that the call has been
 21 queued as a PACA call, and should indicate the current queue position
 22 (Q_POS_r) of the call.
 - 23 + The mobile station shall enter the *Mobile Station Idle State*.
 - 24 - If the purpose of the message is to cancel the PACA call (PURPOSE_r is equal
 25 to '0011'), the mobile station shall perform the following actions:
 - 26 + The mobile station shall set PACA_s to disabled and PACA_CANCEL to '0',
 27 shall disable the PACA state timer, and should indicate to the user that
 28 the PACA call has been canceled.
 - 29 + The mobile station shall enter the *Mobile Station Idle State*.
 - 30 - If the purpose of the message is anything else (PURPOSE_r is not equal to
 31 '0000' or '0011'), the mobile station shall ignore the message. The mobile
 32 station shall remain in the *Mobile Station Origination Attempt Substate*.
 - 33 • If PACA_s is equal to enabled, the mobile station shall perform the following
 34 actions:
 - 35 - If the purpose of the message is to respond to an *Origination Message*
 36 (PURPOSE_r is equal to '0000'), the mobile station shall perform the following
 37 actions:
 - 38 + The mobile station should indicate to the user that the PACA call is still
 39 queued, and should indicate to the user the current queue position
 40 (Q_POS_r) of the call.

- 1 + The mobile station shall set the PACA state timer to the duration shown
2 in Table 3.7.2.3.2.20-2 corresponding to the value of PACA_TIMEOUT_S.
- 3 + The mobile station shall enter the *Mobile Station Idle State*.
- 4 - If the purpose of the message is to provide the queue position of the PACA
5 call (PURPOSE_R is equal to '0001'), the mobile station shall perform the
6 following actions:
- 7 + The mobile station should indicate to the user that the PACA call is still
8 queued, and should indicate the current queue position (Q_POS_R) of the
9 call.
- 10 + The mobile station shall set the PACA state timer to the duration shown
11 in Table 3.7.2.3.2.20-2 corresponding to the value of PACA_TIMEOUT_S.
- 12 + The mobile station shall enter the *Mobile Station Idle State*.
- 13 - If the purpose of the message is to instruct the mobile station to re-originate
14 the PACA call (PURPOSE_R is equal to '0010'), the mobile station shall remain
15 in the *Mobile Station Origination Attempt Substate*.
- 16 - If the purpose of the message is to cancel the PACA call (PURPOSE_R is equal
17 to '0011'), the mobile station shall perform the following actions:
- 18 + The mobile station shall set PACA_S to disabled, shall disable the PACA
19 state timer, and should indicate to the user that the PACA call has been
20 canceled.
- 21 + The mobile station shall enter the *Mobile Station Idle State*.
- 22 14. *Registration Accepted Order*: The mobile station shall perform the procedures as
23 specified in 2.6.11.1.
- 24 15. *Registration Rejected Order*: This order indicates that normal service is not available
25 on this system. The mobile station shall disable the full-TMSI timer. If the received
26 order specifies to delete the TMSI (ORDQ = '00000100'), the mobile station shall set
27 all the bits of the TMSI_CODE_{S-p} to '1'. The mobile station shall enter the *System*
28 *Determination Substate* of the *Mobile Station Initialization State* with a registration
29 rejected indication (see 2.6.1.1).
- 30 16. *Release Order* or *Service Status Order*: If NDSS_ORIG_S is equal to enabled, the
31 mobile station shall set NDSS_ORIG_S to disabled, and should indicate to the user
32 that the call origination has been canceled. The mobile station shall enter the
33 *Mobile Station Idle State* or the *System Determination Substate* of the *Mobile Station*
34 *Initialization State* with a release indication (see 2.6.1.1). If the mobile station enters
35 the *Mobile Station Idle State*, and if PACA_S is equal to enabled, the mobile station
36 shall set PACA_S to disabled and PACA_CANCEL to '0', shall disable the PACA state
37 timer, and should indicate to the user that the PACA call has been canceled.
- 38 17. *Reorder Order*: If NDSS_ORIG_S is equal to enabled, the mobile station shall set
39 NDSS_ORIG_S to disabled, and should indicate to the user that the call origination
40 has been canceled. If PACA_S is equal to enabled, the mobile station shall set PACA_S

1 to disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and
 2 should indicate to the user that the PACA call has been canceled. The mobile
 3 station shall enter the *Mobile Station Idle State*.

4 18. *Retry Order*: The mobile station shall process the order as follows:

- 5 • If RETRY_TYPE_R is equal to '000', the mobile station shall set
 6 RETRY_DELAY_S[RETRY_TYPE] to 0, where RETRY_TYPE is equal to '001', '010',
 7 '011', '100', or '101'.
- 8 • If RETRY_TYPE_R is equal to '001', '100', or '101', then the mobile station shall
 9 perform the following:
 - 10 - If RETRY_DELAY_R is equal to '00000000', then the mobile station shall set
 11 RETRY_DELAY_S[RETRY_TYPE_R] to 0.
 - 12 - If RETRY_DELAY_R is not equal to '00000000', the mobile station shall set
 13 RETRY_DELAY_S as follows:
 - 14 + If the most significant bit of the RETRY_DELAY_R is '0', set
 15 RETRY_DELAY_UNIT_S to 1000ms. If the most significant bit of the
 16 RETRY_DELAY_R is '1', set RETRY_DELAY_UNIT_S to 60000ms.
 - 17 + The mobile station shall set RETRY_DELAY_VALUE_S to the seven least
 18 significant bits of RETRY_DELAY_R.
 - 19 + The mobile station shall store the next system time 80 ms boundary +
 20 RETRY_DELAY_VALUE_S × RETRY_DELAY_UNIT_S ms as
 21 RETRY_DELAY_S[RETRY_TYPE_R].
 - 22 + If RETRY_TYPE_R is equal to '001' or '101', and NDSS_ORIG_S is equal to
 23 enabled, the mobile station shall set NDSS_ORIG_S to disabled and
 24 should indicate to the user that the call origination has been canceled. If
 25 PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled
 26 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
 27 indicate to the user that the PACA call has been canceled.
 - 28 + If RETRY_TYPE_R is equal to '001' or '101', the mobile station shall enter
 29 the *Mobile Station Idle State*.

30 19. *Security Mode Command Message*: The mobile station shall perform the procedures
 31 as specified in 2.6.11.4.

32 20. *Service Redirection Message*: The mobile station shall process the message as
 33 follows:

- 34 • If the mobile station is directed to an unsupported operation mode or band
 35 class, the mobile station shall respond with a *Mobile Station Reject Order* with
 36 ORDQ equal to '00000110' (message requires a capability that is not supported
 37 by the mobile station).
- 38 • If DELETE TMSI_R is equal to '1', the mobile station shall set all the bits of
 39 TMSI_CODE_{S-P} to '1'.
- 40 • The mobile station shall disable the full-TMSI timer.

- 1 • The mobile station shall set RETURN_IF_FAIL_S = RETURN_IF_FAIL_T.
- 2 • If RECORD_TYPE_T is '00000000', the mobile station shall set RETURN_IF_FAIL_S
- 3 = RETURN_IF_FAIL_T, and enter the *System Determination Substate* of the *Mobile*
- 4 *Station Initialization State* with an NDSS off indication (see 2.6.1.1); otherwise:
- 5 - if REDIRECT_TYPE_T is '0', the mobile station shall store the redirection
- 6 record received in the message as REDIRECT_REC_S and shall enter the
- 7 System Determination Substate of the *Mobile Station Initialization State* with
- 8 a redirection indication (see 2.6.1.1).
- 9 - if REDIRECT_TYPE_T is '1', the mobile station shall store the redirection
- 10 record received in the message as REDIRECT_REC_S and shall enable
- 11 NDSS_ORIG_S, and shall record the dialed digits (if any). The mobile station
- 12 shall enter the System Determination Substate of the *Mobile Station*
- 13 *Initialization State* with a redirection indication (see 2.6.1.1).
- 14 21. *SSD Update Message*: The mobile station shall respond to the message as specified
- 15 in 2.3.12.1.5.
- 16 22. *Status Request Message*: The mobile station shall disable the *System Access State*
- 17 timer and respond to the message. If P_REV_IN_USE_S is less than or equal to three,
- 18 the mobile station shall respond with a *Status Response Message*. If
- 19 P_REV_IN_USE_S is greater than three, the mobile station shall respond with an
- 20 *Extended Status Response Message*. If the message does not specify any
- 21 qualification information (QUAL_INFO_TYPE_T is equal to '00000000'), the mobile
- 22 station shall include the requested information records in the response. If the
- 23 message specifies a band class (QUAL_INFO_TYPE_T is equal to '00000001'), the
- 24 mobile station shall only include the requested information records for the specified
- 25 band class (BAND_CLASS_T) in the response. If the message specifies a band class
- 26 and an operating mode (QUAL_INFO_TYPE_T is equal to '00000010'), the mobile
- 27 station shall only include the requested information records for the specified band
- 28 class (BAND_CLASS_T) and operating mode (OP_MODE_T) in the response. If the
- 29 message specifies a band class or a band class and an operating mode which are
- 30 not supported by the mobile station, the mobile station shall send a *Mobile Station*
- 31 *Reject Order* with ORDQ set to '00000110' (message requires a capability that is not
- 32 supported by the mobile station). If the response to this message exceeds the
- 33 allowable length, the mobile station shall send a *Mobile Station Reject Order* with
- 34 ORDQ set to '00001000' (response message would exceed the allowable length). If
- 35 the message specifies an information record which is not supported by the mobile
- 36 station for the specified band class and operating mode, the mobile station shall
- 37 send a *Mobile Station Reject Order* with ORDQ set to '00001001' (information record
- 38 is not supported for the specified band class and operating mode).
- 39 23. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code
- 40 as follows:
- 41 • The mobile station shall store the length of the TMSI zone field by setting
- 42 ASSIGNING_TMSI_ZONE_LEN_{S-p} to TMSI_ZONE_LEN_T,

- 1 • The mobile station shall store the assigning TMSI zone number by setting the
2 ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
3 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- 4 • The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
5 TMSI_CODE_r.

6 The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p}
7 to TMSI_EXP_TIME_r. The mobile station shall disable the full-TMSI timer. The
8 mobile station shall then respond with a *TMSI Assignment Completion Message*
9 within T_{56m} seconds.

10 24. *User Zone Reject Message*

11 25. *BCMC Order*. The mobile station shall process this message as follows:

- 12 • If ORDQ_r is set to '00000000', the mobile station shall perform the following for
13 each of the BCMC flows that the base station is responding to:
 - 14 - If CLEAR_ALL_RETRY_DELAY_r equals '1', the mobile station shall delete the
15 currently stored BCMC Retry Delay List.
 - 16 - If CLEAR_RETRY_DELAY_r equals '1', the mobile station shall delete the entry
17 in the BCMC_RETRY_DELAY_LIST_s[i] corresponding to BCMC_FLOW_ID
18 (See section 2.6.13.11) in this message.
 - 19 - If ALL_BCMC_REASON_r or BCMC_REASON_r equals '0000', Layer 3 shall
20 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE, cause=*
21 *FLOW_NOT_AVAILABLE, reason_ind=CURRENT_SYS)* for each of the
22 corresponding BCMC_FLOW_ID to the BCMC Service Layer.
 - 23 - If ALL_BCMC_REASON_r or BCMC_REASON_r equals '0001', Layer 3 shall
24 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE, cause=*
25 *FLOW_NOT_TRANSMITTED, reason_ind=CURRENT_SYS)* for each of the
26 corresponding BCMC_FLOW_ID to the BCMC Service Layer.
 - 27 - If BCMC_REASON_r equals '0010' for any of the flows or
28 ALL_BCMC_REASON_r equals '0010', the mobile station shall enable the
29 BCMC wait timer with a value of BSPM_WAIT_TIME seconds, shall enter the
30 *Mobile Station Idle State* and shall wait for an updated *BCMC Service*
31 *Parameters Message* as specified in 2.6.13.1.
 - 32 - If ALL_BCMC_REASON_r or BCMC_REASON_r equals '0011', Layer 3 shall
33 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = SUCCESS, cause*
34 *= REGISTRATION_ACCEPTED, reason_ind = CURRENT_SYS)* for each of the
35 corresponding BCMC_FLOW_ID to the BCMC Service Layer.
 - 36 - If ALL_BCMC_REASON_r or BCMC_REASON_r equals '0100', Layer 3 shall
37 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause=*
38 *AUTHORIZATION_FAILURE, reason_ind = CURRENT_SYS)* for each of the
39 corresponding BCMC_FLOW_ID to the BCMC Service Layer.

- 1 - If ALL_BCMC_REASON_r or BCMC_REASON_r equals '0101', the mobile
2 station shall perform the following:
- 3 + Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID,*
4 *result=FAILURE, cause= RETRY_DELAY, reason_ind=CURRENT_SYS)* for
5 each of the corresponding BCMC_FLOW_ID to the BCMC Service Layer.
- 6 + For each of the corresponding BCMC_FLOW_ID, if there is a
7 BCMC_RETRY_DELAY_LIST_s[i].BCMC_FLOW_ID which is same as
8 BCMC_FLOW_ID (See section 2.6.13.11), the mobile station shall set
9 BCMC_RETRY_DELAY_LIST_s[i].RETRY_DELAY to current system time
10 plus ALL_BCMC_RETRY_DELAY_r/BCMC_RETRY_DELAY_r; otherwise, the
11 mobile station shall add new BCMC_RETRY_DELAY_LIST_s[i] to the
12 BCMC Retry Delay List and shall set
13 BCMC_RETRY_DELAY_LIST_s[i].BCMC_FLOW_ID to the BCMC_FLOW_ID,
14 BCMC_RETRY_DELAY_LIST_s[i].RETRY_DELAY to current system time
15 plus ALL_BCMC_RETRY_DELAY_r/BCMC_RETRY_DELAY_r.
- 16 - If the base station indicates BCMC_REASON (indicated via
17 ALL_BCMC_REASON_r/BCMC_REASON_r) of '0000', '0001', '0011', '0100', or
18 '0101' for all of the flows requested, the mobile station shall enter the *Mobile*
19 *Station Idle State*.

20 26. General Extension Message: The mobile station shall process this message as
21 specified in section 2.6.18.

22 27. *EACH Selective Acknowledgment Order*: The mobile station shall process this order
23 as specified in 2.6.3.3.

24 28. *Any other message*: If the mobile station receives any other message specified in
25 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all
26 other messages.

27 If the mobile station performs an access probe handoff or access handoff and receives any
28 of the following messages, it shall process the message as specified in 2.6.3.1.3:

- 29 • If the mobile station is currently monitoring the Paging Channel:
- 30 1. *System Parameters Message*
- 31 2. *Access Parameters Message*
- 32 3. *Neighbor List Message*
- 33 4. *Extended System Parameters Message*
- 34 5. *Extended Neighbor List Message*
- 35 6. *General Neighbor List Message*
- 36 7. *Global Service Redirection Message*
- 37 8. *Extended Global Service Redirection Message*
- 38 9. *Generic Access Parameters Message*

- 1 • If the mobile station is currently monitoring the Primary Broadcast Control
- 2 Channel:
- 3 1. *ANSI-41 System Parameters Message*
- 4 2. *Enhanced Access Parameters Message*
- 5 3. *Universal Neighbor List Message*
- 6 4. *MC-RR Parameters Message*
- 7 5. *Extended Global Service Redirection Message*

8 2.6.3.6 Registration Access Substate

9 In this substate, the mobile station sends a *Registration Message*. If the base station
10 responds with an authentication request, the mobile station responds in this substate.

11 Upon entering the *Registration Access Substate*, the mobile station shall send the
12 *Registration Message*. If the mobile station supports **DEVICE_CHARACTERISTIC_p**, and
13 **CAPABILITY_GEM_ALLOWED_s** = '1', it shall send a *Registration Message* including the
14 information in **DEVICE_CHARACTERISTIC_p** via *General Extension Message* (GEM).

15 If a message received from the base station requires a Layer 2 acknowledgment and does
16 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is
17 outstanding (see [4]).

18 If a message received from the base station requires a Layer 2 acknowledgment and also a
19 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

20 When transmitting a response to a message received from the base station, Layer 3 shall
21 indicate to Layer 2 that the type of the message is a response (see [4]).

22 When transmitting an autonomous message (i.e., a message that is not sent as a response
23 to a message received from the base station) other than the *Registration Message*, Layer 3
24 shall indicate to Layer 2 that the type of the message is a request other than a registration
25 request or a message transmission request (see [4]).

26 When transmitting an autonomous *Registration Message* (i.e., it is not sent as a response to
27 a *Registration Request Order* received from the base station), Layer 3 shall indicate to Layer
28 2 that the type of the message is a request that is a registration (see [4]).

29 While in this substate, the mobile station shall monitor the Paging Channel or the Forward
30 Common Control Channel. If the mobile station declares a loss of the Paging Channel or
31 the Forward Common Control Channel (see 2.6.3.1.8), the mobile station shall perform the
32 following:

- 33 • If **PACA_s** is equal to enabled, the mobile station shall set **PACA_s** to disabled and
34 **PACA_CANCEL** to '0', shall disable the PACA state timer, and should indicate to the
35 user that the PACA call has been canceled.
- 36 • The mobile station shall declare an access attempt failure and update its
37 registration variables as specified in 2.6.5.5.3.2.
- 38 • The mobile station shall disable its transmitter and enter the *Mobile Station Idle*
39 *State*.

1 If the mobile station receives confirmation of delivery of any message sent by the mobile
2 station in this substate, it shall then enter the *Mobile Station Idle State* unless:

- 3 • If the registration access was initiated due to a user direction to power down, the
4 mobile station shall update registration variables as specified in 2.6.5.5.3.3 and
5 may power down.
- 6 • If the mobile station has included the ENC_SEQ_H field in the *Registration Message*.
- 7 • If a message received from the base station requires a response, the mobile station
8 shall send a response to the message in this substate.

9 If the mobile station receives confirmation of delivery of the *Registration Message*, the
10 mobile station shall update its registration variables as specified in 2.6.5.5.3.1.

11 If the mobile station is directed by the user to originate a call, the mobile station may
12 process the origination request as follows:

- 13 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
14 access attempt in progress.
- 15 • If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and
16 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
17 user that the PACA call has been canceled.
- 18 • The mobile station shall enter the *Mobile Station Origination Attempt Substate* with
19 an origination indication.

20 If PACA_S is equal to enabled, the mobile station shall set PACA_CANCEL to '1' when the
21 user directs the mobile station to cancel a PACA call.

22 If the mobile station is to exit the *System Access State* as a result of processing Layer 3
23 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*
24 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to
25 the message has been sent and acknowledged.

26 If Layer 3 receives a message other than message listed below:

- 27 • *Extended Channel Assignment Message* with DIRECT_CH_ASSIGN_IND field
28 included and set to '1'

29 with an indication from Layer 2 that an access attempt for a message being transmitted
30 was not terminated as a result of processing the Layer 2 fields of the received message, the
31 mobile station shall ignore the received message.

32 The following directed messages and orders can be received. If any field value of the
33 message or order is outside its permissible range, the mobile station may send a *Mobile*
34 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 35 1. *Authentication Challenge Message*: If the registration access was initiated due to a
36 user direction to power down, the mobile station shall ignore the message;
37 otherwise, the mobile station shall respond to the message as specified in
38 2.3.12.1.4, regardless of the value of AUTH_S.

- 1 2. *Authentication Request Message*: The mobile station shall process the message and
2 shall respond as specified in 2.3.12.5.2.
- 3 3. *Base Station Challenge Confirmation Order*: If the registration access was initiated
4 due to a user direction to power down, the mobile station shall ignore the message;
5 otherwise, the mobile station shall respond to the message as specified in
6 2.3.12.1.5.
- 7 4. *Base Station Reject Order*: The mobile station shall perform the procedures as
8 specified in 2.6.11.5.
- 9 5. *Data Burst Message*
- 10 6. *Feature Notification Message*
- 11 7. *Local Control Order*
- 12 8. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and
13 record the reason for the *Lock Until Power-Cycled Order* in the mobile station's semi-
14 permanent memory (LCKRSN_{P-s-p} equals the least significant four bits of ORDQ_r).
15 The mobile station should notify the user of the locked condition. The mobile
16 station shall enter the *System Determination Substate* of the *Mobile Station*
17 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System*
18 *Access State* again until after the next mobile station power-up or until it has
19 received an *Unlock Order*. This requirement shall take precedence over any other
20 mobile station requirement specifying entry to the *System Access State*.
- 21 9. *Maintenance Required Order*: The mobile station shall record the reason for the
22 *Maintenance Required Order* in the mobile station's semi-permanent memory
23 (MAINTRSN_{S-p} equals the least significant four bits of ORDQ_r). The mobile station
24 shall remain in the unlocked condition. The mobile station should notify the user of
25 the maintenance required condition.
- 26 10. *PACA Message*: If P_REV_IN_USE_s is less than or equal to four and the mobile
27 station does not support PACA capability, the mobile station shall send a *Mobile*
28 *Station Reject Order* with the ORDQ field set to '00000110' (message requires a
29 capability that is not supported by the mobile station); otherwise, the mobile station
30 shall process the message as follows:
- 31 If PACA_s is equal to disabled, the mobile station shall send a *Mobile Station Reject*
32 *Order* with the ORDQ field set to '00000010' (message not accepted in this state).
- 33 If PACA_s is equal to enabled, the mobile station shall perform the following:
- 34 • If the purpose of the message is to respond to an *Origination Message*
35 (PURPOSE_r is equal to '0000'), the mobile station shall send a *Mobile Station*
36 *Reject Order* with the ORDQ field set to '00000010' (message not accepted in this
37 state).
 - 38 • If the purpose of the message is to provide the queue position of the PACA call
39 (PURPOSE_r is equal to '0001'), the mobile station shall set the PACA state timer
40 to the duration shown in Table 3.7.2.3.2.20-2 corresponding to the value of

- 1 PACA_TIMEOUT_s, should indicate to the user that the PACA call is still queued,
2 and should indicate to the user the current queue position (Q_POS_r) of the call.
- 3 • If the purpose of the message is to instruct the mobile station to re-originate the
4 PACA call (PURPOSE_r is equal to '0010'), Layer 3 shall send an L2-
5 Supervision.Request primitive to Layer 2 to abort any access attempt in
6 progress, shall set the PACA state timer to the duration shown in Table
7 3.7.2.3.2.20-2 corresponding to the value of PACA_TIMEOUT_s, and shall enter
8 the *Mobile Station Origination Attempt Substate* with a PACA response indication.
 - 9 • If the purpose of the message is to cancel the PACA call (PURPOSE_r is equal to
10 '0011'), the mobile station shall set PACA_s to disabled and PACA_CANCEL to '0',
11 shall disable the PACA state timer, and should indicate to the user that the
12 PACA call has been canceled.
- 13 11. *Registration Accepted Order*: The mobile station shall perform the procedures
14 specified in 2.6.11.1
- 15 12. *Registration Rejected Order*: This order indicates that normal service is not available
16 on this system. The mobile station shall disable the full-TMSI timer. If the received
17 order specifies to delete the TMSI (ORDQ = '00000100'), the mobile station shall set
18 all the bits of the TMSI_CODE_{s-p} to '1'. The mobile station shall enter the *System*
19 *Determination Substate* of the *Mobile Station Initialization State* with a registration
20 rejected indication (see 2.6.1.1).
- 21 13. *Release Order*: If NDSS_ORIG_s is equal to enabled, the mobile station shall set
22 NDSS_ORIG_s to disabled, and should indicate to the user that the call origination
23 has been canceled. The mobile station shall enter the *Mobile Station Idle State* or
24 the *System Determination Substate* of the *Mobile Station Initialization State* with a
25 release indication (see 2.6.1.1). If the mobile station enters the *Mobile Station Idle*
26 *State*, and if PACA_s is equal to enabled, the mobile station shall set PACA_s to
27 disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and should
28 indicate to the user that the PACA call has been canceled.
- 29 14. *Retry Order*: The mobile station shall process the message as follows:
- 30 • If RETRY_TYPE_r is equal to '000', the mobile station shall set
31 RETRY_DELAY_s[RETRY_TYPE] to 0, where RETRY_TYPE is equal to '001', '010',
32 '011', '100', or '101'.
 - 33 • If RETRY_TYPE_r is equal to '001', '100', or '101', the mobile station shall perform
34 the following:
 - 35 - If RETRY_DELAY_r is equal to '00000000', then the mobile station shall set
36 RETRY_DELAY_s[RETRY_TYPE_r] to 0.
 - 37 - If RETRY_DELAY_r is not equal to '00000000', the mobile station shall set
38 RETRY_DELAY_s[RETRY_TYPE_r] as follows:
 - 39 + If the most significant bit of the RETRY_DELAY_r is '0', set
40 RETRY_DELAY_UNIT_s to 1000ms. If the most significant bit of the
41 RETRY_DELAY_r is '1', set RETRY_DELAY_UNIT_s to 60000ms.

- 1 + The mobile station shall set $\text{RETRY_DELAY_VALUE}_S$ to the seven least
2 significant bits of RETRY_DELAY_T .
- 3 + The mobile station shall store the next system time 80 ms boundary +
4 $\text{RETRY_DELAY_VALUE}_S \times \text{RETRY_DELAY_UNIT}_S$ ms as
5 $\text{RETRY_DELAY}_S[\text{RETRY_TYPE}_T]$.
- 6 15. *Security Mode Command Message*: The mobile station shall perform the procedures
7 as specified in 2.6.11.4.
- 8 16. *Service Redirection Message*: The mobile station shall process the message as
9 follows:
- 10 • If the mobile station is directed to an unsupported operation mode or band
11 class, the mobile station shall respond with a *Mobile Station Reject Order* with
12 ORDQ equal to '00000110' (message requires a capability that is not supported
13 by the mobile station).
 - 14 • If DELETE_TMSI_T is equal to '1', the mobile station shall set all the bits of
15 TMSI_CODE_{S-P} to '1'. The mobile station shall disable the full-TMSI timer.
 - 16 • The mobile station shall set $\text{RETURN_IF_FAIL}_S = \text{RETURN_IF_FAIL}_T$.
 - 17 • If RECORD_TYPE_T is equal to '00000000', the mobile station shall enter the
18 *System Determination Substate* of the *Mobile Station Initialization State* with an
19 NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the
20 redirection record received in the message as REDIRECT_REC_S and shall enter
21 the *System Determination Substate* of the *Mobile Station Initialization State* with a
22 redirection indication (see 2.6.1.1).
- 23 17. *SSD Update Message*: If the registration access was initiated due to a user direction
24 to power down, the mobile station shall ignore the message. Otherwise, the mobile
25 station shall respond to the message as specified in 2.3.12.1.5.
- 26 18. *Status Request Message*: The mobile station shall disable the *System Access State*
27 timer and respond to the message. If P_REV_IN_USE_S is less than or equal to three,
28 the mobile station shall respond with a *Status Response Message*. If
29 P_REV_IN_USE_S is greater than three, the mobile station shall respond with an
30 *Extended Status Response Message*. If the message does not specify any
31 qualification information (QUAL_INFO_TYPE_T is equal to '00000000'), the mobile
32 station shall include the requested information records in the response. If the
33 message specifies a band class (QUAL_INFO_TYPE_T is equal to '00000001'), the
34 mobile station shall only include the requested information records for the specified
35 band class (BAND_CLASS_T) in the response. If the message specifies a band class
36 and an operating mode (QUAL_INFO_TYPE_T is equal to '00000010'), the mobile
37 station shall only include the requested information records for the specified band
38 class (BAND_CLASS_T) and operating mode (OP_MODE_T) in the response.
- 39 If the message specifies a band class or a band class and an operating mode which
40 are not supported by the mobile station, the mobile station shall send a *Mobile*
41 *Station Reject Order* with ORDQ set to '00000110' (message requires a capability
42 that is not supported by the mobile station). If the response to this message

1 exceeds the allowable length, the mobile station shall send a *Mobile Station Reject*
 2 *Order* with ORDQ set to '00001000' (response message would exceed the allowable
 3 length). If the message specifies an information record which is not supported by
 4 the mobile station for the specified band class and operating mode, the mobile
 5 station shall send a *Mobile Station Reject Order* with ORDQ set to '00001001'
 6 (information record is not supported for the specified band class and operating
 7 mode).

8 19. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code
 9 as follows:

- 10 • The mobile station shall store the length of the TMSI zone field by setting
 11 ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r;
- 12 • The mobile station shall store the assigning TMSI zone number by setting the
 13 ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
 14 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- 15 • The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
 16 TMSI_CODE_r.

17 The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p}
 18 to TMSI_EXP_TIME_r. The mobile station shall disable the full-TMSI timer. The
 19 mobile station shall then respond with a *TMSI Assignment Completion Message*
 20 within T_{56m} seconds.

21 20. *User Zone Reject Message*

22 21. *General Page Message* or *Universal Page Message*: If the mobile station receives a
 23 mobile-station-addressed page, the mobile station may determine if there is a page
 24 match (see 2.6.2.3). If a match is declared, the mobile station shall perform the
 25 following:

- 26 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
 27 access attempt in progress.
- 28 • The mobile station shall enter the *Page Response Substate*.

29 22. *Extended Channel Assignment Message*: If the DIRECT_CH_ASSIGN_IND_r is
 30 included and is set to '1', the mobile station shall perform the following:

- 31 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
 32 access attempt in progress.
- 33 • The mobile station shall process the message as specified in section 2.6.3.3.

34 Otherwise, the mobile station shall ignore this message.

35 23. *Fast Call Setup Order*

- 36 • If ORDQ_r is equal to '00000000', the mobile station shall process the message
 37 and respond with a *Fast Call Setup Order* as specified in 2.6.12.1.
- 38 • If ORDQ_r is equal to '00000001', the mobile station shall process the message
 39 as specified in 2.6.12.1.

1 24. General Extension Message: The mobile station shall process this message as
2 specified in section 2.6.18.

3 25. *EACH Selective Acknowledgment Order*: The mobile station shall process this order
4 as specified in 2.6.3.3.

5 26. *Any other message*: If the mobile station receives any other message specified in
6 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all
7 other messages.

8 2.6.3.7 Mobile Station Message Transmission Substate

9 In this substate, the mobile station sends a *Data Burst Message*, a *Device Information*
10 *Message*, a *Radio Environment Message*, or a *Fast Call Setup Order*. If the base station
11 responds with an authentication request, the mobile station responds in this substate.

12 Support of this substate is optional.

13 If a message received from the base station requires a Layer 2 acknowledgment and does
14 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is
15 outstanding (see [4]).

16 If a message received from the base station requires a Layer 2 acknowledgment and also a
17 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

18 When transmitting a response to a message received from the base station, Layer 3 shall
19 indicate to Layer 2 that the type of the message is a response (see [4]).

20 When transmitting an autonomous message (i.e., a message that is not sent as a response
21 to a message received from the base station) other than the *Data Burst Message*, Layer 3
22 shall indicate to Layer 2 that the message is a request other than a registration request or
23 a message transmission request (see [4]).

24 When transmitting an autonomous *Data Burst Message*, Layer 3 shall indicate to Layer 2
25 that the type of the message is a request that is a message transmission (see [4]).

26 The mobile station shall not send any Short Data Burst (see ~~30~~[53], [42]) until the
27 maximum of the system time stored in $RETRY_DELAY_s[100]$ and $RETRY_DELAY_s[101]$.

28 Upon entering the *Mobile Station Message Transmission Substate*, the mobile station shall
29 transmit the message as follows:

- 30 • The mobile station shall exit the *Mobile Station Message Transmission Substate*,
31 shall enter either the *Mobile Station Idle State* or the *System Determination Substate*
32 with an ACCT blocked indication, and should indicate to the user that the message
33 transmission has terminated if all of the following conditions are true:
 - 34 - $P_REV_IN_USE_s$ is greater than six,
 - 35 - ACCT is enabled for the service option number associated with the *Data Burst*
36 *Message*, due to either of the following two conditions:
 - 37 + The service option number associated with the *Data Burst Message* is equal
38 to an ACCT_SO entry in ACCT_SO_LIST, or

- 1 + The service option group number of the service option associated with the
2 *Data Burst Message* is equal to an ACCT_SO_GRP entry in
3 ACCT_SO_GRP_LIST.
- 4 • If the mobile station entered this substate with a message transmission indication,
5 the mobile station shall transmit the *Data Burst Message* to the base station.
 - 6 • If the mobile station entered this substate with a hook status indication, the mobile
7 station shall set the autonomous message timer equal to AUTO_MSG_INTERVALs
8 and shall start the timer. The mobile station shall transmit the Device Information
9 Message to the base station, with the RECORD_TYPE field of the message set to
10 00100000 and the Hook Indicator field set to the current hook status.
 - 11 • If the mobile station entered this substate with a radio environment report
12 indication, the mobile station shall transmit the *Radio Environment Message* to the
13 base station in assured mode, and increment RER_COUNT upon receiving
14 confirmation of delivery. If, after incrementing, RER_COUNT is equal to
15 RER_MAX_NUM_MSGs, the mobile station shall set RER_MODE_ENABLED to NO. If
16 RER_MODE_ENABLED is set to NO and TKZ_MODE_PENDING is equal to YES, the
17 mobile station shall perform the following:
 - 18 - Set TKZ_MODE_ENABLED to YES and TKZ_MODE_PENDING to NO.
 - 19 - If TKZ_SID_s is equal to SID_s, TKZ_NID_s is equal to NID_s, and
20 TKZ_MODE_SUPPORTED_s is equal to '1', initialize the tracking zone list
21 (TKZ_LIST) to contain TKZ_ID_s; otherwise, initialize the tracking zone list to
22 NULL.
 - 23 - Enable the tracking zone update timer with an initial value of infinity if
24 TKZ_UPDATE_PRD_s is equal to '1111'; otherwise, the mobile station shall enable
25 the tracking zone update timer with an initial value of $2^{TKZ_UPDATE_PRD_s + 6}$
26 seconds.
 - 27 • If the mobile station entered this substate with a tracking zone indication, the
28 mobile station shall perform the following:
 - 29 - The mobile station shall transmit the *Radio Environment Message* to the base
30 station.
 - 31 - If the mobile station receives confirmation of delivery of *Radio Environment*
32 *Message*, the mobile station shall add TKZ_ID_s to TKZ_LIST. For all entries of
33 TKZ_LIST whose TKZ timer is not active, other than TKZ_ID_s, enable the TKZ
34 timer with the duration specified by TKZ_TIMER_s. If TKZ_LIST contains more
35 than TKZ_LIST_LEN_s + 1 entries, the entry with active TKZ timer with smallest
36 remaining TKZ timer value shall be removed from the list before adding the new
37 entry.
 - 38 - The mobile station shall increment TKZ_COUNT upon receiving confirmation of
39 delivery. If, after incrementing, TKZ_COUNT is equal to TKZ_MAX_NUM_MSGs,
40 the mobile station shall disable the tracking zone update timer and set
41 TKZ_MODE_ENABLED to NO.

- 1 • If the mobile station entered this substate with a fast call setup indication, the
2 mobile station shall transmit the *Fast Call Setup Order* (ORDQ = '00000000') to the
3 base station as follows:
- 4 - If the mobile station requests operation in the reduced slot cycle mode, the
5 mobile station shall set the RSC_MODE_IND field to '1' and perform the
6 following:
- 7 + Set RSC_MODE_ENABLED to YES.
- 8 + Set the RSC_END_TIME_UNIT and RSC_END_TIME_VALUE fields as
9 specified in 2.7.3.6, and store the system time specified by these fields as
10 RSC_END_TIME.
- 11 + Set the RSCI field as specified in 2.7.3.6 and store it as RSCI_s; if RSCI_s is
12 equal to '0111', set SLOTTED_s to NO.
- 13 + Set IGNORE_QPCH_s to '1'.
- 14 - Otherwise, the mobile station shall set the RSC_MODE_IND field to '0'.
- 15 • While in this substate, the mobile station shall monitor the Paging Channel or the
16 Forward Common Control Channel. If the mobile station declares a loss of the
17 Paging Channel or the Forward Common Control Channel (see 2.6.3.1.8), the
18 mobile station shall perform the following:
- 19 - If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled and
20 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to
21 the user that the PACA call has been canceled.
- 22 - The mobile station shall declare an access attempt failure and update its
23 registration variables as specified in 2.6.5.5.3.2.
- 24 - The mobile station shall disable its transmitter and enter the *Mobile Station Idle*
25 *State*.

26 If the mobile station receives confirmation of any message sent by the mobile station in this
27 substate, it shall send a response in this substate if required and shall then enter the
28 *Mobile Station Idle State*.

29 If PACA_s is equal to enabled, the mobile station shall set PACA_CANCEL to '1' when the
30 user directs the mobile station to cancel a PACA call.

31 If the mobile station is to exit the *System Access State* as a result of processing Layer 3
32 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*
33 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to
34 the message has been sent and acknowledged.

35 If Layer 3 receives a message other than message listed below:

- 36 • *Extended Channel Assignment Message* with DIRECT_CH_ASSIGN_IND field
37 included and set to '1'

1 with an indication from Layer 2 that an access attempt for a message being transmitted
 2 was not terminated as a result of processing the Layer 2 fields of the received message, the
 3 mobile station shall ignore the received message.

4 The following directed messages and orders can be received. If any field value of the
 5 message or order is outside its permissible range, the mobile station may send a *Mobile*
 6 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 7 1. *Authentication Challenge Message*: The mobile station shall respond to the message
 8 as specified in 2.3.12.1.4, regardless of the value of AUTH_S.
- 9 2. *Authentication Request Message*: The mobile station shall process the message and
 10 shall respond as specified in 2.3.12.5.2.
- 11 3. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the
 12 message as specified in 2.3.12.1.5.
- 13 4. *Base Station Reject Order*: The mobile station shall perform the procedures as
 14 specified in 2.6.11.5.
- 15 5. *Data Burst Message*
- 16 6. *Local Control Order*
- 17 7. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and
 18 record the reason for the *Lock Until Power-Cycled Order* in the mobile station's semi-
 19 permanent memory (LCKRSN_{P_{s-p}} equals the least significant four bits of ORDQ_T).
 20 The mobile station should notify the user of the locked condition. The mobile
 21 station shall enter the *System Determination Substate* of the *Mobile Station*
 22 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System*
 23 *Access State* again until after the next mobile station power-up or until it has
 24 received an *Unlock Order*. This requirement shall take precedence over any other
 25 mobile station requirement specifying entry to the *System Access State*.
- 26 8. *Maintenance Required Order*: The mobile station shall record the reason for the
 27 *Maintenance Required Order* in the mobile station's semi-permanent memory
 28 (MAINTRSN_{S-p} equals the least significant four bits of ORDQ_T). The mobile station
 29 shall remain in the unlocked condition. The mobile station should notify the user of
 30 the maintenance required condition.
- 31 9. *PACA Message*: If P_REV_IN_USE_S is less than or equal to four and the mobile
 32 station does not support PACA capability, the mobile station shall send a *Mobile*
 33 *Station Reject Order* with the ORDQ field set to '00000110' (message requires a
 34 capability that is not supported by the mobile station); otherwise, the mobile station
 35 shall process the message as follows:
 36 If PACA_S is equal to disabled, the mobile station shall send a *Mobile Station Reject*
 37 *Order* with the ORDQ field set to '00000010' (message not accepted in this state).
 38 If PACA_S is equal to enabled, the mobile station shall perform the following:
 - 39 • If the purpose of the message is to respond to an *Origination Message*
 40 (PURPOSE_T is equal to '0000'), the mobile station shall send a *Mobile Station*

- 1 *Reject Order* with the ORDQ field set to '00000010' (message not accepted in this
2 state).
- 3 • If the purpose of the message is to provide the queue position of the PACA call
4 (PURPOSE_T is equal to '0001'), the mobile station shall set the PACA state timer
5 to the duration shown in Table 3.7.2.3.2.20-2 corresponding to the value of
6 PACA_TIMEOUT_S, should indicate to the user that the PACA call is still queued,
7 and should indicate to the user the current queue position (Q_POS_T) of the call.
 - 8 • If the purpose of the message is to instruct the mobile station to re-originate the
9 PACA call (PURPOSE_T is equal to '0010'), Layer 3 shall send an L2-
10 Supervision.Request primitive to Layer 2 to abort any access attempt in
11 progress, shall set the PACA state timer to the duration shown in Table
12 3.7.2.3.2.20-2 corresponding to the value of PACA_TIMEOUT_S, and shall enter
13 the *Mobile Station Origination Attempt Substate* with a PACA response indication.
 - 14 • If the purpose of the message is to cancel the PACA call (PURPOSE_T is equal to
15 '0011'), the mobile station shall set PACA_S to disabled and PACA_CANCEL to '0',
16 shall disable the PACA state timer, and should indicate to the user that the
17 PACA call has been canceled.
- 18 10. *Registration Accepted Order*: The mobile station shall perform the procedures as
19 specified in 2.6.11.1.
- 20 11. *Registration Rejected Order*: This order indicates that normal service is not available
21 on this system. The mobile station shall disable the full-TMSI timer. If the received
22 order specifies to delete the TMSI (ORDQ = '00000100'), the mobile station shall set
23 all the bits of the TMSI_CODE_{S-p} to '1'. The mobile station shall enter the *System*
24 *Determination Substate* of the *Mobile Station Initialization State* with a registration
25 rejected indication (see 2.6.1.1).
- 26 12. *Retry Order*: The mobile station shall process the message as follows:
- 27 • If RETRY_TYPE_T is equal to '000', the mobile station shall set
28 RETRY_DELAY_S[RETRY_TYPE] to 0, where RETRY_TYPE is equal to '001', '010',
29 '011', '100', or '101'.
 - 30 • If RETRY_TYPE_T is equal to '001', '100', or '101', the mobile station shall perform
31 the following:
 - 32 - If RETRY_DELAY_T is equal to '00000000', then the mobile station shall set
33 RETRY_DELAY_S[RETRY_TYPE_T] to 0.
 - 34 - If RETRY_DELAY_T is not equal to '00000000', the mobile station shall set
35 RETRY_DELAY_S[RETRY_TYPE_T] as follows:
 - 36 + If the most significant bit of the RETRY_DELAY_T is '0', set
37 RETRY_DELAY_UNIT_S to 1000ms. If the most significant bit of the
38 RETRY_DELAY_T is '1', set RETRY_DELAY_UNIT_S to 60000ms.
 - 39 + The mobile station shall set RETRY_DELAY_VALUE_S to the seven least
40 significant bits of RETRY_DELAY_T.

1 + The mobile station shall store the next system time 80 ms boundary +
 2 RETRY_DELAY_VALUE_s × RETRY_DELAY_UNIT_s ms as
 3 RETRY_DELAY_s[RETRY_TYPE_r].

4 13. *Security Mode Command Message*: The mobile station shall perform the procedures
 5 as specified in 2.6.11.4.

6 14. *Service Redirection Message*: The mobile station shall process the message as
 7 follows:

- 8 • If the mobile station is directed to an unsupported operation mode or band
 9 class, the mobile station shall respond with a *Mobile Station Reject Order* with
 10 ORDQ equal to '00000110' (message requires a capability that is not supported
 11 by the mobile station).
- 12 • If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of
 13 TMSI_CODE_{s-p} to '1'. The mobile station shall disable the full-TMSI timer.
- 14 • The mobile station shall set RETURN_IF_FAIL_s = RETURN_IF_FAIL_r.
- 15 • If RECORD_TYPE_r is equal to '00000000', the mobile station shall enter the
 16 *System Determination Substate* of the *Mobile Station Initialization State* with an
 17 NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the
 18 redirection record received in the message as REDIRECT_REC_s and shall enter
 19 the *System Determination Substate* of the *Mobile Station Initialization State* with a
 20 redirection indication (see 2.6.1.1).

21 15. *SSD Update Message*: The mobile station shall respond to the message as specified
 22 in 2.3.12.1.5.

23 16. *Status Request Message*: The mobile station shall disable the *System Access State*
 24 timer and respond to the message. If P_REV_IN_USE_s is less than or equal to three,
 25 the mobile station shall respond with a *Status Response Message*. If
 26 P_REV_IN_USE_s is greater than three, the mobile station shall respond with an
 27 *Extended Status Response Message*. If the message does not specify any
 28 qualification information (QUAL_INFO_TYPE_r is equal to '00000000'), the mobile
 29 station shall include the requested information records in the response. If the
 30 message specifies a band class (QUAL_INFO_TYPE_r is equal to '00000001'), the
 31 mobile station shall only include the requested information records for the specified
 32 band class (BAND_CLASS_r) in the response. If the message specifies a band class
 33 and an operating mode (QUAL_INFO_TYPE_r is equal to '00000010'), the mobile
 34 station shall only include the requested information records for the specified band
 35 class (BAND_CLASS_r) and operating mode (OP_MODE_r) in the response.

36 If the message specifies a band class or a band class and an operating mode which
 37 is not supported by the mobile station, the mobile station shall send a *Mobile*
 38 *Station Reject Order* with ORDQ set to '00000110' (message requires a capability
 39 that is not supported by the mobile station). If the response to this message
 40 exceeds the allowable length, the mobile station shall send a *Mobile Station Reject*
 41 *Order* with ORDQ set to '00001000' (response message would exceed the allowable
 42 length). If the message specifies an information record which is not supported by

1 the mobile station for the specified band class and operating mode, the mobile
 2 station shall send a *Mobile Station Reject Order* with ORDQ set to '00001001'
 3 (information record is not supported for the specified band class and operating
 4 mode).

5 17. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code
 6 as follows:

- 7 • The mobile station shall store the length of the TMSI zone field by setting
 8 ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r,
- 9 • The mobile station shall store the assigning TMSI zone number by setting the
 10 ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
 11 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- 12 • The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
 13 TMSI_CODE_r.

14 The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p}
 15 to TMSI_EXP_TIME_r. The mobile station shall disable the full-TMSI timer. The
 16 mobile station shall then respond with a *TMSI Assignment Completion Message*
 17 within T_{56m} seconds.

18 18. *General Page Message* or *Universal Page Message*: If the mobile station receives a
 19 mobile-station-addressed page, the mobile station may determine whether there is a
 20 page match (see 2.6.2.3). If a match is declared, the mobile station shall perform
 21 the following:

- 22 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
 23 access attempt in progress.
- 24 • If the mobile station entered this substate with a message transmission
 25 indication, the mobile station may store the *Data Burst Message* for later
 26 transmission.
- 27 • The mobile station shall enter the *Page Response Substate*.

28 19. *Extended Channel Assignment Message*: If the DIRECT_CH_ASSIGN_IND_r is
 29 included and is set to '1', the mobile station shall perform the following:

- 30 • If the mobile station entered this substate with a message transmission
 31 indication, the mobile station may store the *Data Burst Message* for later
 32 transmission.
- 33 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
 34 access attempt in progress.
- 35 • The mobile station shall process the message as specified in section 2.6.3.3.

36 Otherwise, the mobile station shall ignore this message.

37 20. *Fast Call Setup Order*:

- 38 • If ORDQ_r is equal to '00000000', the mobile station shall process the message
 39 and respond with a *Fast Call Setup Order* as specified in 2.6.12.1.

- If $ORDQ_r$ is equal to '00000001', the mobile station shall process the message as specified in 2.6.12.1.

21. *General Extension Message*: The mobile station shall process this message as specified in section 2.6.18.

22. *EACH Selective Acknowledgment Order*: The mobile station shall process this order as specified in 2.6.3.3.

23. *Any other message*: If the mobile station receives any other message specified in Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all other messages.

2.6.3.8 PACA Cancel Substate

In this substate, the mobile station sends a *PACA Cancel Message*. If the base station responds with an authentication request, the mobile station responds in this substate.

Upon entering the *PACA Cancel Substate*, the mobile station shall transmit the *PACA Cancel Message*.

If a message received from the base station requires a Layer 2 acknowledgment and does not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is outstanding (see [4]).

If a message received from the base station requires a Layer 2 acknowledgment and also a Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

When transmitting a response to a message received from the base station, Layer 3 shall indicate to Layer 2 that the type of the message is a response (see [4]).

When transmitting an autonomous message (i.e., a message that is not sent as a response to a message received from the base station), Layer 3 shall indicate to Layer 2 that the type of the message is a request other than a registration request or a message transmission request (see [4]).

While in this substate, the mobile station shall monitor the Paging Channel or the Forward Common Control Channel. If the mobile station declares a loss of the Paging Channel or the Forward Common Control Channel (see 2.6.3.1.8), it shall declare an access attempt failure and update its registration variables as specified in 2.6.5.5.3.2, disable its transmitter and enter the *Mobile Station Idle State*. If the mobile station receives confirmation of any message sent by the mobile station in this substate, it shall send a response in this substate if required and shall then enter the *Mobile Station Idle State*.

If the mobile station is to exit the *System Access State* as a result of processing Layer 3 fields of a message requiring an acknowledgment, the mobile station shall exit the *System Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to the message has been sent and acknowledged.

If Layer 3 receives a message other than message listed below:

- *Extended Channel Assignment Message* with `DIRECT_CH_ASSIGN_IND` field included and set to '1'

1 with an indication from Layer 2 that an access attempt for a message being transmitted
 2 was not terminated as a result of processing the Layer 2 fields of the received message, the
 3 mobile station shall ignore the received message.

4 The following directed messages and orders can be received. If any field value of the
 5 message or order is outside its permissible range, the mobile station may send a *Mobile*
 6 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 7 1. *Authentication Challenge Message*: The mobile station shall respond to the message
 8 as specified in 2.3.12.1.4, regardless of the value of AUTH_S.
- 9 2. *Authentication Request Message*: The mobile station shall process the message and
 10 shall respond as specified in 2.3.12.5.2.
- 11 3. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the
 12 message as specified in 2.3.12.1.5.
- 13 4. *Base Station Reject Order*: The mobile station shall perform the procedures as
 14 specified in 2.6.11.5.
- 15 5. *Data Burst Message*
- 16 6. *Local Control Order*
- 17 7. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and
 18 record the reason for the *Lock Until Power-Cycled Order* in the mobile station's semi-
 19 permanent memory (LCKRSN_{P_{s-p}} equals the least significant four bits of ORDQ_T).
 20 The mobile station should notify the user of the locked condition. The mobile
 21 station shall enter the *System Determination Substate* of the *Mobile Station*
 22 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System*
 23 *Access State* again until after the next mobile station power-up or until it has
 24 received an *Unlock Order*. This requirement shall take precedence over any other
 25 mobile station requirement specifying entry to the *System Access State*.
- 26 8. *Maintenance Required Order*: The mobile station shall record the reason for the
 27 *Maintenance Required Order* in the mobile station's semi-permanent memory
 28 (MAINTRSN_{S-p} equals the least significant four bits of ORDQ_T). The mobile station
 29 shall remain in the unlocked condition. The mobile station should notify the user of
 30 the maintenance required condition.
- 31 9. *PACA Message*: The mobile station shall send a *Mobile Station Reject Order* with the
 32 ORDQ field set to '00000010' (message not accepted in this state).
- 33 10. *Registration Accepted Order*: The mobile station shall perform the procedures as
 34 specified in 2.6.11.1.
- 35 11. *Registration Rejected Order*: This order indicates that normal service is not available
 36 on this system. The mobile station shall disable the full-TMSI timer. If the received
 37 order specifies to delete the TMSI (ORDQ = '00000100'), the mobile station shall set
 38 all the bits of the TMSI_CODE_{S-p} to '1'. The mobile station shall enter the *System*
 39 *Determination Substate* of the *Mobile Station Initialization State* with a registration
 40 rejected indication (see 2.6.1.1).

- 1 12. *Retry Order*: The mobile station shall process the message as follows:
- 2 • If $RETRY_TYPE_R$ is equal to '000', the mobile station shall set
- 3 $RETRY_DELAY_S[RETRY_TYPE]$ to 0, where $RETRY_TYPE$ is equal to '001', '010',
- 4 '011', '100', or '101'.
- 5 • If $RETRY_TYPE_R$ is equal to '001', '100', or '101', the mobile station shall perform
- 6 the following:
- 7 - If $RETRY_DELAY_R$ is equal to '00000000', then the mobile station shall set
- 8 $RETRY_DELAY_S[RETRY_TYPE_R]$ to 0.
- 9 - If $RETRY_DELAY_R$ is not equal to '00000000', the mobile station shall set
- 10 $RETRY_DELAY_S[RETRY_TYPE_R]$ as follows:
- 11 + If the most significant bit of the $RETRY_DELAY_R$ is '0', set
- 12 $RETRY_DELAY_UNIT_S$ to 1000ms. If the most significant bit of the
- 13 $RETRY_DELAY_R$ is '1', set $RETRY_DELAY_UNIT_S$ to 60000ms.
- 14 + The mobile station shall set $RETRY_DELAY_VALUE_S$ to the seven least
- 15 significant bits of $RETRY_DELAY_R$.
- 16 + The mobile station shall store the next system time 80 ms boundary +
- 17 $RETRY_DELAY_VALUE_S \times RETRY_DELAY_UNIT_S$ ms as
- 18 $RETRY_DELAY_S[RETRY_TYPE_R]$.
- 19 13. *Security Mode Command Message*: The mobile station shall perform the procedures
- 20 as specified in 2.6.11.4.
- 21 14. *Service Redirection Message*: The mobile station shall process the message as
- 22 follows:
- 23 • If the mobile station is directed to an unsupported operation mode or band
- 24 class, the mobile station shall respond with a *Mobile Station Reject Order* with
- 25 ORDQ equal to '00000110' (message requires a capability that is not supported
- 26 by the mobile station).
- 27 • If $DELETE_TMSI_R$ is equal to '1', the mobile station shall set all the bits of
- 28 $TMSI_CODE_{S-p}$ to '1'. The mobile station shall disable the full-TMSI timer.
- 29 • The mobile station shall set $RETURN_IF_FAIL_S = RETURN_IF_FAIL_R$.
- 30 • If $RECORD_TYPE_R$ is equal to '00000000', the mobile station shall enter the
- 31 *System Determination Substate* of the *Mobile Station Initialization State* with an
- 32 NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the
- 33 redirection record received in the message as $REDIRECT_REC_S$ and shall enter
- 34 the *System Determination Substate* of the *Mobile Station Initialization State* with a
- 35 redirection indication (see 2.6.1.1).
- 36 15. *SSD Update Message*: The mobile station shall respond to the message as specified
- 37 in 2.3.12.1.5.
- 38 16. *Status Request Message*: The mobile station shall disable the *System Access State*
- 39 timer and respond to the message. If $P_REV_IN_USE_S$ is less than or equal to three,
- 40 the mobile station shall respond with a *Status Response Message*. If

1 P_REV_IN_USE_s is greater than three, the mobile station shall respond with an
 2 *Extended Status Response Message*. If the message does not specify any
 3 qualification information (QUAL_INFO_TYPE_r is equal to '00000000'), the mobile
 4 station shall include the requested information records in the response. If the
 5 message specifies a band class (QUAL_INFO_TYPE_r is equal to '00000001'), the
 6 mobile station shall only include the requested information records for the specified
 7 band class (BAND_CLASS_r) in the response. If the message specifies a band class
 8 and an operating mode (QUAL_INFO_TYPE_r is equal to '00000010'), the mobile
 9 station shall only include the requested information records for the specified band
 10 class (BAND_CLASS_r) and operating mode (OP_MODE_r) in the *Status Response*
 11 *Message*.

12 If the message specifies a band class or a band class and an operating mode which
 13 is not supported by the mobile station, the mobile station shall send a *Mobile*
 14 *Station Reject Order* with ORDQ set to '00000110' (message requires a capability
 15 that is not supported by the mobile station). If the response to this message
 16 exceeds the allowable length, the mobile station shall send a *Mobile Station Reject*
 17 *Order* with ORDQ set to '00001000' (response message would exceed the allowable
 18 length). If the message specifies an information record which is not supported by
 19 the mobile station for the specified band class and operating mode, the mobile
 20 station shall send a *Mobile Station Reject Order* with ORDQ set to '00001001'
 21 (information record is not supported for the specified band class and operating
 22 mode).

23 17. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code
 24 as follows:

- 25 • The mobile station shall store the length of the TMSI zone field by setting
 26 ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r,
- 27 • The mobile station shall store the assigning TMSI zone number by setting the
 28 ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
 29 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- 30 • The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
 31 TMSI_CODE_r.

32 The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p}
 33 to TMSI_EXP_TIME_r. The mobile station shall disable the full-TMSI timer. The
 34 mobile station shall then respond with a *TMSI Assignment Completion Message*
 35 within T_{56m} seconds.

36 18. *General Page Message* or *Universal Page Message*: If the mobile station receives a
 37 mobile-station-addressed page, the mobile station may determine whether there is a
 38 page match (see 2.6.2.3). If a match is declared, the mobile station shall perform
 39 the following:

- 40 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
 41 access attempt in progress.
- 42 • The mobile station shall enter the *Page Response Substate*.

- 1 19. *Extended Channel Assignment Message*: If the DIRECT_CH_ASSIGN_IND_r is
2 included and is set to '1', the mobile station shall perform the following:
- 3 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
4 access attempt in progress.
 - 5 • The mobile station shall process the message as specified in section 2.6.3.3.
6 Otherwise, the mobile station shall ignore this message.
- 7 20. *Fast Call Setup Order*:
- 8 • If ORDQ_r is equal to '00000000', the mobile station shall process the message
9 and respond with a *Fast Call Setup Order* as specified in 2.6.12.1.
 - 10 • If ORDQ_r is equal to '00000001', the mobile station shall process the message
11 as specified in 2.6.12.1.
- 12 21. *General Extension Message*: The mobile station shall process this message as
13 specified in section 2.6.18.
- 14 22. *EACH Selective Acknowledgment Order*: The mobile station shall process this order
15 as specified in 2.6.3.3.
- 16 23. *Any other message*: If the mobile station receives any other message specified in
17 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all
18 other messages.

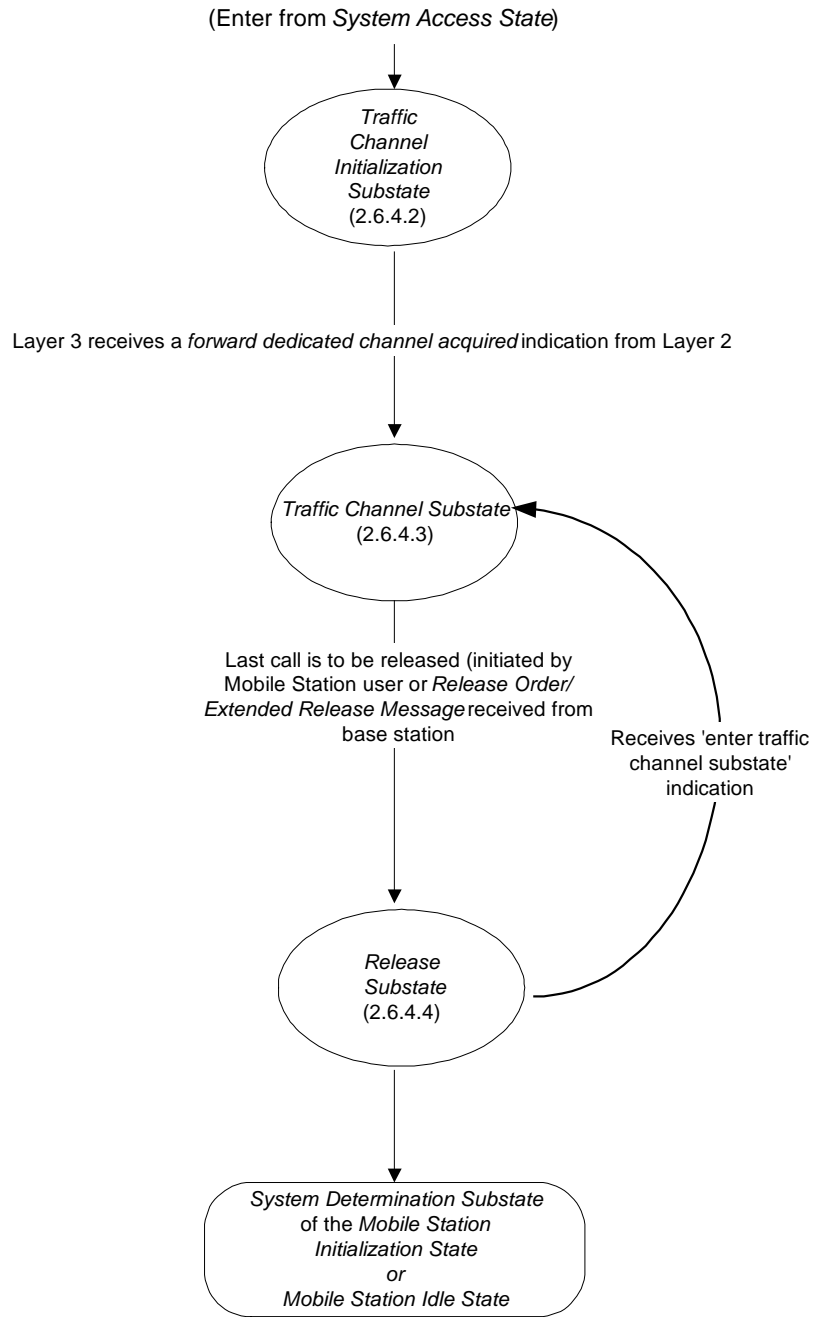

19 2.6.4 Mobile Station Control on the Traffic Channel State

20 In this state, the mobile station communicates with the base station using the Forward and
21 Reverse Traffic Channels.

22 As illustrated in Figure 2.6.4-1, the *Mobile Station Control on the Traffic Channel State*
23 consists of the following substates:

- 24 • *Traffic Channel Initialization Substate* - In this substate, the mobile station verifies
25 that it can receive the Forward Traffic Channel and begins transmitting on the
26 Reverse Traffic Channel.
- 27 • *Traffic Channel Substate* - In this substate, the mobile station exchanges Traffic
28 Channel frames with the base station in accordance with the current service
29 configuration. The mobile station may perform the gating operation of Reverse Pilot
30 Channel. While in this substate, one or more Call Control instances can be
31 activated (see 2.6.10).
- 32 • *Release Substate* - In this substate, the mobile station disconnects the calls and the
33 physical channels.

34
35

Figure 2.6.4-1. Mobile Station Control on the Traffic Channel State

2.6.4.1 Special Functions and Actions

The mobile station performs special functions and actions in one or more of the substates of the *Mobile Station Control on the Traffic Channel State*.

2.6.4.1.1 Forward Traffic Channel Power Control

The mobile station uses FPC_MODE_NO_SCH_s as FPC_MODE_s except during the forward Supplemental Channel assignment interval. During the forward Supplemental Channel assignment interval, the mobile station uses FPC_MODE_SCH_s as FPC_MODE_s.

To support Forward Traffic Channel power control, the mobile station reports frame error rate statistics to the base station. If the base station enables periodic reporting, the mobile station reports frame error rate statistics at specified intervals. If the base station enables threshold reporting, the mobile station reports frame error rate statistics when the frame error rate reaches a specified threshold.⁵⁸

The mobile station shall maintain the following frame counters:

- A counter (TOT_FRAMES_s) for the total number of frames received on the Forward Fundamental Channel.
- A counter (BAD_FRAMES_s) for the number of bad frames detected on the Forward Fundamental Channel.
- A counter (DCCH_TOT_FRAMES_s) for the total number of frames received on the Forward Dedicated Control Channel, when the Dedicated Control Channel is assigned.
- A counter (DCCH_BAD_FRAMES_s) for the total number of bad frames received on the Forward Dedicated Control Channel, when the Dedicated Control Channel is assigned.

The mobile station shall maintain the following counters for each Supplemental Channel assigned, if FOR_SCH_FER_REP_s is equal to '1':

- A counter (SCH_TOT_FRAMES_s) for the number of frames received on the assigned Supplemental Channel.
- A counter (SCH_BAD_FRAMES_s) for the number of bad frames received on the assigned Supplemental Channel.

The mobile station shall increment the counter by 1 at every 20 ms interval if a 20ms frame or at least one 5ms frame is received from the Forward Fundamental Channel or Dedicated Control Channel:

- If the received frame is from the Fundamental Channel and if any of the following conditions is true

⁵⁸ Periodic reporting and threshold reporting may be independently enabled or disabled by the base station.

- 1 - RC 11 or RC 12 is not assigned on the forward fundamental channel
2 - or if RC 11 or RC 12 is assigned on the forward fundamental channel and this is
3 a guaranteed transmission frame,
4 then the mobile station shall perform the following:
- 5 - Increment TOT_FRAMES_S by 1.
6 - If the received 20ms frame is bad or one of the 5ms frames is bad, the mobile
7 station shall increment BAD_FRAMES_S by 1.
8 • If the received frame is from the Forward Dedicated Control Channel, the mobile
9 station shall perform the following:
- 10 - Increment DCCH_TOT_FRAMES_S by 1.
11 - If the received 20ms frame is bad or one of the 5ms frames is bad, the mobile
12 station shall increment DCCH_BAD_FRAMES_S by 1.
13 • If either of the following conditions is true:
- 14 - PWR_THRESH_ENABLE_S is equal to '1' and if one of the following conditions is
15 true:
16 + If the mobile station is to perform the primary inner loop estimation on the
17 received Forward Fundamental Channel [FPC_PRI_CHAN_S = '0'], and
18 BAD_FRAMES_S is equal to PWR_REP_THRESH_S or
19 + If the mobile station is to perform the primary inner loop estimation on the
20 received Forward Dedicated Control Channel [FPC_PRI_CHAN_S = '1'], and
21 DCCH_BAD_FRAMES_S is equal to PWR_REP_THRESH_S.
- 22 or
- 23 - PWR_PERIOD_ENABLE_S is equal to '1' and if one of the following conditions is
24 true:
25 + If the mobile station is to perform the primary inner loop estimation on the
26 received Forward Fundamental Channel [FPC_PRI_CHAN_S = '0'], and
27 TOT_FRAMES_S is equal to $\lfloor (2^{(PWR_REP_FRAMES_S/2)} \times 5) \rfloor$, or
28 + If the mobile station is to perform the primary inner loop estimation on the
29 received Forward Dedicated Control Channel [FPC_PRI_CHAN_S = '1'], and
30 DCCH_TOT_FRAMES_S is equal to $\lfloor (2^{(PWR_REP_FRAMES_S/2)} \times 5) \rfloor$,
- 31 then the mobile station shall send a *Power Measurement Report Message* to the base
32 station. The mobile station should send the *Power Measurement Report Message* in
33 unassured mode. After sending a *Power Measurement Report Message*, the mobile
34 station shall set TOT_FRAMES_S, BAD_FRAMES_S to zero, and if the Dedicated
35 Control Channel is assigned, shall set DCCH_TOT_FRAMES_S and
36 DCCH_BAD_FRAMES_S to zero. The mobile station shall not increment the counters
37 for a period of PWR_REP_DELAY_S × 4 frames following the first transmission of the
38 message.

- 1 • If FPC_PRI_CHAN_s is equal to '0' and TOT_FRAMES_s is equal to
2 $\lfloor (2(\text{PWR_REP_FRAMES}_s/2) \times 5) \rfloor$, the mobile station shall perform the following:
- 3 - Set TOT_FRAMES_s and BAD_FRAMES_s to zero.
- 4 - Set DCCH_TOT_FRAMES_s and DCCH_BAD_FRAMES_s to zero, if the Dedicated
5 Control Channel is assigned.
- 6 • If FPC_PRI_CHAN_s is equal to '1' and DCCH_TOT_FRAMES_s is equal to
7 $\lfloor (2(\text{PWR_REP_FRAMES}_s/2) \times 5) \rfloor$, the mobile station shall set
8 TOT_FRAMES_s, BAD_FRAMES_s, DCCH_TOT_FRAMES_s, and DCCH_BAD_FRAMES_s
9 to zero.

10 For each received frame from an assigned Supplemental Channel, the mobile station shall
11 perform the following, if FOR_SCH_FER_REP_s is equal to '1':

- 12 • Increment SCH_TOT_FRAMES_s by 1.
- 13 • If the received frame is bad, increment SCH_BAD_FRAMES_s by 1.

14 At the end of a burst on each assigned Supplemental Channel, if FOR_SCH_FER_REP_s is
15 equal to '1', the mobile station shall report the total number of frames received on this
16 Supplemental Channel (SCH_TOT_FRAMES_s) and the bad frames detected
17 (SCH_BAD_FRAMES_s) with the fields SCH_PWR_MEAS_FRAMES and
18 SCH_ERRORS_DETECTED in the *Power Measurement Report Message* respectively. After
19 sending the *Power Measurement Report Message* for the Supplemental Channel, the mobile
20 station shall set SCH_TOTAL_FRAMES_s and SCH_BAD_FRAMES_s of the reported SCH to
21 zero.

22 If both Forward Fundamental Channel and the Forward Dedicated Control Channel are
23 assigned to the mobile station, the mobile station shall perform the following:

- 24 • The mobile station shall set FPC_DELTA_SETPT_s to (FPC_FCH_CURR_SETPT_s -
25 FPC_DCCH_CURR_SETPT_s).
- 26 • For each received frame, if $|\text{FPC_FCH_CURR_SETPT}_s - \text{FPC_DCCH_CURR_SETPT}_s$
27 - FPC_DELTA_SETPT<sub>s}| is equal to or greater than its assigned threshold
28 FPC_SETPT_THRESH_s, the mobile station shall send the *Outer Loop Report Message*
29 requiring acknowledgment to the base station, and the mobile station shall then set
30 FPC_DELTA_SETPT_s to (FPC_FCH_CURR_SETPT_s - FPC_DCCH_CURR_SETPT_s).</sub>

31 For each of the supplemental channels assigned to the mobile station and FPC_MODE_s is
32 set to '000', the mobile station shall perform the following:

- 33 • The mobile station shall set FPC_DELTA_SCH_SETPT_s to
34 (FPC_FCH_CURR_SETPT_s - FPC_SCH_CURR_SETPT_s) if FPC_PRI_CHAN_s is equal to
35 '0'.
- 36 • The mobile station shall set FPC_DELTA_SCH_SETPT_s to
37 (FPC_DCCH_CURR_SETPT_s - FPC_SCH_CURR_SETPT_s) if FPC_PRI_CHAN_s is equal
38 to '1'.

- 1 • For each received frame, if $FPC_PRI_CHAN_s$ is equal to '0' and
 2 $|FPC_FCH_CURR_SETPT_s - FPC_SCH_CURR_SETPT_s -$
 3 $FPC_DELTA_SCH_SETPT_s|$ is equal to or greater than its assigned threshold
 4 $FPC_SETPT_THRESH_SCH_s$, the mobile station shall send the *Outer Loop Report*
 5 *Message* in assured mode, and the mobile station shall then set
 6 $FPC_DELTA_SCH_SETPT_s$ to $(FPC_FCH_CURR_SETPT_s - FPC_SCH_CURR_SETPT_s)$.
- 7 • For each received frame, if $FPC_PRI_CHAN_s$ is equal to '1' and
 8 $|FPC_DCCH_CURR_SETPT_s - FPC_SCH_CURR_SETPT_s -$
 9 $FPC_DELTA_SCH_SETPT_s|$ is equal to or greater than its assigned threshold
 10 $FPC_SETPT_THRESH_SCH_s$, the mobile station shall send the *Outer Loop Report*
 11 *Message* in assured mode, and the mobile station shall then set
 12 $FPC_DELTA_SCH_SETPT_s$ to $(FPC_DCCH_CURR_SETPT_s -$
 13 $FPC_SCH_CURR_SETPT_s)$.

14 If the Supplemental channels are assigned to the mobile station and FPC_MODE_s is set to
 15 '001', '010', '101', or '110', for each additional Forward Supplemental Channel other than
 16 the Forward Supplemental Channel specified by $FPC_SEC_CHAN_s$, the mobile station shall
 17 perform the following:

- 18 • The mobile station shall set $FPC_DELTA_SCH_SETPT_s$ to
 19 $(FPC_SCH_CURR_SETPT_s[FPC_SEC_CHAN_s] - FPC_SCH_CURR_SETPT_s)$ for the
 20 Supplemental Channel.
- 21 • For each received frame, if $|FPC_SCH_CURR_SETPT_s[FPC_SEC_CHAN_s] -$
 22 $FPC_SCH_CURR_SETPT_s - FPC_DELTA_SCH_SETPT_s|$ is equal to or greater than
 23 its assigned threshold $FPC_SETPT_THRESH_SCH_s$, the mobile station shall send
 24 the *Outer Loop Report Message* in assured mode, and the mobile station shall then
 25 set $FPC_DELTA_SCH_SETPT_s$ to $(FPC_SCH_CURR_SETPT_s[FPC_SEC_CHAN_s] -$
 26 $FPC_SCH_CURR_SETPT_s)$.

27 2.6.4.1.1.1 Forward Traffic Channel Power Control Initialization

28 To initialize Forward Traffic Channel power control, the mobile station shall set
 29 TOT_FRAMES_s , BAD_FRAMES_s , $DCCH_TOT_FRAMES_s$, and $DCCH_BAD_FRAMES_s$ to zero.
 30 The mobile station shall initialize the frame counters $SCH_TOT_FRAMES_s$ and
 31 $SCH_BAD_FRAMES_s$ for each assigned Supplemental Channel to zero. The mobile station
 32 shall initialize $FOR_SCH_FER_REP_s$ to zero.

33 2.6.4.1.1.2 Processing the Power Control Parameters Message

34 The mobile station shall store the following parameters from the *Power Control Parameters*
 35 *Message*:

- 36 • Power control reporting threshold ($PWR_REP_THRESH_s = PWR_REP_THRESH_r$)
 37 • Power control reporting frame count ($PWR_REP_FRAMES_s = PWR_REP_FRAMES_r$)
 38 • Threshold report mode indicator
 39 ($PWR_THRESH_ENABLE_s = PWR_THRESH_ENABLE_r$)

- 1 • Periodic report mode indicator
2 (PWR_PERIOD_ENABLE_S = PWR_PERIOD_ENABLE_T)
- 3 • Power report delay (PWR_REP_DELAY_S = PWR_REP_DELAY_T)

4 The mobile station shall set TOT_FRAMES_S and BAD_FRAMES_S to zero if FCH is assigned.
5 The mobile station shall set DCCH_TOT_FRAMES_S and DCCH_BAD_FRAMES_S to zero if
6 DCCH is assigned.

7 2.6.4.1.1.3 Processing the Power Control Message

8 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to
9 '00000110' (message requires a capability that is not supported by the mobile station) if
10 any of the following conditions are detected:

- 11 • If the mobile station does not support any Radio Configuration greater than 2 and
12 FPC_MODE_T is not supported by the mobile station.
- 13 • If the mobile station does not support Supplemental Channel and FPC_MODE_T is
14 set to the '001', '010', '101', or '110'.
- 15 • If PWR_CNTL_STEP_T corresponds to a power control step size (see [2]) is not
16 supported by the mobile station.

17 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to
18 '00000111' (message cannot be handled by the current mobile station configuration) if any
19 of the following conditions are detected:

- 20 • FPC_PRI_CHAN_T is set to '1' and only the Fundamental Channel is assigned.
- 21 • FPC_PRI_CHAN_T is set to '0' and only the Dedicated Control Channel is assigned.

22 If none of the above conditions are true, the mobile station shall process the message as
23 follows at the action time (see 2.6.4.1.5) specified in the message:

- 24 • The mobile station shall store the power control step size (PWR_CNTL_STEP_S =
25 PWR_CNTL_STEP_T).
- 26 • If FPC_INCL_T is equal to '1', the mobile station shall perform the following:
 - 27 - The mobile station shall set FPC_MODE_NO_SCH_S = FPC_MODE_T.
 - 28 - The mobile station shall set FPC_MODE_S = FPC_MODE_NO_SCH_S if there is no
29 forward Supplemental Channel burst in progress (see 2.6.6.2.5.1.1).
 - 30 - The mobile station shall set FPC_PRI_CHAN_S to FPC_PRI_CHAN_T
 - 31 - If FPC_OLPC_FCH_INCL is equal to '1', the mobile station shall:
 - 32 + Set FPC_FCH_FER_S to FPC_FCH_FER_T.
 - 33 + If FPC_FCH_MIN_SETPT_T is not equal to '11111111', set
34 FPC_FCH_MIN_SETPT_S to FPC_FCH_MIN_SETPT_T; otherwise, set
35 FPC_FCH_MIN_SETPT_S to FPC_FCH_CURR_SETPT_S.

- 1 + If FPC_FCH_MAX_SETPT_T is not equal to '11111111', set
2 FPC_FCH_MAX_SETPT_S to FPC_FCH_MAX_SETPT_T; otherwise, set
3 FPC_FCH_MAX_SETPT_S to FPC_FCH_CURR_SETPT_S.
- 4 - If FPC_OLPC_DCCH_INCL is equal to '1', the mobile station shall:
- 5 + Set FPC_DCCH_FER_S to FPC_DCCH_FER_T.
- 6 + If FPC_DCCH_MIN_SETPT_T is not equal to '11111111', set
7 FPC_DCCH_MIN_SETPT_S to FPC_DCCH_MIN_SETPT_T; otherwise, set
8 FPC_DCCH_MIN_SETPT_S to FPC_DCCH_CURR_SETPT_S.
- 9 + If FPC_DCCH_MAX_SETPT_T is not equal to '11111111', set
10 FPC_DCCH_MAX_SETPT_S to FPC_DCCH_MAX_SETPT_T; otherwise, set
11 FPC_DCCH_MAX_SETPT_S to FPC_DCCH_CURR_SETPT_S.
- 12 - If FPC_INCL is equal to '1' and FPC_MODE is equal to '001', '010', '101', or '110',
13 the mobile station shall:
- 14 + Set FPC_SEC_CHAN_S to FPC_SEC_CHAN_T.
- 15 + Set FPC_BCMC_CHAN_S to FPC_BCMC_CHAN_T.
- 16 - If NUM_SUP_T is not equal to '00', for each Supplemental Channel included in the
17 message, the mobile station shall:
- 18 + Set SCH_ID_S to SCH_ID_T.
- 19 + Set FPC_SCH_FER_S[SCH_ID_S] to FPC_SCH_FER_T.
- 20 + If FPC_SCH_MIN_SETPT_T is not equal to '11111111', set
21 FPC_SCH_MIN_SETPT_S[SCH_ID_S] to FPC_SCH_MIN_SETPT_T; otherwise, set
22 FPC_SCH_MIN_SETPT_S[SCH_ID_S] to FPC_SCH_CURR_SETPT_S.
- 23 + If FPC_SCH_MAX_SETPT_T is not equal to '11111111', set
24 FPC_SCH_MAX_SETPT_S[SCH_ID_S] to FPC_SCH_MAX_SETPT_T; otherwise, set
25 FPC_SCH_MAX_SETPT_S[SCH_ID_S] to FPC_SCH_CURR_SETPT_S.
- 26 - If FPC_THRESH_INCL is equal to '1', the mobile station shall set
27 FPC_SETPT_THRESH_S to FPC_SETPT_THRESH_T.
- 28 - If FPC_THRESH_SCH_INCL is equal to '1', the mobile station shall set
29 FPC_SETPT_THRESH_SCH_S to FPC_SETPT_THRESH_SCH_T.
- 30 • If RPC_INCL_T is equal to '1' and the mobile station supports any Radio
31 Configuration greater than 2, the mobile station shall perform the following:
- 32 - If RPC_ADJ_REC_TYPE is equal to '0000', the mobile station shall update the
33 Reverse Channel Adjustment Gain Table (see [2]) containing an offset relative to
34 the Reverse Pilot Channel power for each reverse link code channel received in
35 this message.
- 36 - If RPC_ADJ_REC_TYPE is equal to '0001' or '0010', the mobile station shall
37 update the Reverse Link Attribute Adjustment Gain Table (see [2]) containing an
38 offset relative to the Reverse Pilot Channel power for each transmission rate,
39 frame length, coding type received in this message.

- 1 - If RPC_ADJ_REC_TYPE is equal to '0011', at the action time of the message, the
2 mobile station shall update the Reverse Link Attribute Adjustment Gain Table
3 (see [2]) containing an offset relative to the Reverse Pilot Channel power for the
4 R-CQICH.
- 5 - If RPC_ADJ_REC_TYPE is equal to '0100', the mobile station shall perform the
6 following:
- 7 + At the first R-PDCH frame boundary after the action time of the message, the
8 mobile station shall update the Reverse Link Attribute Adjustment Gain
9 Table (see [2]) containing an offset relative to the Reverse Pilot Channel
10 power for any combination of the following channels:
- 11 ○ R-REQCH,
12 ○ R-SPICH,
13 ○ R-PDCCH possibly for each encoder packet size, or for the boosted and
14 non boosted modes
15 ○ R-PDCH possibly for each encoder packet size, or for the boosted and
16 non boosted modes, or for each encoder packet size and transmission
17 round.
- 18 + At the action time of the message, the mobile station shall update the
19 Reverse Link Attribute Adjustment Gain Table (see [2]) containing an offset
20 relative to the Reverse Pilot Channel power for the R-ACKCH.
- 21 + If REV_SPICH_ADJ_INCL_T is equal to '1', the mobile station shall set
22 REV_SPICH_EP_SIZE_S to REV_SPICH_EP_SIZE_T+1.
- 23 + If REV_PDCH_PARMS_INCL_T is equal to '1', the mobile station shall set
24 REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_S to
25 REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_T+1, and
26 REV_PDCH_NUM_ARQ_ROUNDS_BOOST_S to
27 REV_PDCH_NUM_ARQ_ROUNDS_BOOST_T+1.

28 2.6.4.1.1.4 Processing the Rate Change Message

29 The mobile station shall process this message as follows at the action time (see 2.6.4.1.5)
30 specified in the message:

- 31 • The mobile station shall set FULL_CI_FEEDBACK_IND_S to
32 FULL_CI_FEEDBACK_IND_T.
- 33 • If REV_CQICH_RATE_CHANGE_INCL_T is equal to '1', the mobile station shall set
34 REV_CQICH_REPS_S to REV_CQICH_REPS_T. In addition, if
35 RL_CQICH_ATT_ADJ_GAIN_INCL_T is equal to '1', the mobile station shall update the
36 Reverse Link Attribute Adjustment Gain Table (see [2]) containing the offsets
37 relative to the Reverse Pilot Channel power for the corresponding transmission
38 power level (HIGH or LOW).
- 39 • If SWITCHING_PARMS_INCL_T is included and equal to '1', the mobile station shall
40 set NUM_SOFT_SWITCHING_FRAMES_S to NUM_SOFT_SWITCHING_FRAMES_T + 1,

- 1 and, NUM_SOFTER_SWITCHING_FRAMES_s to
2 NUM_SOFTER_SWITCHING_FRAMES_r + 1.
- 3 • If CHM_SWITCHING_PARMES_INCL is included and equal to '1', the mobile station
4 shall set NUM_SOFT_SWITCHING_FRAMES_CHM_s to
5 NUM_SOFT_SWITCHING_FRAMES_CHM_r + 1, and
6 NUM_SOFTER_SWITCHING_FRAMES_CHM_s to
7 NUM_SOFTER_SWITCHING_FRAMES_CHM_r + 1.
 - 8 • If CHM_SWITCHING_PARMES_INCL is included and equal to '0', the mobile station
9 shall set NUM_SOFT_SWITCHING_FRAMES_CHM_s to
10 NUM_SOFT_SWITCHING_FRAMES_r + 1, and
11 NUM_SOFTER_SWITCHING_FRAMES_CHM_s to
12 NUM_SOFTER_SWITCHING_FRAMES_r + 1.
 - 13 • If REV_ACKCH_RATE_CHANGE_INCL_r is equal to '1', the mobile station shall set
14 REV_ACKCH_REPS_s to REV_ACKCH_REPS_r.
 - 15 • If REV_PDCH_MAX_PARMES_INCL_r is equal to '1', the base station shall set
16 REV_PDCH_MAX_AUTO_TPR_s to REV_PDCH_MAX_AUTO_TPR_r, and
17 REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_s to
18 REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_r+1.
 - 19 • If REV_PDCH_PARMES_INCL_r is equal to '1', the mobile station shall set
20 REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_s to
21 REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_r+1, and
22 REV_PDCH_NUM_ARQ_ROUNDS_BOOST_s to
23 REV_PDCH_NUM_ARQ_ROUNDS_BOOST_r+1.

24

25

2.6.4.1.2 Service Configuration and Negotiation

During Traffic Channel operation, the mobile station and base station communicate through the exchange of Forward and Reverse Traffic Channel frames. The mobile station and base station use a common set of attributes for building and interpreting Traffic Channel frames. This set of attributes, referred to as a service configuration, consists of both negotiable and non-negotiable parameters.

The set of negotiable service configuration parameters consists of the following:

1. *Forward and Reverse Multiplex Options:* These control the way in which the information bits of the Forward and Reverse Traffic Channel frames, respectively, are divided into various types of traffic, such as signaling traffic, primary traffic and secondary traffic. A multiplex option together with a radio configuration specifies the frame structures and transmission rates (see [3]). The multiplex options which support Supplemental Code Channel transmission and Supplemental Channel transmission on the Forward and Reverse Traffic Channels are included in [3]. Multiplex Options 3 through 16 also indicate the capability for supporting Supplemental Code Channel transmission on the Forward and Reverse Traffic Channels. Invocation of Supplemental Code Channel operation on the Forward or Reverse Traffic Channels occurs by the *Supplemental Channel Request Message*, the *Supplemental Channel Assignment Message*, and the *General Handoff Direction Message*. Invocation of Supplemental Channel operation on the Forward or Reverse Traffic Channels occurs by the *Supplemental Channel Request Mini Message*, the *Extended Supplemental Channel Assignment Message*, the *Forward Supplemental Channel Assignment Mini Message*, *Universal Handoff Direction Message*, and the *Reverse Supplemental Channel Assignment Mini Message*. The multiplex option used for the Forward Traffic Channel can be the same as that used for the Reverse Traffic Channel, or it can be different.
2. *Forward and Reverse Traffic Channel Configurations:* These include the Radio Configurations and other necessary attributes for the Forward and Reverse Traffic Channels. The Traffic Channel Configuration used can be different for the Forward and Reverse Traffic Channels or it can be the same.
3. *Forward and Reverse Traffic Channel Transmission Rates:* These are the transmission rates actually used for the Forward and Reverse Traffic Channels respectively. The transmission rates for the Forward Traffic Channel can include all of the transmission rates supported by the radio configuration associated with the Forward Traffic Channel multiplex option, or a subset of the supported rates. Similarly, the transmission rates used for the Reverse Traffic Channel can include all rates supported by the radio configuration associated with the Reverse Traffic Channel multiplex option, or a subset of the supported rates. The transmission rates used for the Forward Traffic Channel can be the same as those used for the Reverse Traffic Channel, or they can be different.
4. *Service Option Connections:* These are the services in use on the Traffic Channel. There can be multiple service option connections. It is also possible that there is no service option connection, in which case the mobile station uses the Reverse

1 Traffic Channel as follows:

- 2 • Sends null traffic on the Reverse Fundamental Channel, if the Fundamental
3 Channel is present.
- 4 • Sends signaling traffic on the Reverse Traffic Channel where r-dsch is mapped
5 to.

6 Associated with each service option connection are a service option, a Forward
7 Traffic Channel traffic type, a Reverse Traffic Channel traffic type, and a service
8 option connection reference. The associated service option formally defines the way
9 in which traffic bits are processed by the mobile station and base station. The
10 associated Forward and Reverse Traffic Channel traffic types specify the types of
11 traffic used to support the service option. A service option can require the use of a
12 particular type of traffic, such as primary or secondary, or it can accept more than
13 one traffic type. A service option can be one-way, in which case it can be supported
14 on the Forward Traffic Channel only or the Reverse Traffic Channel only.

15 Alternatively, a service option can be two-way, in which case it can be supported on
16 the Forward and Reverse Traffic Channels simultaneously. Connected service
17 options can also invoke operation on Supplemental Code Channels in either one or
18 both of the Forward and Reverse Traffic Channels by negotiating a multiplex option
19 that supports operation on Supplemental Code Channels (see [3] for Multiplex
20 options applicable to Supplemental Code Channels), and by using the appropriate
21 Supplemental Code Channel related messages (i.e., the *Supplemental Channel
22 Request Message*, the *Supplemental Channel Assignment Message*, and the *General
23 Handoff Direction Message*). After Supplemental Code Channels have been assigned
24 by the base station, the connected service option can transmit primary and/or
25 secondary traffic on Supplemental Code Channels. Connected service options can
26 also invoke operation on Supplemental Channels in either one or both of the
27 Forward and Reverse Traffic Channels by negotiating a multiplex option that
28 supports operation on Supplemental Channels (see [3] for Multiplex Options
29 applicable to Supplemental Channel) and by using the appropriate Supplemental
30 Channel related messages (i.e., the *Supplemental Channel Request Mini Message*, the
31 *Extended Supplemental Channel Assignment Message*, the *Forward Supplemental
32 Channel Assignment Mini Message*, the *Reverse Supplemental Channel Assignment
33 Mini Message*, and the *Universal Handoff Direction Message*). After Supplemental
34 Channels have been assigned by the base station, the connected service option can
35 transmit primary and/or secondary traffic on Supplemental Channels. The
36 associated service option connection reference provides a means for uniquely
37 identifying the service option connection. The reference serves to resolve ambiguity
38 when there are multiple service option connections in use.

39 The non-negotiable service configuration parameters are sent from the base station to the
40 mobile stations only, and consists of the following:

- 41 1. *Reverse Pilot Gating Rate*: This controls the way in which the reverse pilot is gated
42 on the Reverse Pilot Channel. The base station specifies the reverse pilot gating
43 rate to be used in the *Service Connect Message*, the *General Handoff Direction
44 Message*, and the *Universal Handoff Direction Message*.

- 1 2. *Forward and Reverse Power Control Parameters:* These consist of forward power
2 control operation mode, outer loop power control parameters (e.g. target frame error
3 rate, minimum E_b/N_t setpoint, and maximum E_b/N_t setpoint) for the Forward
4 Fundamental Channel and Forward Dedicated Control Channel, and Power Control
5 Subchannel indicator which indicates where the mobile station is to perform the
6 primary inner loop estimation and the base station is to multiplex the Power Control
7 Subchannel.
- 8 3. *Logical to Physical Mapping:* This is a table of logical to physical mapping entries,
9 consisting of service reference identifier, logical resource, physical resource, forward
10 flag, reverse flag, and priority.

11 The mobile station can request a default service configuration associated with a service
12 option at call origination, and can request new service configurations during Traffic
13 Channel operation. A requested service configuration can differ greatly from its
14 predecessor or can be very similar. For example, the mobile station can request a service
15 configuration in which all of the service option connections are different from those of the
16 existing configuration; or the mobile station can request a service configuration in which
17 the existing service option connections are maintained with only minor changes, such as a
18 different set of transmission rates or a different mapping of service option connections to
19 Forward and Reverse Traffic Channel traffic types.

20 If the mobile station requests a service configuration that is acceptable to the base station,
21 they both begin using the new service configuration. If the mobile station requests a
22 service configuration that is not acceptable to the base station, the base station can reject
23 the requested service configuration or propose an alternative service configuration. If the
24 base station proposes an alternative service configuration, the mobile station can accept or
25 reject the base station's proposed service configuration, or propose yet another service
26 configuration. This process, called service negotiation, ends when the mobile station and
27 the base station find a mutually acceptable service configuration, or when either the mobile
28 station or the base station rejects a service configuration proposed by the other.

29 It is also possible for the base station to request a default service configuration associated
30 with a service option when paging the mobile station and to request new service
31 configurations during Traffic Channel operation. The service negotiation proceeds as
32 described above, but with the roles of the mobile station and base station reversed.

33 For CDMA mode operation in Band Class 0, the mobile station and base station can also
34 use an alternative method for negotiating a service configuration known as service option
35 negotiation. Service option negotiation is similar to service negotiation, but offers less
36 flexibility for specifying the attributes of the service configuration. During service option
37 negotiation, the base station or the mobile station specifies only which service option is to
38 be used. There is no facility for explicitly specifying the multiplex options, traffic types or
39 transmission rates to be used on the Forward and Reverse Traffic Channels in conjunction
40 with the service option. Instead, implicit service configuration attributes are assumed. In
41 particular, the Forward and Reverse multiplex options and transmission rates are assumed
42 to be the default multiplex options and transmission rates associated with the requested
43 service option, and the traffic type for both the Forward and Reverse Traffic Channels is

1 assumed to be primary traffic; furthermore, a service configuration established using
2 service option negotiation is restricted to having only a single service option connection.

3 At mobile station origination and termination, the type of negotiation to use, either service
4 negotiation or service option negotiation, is indicated in the *Channel Assignment Message*.
5 Service negotiation is always used after the mobile station receives an *Extended Channel*
6 *Assignment Message*. If a CDMA-to-CDMA hard handoff occurs during the call, the type of
7 negotiation to use following the handoff is indicated in the *Extended Handoff Direction*
8 *Message*, the *General Handoff Direction Message*, or the *Universal Handoff Direction*
9 *Message*.

10 For CDMA mode operation in band classes other than Band Class 0, only service
11 negotiation is to be used.

12 The following messages are used to support service negotiation:

- 13 1. *Service Request Message*: The mobile station can use this message to propose a
14 service configuration, or to accept or reject a service configuration proposed in a
15 *Service Response Message*. The base station can use this message to propose a
16 service configuration, or to reject a service configuration proposed in a *Service*
17 *Response Message*.
- 18 2. *Service Response Message*: The mobile station can use this message to accept or
19 reject a service configuration proposed in a *Service Request Message*, or to propose
20 an alternative service configuration. The base station can use this message to reject
21 a service configuration proposed in a *Service Request Message*, or to propose an
22 alternative service configuration.
- 23 3. *Service Connect Message*: The base station can use this message to accept a service
24 configuration proposed in a *Service Request Message* or *Service Response Message*,
25 and to instruct the mobile station to begin using the service configuration.
- 26 4. *Service Connect Completion Message*: The mobile station can use this message to
27 acknowledge the transition to a new service configuration.
- 28 5. *Service Option Control Message*: The mobile station and base station can use this
29 message to invoke service-option-specific functions.
- 30 6. *Extended Channel Assignment Message*: The base station can use this message to
31 accept or reject the initial service configuration proposed by the mobile station in an
32 *Origination Message* or a *Page Response Message*.

33 The following messages are used to support service option negotiation:

- 34 1. *Service Option Request Order*: The mobile station and base station can use this
35 message either to request a service option or to suggest an alternative service
36 option.
- 37 2. *Service Option Response Order*: The mobile station and base station can use this
38 message to accept or to reject a service option request.
- 39 3. *Service Option Control Order*: The mobile station and base station can use this
40 message to invoke service option specific functions.

1 The following messages are used to support both service negotiation and service option
2 negotiation:

- 3 1. *Origination Message*: The mobile station can use this message to propose an initial
4 service configuration.
- 5 2. *Channel Assignment Message*: The base station can use this message to accept or
6 to reject the initial service configuration proposed by the mobile station in an
7 *Origination Message* or a *Page Response Message* and to indicate which type of
8 negotiation, either service negotiation or service option negotiation, is to be used
9 during the call.
- 10 3. *Extended Handoff Direction Message*: The base station can use this message to
11 indicate which type of negotiation, either service negotiation or service option
12 negotiation, is to be used following a CDMA-to-CDMA hard handoff.
- 13 4. *General Handoff Direction Message*: The base station can use this message to
14 indicate which type of negotiation, either service negotiation or service option
15 negotiation, is to be used following a CDMA-to-CDMA hard handoff. The base
16 station can use this message to accept a service configuration proposed in a *Service*
17 *Request Message* or *Service Response Message*. The base station can also use this
18 message to instruct the mobile station to begin using the service configuration.
- 19 5. *General Page Message* or *Universal Page Message*: The base station can use a
20 mobile-station-addressed page in a *General Page Message* or in a *Universal Page*
21 *Message* to propose an initial service configuration.
- 22 6. *Page Response Message*: The mobile station can use this message to accept or to
23 reject the initial service configuration proposed by the base station in a mobile-
24 station-addressed page, or to propose an alternative initial service configuration.
- 25 7. *Status Request Message*: The base station can use this message to request service
26 capability information from the mobile station.
- 27 8. *Status Response Message*: The mobile station can use this message to return the
28 service capability information requested by the base station in a *Status Request*
29 *Message*.
- 30 9. *Extended Status Response Message*: The mobile station can use this message to
31 return the service capability information requested by the base station in a *Status*
32 *Request Message*.
- 33 10. *Universal Handoff Direction Message*: The base station can use this message to
34 indicate which type of negotiation, either service negotiation or service option
35 negotiation, is to be used following a CDMA-to-CDMA hard handoff. The base
36 station can use this message to accept a service configuration proposed in a *Service*
37 *Request Message* or *Service Response Message*. The base station can also use this
38 message to instruct the mobile station to begin using the service configuration.
- 39 11. *General Extension Message*: The mobile station shall process this message as
40 specified in section 2.6.18.

1 2.6.4.1.2.1 Use of Variables

2 2.6.4.1.2.1.1 Maintaining the Service Request Sequence Number

3 The mobile station shall maintain a service request sequence number variable,
4 $SERV_REQ_NUM_S$ for use with service negotiation. Upon entering the *Mobile Station*
5 *Control On the Traffic Channel State*, the mobile station shall set $SERV_REQ_NUM_S$ to 0.

6 Each time the mobile station sends a new *Service Request Message*, it shall set the
7 $SERV_REQ_SEQ$ field of the message to the current value of $SERV_REQ_NUM_S$, and shall
8 then set $SERV_REQ_NUM_S$ equal to $(SERV_REQ_NUM_S + 1)$ modulo 8.

9 2.6.4.1.2.1.2 Maintaining the Service Negotiation Indicator Variable

10 The mobile station shall maintain a service negotiation indicator variable, $SERV_NEG_S$, to
11 indicate which type of negotiation to use, either service negotiation or service option
12 negotiation. The mobile station shall set $SERV_NEG_S$ to enabled whenever service
13 negotiation is to be used, and shall set $SERV_NEG_S$ to disabled whenever service option
14 negotiation is to be used. The precise rules for setting $SERV_NEG_S$ are specified in 2.6.4.2
15 and 2.6.6.2.5.1.

16 For CDMA operation in band classes other than Band Class 0, the mobile station shall set
17 $SERV_NEG_S$ to enabled.

18 2.6.4.1.2.1.3 Maintaining the Service Option Request Number

19 The mobile station shall maintain a service option request number variable, SO_REQ_S , for
20 use with service option negotiation. The mobile station shall set SO_REQ_S to a special
21 value, NULL, if the mobile station does not have an outstanding service option request. If
22 the mobile station has an outstanding service option request, the mobile station shall set
23 SO_REQ_S to the number of the service option associated with the outstanding request.

24 2.6.4.1.2.1.4 Stored Service Configuration and Reconnection

25 This section provides an overview of how the mobile station and the base station may store
26 the service configuration and how the stored service configuration may be restored upon
27 re-establishing dedicated channels.

28 Upon establishing a call and entering the *Mobile Station Control on the Traffic Channel State*,
29 service negotiation procedures are performed as specified in 2.6.4.1.2.2 to establish a
30 mutually acceptable service configuration between the mobile station and the base station.
31 The service configuration consists of parameters specified via the Service Configuration
32 information record (see 3.7.5.7) and Non-Negotiable Service Configuration information
33 record (see 3.7.5.20). The mobile station and the base station may store the established
34 service configuration. This is done so that when the call is re-established, the stored service
35 configuration may be restored and without performing the service negotiation procedures.
36 In order to ensure that the service configuration restored at the mobile station and the base
37 station are identical (that is, the values of the service configuration parameters are
38 identical), a service configuration synchronization identifier (called $SYNC_ID$) is associated
39 with each stored service configuration. $SYNC_ID$ is a variable length identifier assigned by
40 the base station corresponding to a particular Service Configuration information record and

1 Non-negotiable Service Configuration information record. The SYNC_ID value is used by
 2 the base station to determine whether these two information records may be omitted from
 3 the *Service Connect Message*.

4 When P_REV_IN_USE_s is less than or equal to six, there is no requirement on storing the
 5 established service configuration for future use. In this case, when a call is re-established
 6 and the mobile station enters the *Mobile Station Control on the Traffic Channel State*, service
 7 configuration must be re-established by performing service negotiation procedures again.

8 When P_REV_IN_USE_s is greater than six, based on the value of SYNC_ID included by the
 9 mobile station in the *Origination Message*, *Page Response Message*, or *Enhanced Origination*
 10 *Message* the base station may not send the Service Configuration information record and
 11 the Non-negotiable Service Configuration information record over the air and instructs the
 12 mobile station to start using the stored information records corresponding to the SYNC_ID
 13 reported by the mobile station.

14 When P_REV_IN_USE_s is equal to or greater than nine, the mobile station is required to
 15 store minimum of four service configurations. Also, the stored service configuration can be
 16 restored incrementally as well. That is, if N service option connections are contained in the
 17 stored service configuration, then the mobile station can request to restore one of these
 18 service option connections upon establishing dedicated channels. This is achieved via the
 19 SR_ID field of the *Origination Message* or *Reconnect Message*. Once operating on the
 20 dedicated channels, the mobile station can request to restore additional service option
 21 connections via the *Enhanced Origination Message*. The base station in turn can grant the
 22 mobile station request via *Extended Channel Assignment Message*, *Service Connect*
 23 *Message*, or *Call Assignment Message*. If the base station uses *Extended Channel*
 24 *Assignment Message* to grant the mobile station request, then the base station is not
 25 required to send a *Service Connect Message*. During traffic channel operation, service
 26 option connections are to be restored only from the SYNC_ID that is currently in use (if
 27 any).

28 When P_REV_IN_USE_s is equal to or greater than 11, the base station can autonomously
 29 order the mobile station to restore a stored service configuration via the *Extended Channel*
 30 *Assignment Message* or *Service Connect Message* even when the mobile station has not
 31 requested to restore a service configuration, or when the mobile station has requested to
 32 restore a different service configuration. Additionally, the base station can signal the
 33 SYNC_ID value corresponding to the currently used service configuration using the
 34 *Universal Handoff Direction Message*.

35 2.6.4.1.2.2 Service Subfunctions

36 As illustrated in Figure 2.6.4.1.2.2-1, the mobile station supports service configuration and
 37 negotiation by performing the following set of service subfunctions:

- 38 • *Normal Service Subfunction* - While this subfunction is active, the mobile station
 39 processes service configuration requests from the user and from the base station.
- 40 • *Waiting for Service Request Message Subfunction* - While this subfunction is active,
 41 the mobile station waits to receive a *Service Request Message*.

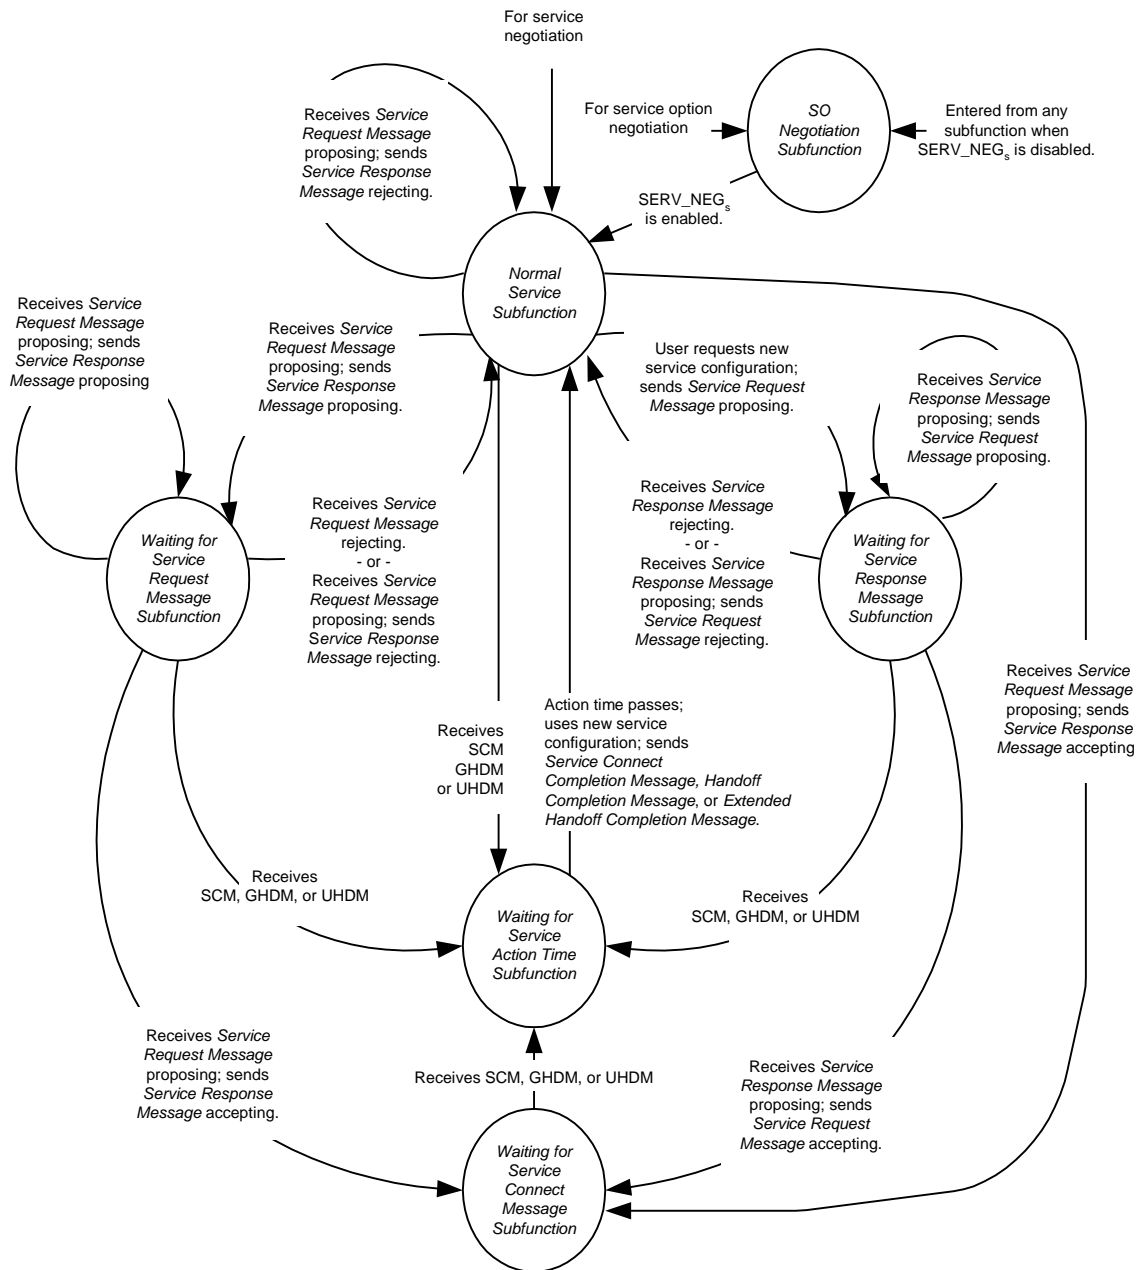

- 1 • *Waiting for Service Response Message Subfunction* - While this subfunction is active,
2 the mobile station waits to receive a *Service Response Message*.
- 3 • *Waiting for Service Connect Message Subfunction* - While this subfunction is active,
4 the mobile station waits to receive a *Service Connect Message*, a *General Handoff*
5 *Direction Message*, or a *Universal Handoff Direction Message* containing a service
6 configuration record.
- 7 • *Waiting for Service Action Time Subfunction* - While this subfunction is active, the
8 mobile station waits for the action time associated with a new service configuration
9 and then sends a *Service Connect Completion Message*, a *Handoff Completion*
10 *Message*, or an *Extended Handoff Completion Message*.
- 11 • *SO Negotiation Subfunction* - While this subfunction is active, the mobile station
12 supports service option negotiation with the base station. This subfunction is only
13 used while operating in Band Class 0.

14 The *SO Negotiation Subfunction* supports service option negotiation. All of the other service
15 subfunctions support service negotiation.

16 At any given time during Traffic Channel operation, only one of the service subfunctions is
17 active. For example, when the mobile station first enters the *Traffic Channel Initialization*
18 *Substate* of the *Mobile Station Control on the Traffic Channel State*, the *Normal Service*
19 *Subfunction*, the *Waiting for Service Connect Message Subfunction* or the *SO Negotiation*
20 *Subfunction* is active. Each of the other service subfunctions may become active in
21 response to various events which occur during the Traffic Channel substates. Typically,
22 the mobile station processes events pertaining to service configuration and negotiation in
23 accordance with the requirements for the active service subfunction, however, some Traffic
24 Channel substates do not allow for the processing of certain events pertaining to service
25 configuration and negotiation, or specify requirements for processing such events which
26 supersede the requirements of the active service subfunction.

27

28

- Notes:
- SCM stands for *Service Connect Message*.
 - $GHDM$ stands for *General Handoff Direction Message*.
 - $UHDM$ stands for *Universal Handoff Direction Message*.
 - Processing for special cases, such as timeouts and errors, is not shown in this diagram.

Figure 2.6.4.1.2.2-1. Mobile Station Service Subfunctions

1 2.6.4.1.2.2.1 Normal Service Subfunction

2 While this subfunction is active, the mobile station processes service configuration
3 requests from the user and from the base station.

4 While the *Normal Service Subfunction* is active, the mobile station shall perform the
5 following:

- 6 • The mobile station shall process Forward and Reverse Traffic Channel frames in
7 accordance with the current service configuration. The mobile station shall discard
8 any Forward Traffic Channel frame which has a format that is not supported by the
9 mobile station. The mobile station may discard any type of Forward Traffic Channel
10 traffic that is not signaling traffic and is not part of the current service
11 configuration.
- 12 • To initiate service negotiation for a new service configuration, the mobile station
13 shall send a *Service Request Message* to propose the new service configuration. The
14 mobile station shall activate the *Waiting for Service Response Message Subfunction*.
- 15 • For any service option connection that is part of the current service configuration,
16 the mobile station may send a *Service Option Control Message* to invoke a service
17 option specific function in accordance with the requirements for the associated
18 service option.
- 19 • If $SERV_NEG_s$ changes from enabled to disabled (see 2.6.6.2.5.1), the mobile
20 station shall activate the *SO Negotiation Subfunction*.
- 21 • If the mobile station receives one of the following service negotiation messages, the
22 mobile station shall process the message according to the specified requirements:
 - 23 1. *Service Connect Message*: The mobile station shall perform the following:
 - 24 - If $USE_OLD_SERV_CONFIG_r$ equals '01' or '10', and if the mobile station
25 entered the *Mobile Station Control on the Traffic Channel State* due to
26 receiving an *Extended Channel Assignment Message* with
27 $GRANTED_MODE$ set to '11', the mobile station shall send a *Mobile*
28 *Station Reject Order* with the $ORDQ$ field set to '00010100' (stored
29 configuration already restored at channel assignment) within T_{56m}
30 seconds and shall not perform the rest of the procedures below.
 - 31 - If $USE_OLD_SERV_CONFIG_r$ equals '00', the mobile station shall
32 perform the following: If the mobile station accepts the service
33 configuration specified in the message, the mobile station shall activate
34 the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
35 station shall send a *Mobile Station Reject Order* ($ORDQ = '00000111'$)
36 within T_{56m} seconds.
 - 37 - If $USE_OLD_SERV_CONFIG_r$ equals '01', the mobile station shall
38 perform the following: If the mobile station accepts the service
39 configuration currently stored at the mobile station, the mobile station
40 shall activate the *Waiting for Service Action Time Subfunction*; otherwise,

- 1 the mobile station shall send a Mobile Station Reject Order (ORDQ =
2 '00000111') within T_{56m} seconds.
- 3 - If USE_OLD_SERV_CONFIG_r equals '10', the mobile station shall
4 perform the following: If the mobile station accepts the service
5 configuration resulting from updating the stored service configuration
6 with the service configuration received in this message, the mobile
7 station shall activate the Waiting for Service Action Time Subfunction;
8 otherwise, the mobile station shall send a Mobile Station Reject Order
9 (ORDQ = '00000111') within T_{56m} seconds.
- 10 - If USE_OLD_SERV_CONFIG_r equals '11', the mobile station shall
11 perform the following: if the mobile station accepts the service
12 configuration resulting from restoring the indicated service option
13 connection records from the stored service configuration and releasing
14 the indicated service option connection records from the current service
15 configuration, the mobile station shall activate the Waiting for Service
16 Action Time Subfunction; otherwise, the mobile station shall send a
17 *Mobile Station Reject Order* (ORDQ = '00000111') within T_{56m} seconds.
- 18 2. *Service Option Control Message*: If the service option connection specified by the
19 message is part of the current service configuration, and the service option
20 specified by the message is the same as the service option associated with the
21 service option connection, the mobile station shall interpret the action time of
22 the message as specified in 2.6.4.1.5, and shall process the message in
23 accordance with the requirements for the service option; otherwise, the mobile
24 station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within
25 T_{56m} seconds.
- 26 3. *Service Request Message*: The mobile station shall process the message as
27 follows:
- 28 - If the purpose of the message is to reject a proposed service configuration,
29 the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
30 '00000010') within T_{56m} seconds.
- 31 - If the purpose of the message is to propose a service configuration, the
32 mobile station shall process the message as follows:
- 33 + If the mobile station accepts the proposed service configuration, the
34 mobile station shall send a *Service Response Message* to accept the
35 proposed service configuration within T_{59m} seconds. The mobile station
36 shall activate the *Waiting for Service Connect Message Subfunction*.
- 37 + If the mobile station does not accept the proposed service configuration
38 and does not have an alternative service configuration to propose, the
39 mobile station shall send a *Service Response Message* to reject the
40 proposed service configuration within T_{59m} seconds.

- 1 + If the mobile station does not accept the proposed service configuration
2 and has an alternative service configuration to propose, the mobile
3 station shall send a *Service Response Message* to propose the alternative
4 service configuration within T_{59m} seconds. The mobile station shall
5 activate the *Waiting for Service Request Message Subfunction*.
- 6 4. *Service Response Message*: The mobile station shall send a *Mobile Station Reject*
7 *Order* (ORDQ = '00000010') within T_{56m} seconds.
- 8 5. *General Handoff Direction Message*: If the SCR_INCLUDED field is included in
9 this message and is set to '1':
10 If the mobile station has not rejected this message, the mobile station shall
11 activate the *Waiting for Service Action Time Subfunction*.
- 12 6. *Universal Handoff Direction Message*: If the SCR_INCLUDED field is included
13 in this message and is set to '1':
14 If the mobile station has not rejected this message, the mobile station shall
15 activate the *Waiting for Service Action Time Subfunction*.
- 16 • If the mobile station receives one of the following service option negotiation
17 messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
18 '00000010') within T_{56m} seconds:
19 1. *Service Option Request Order*
20 2. *Service Option Response Order*
21 3. *Service Option Control Order*

22 2.6.4.1.2.2.2 Waiting for Service Request Message Subfunction

23 While this subfunction is active, the mobile station waits to receive a *Service Request*
24 *Message*.

25 Upon activation of the *Waiting for Service Request Message Subfunction*, the mobile station
26 shall set the subfunction timer for T_{68m} seconds.

27 While the *Waiting for Service Request Message Subfunction* is active, the mobile station shall
28 perform the following:

- 29 • If the subfunction timer expires, the mobile station shall activate the *Normal Service*
30 *Subfunction*.
- 31 • The mobile station shall process Forward and Reverse Traffic Channel frames in
32 accordance with the current service configuration. The mobile station shall discard
33 any Forward Traffic Channel frame which has a format that is not supported by the
34 mobile station. The mobile station may discard any type of Forward Traffic Channel
35 traffic that is not signaling traffic and is not part of the current service
36 configuration.
- 37 • The mobile station shall not initiate service negotiation for a new service
38 configuration.

- 1 • For any service option connection that is part of the current service configuration,
2 the mobile station may send a *Service Option Control Message* to invoke a service
3 option specific function in accordance with the requirements for the associated
4 service option.
- 5 • If SERV_NEG_S changes from enabled to disabled (see 2.6.6.2.5.1), the mobile
6 station shall activate the *SO Negotiation Subfunction*.
- 7 • If the mobile station receives one of the following service negotiation messages, the
8 mobile station shall process the message according to the specified requirements:
 - 9 1. *Service Connect Message*: The mobile station shall perform the following:
 - 10 - If USE_OLD_SERV_CONFIG_r equals '01' or '10', and if the mobile station
11 entered the *Mobile Station Control on the Traffic Channel State* due to
12 receiving an *Extended Channel Assignment Message* with GRANTED_MODE
13 set to '11', the mobile station shall send a *Mobile Station Reject Order* with
14 the ORDQ field set to '00010100' (stored configuration already restored at
15 channel assignment) within T_{56m} seconds, and shall activate the *Normal*
16 *Service Subfunction*.
 - 17 - If USE_OLD_SERV_CONFIG_r equals '00', the mobile station shall perform
18 the following: If the mobile station accepts the service configuration specified
19 in the message, the mobile station shall activate the *Waiting for Service*
20 *Action Time Subfunction*; otherwise, the mobile station shall send a *Mobile*
21 *Station Reject Order* (ORDQ = '00000111') within T_{56m} seconds and shall
22 activate the *Normal Service Subfunction*.
 - 23 - If USE_OLD_SERV_CONFIG_r equals '01', the mobile station shall perform
24 the following: If the mobile station accepts the service configuration
25 currently stored at the mobile station, the mobile station shall activate the
26 *Waiting for Service Action Time Subfunction*; otherwise, the mobile station
27 shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within T_{56m}
28 seconds and shall activate the *Normal Service Subfunction*.
 - 29 - If USE_OLD_SERV_CONFIG_r equals '10', the mobile station shall perform
30 the following: If the mobile station accepts the service configuration resulting
31 from updating the stored service configuration with the service configuration
32 received in this message, the mobile station shall activate the *Waiting for*
33 *Service Action Time Subfunction*; otherwise, the mobile station shall send a
34 *Mobile Station Reject Order* (ORDQ = '00000111') within T_{56m} seconds and
35 shall activate the *Normal Service Subfunction*.
 - 36 - If USE_OLD_SERV_CONFIG_r equals '11', the mobile station shall perform
37 the following: if the mobile station accepts the service configuration resulting
38 from restoring the indicated service option connection records from the
39 stored service configuration and releasing the indicated service option
40 connection records from the current service configuration, the mobile station
41 shall activate the *Waiting for Service Action Time Subfunction*; otherwise,
42 the mobile station shall send a *Mobile Station Reject Order* (ORDQ =

- 1 ‘00000111’) within T_{56m} seconds and shall activate the *Normal Service*
2 *Subfunction*.
- 3 2. *Service Option Control Message*: If the service option connection specified by the
4 message is part of the current service configuration, and the service option
5 specified by the message is the same as the service option associated with the
6 service option connection, the mobile station shall interpret the action time of
7 the message as specified in 2.6.4.1.5, and shall process the message in
8 accordance with the requirements for the service option; otherwise, the mobile
9 station shall send a *Mobile Station Reject Order* (ORDQ = ‘00000111’) within
10 T_{56m} seconds.
- 11 3. *Service Request Message*: The mobile station shall process the message as
12 follows:
- 13 - If the purpose of the message is to reject a proposed service configuration,
14 the mobile station shall activate the *Normal Service Subfunction*.
 - 15 - If the purpose of the message is to propose a service configuration, the
16 mobile station shall process the message as follows:
 - 17 + If the mobile station accepts the proposed service configuration, the
18 mobile station shall send a *Service Response Message* to accept the
19 proposed service configuration within T_{59m} seconds. The mobile station
20 shall activate the *Waiting for Service Connect Message Subfunction*.
 - 21 + If the mobile station does not accept the proposed service configuration
22 and does not have an alternative service configuration to propose, the
23 mobile station shall send a *Service Response Message* to reject the
24 proposed service configuration within T_{59m} seconds. The mobile station
25 shall activate the *Normal Service Subfunction*.
 - 26 + If the mobile station does not accept the proposed service configuration
27 and has an alternative service configuration to propose, the mobile
28 station shall send a *Service Response Message* to propose the alternative
29 service configuration within T_{59m} seconds. The mobile station shall
30 reset the subfunction timer for T_{68m} seconds.
- 31 4. *Service Response Message*: The mobile station shall send a *Mobile Station Reject*
32 *Order* (ORDQ = ‘00000010’) within T_{56m} seconds.
- 33 5. *General Handoff Direction Message*: If the SCR_INCLUDED field is included in
34 this message and is set to ‘1’:
35 If the mobile station has not rejected this message, the mobile station shall
36 activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
37 station shall activate the *Normal Service Subfunction*.
- 38 6. *Universal Handoff Direction Message*: If the SCR_INCLUDED field is included in
39 this message and is set to ‘1’:

1 If the mobile station has not rejected this message, the mobile station shall
 2 activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
 3 station shall activate the *Normal Service Subfunction*.

- 4 • If the mobile station receives one of the following service option negotiation
 5 messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
 6 '00000010') within T_{56m} seconds:
 - 7 1. *Service Option Request Order*
 - 8 2. *Service Option Response Order*
 - 9 3. *Service Option Control Order*

10 2.6.4.1.2.2.3 Waiting for Service Response Message Subfunction

11 While this subfunction is active, the mobile station waits to receive a *Service Response*
 12 *Message*.

13 Upon activation of the *Waiting for Service Response Message Subfunction*, the mobile station
 14 shall set the subfunction timer for T_{68m} seconds.

15 While the *Waiting for Service Response Message Subfunction* is active, the mobile station
 16 shall perform the following:

- 17 • If the subfunction timer expires, the mobile station shall activate the *Normal Service*
 18 *Subfunction*.
- 19 • The mobile station shall process Forward and Reverse Traffic Channel frames in
 20 accordance with the current service configuration. The mobile station shall discard
 21 any Forward Traffic Channel frame which has a format that is not supported by the
 22 mobile station. The mobile station may discard any type of Forward Traffic Channel
 23 traffic that is not signaling traffic and is not part of the current service
 24 configuration.
- 25 • The mobile station shall not initiate service negotiation for a new service
 26 configuration.
- 27 • For any service option connection that is part of the current service configuration,
 28 the mobile station may send a *Service Option Control Message* to invoke a service
 29 option specific function in accordance with the requirements for the associated
 30 service option.
- 31 • If $SERV_NEG_s$ changes from enabled to disabled (see 2.6.6.2.5.1), the mobile
 32 station shall activate the *SO Negotiation Subfunction*.
- 33 • If the mobile station receives one of the following service negotiation messages, the
 34 mobile station shall process the message according to the specified requirements:
 - 35 1. *Service Connect Message*: The mobile station shall perform the following:
 - 36 - If $USE_OLD_SERV_CONFIG_r$ equals '01' or '10', and if the mobile station
 37 entered the *Mobile Station Control on the Traffic Channel State* due to
 38 receiving an *Extended Channel Assignment Message* with $GRANTED_MODE$
 39 set to '11', the mobile station shall send a *Mobile Station Reject Order* with

- 1 the ORDQ field set to '00010100' (stored configuration already restored at
 2 channel assignment) within T_{56m} seconds, and shall activate the *Normal*
 3 *Service Subfunction*.
- 4 - If USE_OLD_SERV_CONFIG_r equals '00', the mobile station shall perform
 5 the following: If the mobile station accepts the service configuration specified
 6 in the message, the mobile station shall activate the *Waiting for Service*
 7 *Action Time Subfunction*; otherwise, the mobile station shall send a *Mobile*
 8 *Station Reject Order* (ORDQ = '00000111') within T_{56m} seconds and shall
 9 activate the *Normal Service Subfunction*.
- 10 - If USE_OLD_SERV_CONFIG_r equals '01', the mobile station shall perform
 11 the following: If the mobile station accepts the service configuration
 12 currently stored at the mobile station, the mobile station shall activate the
 13 *Waiting for Service Action Time Subfunction*; otherwise, the mobile station
 14 shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within T_{56m}
 15 seconds and shall activate the *Normal Service Subfunction*.
- 16 - If USE_OLD_SERV_CONFIG_r equals '10', the mobile station shall perform
 17 the following: If the mobile station accepts the service configuration resulting
 18 from updating the stored service configuration with the service configuration
 19 received in this message, the mobile station shall activate the *Waiting for*
 20 *Service Action Time Subfunction*; otherwise, the mobile station shall send a
 21 *Mobile Station Reject Order* (ORDQ = '00000111') within T_{56m} seconds and
 22 shall activate the *Normal Service Subfunction*.
- 23 - If USE_OLD_SERV_CONFIG_r equals '11', the mobile station shall perform
 24 the following: if the mobile station accepts the service configuration resulting
 25 from restoring the indicated service option connection records from the
 26 stored service configuration and releasing the indicated service option
 27 connection records from the current service configuration, the mobile station
 28 shall activate the *Waiting for Service Action Time Subfunction*; otherwise,
 29 the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
 30 '00000111') within T_{56m} seconds and shall activate the *Normal Service*
 31 *Subfunction*.
- 32 2. *Service Option Control Message*: If the service option connection specified by the
 33 message is part of the current service configuration, and the service option
 34 specified by the message is the same as the service option associated with the
 35 service option connection, the mobile station shall interpret the action time of
 36 the message as specified in 2.6.4.1.5, and shall process the message in
 37 accordance with the requirements for the service option; otherwise, the mobile
 38 station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within
 39 T_{56m} seconds.
- 40 3. *Service Request Message*: The mobile station shall process the message as
 41 follows:

- 1 - If the purpose of the message is to reject a proposed service configuration,
2 the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
3 '00000010') within T_{56m} seconds.
- 4 - If the purpose of the message is to propose a service configuration, the
5 mobile station shall discontinue processing the service configuration
6 requested by the user and shall process the message as follows:
7 + If the mobile station accepts the proposed service configuration, the
8 mobile station shall send a *Service Response Message* to accept the
9 proposed service configuration within T_{59m} seconds. The mobile station
10 shall activate the *Waiting for Service Connect Message Subfunction*.
11 + If the mobile station does not accept the proposed service configuration
12 and does not have an alternative service configuration to propose, the
13 mobile station shall send a *Service Response Message* to reject the
14 proposed service configuration within T_{59m} seconds. The mobile station
15 shall activate the *Normal Service Subfunction*.
16 + If the mobile station does not accept the proposed service configuration
17 and has an alternative service configuration to propose, the mobile
18 station shall send a *Service Response Message* to propose the alternative
19 service configuration within T_{59m} seconds. The mobile station shall
20 activate the *Waiting for Service Request Message Subfunction*.
- 21 4. *Service Response Message*: The mobile station shall process the message as
22 follows:
23 - If the service request sequence number (SERV_REQ_SEQ_r) from the message
24 does not match the sequence number of the *Service Request Message* for
25 which the mobile station is expecting a response, the mobile station shall
26 not process the other Layer 3 fields of the message.
27 - If the purpose of the message is to reject the service configuration proposed
28 in the corresponding *Service Request Message*, the mobile station shall
29 activate the *Normal Service Subfunction*. The mobile station may indicate to
30 the user that the requested service configuration has been rejected.
31 - If the purpose of the message is to propose a service configuration, the
32 mobile station shall process the message as follows:
33 + If the mobile station accepts the proposed service configuration, the
34 mobile station shall send a *Service Request Message* to accept the
35 proposed service configuration within T_{59m} seconds. The mobile station
36 shall activate the *Waiting for Service Connect Message Subfunction*.
37 + If the mobile station does not accept the proposed service configuration
38 and does not have an alternative service configuration to propose, the
39 mobile station shall send a *Service Request Message* to reject the
40 proposed service configuration within T_{59m} seconds. The mobile station
41 shall activate the *Normal Service Subfunction*.

- 1 + If the mobile station does not accept the proposed service configuration
2 and has an alternative service configuration to propose, the mobile
3 station shall send a *Service Request Message* to propose the alternative
4 service configuration within T_{59m} seconds. The mobile station shall
5 reset the subfunction timer for T_{68m} seconds.
- 6 5. *General Handoff Direction Message*: If the SCR_INCLUDED field is included in
7 this message and is set to '1':
8 If the mobile station has not rejected this message, the mobile station shall
9 activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
10 station shall activate the *Normal Service Subfunction*.
- 11 6. *Universal Handoff Direction Message*: If the SCR_INCLUDED field is included in
12 this message and is set to '1':
13 If the mobile station has not rejected this message, the mobile station shall
14 activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
15 station shall activate the *Normal Service Subfunction*.
- 16 • If the mobile station receives one of the following service option negotiation
17 messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
18 '00000010') within T_{56m} seconds:
- 19 1. *Service Option Request Order*
20 2. *Service Option Response Order*
21 3. *Service Option Control Order*

22 2.6.4.1.2.2.4 Waiting for Service Connect Message Subfunction

23 While this subfunction is active, the mobile station waits to receive a *Service Connect*
24 *Message*, a *General Handoff Direction Message*, or a *Universal Handoff Direction Message*
25 containing a service configuration record.

26 Upon activation of the *Waiting for Service Connect Message Subfunction*, the mobile station
27 shall set the subfunction timer for T_{65m} seconds.

28 While the *Waiting for Service Connect Message Subfunction* is active, the mobile station shall
29 perform the following:

- 30 • If the subfunction timer expires, the mobile station shall activate the *Normal Service*
31 *Subfunction*.
- 32 • The mobile station shall process Forward and Reverse Traffic Channel frames in
33 accordance with the current service configuration. The mobile station shall discard
34 any Forward Traffic Channel frame which has a format that is not supported by the
35 mobile station. The mobile station may discard any type of Forward Traffic Channel
36 traffic that is not signaling traffic and is not part of the current service
37 configuration.
- 38 • The mobile station shall not initiate service negotiation for a new service
39 configuration.

- 1 • For any service option connection that is part of the current service configuration,
2 the mobile station may send a *Service Option Control Message* to invoke a service
3 option specific function in accordance with the requirements for the associated
4 service option.
- 5 • If SERV_NEG_S changes from enabled to disabled (see 2.6.6.2.5.1), the mobile
6 station shall activate the *SO Negotiation Subfunction*.
- 7 • If the mobile station receives one of the following service negotiation messages, the
8 mobile station shall process the message according to the specified requirements:
- 9 1. *Service Connect Message*: The mobile station shall perform the following:
- 10 - If USE_OLD_SERV_CONFIG_r equals '01' or '10', and if the mobile station
11 entered the *Mobile Station Control on the Traffic Channel State* due to
12 receiving an *Extended Channel Assignment Message* with GRANTED_MODE
13 set to '11', the mobile station shall send a *Mobile Station Reject Order* with
14 the ORDQ field set to '00010100' (stored configuration already restored at
15 channel assignment) within T_{56m} seconds, and shall activate the *Normal*
16 *Service Subfunction*.
- 17 - If USE_OLD_SERV_CONFIG_r equals '00', the mobile station shall perform
18 the following: If the mobile station accepts the service configuration specified
19 in the message, the mobile station shall activate the *Waiting for Service*
20 *Action Time Subfunction*; otherwise, the mobile station shall send a *Mobile*
21 *Station Reject Order* (ORDQ = '00000111') within T_{56m} seconds and shall
22 activate the *Normal Service Subfunction*.
- 23 - If USE_OLD_SERV_CONFIG_r equals '01', the mobile station shall perform
24 the following: If the mobile station accepts the service configuration
25 currently stored at the mobile station, the mobile station shall activate the
26 *Waiting for Service Action Time Subfunction*; otherwise, the mobile station
27 shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within T_{56m}
28 seconds, and shall activate the *Normal Service Subfunction*.
- 29 - If USE_OLD_SERV_CONFIG_r equals '10', the mobile station shall perform
30 the following: If the mobile station accepts the service configuration resulting
31 from updating the stored service configuration with the service configuration
32 received in this message, the mobile station shall activate the *Waiting for*
33 *Service Action Time Subfunction*; otherwise, the mobile station shall send a
34 *Mobile Station Reject Order* (ORDQ = '00000111') within T_{56m} seconds, and
35 shall activate the *Normal Service Subfunction*.
- 36 - If USE_OLD_SERV_CONFIG_r equals '11', the mobile station shall perform
37 the following: if the mobile station accepts the service configuration resulting
38 from restoring the indicated service option connection records from the
39 stored service configuration and releasing the indicated service option
40 connection records from the current service configuration, the mobile station
41 shall activate the *Waiting for Service Action Time Subfunction*; otherwise,
42 the mobile station shall send a *Mobile Station Reject Order* (ORDQ =

- 1 ‘00000111’) within T_{56m} seconds, and shall activate the *Normal Service*
2 *Subfunction*.
- 3 2. *Service Option Control Message*: If the service option connection specified by the
4 message is part of the current service configuration, and the service option
5 specified by the message is the same as the service option associated with the
6 service option connection, the mobile station shall interpret the action time of
7 the message as specified in 2.6.4.1.5, and shall process the message in
8 accordance with the requirements for the service option; otherwise, the mobile
9 station shall send a *Mobile Station Reject Order* (ORDQ = ‘00000111’) within
10 T_{56m} seconds.
- 11 3. *Service Request Message*: The mobile station shall process the message as
12 follows:
- 13 - If the purpose of the message is to reject a proposed service configuration,
14 the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
15 ‘00000010’) within T_{56m} seconds.
- 16 - If the purpose of the message is to propose a service configuration, the
17 mobile station shall process the message as follows:
- 18 + If the mobile station accepts the proposed service configuration, the
19 mobile station shall send a *Service Response Message* to accept the
20 proposed service configuration within T_{59m} seconds. The mobile station
21 shall reset the subfunction timer for T_{65m} seconds.
- 22 + If the mobile station does not accept the proposed service configuration
23 and does not have an alternative service configuration to propose, the
24 mobile station shall send a *Service Response Message* to reject the
25 proposed service configuration within T_{59m} seconds. The mobile station
26 shall activate the *Normal Service Subfunction*.
- 27 + If the mobile station does not accept the proposed service configuration
28 and has an alternative service configuration to propose, the mobile
29 station shall send a *Service Response Message* to propose the alternative
30 service configuration within T_{59m} seconds. The mobile station shall
31 activate the *Waiting for Service Request Message Subfunction*.
- 32 4. *Service Response Message*: The mobile station shall send a *Mobile Station Reject*
33 *Order* (ORDQ = ‘00000010’) within T_{56m} seconds.
- 34 5. *General Handoff Direction Message*: If the SCR_INCLUDED field is included in
35 this message and is set to ‘1’:
36 If the mobile station has not rejected this message, the mobile station shall
37 activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
38 station shall activate the *Normal Service Subfunction*.
- 39 6. *Universal Handoff Direction Message*: If the SCR_INCLUDED field is included in
40 this message and is set to ‘1’:

1 If the mobile station has not rejected this message, the mobile station shall
 2 activate *the Waiting for Service Action Time Subfunction*; otherwise, the mobile
 3 station shall activate the *Normal Service Subfunction*.

- 4 • If the mobile station receives one of the following service option negotiation
 5 messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
 6 ‘00000010’) within T_{56m} seconds:
 - 7 1. *Service Option Request Order*
 - 8 2. *Service Option Response Order*
 - 9 3. *Service Option Control Order*

10 2.6.4.1.2.2.5 Waiting for Service Action Time Subfunction

11 While this subfunction is active, the mobile station waits for the action time associated with
 12 a new service configuration. If the action time was specified by a *Service Connect Message*,
 13 the mobile station shall send the *Service Connect Completion Message* at the action time.

14 While the *Waiting for Service Action Time Subfunction* is active, the mobile station shall
 15 perform the following:

- 16 • Prior to the action time associated with the *Service Connect Message*, *General*
 17 *Handoff Direction Message* (containing a service configuration record), or *Universal*
 18 *Handoff Direction Message* (containing a service configuration record), the mobile
 19 station shall process Forward and Reverse Traffic Channel frames in accordance
 20 with the current service configuration. The mobile station shall discard any
 21 Forward Traffic Channel frame which has a format that is not supported by the
 22 mobile station. The mobile station may discard any type of Forward Traffic Channel
 23 traffic that is not signaling traffic and is not part of the current service
 24 configuration.
- 25 • At the action time associated with the *Service Connect Message*, *General Handoff*
 26 *Direction Message* (containing a service configuration record) or *Universal Handoff*
 27 *Direction Message* (containing a service configuration record), the mobile station
 28 shall perform the following⁵⁹:
 - 29 - If this is a *Service Connect Message* and USE_TYPE0_PLCM_r equals ‘1’, the
 30 mobile station shall perform the following:

⁵⁹ Note that these procedures that take place at the action time may not occur for this message if a GHDM/UHDM with SCR_INCLUDED equal to ‘1’ is received before the action time of this message. In this case, these procedures take place for the new message. One exception is that the call assignments from this message take effect at the action time of this message regardless of the call assignments from the new message.

- 1 + If P_REV_IN_USE_S is less than 11, set PLCM_TYPE_S to '0000'; otherwise set
2 PLCM_TYPE_S to '0100'.
- 3 + The mobile station shall use the Public Long Code Mask derived from
4 PLCM_TYPE_S as specified in 2.3.6.
- 5 - If this is a *Service Connect Message* with USE_OLD_SERV_CONFIG_R equals '01',
6 the mobile station shall perform the following:
- 7 + If SYNC_ID_INCL_R is included and set to '1', the SYNC_ID_R indicates the
8 stored service configuration to be restored; otherwise, the SYNC_ID conveyed
9 by the mobile station indicates the stored service configuration to be
10 restored.
- 11 + The Call Control instance identified by NULL shall also be identified by the
12 connection reference assigned to the first service option connection in the
13 stored Service Configuration information record.
- 14 + For each service option connection (with corresponding connection reference
15 CON_REF_i) in the stored service configuration record, if any, except for the
16 first one, Layer 3 shall instantiate a Call Control instance (as specified in
17 2.6.10) with a 'restore indication'. The mobile station shall identify each of
18 these Call Control instances by the corresponding CON_REF_i.
- 19 + The mobile station shall begin to use the stored service configuration
20 corresponding to this SYNC_ID as the current service configuration as
21 specified in 2.6.4.1.2.2.5.2 and shall begin to process Forward and Reverse
22 Traffic Channel frames accordingly. The mobile station shall send a *Service*
23 *Connect Completion Message* within T_{56m} seconds after the action time.
- 24 + The mobile station shall store the synchronization identifier corresponding to
25 the stored service configuration as SYNC_ID_S.
- 26 + The mobile station shall exit this subfunction and activate the *Normal*
27 *Service Subfunction*.
- 28 - If this is a *Service Connect Message* with USE_OLD_SERV_CONFIG_R equals '10',
29 the mobile station shall perform the following:
- 30 + If SYNC_ID_INCL_R is included and set to '1' and
31 SYNC_ID_BS_INITIATED_IND_R is set to '1', the SYNC_ID_R indicates the stored
32 service configuration to be restored; otherwise, the SYNC_ID conveyed by the
33 mobile station indicates the stored service configuration to be restored.
- 34 + The mobile station shall update the stored service configuration with the
35 received service configuration as follows:
- 36 ○ The mobile station shall restore the stored service configuration as
37 specified in 2.6.4.1.2.2.5.2.
- 38 ○ The mobile station shall process the received Service Configuration
39 Record as specified in 2.6.4.1.12.

- 1 ○ The mobile station shall process the received Non-negotiable Service
2 Configuration Record as specified in 2.6.4.1.13.
- 3 + For each service option connection (with corresponding connection reference
4 CON_REF_i) in the stored service configuration record, if any, except for the
5 first one, Layer 3 shall instantiate a Call Control instance (as specified in
6 2.6.10) with a 'restore indication'. The mobile station shall identify each of
7 these Call Control instances by the corresponding CON_REF_i.
- 8 + The mobile station shall begin to use the updated service configuration as
9 the current service configuration and shall begin to process Forward and
10 Reverse Traffic Channel frames accordingly. The mobile station shall send a
11 *Service Connect Completion Message* within T_{56m} seconds after the action
12 time.
- 13 + If SYNC_ID_INCL_r is set to '1' and SYNC_ID_BS_INITIATED_IND_r is set to '0',
14 the mobile station shall perform the following::
- 15 ○ The mobile station shall store the synchronization identifier received
16 from the base station (SYNC_ID_s = SYNC_ID_r).
- 17 ○ The mobile station shall store the new service configuration
18 corresponding to SYNC_ID_s as specified in 2.6.4.1.2.2.5.1.
19 Otherwise, the mobile station shall set SYNC_ID_s to NULL.
- 20 + The mobile station shall exit this subfunction and activate the *Normal*
21 *Service Subfunction*.
- 22 - If this is a *Service Connect Message* with USE_OLD_SERV_CONFIG_r equals '11',
23 the mobile station shall perform the following:
- 24 + If the SYNC_ID_INCL field is included in this message and set to '1', the
25 SYNC_ID included in this message indicates the stored service configuration
26 to be restored; otherwise, the SYNC_ID conveyed by the mobile station
27 indicates the stored service configuration to be restored.
- 28 ○ Prior to this message, if an *Extended Channel Assignment Message* with
29 GRANTED_MODE set to '11' was not received and a *Service Connect*
30 *Message*, *General Handoff Direction Message* (with service configuration),
31 or *Universal Handoff Direction Message* (with service configuration) was
32 not successfully received or accepted by the mobile station since entering
33 the *Traffic Channel Substate*, the mobile station shall perform the
34 following:
- 35 ◇ The mobile station shall begin to use the service configuration which
36 was stored by the mobile station when it left the *Mobile Station*
37 *Control on the Traffic Channel State* as the current service
38 configuration as specified in 2.6.4.1.2.2.5.2 where only the service
39 option connection record corresponding to SR_ID_r received in the
40 *Service Connect Message* shall be restored.

- 1 ◇ The Call Control instance identified by NULL shall also be identified
2 by the connection reference assigned to the restored service option
3 connection.
- 4 ◇ The mobile station shall begin to process Forward and Reverse Traffic
5 Channel frames accordingly with the restored service configuration.
6 The mobile station shall send a *Service Connect Completion Message*
7 within T_{56m} seconds after the action time.
- 8 ◇ The mobile station shall store the synchronization identifier
9 corresponding to the stored service configuration as $SYNC_ID_S$.
- 10 ◇ The mobile station shall exit this subfunction and activate the *Normal*
11 *Service Subfunction*.
- 12 ○ Otherwise, the mobile station shall perform the following at the action
13 time of this message:
- 14 ◇ The mobile station shall restore the indicated service option
15 connection record(s) from the stored service configuration as
16 specified in 2.6.4.1.2.2.5.2, where the service option connection
17 records to be restored are determined as follows:
- 18 — If SR_ID_T equals '111', the mobile station shall restore all
19 remaining service option connection records. Otherwise, if SR_ID_T
20 equals '000', the mobile station shall restore service option
21 connection records corresponding to SR_ID_S indicated by
22 $SR_ID_RESTORE_BITMAP_T$ received in this message; otherwise
23 the mobile station shall restore the service option connection
24 record corresponding to the SR_ID_T received in this message.
- 25 — Layer 3 shall instantiate a Call Control instance (as specified in
26 2.6.10) for each of the restored service option connections with a
27 'restore indication' and Layer 3 shall identify each of these Call
28 Control instances by the value of the CON_REF field
29 corresponding to the restored service option connection.
- 30 — The mobile station shall perform the following:
- 31 a. If SR_ID_T equals '111', the mobile station shall disable the
32 enhanced origination timers corresponding to each *Enhanced*
33 *Origination Message* sent with $SYNC_ID_INCL$ field set to '1'
34 and shall remove the corresponding TAG value from the list
35 $TAG_OUTSTANDING_LIST$.
- 36 b. Otherwise, the mobile station shall disable the enhanced
37 origination timer corresponding to the *Enhanced Origination*
38 *Message* with SR_ID field set to either '111' or to the SR_ID_T
39 value received in this message and shall remove the

1 corresponding TAG value from the list
2 TAG_OUTSTANDING_LIST.

3 ◇ If the SR_ID_RELEASE_BITMAP_INCL field is included and is set to
4 '1', the mobile station shall release the indicated service option
5 connection record(s) from the current service configuration, where
6 the service option connection records to be released are determined
7 as follows:

8 — The mobile station shall release service option connection records
9 corresponding to SR_IDs indicated by SR_ID_RELEASE_BITMAP_r
10 received in this message.

11 — Layer 3 shall terminate a Call Control instance for each of the
12 released service option connections.

13 - Otherwise, the mobile station shall perform the following:

14 + Prior to this message, if a *Service Connect Message*, *General Handoff*
15 *Direction Message* (with service configuration), or *Universal Handoff Direction*
16 *Message* (with service configuration) was not successfully received or
17 accepted by the mobile station since entering the *Traffic Channel Substate*,
18 the mobile station shall perform the following:

19 ○ The mobile station shall set the service configuration parameters (i.e.
20 those signaled via the Service Configuration information record and the
21 Non-Negotiable Service Configuration information record) to their default
22 values as specified in 2.6.4.2.

23 + The mobile station shall process the received Service Configuration Record
24 as specified in 2.6.4.1.12, shall process the received Non-negotiable Service
25 Configuration Record as specified in 2.6.4.1.13 (if included), and shall begin
26 to use the service configuration specified by the *Service Connect Message*,
27 *General Handoff Direction Message* or *Universal Handoff Direction Message*
28 containing a service configuration record as the current service configuration
29 and shall begin to process Forward and Reverse Traffic Channel frames
30 accordingly. If the action time was specified by a *Service Connect Message*,
31 the mobile station shall send a *Service Connect Completion Message* within
32 T_{56m} seconds after the action time.

33 + If SYNC_ID_INCL_r is set to '1', the mobile station shall perform the following:

34 ○ The mobile station shall store the synchronization identifier received
35 from the base station (SYNC_ID_s = SYNC_ID_r).

36 ○ The mobile station shall store the new service configuration
37 corresponding to SYNC_ID_s as specified in 2.6.4.1.2.2.5.1.

38 Otherwise, the mobile station shall set SYNC_ID_s to NULL.

- 1 + If P_REV_IN_USE_s is greater than six, the Non-Negotiable Service
2 Configuration information record is not included in this message, and the
3 value of SR_ID corresponding to the logical resource of '0000' in the
4 LOGICAL_TO_PHYSICAL_MAPPING_TABLE is NULL, the mobile station shall
5 set this SR_ID field to the value specified in the Service Configuration
6 information record.
- 7 + If CC_INFO_INCL_r equals '1', then for each of the NUM_CALLS_ASSIGN_r
8 occurrences of the call control parameters included in the message, the
9 mobile station shall perform the following:
- 10 ○ If RESPONSE_IND_r equals '1', and TAG_r matches any of the TAG values
11 contained in the list TAG_OUTSTANDING_LIST, the Layer 3 shall
12 instantiate a Call Control instance (as specified in 2.6.10). The mobile
13 station shall identify this Call Control instance by CON_REF_r. The mobile
14 station shall disable the enhanced origination timer associated with
15 TAG_r and remove the TAG value specified by TAG_r from the list
16 TAG_OUTSTANDING_LIST.
- 17 ○ If RESPONSE_IND_r equals '0', the mobile station shall store the bypass
18 indicator (BYPASS_ALERT_ANSWER_s = BYPASS_ALERT_ANSWER_r) and
19 the Layer 3 shall instantiate a Call Control instance (as specified in
20 2.6.10). The mobile station shall identify this Call Control instance by
21 CON_REF_r.
- 22 + The mobile station shall exit this subfunction and activate the *Normal*
23 *Service Subfunction*.
- 24 • The mobile station shall not initiate service negotiation for a new service
25 configuration.
- 26 • For any service option connection that is part of the current or pending service
27 configuration, the mobile station may send a *Service Option Control Message* to
28 invoke a service option specific function in accordance with the requirements for the
29 associated service option.
- 30 • If SERV_NEG_s changes from enabled to disabled (see 2.6.6.2.5.1), the mobile
31 station shall activate the *SO Negotiation Subfunction*.
- 32 • If the mobile station receives one of the following service negotiation messages, the
33 mobile station shall process the message according to the specified requirements:
- 34 1. *Service Connect Message*: The mobile station shall send a *Mobile Station Reject*
35 *Order* (ORDQ = '00000010') within T_{56m} seconds.
- 36 2. *Service Option Control Message*: If the service option connection specified by the
37 message is part of the current or pending service configuration, and the service
38 option specified by the message is the same as the service option associated
39 with the service option connection, the mobile station shall interpret the action
40 time of the message as specified in 2.6.4.1.5, and shall process the message in
41 accordance with the requirements for the service option; otherwise, the mobile

- 1 station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within
2 T_{56m} seconds.
- 3 3. *Service Request Message*: The mobile station shall send a *Mobile Station Reject*
4 *Order* (ORDQ = '00000010') within T_{56m} seconds.
- 5 4. *Service Response Message*: The mobile station shall send a *Mobile Station Reject*
6 *Order* (ORDQ = '00000010') within T_{56m} seconds.
- 7 5. *General Handoff Direction Message*: If the SCR_INCLUDED field is included in
8 this message and is set to '1':
9 If the mobile station has not rejected this message, the mobile station shall
10 remain in this subfunction until the action time specified in the message, and
11 shall perform the following:
- 12 - The mobile station shall not perform the above procedures for the previous
13 message. But the call assignments from the previous message (if any) shall
14 take effect at the action time of the previous message.
 - 15 - The mobile station shall perform the above procedures for this message (that
16 is, begin to use the service configuration specified by the *General Handoff*
17 *Direction Message*) at the action time of this message.
- 18 6. *Universal Handoff Direction Message*: If the SCR_INCLUDED field is included in
19 this message and is set to '1':
20 If the mobile station has not rejected this message, the mobile station shall
21 remain in this subfunction until the action time specified in the message, and
22 shall perform the following:
- 23 - The mobile station shall not perform the above procedures for the previous
24 message. But the call assignments from the previous message (if any) shall
25 take effect at the action time of the previous message.
 - 26 - The mobile station shall perform the above procedures for this message (that
27 is, begin to use the service configuration and call assignments (if any)
28 specified by the *Universal Handoff Direction Message*) at the action time of
29 this message.
- 30 • If the mobile station receives one of the following service option negotiation
31 messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
32 '00000010') within T_{56m} seconds:
 - 33 1. *Service Option Request Order*
 - 34 2. *Service Option Response Order*
 - 35 3. *Service Option Control Order*

36 2.6.4.1.2.2.5.1 Storing a Service Configuration with SYNC_ID

37 The mobile station shall set NUM_SYNC_ID_SUPPORTED as follows:

- 1 • If the mobile station has not reported the Capability Information information record
2 with the ADD_NUM_SYNC_ID field, the mobile station shall set
3 NUM_SYNC_ID_SUPPORTED to four.
- 4 • If the mobile station has reported the Capability Information information record
5 with the ADD_NUM_SYNC_ID field, the mobile station shall set
6 NUM_SYNC_ID_SUPPORTED to five plus the value of the ADD_NUM_SYNC_ID field
7 included in the Capability Information information record.

8 The mobile station shall be capable of storing a minimum of NUM_SYNC_ID_SUPPORTED
9 service configurations along with their corresponding SYNC_ID, SID and NID.

10 Two SYNC_IDs are considered to be equal if and only if both the length and value of the
11 SYNC_IDs is equal.

12 The mobile station shall use the following procedure in the order listed below to store the
13 current service configuration when it is associated with a SYNC_ID:

- 14 • If the mobile station has a stored service configuration associated with SID_s, NID_s
15 and SYNC_ID_s, then the mobile station shall delete the stored service configuration.
- 16 • If the number of stored service configurations is NUM_SYNC_ID_SUPPORTED or
17 more, the mobile station shall not delete the (NUM_SYNC_ID_SUPPORTED - 1)
18 most recently used⁶⁰ service configuration(s) and corresponding synchronization
19 identifier(s), SID(s), NID(s).
- 20 • The mobile station shall store the current service configuration (that is, parameters
21 conveyed by both the Service Configuration information record and the Non-
22 negotiable Service Configuration information record) and the SYNC_ID_s
23 corresponding to the current service configuration along with SID_s and NID_s.

24 2.6.4.1.2.2.5.2 Restoring a stored Service Configuration based on SYNC_ID

25 When restoring a stored service configuration based on SYNC_ID, the mobile station shall
26 restore only those parameters defined in the current P_REV_IN_USE_s.

27 2.6.4.1.2.2.6 SO Negotiation Subfunction

28 The *SO Negotiation Subfunction* is only supported for mobile stations operating in Band
29 Class 0.

30 Service option negotiation is not supported for P_REV_IN_USE_s greater than six.

31 Upon activation of the *SO Negotiation Subfunction*, the mobile station shall delete from the
32 current service configuration any service option connection which does not use primary
33 traffic on both the Forward and Reverse Traffic Channels and the Layer 3 shall terminate
34 the corresponding Call Control instances. The Call Control instance corresponding to the
35 service option connection which uses primary traffic, if any, shall be identified by NULL.

⁶⁰ The stored service configuration is considered used when it is stored for the first time or when it is used again during a call using the SYNC_ID feature.

1 While the *SO Negotiation Subfunction* is active, the mobile station shall perform the
2 following:

- 3 • If the current service configuration includes a service option connection, the mobile
4 station shall process the received primary traffic bits in accordance with the
5 requirements for the service option associated with the service option connection;
6 otherwise, the mobile station shall discard the received primary traffic bits.
- 7 • If the current service configuration includes a service option connection, the mobile
8 station shall transmit primary traffic bits in accordance with the requirements for
9 the service option associated with the service option connection; otherwise, the
10 mobile station shall transmit null traffic on the Reverse Fundamental Channel, if
11 the Fundamental Channel is present or transmit power control bits on the Reverse
12 Pilot Channel, if only the Dedicated Control Channel is present.
- 13 • If the current service configuration includes a service option connection, the mobile
14 station may send a *Service Option Control Order* to invoke a service option specific
15 function in accordance with the requirements for the service option associated with
16 the service option connection.
- 17 • To initiate service option negotiation, the mobile station shall set SO_REQ_S to the
18 number of the requested service option and shall send a *Service Option Request*
19 *Order* containing the requested service option number.
- 20 • If $SERV_NEG_S$ changes from disabled to enabled (see 2.6.6.2.5.1), the mobile
21 station shall set SO_REQ_S to NULL and shall activate the *Normal Service*
22 *Subfunction*.
- 23 • If the mobile station receives a *Service Option Request Order*, it shall process the
24 order as follows:
 - 25 - If the mobile station accepts the requested service option, the mobile station
26 shall set SO_REQ_S to NULL and shall send a *Service Option Response Order*
27 accepting the requested service option within T_{58m} seconds. The mobile station
28 shall interpret the message action time of the *Service Option Request Order* in
29 accordance with the requirements for the requested service option and the
30 mobile station shall begin using the service configuration implied by the
31 requested service option in accordance with those requirements. The implied
32 service configuration shall include the default Forward and Reverse multiplex
33 options and radio configurations associated with the requested service option,
34 and shall include one service option connection for which the service option
35 connection reference is 1, the service option is the requested service option, and
36 the Forward and Reverse Traffic Channel types are both primary traffic. If a Call
37 Control instance currently exists, the Layer 3 shall use this Call Control
38 instance for a new service option connection; otherwise, the Layer 3 shall
39 instantiate a Call Control instance (as specified in 2.6.10) and this Call Control
40 instance shall be identified by both a connection reference with a value of 1 and
41 a default identifier with a value of NULL.
 - 42 - If the mobile station does not accept the requested service option and has an
43 alternative service option to request, the mobile station shall set SO_REQ_S to the

- 1 alternative service option number and shall send a *Service Option Request Order*
2 requesting the alternative service option within T_{58m} seconds.
- 3 - If the mobile station does not accept the requested service option and does not
4 have an alternative service option to request, the mobile station shall set
5 SO_REQ_s to NULL and shall send a *Service Option Response Order* to reject the
6 request within T_{58m} seconds. The mobile station shall continue to use the
7 current service configuration.
- 8 • If the mobile station receives a *Service Option Response Order*, it shall process the
9 order as follows:
- 10 - If the service option number specified in the order is equal to SO_REQ_s , the
11 mobile station shall set SO_REQ_s to NULL. The mobile station shall interpret
12 the message action time of the *Service Option Response Order* in accordance with
13 the requirements for the specified service option, and the mobile station shall
14 begin using the service configuration implied by the specified service option in
15 accordance with those requirements. The implied service configuration shall
16 include the default Forward and Reverse multiplex options and radio
17 configurations associated with the specified service option, and shall include
18 one service option connection for which the service option connection reference
19 is 1, the service option is the specified service option, and the Forward and
20 Reverse Traffic Channel types are both primary traffic. If a Call Control instance
21 currently exists, the Layer 3 shall use this Call Control instance for a new
22 service option connection; otherwise, the Layer 3 shall instantiate a Call Control
23 instance (as specified in 2.6.10) and this Call Control instance shall be identified
24 by both a connection reference with a value of 1 and a default identifier with a
25 value of NULL.
- 26 - If the order indicates a service option rejection, the mobile station shall set
27 SO_REQ_s to NULL. The mobile station shall continue to use the current service
28 configuration.
- 29 - If the order does not indicate a service option rejection and the service option
30 specified in the order is not equal to SO_REQ_s , the mobile station shall set
31 SO_REQ_s to NULL and shall send a *Mobile Station Reject Order* (ORDQ =
32 '00000100') within T_{58m} seconds. The mobile station shall continue to use the
33 current service configuration.
- 34 • If the mobile station receives a *Service Option Control Order*, it shall process the
35 order as follows:
- 36 - If the current service configuration includes a service option connection, the
37 mobile station shall interpret the message action time of the *Service Option*
38 *Control Order* in accordance with the requirements for the service option
39 associated with the service option connection and the mobile station shall
40 process the *Service Option Control Order* in accordance with those requirements;
- 41 - otherwise, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
42 '00000001') within T_{56m} seconds.

- 1 • If the mobile station receives one of the following service negotiation messages, the
2 mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000010') within
3 T56m seconds:

- 4 1. *Service Connect Message*
- 5 2. *Service Option Control Message*
- 6 3. *Service Request Message*
- 7 4. *Service Response Message*

8 2.6.4.1.3 Ordering of Messages

9 The Layer 2 protocol does not guarantee delivery of messages in any order. If the mobile
10 station requires that the base station receive a set of messages in a certain order, the
11 mobile station shall send each message in assured mode requiring confirmation of delivery
12 and shall wait for the confirmation of delivery of each message before transmitting the next
13 message in the set.

14 2.6.4.1.4 Processing the In-Traffic System Parameters Message

15 The mobile station shall store the following parameters from the *In-Traffic System*
16 *Parameters Message*:

- 17 • System identification (SID_s = SID_r)
- 18 • Network identification (NID_s = NID_r)
- 19 • Search window size for the Active Set and the Candidate Set
20 (SRCH_WIN_A_s = SRCH_WIN_A_r)
- 21 • Search window size for the Neighbor Set (SRCH_WIN_N_s = SRCH_WIN_N_r)
- 22 • Search window size for the Remaining Set (SRCH_WIN_R_s = SRCH_WIN_R_r)
- 23 • Pilot detection threshold (T_ADD_s = T_ADD_r)
- 24 • Pilot drop threshold (T_DROP_s = T_DROP_r)
- 25 • Active Set versus Candidate Set comparison threshold (T_COMP_s = T_COMP_r)
- 26 • Drop timer value (T_TDROPS = T_TDROPR)
- 27 • Drop timer range value (T_TDROPRANGE_s = T_TDROPRANGE_r) if
28 T_TDROPRANGE_INCL_r is equal to '1'; otherwise, (T_TDROPRANGE_s = '0000')
- 29 • Forward Packet Data Channel supported indicator (FOR_PDCH_SUPPORTED_s =
30 FOR_PDCH_SUPPORTED_r)
- 31 • Short Data Burst supported indicator (SDB_SUPPORTED_s = SDB_SUPPORTED_r)
- 32 • If included, permission for the mobile station to request QoS settings in the
33 *Origination Message*, *Origination Continuation Message*, or *Enhanced Origination*
34 *Message* (MOB_QOS_s = MOB_QOS_r)
- 35 • Mobile station initiated position location determination supported indicator
36 (MS_INIT_POS_LOC_SUP_IND_s = MS_INIT_POS_LOC_SUP_IND_r).

- 1 • PDCH Control Hold Mode supported indicator ($PDCH_CHM_SUPPORTED_S =$
2 $PDCH_CHM_SUPPORTED_T$) if included; otherwise, set $PDCH_CHM_SUPPORTED_S$ to
3 '0'.
- 4 • Reverse Packet Data Channel supported indicator ($REV_PDCH_SUPPORTED_S =$
5 $REV_PDCH_SUPPORTED_T$) if included; otherwise, set $REV_PDCH_SUPPORTED_S$ to
6 '0'.
- 7 • Channel configuration request allowed indicator ($USE_CH_CFG_RRM_S =$
8 $USE_CH_CFG_RRM_T$) if included; otherwise, set $USE_CH_CFG_RRM_S$ to '0'.
- 9 • Maximum age for retention of Neighbor Set members
10 ($NGHBR_MAX_AGE_S = NGHBR_MAX_AGE_T$)
- 11 • Protocol revision level ($P_REV_S = P_REV_T$), and protocol revision level currently in
12 use ($P_REV_IN_USE_S = \min(P_REV_S, MOB_P_REV_P$ of the current band class))
- 13 • Slope of the handoff add/drop criterion ($SOFT_SLOPE_S = SOFT_SLOPE_T$)
- 14 • Intercept of the handoff add criterion ($ADD_INTERCEPT_S = ADD_INTERCEPT_T$)
- 15 • Intercept of the handoff drop criterion ($DROP_INTERCEPT_S = DROP_INTERCEPT_T$)
- 16 • If included, neighbor pilot strength measurement threshold offset ($T_MULCHAN_S =$
17 $T_MULCHAN_T$)
- 18 • If included, Reverse Supplemental Code Channel beginning of transmission
19 preamble length ($BEGIN_PREAMBLE_S = BEGIN_PREAMBLE_T$)
- 20 • If included, Reverse Supplemental Code Channel discontinuous transmission
21 resumption preamble length ($RESUME_PREAMBLE_S = RESUME_PREAMBLE_T$)
- 22 • If included, Slotted Timer ($T_SLOTTED_S = T_SLOTTED_T$)
- 23 • If the mobile station supports packet data service options, the mobile station shall
24 store the packet data services zone identifier ($PACKET_ZONE_ID_S =$
25 $PACKET_ZONE_ID_T$).
- 26 • If the mobile station supports packet data service options and the
27 $PZ_HYST_ENABLED$ field is included, the mobile station shall store the packet zone
28 hysteresis enabled indicator ($PZ_HYST_ENABLED_S = PZ_HYST_ENABLED_T$);
29 otherwise, the mobile station shall set $PZ_HYST_ENABLED_S$ to '1'.
- 30 • If the $PZ_HYST_LIST_LEN$ field is included, the mobile station shall store the packet
31 zone hysteresis list length ($PZ_HYST_LIST_LEN_S = PZ_HYST_LIST_LEN_T$); otherwise,
32 the mobile station shall set $PZ_HYST_LIST_LEN_S$ to 4.
- 33 • If the $PZ_HYST_ACT_TIMER$ field is included, the mobile station shall store the
34 packet zone hysteresis activation timer ($PZ_HYST_ACT_TIMER_S =$
35 $PZ_HYST_ACT_TIMER_T$); otherwise, the mobile station shall set
36 $PZ_HYST_ACT_TIMER_S$ to 30 seconds.
- 37 • If the $PZ_HYST_TIMER_MUL$ field and the $PZ_HYST_TIMER_EXP$ field are included,
38 the mobile station shall store the packet zone hysteresis timer ($PZ_HYST_TIMER_S =$

1 PZ_HYST_TIMER_MUL_r × 8 ^ PZ_HYST_TIMER_EXPr); otherwise, the mobile station
 2 shall set PZ_HYST_TIMERs to 60 seconds.

- 3 • If ENC_SUPPORTED_r is equal to '1', the mobile station shall store:
 - 4 - Signaling encryption supported indicator (SIG_ENCRYPT_SUP_s =
 5 SIG_ENCRYPT_SUP_r)
 - 6 - User information encryption supported indicator (UI_ENCRYPT_SUP_s =
 7 UI_ENCRYPT_SUP_r)
- 8 • Concurrent services supported indicator (CS_SUPPORTED_s = CS_SUPPORTED_r).
- 9 • Maximum number of additional service reference identifiers allowed in origination
 10 (MAX_ADD_SERV_INSTANCES_s = MAX_ADD_SERV_INSTANCE_r), if included;
 11 otherwise, the mobile station shall set MAX_ADD_SERV_INSTANCES_s to 0.
- 12 • Control Hold Mode supported indicator (CHM_SUPPORTED_s = CHM_SUPPORTED_r)
 13 if included; otherwise, the mobile station shall perform the following:
 - 14 - If P_REV_IN_USE_s is less than six, set CHM_SUPPORTED_s to '0'.
 - 15 - Otherwise, set CHM_SUPPORTED_s to '1'.
- 16 • CDMA off time report supported indicator
 17 (CDMA_OFF_TIME_REP_SUP_IND_s = CDMA_OFF_TIME_REP_SUP_IND_r).
- 18 • If CDMA_OFF_TIME_REP_SUP_IND_r is equal to '1', the mobile station shall store
 19 CDMA off time report threshold (CDMA_OFF_TIME_REP_THRESHOLD_s =
 20 CDMA_OFF_TIME_REP_THRESHOLD_r in units specified by
 21 CDMA_OFF_TIME_REP_UNIT_r).
- 22 • The mobile station shall set BCMC_ON_TRAFFIC_SUP_s to
 23 BCMC_ON_TRAFFIC_SUP_r. If BCMC_ON_TRAFFIC_SUP_r is set to '1', the mobile
 24 station shall store AUTO_REQ_TRAF_ALLOWED_IND_s =
 25 AUTO_REQ_TRAF_ALLOWED_IND_r.

26 The mobile station shall determine its roaming status (see 2.6.5.3). The mobile station
 27 should indicate to the user whether the mobile station is roaming.

28 2.6.4.1.5 Message Action Times

29 A Forward Traffic Channel message without a USE_TIME field or with a USE_TIME field set
 30 to '0' has an implicit action time. A message that has its USE_TIME field set to '1' has an
 31 explicit action time that is specified in the ACTION_TIME field of the message.

32 A message with an explicit action time is called a pending message.

33 Unless otherwise specified, a message having an implicit action time shall take effect no
 34 later than the first 80 ms boundary (relative to System Time plus FRAME_OFFSET_s × 1.25
 35 ms) occurring at least 80 ms after the end of the frame containing the last bit of the
 36 message. A message with an explicit action time, except for a *Power Up Function Message*,
 37 shall take effect when System Time minus FRAME_OFFSET_s × 1.25 ms (in 80 ms units)
 38 modulo 64 becomes equal to the message's ACTION_TIME field. A *Power Up Function*
 39 *Message* shall take effect ACTION_TIME_FRAME frames after the time when System Time

1 minus $\text{FRAME_OFFSET}_s \times 1.25$ ms (in 80 ms units) modulo 64 becomes equal to the
 2 message's ACTION_TIME field. The difference in time between ACTION_TIME and the end
 3 of the frame containing the last bit of the message shall be at least 80 ms.

4 The mobile station shall support two pending messages at any given time, not including
 5 pending *Service Option Control Orders* or *Service Option Control Messages*. The number of
 6 pending *Service Option Control Orders* or *Service Option Control Messages* that the mobile
 7 station is required to support is specific to the service option (see the relevant service
 8 option description). In addition, the mobile station shall support one pending *Power Up*
 9 *Function Message*.

10 2.6.4.1.6 Long Code Transition Request Processing

11 The mobile station performs these procedures upon receiving a *Long Code Transition*
 12 *Request Order*.

13 If the *Long Code Transition Request Order* requests a transition to the private long code, and
 14 the mobile station is able to generate the private long code (see 2.3.12.3), and the mobile
 15 station accepts the request, the mobile station shall send a *Long Code Transition Response*
 16 *Order* (ORDQ = '00000011') within T_{56m} seconds. The mobile station shall use the private
 17 long code on both the Forward Traffic Channel and the Reverse Traffic Channel. The
 18 mobile station shall store the public long code mask and PLCM_TYPE_s currently in use and
 19 begin using the private long code at the explicit action time (see 2.6.4.1.5) specified in the
 20 message. At the action time of the message, the mobile station should indicate to the user
 21 that the voice privacy mode is active. If the *Long Code Transition Request Order* requests a
 22 private long code transition, and the mobile station is not able to generate the private long
 23 code or the mobile station does not accept the request, the mobile station shall send a *Long*
 24 *Code Transition Response Order* (ORDQ = '00000010') within T_{56m} seconds.

25 If the *Long Code Transition Request Order* requests a transition to the public long code and
 26 the mobile station accepts the request, the mobile station shall send a *Long Code Transition*
 27 *Response Order* (ORDQ = '00000010') within T_{56m} seconds. The mobile station shall use
 28 the public long code on both the Forward Traffic Channel and the Reverse Traffic Channel.
 29 The mobile station shall begin using the public long code that is stored previously, derived
 30 from PLCM_TYPE_s as specified in 2.3.6, at the explicit action time (see 2.6.4.1.5) specified
 31 in the message. At the action time of the message, the mobile station should indicate to
 32 the user that the voice privacy mode is inactive. If the *Long Code Transition Request Order*
 33 requests a public long code transition, and the mobile station does not accept the request,
 34 the mobile station shall send a *Long Code Transition Response Order* (ORDQ = '00000011')
 35 within T_{56m} seconds.

36 2.6.4.1.7 Power Up Function (PUF)

37 Figure 2.6.4.1.7-1 illustrates the general structure of a PUF attempt. A PUF pulse is the
 38 interval during which the mobile station transmits at the specified power level while
 39 executing the Power Up Function.

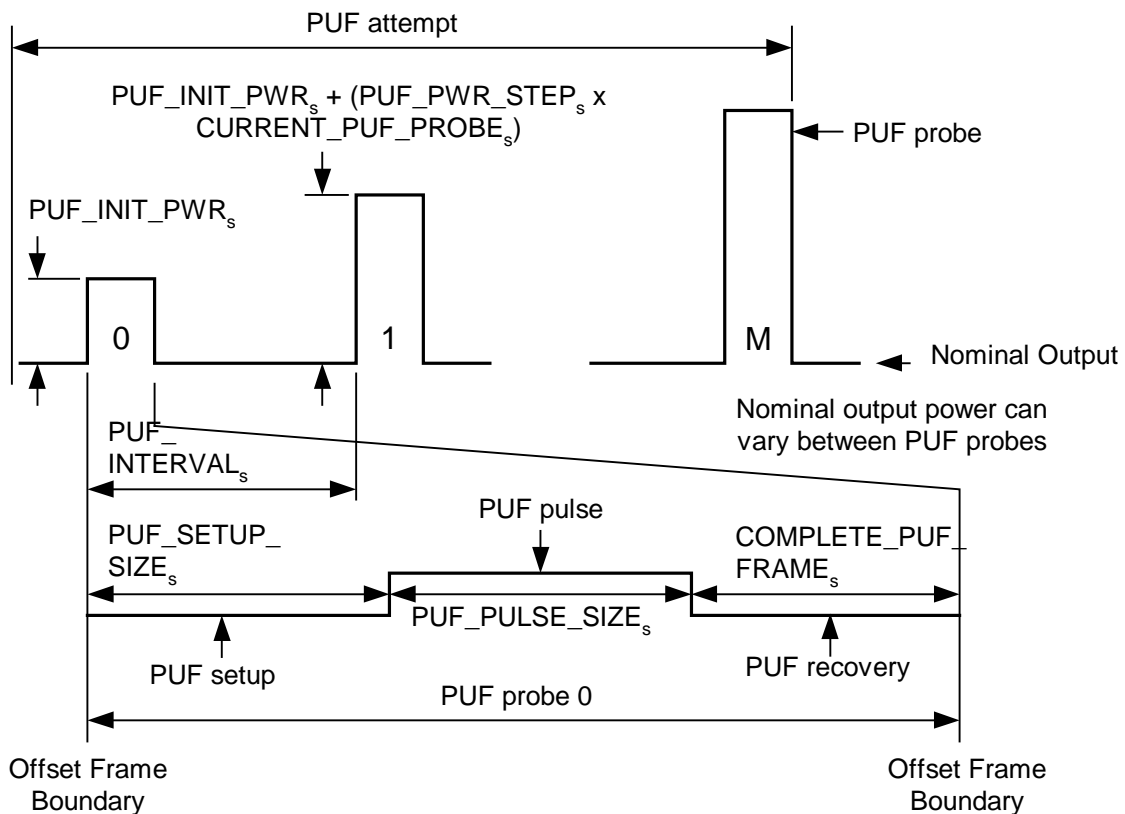

40 A PUF probe is one or more consecutive Traffic Channel frames. A PUF probe consists of
 41 three parts: PUF setup, PUF pulse, and PUF recovery. PUF_SETUP_SIZE is the duration of
 42 the PUF setup part, in power control groups. PUF_PULSE_SIZE is the duration of the PUF

1 pulse, in power control groups. The PUF recovery period occupies the remainder of the last
 2 frame of the PUF probe.

3 A PUF attempt is a sequence of PUF probes sent by the mobile station in response to a
 4 *Power Up Function Message*. A PUF attempt begins at an offset frame boundary within 80
 5 ms of the ACTION_TIME specified in the *Power Up Function Message*. A PUF attempt can
 6 be terminated in one of four ways:

- 7 • The mobile station receives a *Power Up Function Completion Message*.
- 8 • The mobile station has transmitted the maximum number of PUF probes specified
 9 in the *Power Up Function Message*.
- 10 • The mobile station has transmitted the maximum number of probes allowed at its
 11 maximum output power.
- 12 • The mobile station receives a new *Power Up Function Message*.

13

14

15

Figure 2.6.4.1.7-1. Structure of PUF Attempt

1

2 2.6.4.1.7.1 Processing the Power Up Function Message

3 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to
4 '0000110' (message requires a capability that is not supported by the mobile station) if
5 any of the following conditions are detected:

- 6 • PUF_FREQ_INCL_T is set to '1' and PUF_BAND_CLASS_T is not supported by the
7 mobile station.
- 8 • PUF_FREQ_INCL_T is set to '1' and the mobile station is unable to re-tune to the PUF
9 Target Frequency during (PUF_SETUP_SIZE_T + 1) power control groups.
- 10 • MOB_P_REV_P is not equal to five and the mobile station does not support the Power
11 Up Function.

12 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to
13 '00001100' (invalid Frequency Assignment), if the Frequency Assignment specified in the
14 message is the same as the Serving Frequency (PUF_FREQ_INCL_T is equal to '1',
15 PUF_BAND_CLASS_T is equal to CDMABAND_S and PUF_CDMA_FREQ_T is equal to
16 CDMACH_S).

17 If the mobile station is processing a PUF probe, the mobile station shall wait for the PUF
18 probe to complete. It shall then terminate the current PUF attempt. The mobile station
19 shall store the following parameters:

- 20 • Maximum number of PUF probes transmitted at full power level (MAX_PWR_PUF_S =
21 MAX_PWR_PUF_T + 1)
- 22 • Total number of PUF probes (TOTAL_PUF_PROBES_S = TOTAL_PUF_PROBES_T + 1)
- 23 • PUF interval (PUF_INTERVAL_S = PUF_INTERVAL_T)
- 24 • Number of PUF setup power control groups (PUF_SETUP_SIZE_S =
25 PUF_SETUP_SIZE_T + 1)
- 26 • Number of PUF pulse power control groups (PUF_PULSE_SIZE_S =
27 PUF_PULSE_SIZE_T + 1)
- 28 • Power increase of initial PUF pulse (PUF_INIT_PWR_S = PUF_INIT_PWR_T)
- 29 • Power increase for each successive PUF pulse (PUF_PWR_STEP_S = PUF_PWR_STEP_T)
- 30 • Frequency included indicator (PUF_FREQ_INCL_S = PUF_FREQ_INCL_T)

31 If PUF_FREQ_INCL_S equals '1', the mobile station shall store the following:

- 32 • PUF probe Target Frequency CDMA Channel number (PUF_TF_CDMACH_S =
33 PUF_CDMA_FREQ_T)
- 34 • PUF probe Target Frequency CDMA band class (PUF_TF_CDMABAND_S =
35 PUF_BAND_CLASS_T)

36 The mobile station shall set CURRENT_PUF_PROBE_S equal to 0.

37 The mobile station shall then begin the PUF attempt at the time specified in 2.6.4.1.7.2.

1 2.6.4.1.7.2 Power Up Function Procedures

2 The mobile station shall process the initial PUF probe beginning at the start of the frame
3 which starts $ACTION_TIME_FRAME_T \times 20 \text{ ms} + FRAME_OFFSET_S \times 1.25 \text{ ms}$ after the
4 System Time specified by $ACTION_TIME_T$. The mobile station shall process additional PUF
5 probes beginning at intervals of $PUF_INTERVAL_S$ frames from the beginning of the initial
6 PUF probe.

7 The mobile station shall transmit the PUF probes as described in 2.6.4.1.7.2.1 and
8 2.6.4.1.7.2.2.

9 2.6.4.1.7.2.1 PUF Probe On Serving Frequency

10 The mobile station shall process each PUF probe as follows:

- 11 • The mobile station shall use closed loop power control procedures as specified in
12 [2].
- 13 • The mobile station shall use the gated output procedures specified in [2].
- 14 • The mobile station shall control its mean output power as specified in [2].
- 15 • The mobile station shall monitor its output power during the PUF pulse, and should
16 monitor its output power at least once during each power control group of the PUF
17 pulse. If the mobile station detects that the transmit power level specified in [2] is
18 equal to or greater than the maximum power output of the mobile station at any
19 time during a PUF pulse, the mobile station shall decrement $MAX_PWR_PUF_S$ by
20 one for that PUF pulse.
- 21 • The mobile station shall transmit the traffic channel preamble for the duration of
22 the PUF probe on the Reverse Fundamental Channel.

23 After the processing of each PUF probe, the mobile station shall increment
24 $CURRENT_PUF_PROBE_S$ by 1. If $MAX_PWR_PUF_S$ is equal to 0, the mobile station shall
25 terminate the PUF attempt. If $CURRENT_PUF_PROBE_S$ equal to $TOTAL_PUF_PROBE_S$, the
26 mobile station shall terminate the PUF attempt.

27 2.6.4.1.7.2.2 PUF Probe On PUF Target Frequency

28 The mobile station shall process each PUF probe as follows:

- 29 • The mobile station shall use closed loop power control procedures as specified in
30 [2].
- 31 • The mobile station shall use the gated output procedures specified in [2].
- 32 • The mobile station shall control its mean output power as specified in [2].
- 33 • The mobile station shall store the following Serving Frequency parameters from its
34 current configuration:
 - 35 - CDMA Band Class ($PUF_SF_CDMABAND_S = CDMABAND_S$)
 - 36 - Frequency assignment ($PUF_SF_CDMACH_S = CDMACH_S$)

- 1 • The mobile station shall monitor its output power during the PUF pulse, and should
2 monitor its output power at least once during each power control group of PUF
3 pulse. If the mobile station detects that the transmit power level specified in [2] is
4 equal to or greater than the maximum power output of the mobile station at any
5 time during a PUF pulse, the mobile station shall decrement the $MAX_PWR_PUF_s$
6 by one for that PUF pulse.
- 7 • At the beginning of the PUF probe, the mobile station shall disable its transmitter,
8 stop processing the Forward Supplemental Code Channel (if any), or the Forward
9 Supplemental Channel (if any), disable all corrections to the mobile station time
10 reference (see [2]), tune to the CDMA channel specified by $PUF_TF_CDMACH_s$, and
11 $PUF_TF_CDMABAND_s$ and re-enable its transmitter.
- 12 • The mobile station shall transmit the traffic channel preamble on the Reverse
13 Fundamental Channel during the PUF pulse at $PUF_TX_PWR_s$.
- 14 • The mobile station should disable its transmitter immediately after the end of the
15 PUF pulse, and shall disable its transmitter before the end of the first power control
16 group after the PUF pulse. It shall then tune to its assigned CDMA channel as
17 given by $CDMACH_s$ and $CDMABAND_s$.
- 18 • If the interval between the time that the mobile station tunes to the PUF Target
19 Frequency and the time that it re-tunes to the Serving Frequency is equal to or
20 greater than $(N_{2m} \times 0.02)$ seconds, the mobile station shall wait to receive a period
21 of $(N_{3m} \times 20)$ ms with sufficient signal quality on the physical channel
22 corresponding to $FPC_PRI_CHAN_s$.
- 23 • The mobile station shall then re-enable its transmitter and re-enable any
24 adjustments to the mobile station time reference.
- 25 • If the Forward Supplemental Code Channel assignment has not expired while the
26 mobile station has tuned to the PUF Target Frequency, then the mobile station shall
27 resume processing the Forward Supplemental Code Channels after re-tuning to the
28 Serving Frequency.
- 29 • If the Forward Supplemental Channel assignment has not expired while the mobile
30 station has tuned to the PUF Target Frequency, then the mobile station shall
31 resume processing the Forward Supplemental Channels after re-tuning to the
32 Serving Frequency.
- 33 • If the Reverse Supplemental Code Channel assignment has not expired while the
34 mobile station has tuned to the PUF Target Frequency, then the mobile station may
35 resume transmitting the Reverse Supplemental Code Channels after re-tuning to
36 the Serving Frequency.
- 37 • If the Reverse Supplemental Channel assignment has not expired while the mobile
38 station has tuned to the PUF Target Frequency, then the mobile station may resume
39 transmitting the Reverse Supplemental Channels after re-tuning to the Serving
40 Frequency.

41 After the processing of each PUF probe, the mobile station shall increment
42 $CURRENT_PUF_PROBE_s$ by one. If $MAX_PWR_PUF_s$ is equal to 0, the mobile station shall

1 terminate the PUF attempt. If $CURRENT_PUF_PROBE_S$ is equal to $TOTAL_PUF_PROBE_S$,
 2 the mobile station shall terminate the PUF attempt.

3 2.6.4.1.7.3 Processing the Power Up Function Completion Message

4 The mobile station shall terminate any PUF attempt no later than the completion of the
 5 current probe in progress and shall discard any pending *Power Up Function Message*. If
 6 LOC_IND_R is equal to '1', the mobile station may store the following parameters:

- 7 • Mobile Station Latitude ($MS_LAT_S = MS_LAT_R$)
- 8 • Mobile Station Longitude ($MS_LONG_S = MS_LONG_R$)
- 9 • Time stamp ($MS_LOC_TSTAMP_S = MS_LOC_TSTAMP_R$)

10 2.6.4.1.8 Forward Traffic Channel Supervision

11 When in the *Mobile Station Control on the Traffic Channel State*, the mobile station shall
 12 continuously monitor the Forward Channel, except:

- 13 • During a PUF probe in which it transmits on a PUF target frequency (see 2.6.4.1.7),
- 14 • During a search of pilots on a CDMA Candidate Frequency (see 2.6.6.2.8.3),

15 When a Forward Common Power Control Channel is not assigned, the mobile station shall
 16 perform the procedure described in 2.6.4.1.8.1. When a Forward Forward Common Power
 17 Control Channel is assigned, the mobile station shall perform the procedure described in
 18 2.6.4.1.8.2.

19 2.6.4.1.8.1 Forward Traffic Channel Supervision when a Forward Common Power Control 20 Channel is not assigned

21 The mobile station shall monitor the physical channel corresponding to $FPC_PRI_CHAN_S$ as
 22 follows:

- 23 • If $RESQ_ENABLED_S$ is equal to '1' and $FPC_PRI_CHAN_S$ is equal to '0', the mobile
 24 station shall perform the following:
 - 25 - While the mobile station's transmitter is enabled:
 - 26 + If the rescue attempt timer is not enabled and the mobile station detects a
 27 'forward link error' trigger as specified in 2.6.4.1.8.1.1, then the mobile
 28 station shall perform the following:
 - 29 ○ disable its transmitter, and
 - 30 ○ enable the rescue delay timer with an initial value of
 31 $(RESQ_DELAY_TIME_S \times 80)$ ms.
 - 32 + If the rescue attempt timer is enabled and the mobile station detects a 'good
 33 forward link' trigger as specified in 2.6.4.1.8.1.1, then the mobile station
 34 shall disable the rescue attempt timer, and shall resume Forward and
 35 Reverse Traffic Channel power control as specified in 2.6.4.1.1 and
 36 2.6.6.2.7.2, respectively.
 - 37 - While the mobile station's transmitter is disabled:

- 1 + If the mobile station did not disable its transmitter due to an
 2 acknowledgment failure and the mobile station detects a ‘good forward link’
 3 trigger as specified in 2.6.4.1.8.1.1, then the mobile station should re-enable
 4 its transmitter, and shall also perform the following:
- 5 ○ disable the rescue delay timer or rescue allowed timer, if either is
 6 enabled.
 - 7 ○ send a *Call Rescue Cancel Order* in assured mode, if the mobile station is
 8 not otherwise required to send an *Extended Pilot Strength Measurement*
 9 *Message*.
- 10 • Otherwise, the mobile station shall perform the following:
 - 11 - If the mobile station detects a ‘forward link error’ trigger as specified in
 12 2.6.4.1.8.1.1, it shall disable its transmitter.
 - 13 - Thereafter, if the mobile station detects a ‘good forward link’ trigger as specified
 14 in 2.6.4.1.8.1.1, then the mobile station should re-enable its transmitter.

15 The mobile station shall establish a Forward Traffic Channel fade timer. The timer shall be
 16 enabled when the mobile station first enables its transmitter when in the *Traffic Channel*
 17 *Initialization Substate* of the *Mobile Station Control on the Traffic Channel State*. The fade
 18 timer shall be reset for T_{5m} seconds whenever the mobile station detects a ‘good forward
 19 link’ trigger as specified in 2.6.4.1.8.1.1. The mobile station shall disable the fade timer
 20 when it tunes to a PUF target frequency, and shall re-enable the fade timer at the end of
 21 the PUF probe. If the timer expires, the mobile station shall disable its transmitter and
 22 declare a loss of the Forward Traffic Channel. If $CRRM_MSG_IND_s$ equals ‘1’ and if no other
 23 access channel message is transmitted after loss of the Forward Traffic Channel, the mobile
 24 station may enter the *Update Overhead Information Substate* of the *System Access State* (see
 25 2.6.3) with an origination indication, within 20 seconds of the loss of the Forward Traffic
 26 Channel, to transmit the *Call Recovery Request Message*.

27 The mobile station also enables, disables, and resets the fade timer as described in
 28 2.6.6.2.8 and 2.6.6.2.10 when it performs a hard handoff or a periodic search.

29 2.6.4.1.8.1.1 Triggers

30 The mobile station shall detect ‘good forward link’ trigger as specified below:

- 31 • If RC11 or RC12 is used on Forward Link and blanking is enabled (i.e.
 32 FOR_FCH_BLANKING_DUTYCYCLE is set to value other than ‘000’), then the mobile
 33 station shall detect ‘good forward link’ trigger when any one of the following
 34 condition is met:
 - 35 - Mobile station receives a period of $(N_{3m} \times 20)$ ms with sufficient signal quality
 36 on the physical channel corresponding to FPC_PRI_CHAN_s.
 - 37 - Mobile station receives a N_{3m} consecutive guaranteed transmission frames with
 38 sufficient signal quality on the physical channel corresponding to
 39 FPC_PRI_CHAN_s.

- Otherwise, the mobile station shall detect ‘good forward link’ trigger when it receives a period of $(N_{3m} \times 20)$ ms with sufficient signal quality on the physical channel corresponding to $FPC_PRI_CHAN_S$.

The mobile station shall detect ‘forward link error’ trigger as specified below:

- If RC11 or RC12 is used on Forward Link and blanking is enabled (i.e. $FOR_FCH_BLANKING_DUTYCYCLE$ is set to value other than ‘000’), then the mobile station shall detect ‘forward link error’ trigger when it receives $FOR_N2M_IND_S$ consecutive guaranteed transmission frames with insufficient signal quality on the physical channel corresponding to $FPC_PRI_CHAN_S$.
- Otherwise, the mobile station shall detect ‘forward link error’ trigger when it receives a period of $(N_{2m} \times 20)$ ms with insufficient signal quality on the physical channel corresponding to $FPC_PRI_CHAN_S$.

2.6.4.1.8.2 Forward Traffic Channel Supervision when a Forward Common Power Control Channel is assigned

The mobile station shall monitor the Forward Common Power Control Channel as follows:

- If the mobile station receives a period of $(N_{16m} \times 1.25)$ ms with insufficient signal quality on the Forward Common Power Control Subchannels assigned to this mobile, it shall disable its transmitter.
- Thereafter, if the mobile station receives a period of $(N_{17m} \times 1.25)$ ms with sufficient signal quality on the Forward Common Power Control Subchannels assigned to this mobile, then the mobile station should re-enable its transmitter.

The mobile station shall establish a Forward Traffic Channel fade timer. The timer shall be enabled when the mobile station first enables its transmitter when in the *Traffic Channel Initialization Substate* of the *Mobile Station Control on the Traffic Channel State*. The fade timer shall be reset for T_{5m} seconds whenever the mobile station receives a period of $(N_{17m} \times 1.25)$ ms with sufficient signal quality on the Forward Common Power Control Subchannels assigned to this mobile. If the timer expires, the mobile station shall disable its transmitter and declare a loss of the Forward Traffic Channel. If $CRRM_MSG_IND_S$ equals ‘1’ and if no other access channel message is transmitted after loss of the Forward Traffic Channel, the mobile station may enter the *Update Overhead Information Substate* of the *System Access State* (see 2.6.3) with an origination indication, within 20 seconds of the loss of the Forward Traffic Channel, to transmit the *Call Recovery Request Message*.

The mobile station also enables, disables, and resets the fade timer as described in 2.6.6.2.7, 2.6.6.2.8 and 2.6.6.2.10 when it performs a soft handoff, a hard handoff or a periodic search.

Additionally, the mobile station shall perform a ping as follows:

- The mobile station shall establish a Forward Traffic Channel ping timer as follows:
 - When the mobile station first enables its transmitter in the *Traffic Channel Initialization Substate* of the *Mobile Station Control on the Traffic Channel State*, the mobile station shall enable the Forward Traffic Channel ping timer and set it

1 to T_{78m} seconds.

- 2 - When the mobile station receives a message that assigns a F-CPCCH, the mobile
3 station shall enable the Forward Traffic Channel ping timer and set it to T_{78m}
4 seconds.
- 5 • When the mobile station receives a Physical Layer SDU destined for this mobile
6 station on the F-PDCH or on the shared F-DCCH (See [3]), the Forward Traffic
7 Channel ping timer shall be reset for T_{78m} seconds.
- 8 • When the Forward Traffic Channel ping timer expires, the mobile station shall send
9 a *L2 Acknowledgment Order* in assured mode if there is no other Layer 3 message to
10 be sent in assured mode available for transmission.

11 2.6.4.1.9 Processing the Extended Release Message and the Extended Release Mini 12 Message

- 13 • Upon receiving the *Extended Release Message* or the *Extended Release Mini*
14 *Message*, the mobile station shall process the message as follows:
 - 15 - If $USE_EXT_CH_IND_r$ is equal to '1', then the mobile station shall set
16 $USE_EXT_CH_IND_s$ to $USE_EXT_CH_IND_r$; otherwise, the mobile station shall
17 set $USE_EXT_CH_IND_s$ to '0'.
 - 18 - If the mobile station determines that the configuration specified by CH_IND_r or
19 $EXT_CH_IND_r$ is not valid (see Tables 3.7.3.3.2.34-1, and 3.7.3.3.2.34-3), the
20 mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to
21 '0000111' (message can not be handled by the current mobile station
22 configuration) and the mobile station shall not perform the remaining
23 procedures in this section.
 - 24 - If $USE_EXT_CH_IND_s$ is equal to '0' and CH_IND_r is equal to '111' or the
25 physical channels indicated by the two least significant bits of CH_IND_r includes
26 all the physical channels (FCH, DCCH, or both) currently being processed by the
27 mobile station, the Layer 3 shall send a "release indication" to all Call Control
28 instances and shall perform the following:
 - 29 + The mobile station shall set $TBR_RAND_SUPPR_ENABLE_s =$
30 $TBR_RAND_SUPPR_ENABLE_r$.
 - 31 + The mobile station shall set $TBR_RAND_WINDOW_s$ to
32 $TBR_RAND_WINDOW_r$.
 - 33 + Enter the *Release Substate* with a base station extended release indication if
34 the message is the *Extended Release Message*.
 - 35 + Enter the *Release Substate* with a base station extended release mini
36 message indication if the message is the *Extended Release Mini Message*.
 - 37 - Otherwise, the mobile station shall perform the following:
 - 38 + If the received message is the *Extended Release Message*, the mobile station
39 shall send an *Extended Release Response Message* to the base station. If the
40 received message is the *Extended Release Mini Message*, the mobile station

1 shall send an *Extended Release Response Mini Message* to the base station.

- 2 + If USE_EXT_CH_IND_s is equal to '1', then the mobile station shall perform
3 the following:
- 4 ○ If SWITCHING_PARM_INCL_r is included and equal to '1', the mobile
5 station shall set NUM_SOFT_SWITCHING_FRAMES_CHM_s to
6 NUM_SOFT_SWITCHING_FRAMES_CHM_r + 1, and
7 NUM_SOFT_SWITCING_FRAMES_CHM_s to
8 NUM_SOFT_SWITCING_FRAMES_CHM_r + 1.
 - 9 ○ If EXT_CH_IND_r indicates that F-DCCH is assigned and F-FCH is not
10 assigned, the mobile station shall set FPC_PRI_CHAN_s to '1' at the action
11 time of the message.
 - 12 ○ If EXT_CH_IND_r indicates that F-FCH is assigned and F-DCCH is not
13 assigned, the mobile station shall set FPC_PRI_CHAN_s to '0' at the action
14 time of the message.
 - 15 ○ If EXT_CH_IND_r indicates that an R-FCH is to be released, then the
16 mobile station shall stop transmitting on R-FCH at the action time
17 specified by the message. If EXT_CH_IND_r indicates that an F-FCH is to
18 be released, then the mobile station shall stop processing F-FCH at the
19 action time specified by the message.
 - 20 ○ If EXT_CH_IND_r indicates that an R-DCCH is to be released, then the
21 mobile station shall stop transmitting on R-DCCH at the action time
22 specified by the message. If EXT_CH_IND_r indicates that an F-DCCH is
23 to be released, then the mobile station shall stop processing F-DCCH at
24 the action time specified by the message.
 - 25 ○ If EXT_CH_IND_r indicates that an R-PDCH is to be released, then the
26 mobile station shall stop transmitting on R-PDCH at the action time
27 specified by the message.
 - 28 ○ If GATING_RATE_INCL_r is equal to '1', the mobile station shall set
29 PILOT_GATING_RATE_s = PILOT_GATING_RATE_r at the action time of the
30 message.
 - 31 ○ If PDCH_CONTROL_HOLD_r is equal to '1', the mobile station shall
32 perform the following:
 - 33 ◇ Set PILOT_GATING_USE_RATE to '1' and start the reverse pilot
34 gating and R-CQICH gating at PILOT_GATING_RATE_s at the action
35 time of the message.
 - 36 ◇ The mobile station shall cancel the forward and reverse supplemental
37 channel assignment, if any, at the action time of the message.

- 1 ○ The mobile station shall set $EXT_CH_IND_S$ to $EXT_CH_IND_R$.
- 2 + Otherwise ($USE_EXT_CH_IND_S$ is equal to '0'), the mobile station shall
- 3 perform the following:
- 4 ○ The mobile station shall update CH_IND_S as follows: If the least
- 5 significant bit of CH_IND_R equals '1', the mobile station shall set
- 6 $CH_IND_S = '10'$. If the second most significant bit of CH_IND_R equals '1',
- 7 the mobile station shall set $CH_IND_S = '01'$.
- 8 ○ If CH_IND_R is equal to '001' or '101', the mobile station shall set
- 9 $FPC_PRI_CHAN_S$ to '1' at the action time of the message.
- 10 ○ If CH_IND_R is equal to '010', the mobile station shall set $FPC_PRI_CHAN_S$
- 11 to '0' at the action time of the message.
- 12 ○ If the least significant bit of CH_IND_R equals '1', then the mobile station
- 13 shall stop transmitting on R-FCH and stop processing F-FCH, if
- 14 assigned, at the action time specified by the message.
- 15 ○ If the second most significant bit of CH_IND_R equals '1', then the mobile
- 16 station shall stop transmitting on R-DCCH and stop processing F-DCCH,
- 17 if assigned, at the action time specified by the message.
- 18 ○ If $GATING_RATE_INCL_R$ equals '1', the mobile station shall set
- 19 $PILOT_GATING_RATE_S = PILOT_GATING_RATE_R$ at the action time of the
- 20 message.
- 21 ○ If the most significant bit of CH_IND_R equals '1', the mobile station shall
- 22 set $PILOT_GATING_USE_RATE$ to '1'. The mobile station shall start the
- 23 reverse pilot gating at $PILOT_GATING_RATE_S$ at the action time of the
- 24 message. Furthermore, if the least significant bit of CH_IND_R equals '1'
- 25 (that is, the Fundamental Channel is being released), the mobile station
- 26 shall store the configuration used for the Fundamental Channel. The
- 27 mobile station shall cancel the forward and reverse supplemental
- 28 channel assignment, if any, at the action time of the message.
- 29 ○ If a Forward Packet Data Channel is assigned, the mobile station shall
- 30 perform the following:
- 31 ◇ Stop processing the Forward Packet Data Channel at the action time
- 32 specified by the message.
- 33 ◇ If a Reverse Packet Data Channel is assigned, the mobile station
- 34 shall stop transmitting on the Reverse Packet Data Channel at the
- 35 action time specified by the message.
- 36 ◇ If the two least significant bits of CH_IND_R is equal to '00', the mobile
- 37 station shall perform the following:

- 1 – If EXT_CH_IND_s signals the allocation of F-FCH and R-FCH, and
2 does not signal allocation of F-DCCH nor R-DCCH, the mobile
3 station shall set CH_IND_s = '01' at the action time specified by the
4 message.
- 5 – If EXT_CH_IND_s signals the allocation of F-DCCH and R-DCCH,
6 and does not signal allocation of F-FCH nor R-FCH, the mobile
7 station shall set CH_IND_s = '10' at the action time specified by the
8 message.
- 9 – If EXT_CH_IND_s signals the allocation of F-FCH, R-FCH, F-DCCH
10 and R-DCCH, the mobile station shall set CH_IND_s = '11' at the
11 action time specified by the message.

12 2.6.4.1.10 Processing the Resource Allocation Message and Resource Allocation Mini 13 Message

14 The mobile station shall process the *Resource Allocation Message* and the *Resource*
15 *Allocation Mini Message* as follows:

- 16 • The mobile station shall set FPC_PRI_CHAN_s = FPC_PRI_CHAN_r at the action time
17 of the message.
- 18 • If a F-PDCH is not assigned and the Fundamental Channel was previously
19 established prior to transitioning to the *Control Hold Mode*, the mobile station shall
20 start processing F-FCH and start transmitting on R-FCH at the action time of the
21 message. The mobile station shall establish the Fundamental Channel with the
22 same configuration as previously used, and shall set CH_IND_s to '11'.
- 23 • The mobile station shall set PILOT_GATING_USE_RATE to '0' and shall start the
24 continuous reverse pilot at the action time of the message and, if a F-PDCH is
25 assigned, the mobile station shall start the continuous R-CQICH as defined in [3].

26 2.6.4.1.11 Reserved

27 2.6.4.1.12 Processing the Service Configuration Record

28 The mobile station shall update the Service Configuration information record currently in
29 use as follows:

- 30 • If P_REV_IN_USE_s is less than eight, the mobile station shall update the multiplex
31 option information as follows:
 - 32 - The mobile station shall store the forward Fundamental Channel multiplex
33 option [FOR_FCH_MUX_OPTION_s = FOR_MUX_OPTION_r].
 - 34 - The mobile station shall store the reverse Fundamental Channel multiplex
35 option [REV_FCH_MUX_OPTION_s = REV_MUX_OPTION_r].
 - 36 - The mobile station shall store the forward Dedicated Control Channel multiplex
37 option [FOR_DCCH_MUX_OPTION_s = FOR_MUX_OPTION_r].

- 1 - The mobile station shall store the reverse Dedicated Control Channel multiplex
2 option [REV_DCCH_MUX_OPTION_S = REV_MUX_OPTION_r].
- 3 • If P_REV_IN_USE_S is greater than or equal to eight, the mobile station shall update
4 the multiplex option information as follows:
- 5 - If FCH_DCCH_MUX_OPTION_IND is equal to '00':
- 6 + The mobile station shall store the forward Fundamental Channel multiplex
7 option (FOR_FCH_MUX_OPTION_S = FOR_MUX_OPTION_r).
- 8 + The mobile station shall store the forward Dedicated Control Channel
9 multiplex option (FOR_DCCH_MUX_OPTION_S = FOR_MUX_OPTION_r).
- 10 + The mobile station shall store the reverse Fundamental Channel multiplex
11 option (REV_FCH_MUX_OPTION_S = REV_MUX_OPTION_r).
- 12 + The mobile station shall store the reverse Dedicated Control Channel
13 multiplex option (REV_DCCH_MUX_OPTION_S = REV_MUX_OPTION_r).
- 14 - If FCH_DCCH_MUX_OPTION_IND is equal to '01':
- 15 + The mobile station shall store the forward Fundamental Channel multiplex
16 option (FOR_FCH_MUX_OPTION_S = FOR_MUX_OPTION_r).
- 17 + The mobile station shall store the reverse Fundamental Channel multiplex
18 option (REV_FCH_MUX_OPTION_S = REV_MUX_OPTION_r).
- 19 - If FCH_DCCH_MUX_OPTION_IND is equal to '10':
- 20 + The mobile station shall store the forward Dedicated Control Channel
21 multiplex option (FOR_DCCH_MUX_OPTION_S = FOR_MUX_OPTION_r).
- 22 + The mobile station shall store the reverse Dedicated Control Channel
23 multiplex option (REV_DCCH_MUX_OPTION_S = REV_MUX_OPTION_r).
- 24 - If FCH_DCCH_MUX_OPTION_IND is equal to '11':
- 25 + The mobile station shall store the forward Fundamental Channel multiplex
26 option (FOR_FCH_MUX_OPTION_S = FOR_MUX_OPTION_r).
- 27 + The mobile station shall store the reverse Fundamental Channel multiplex
28 option (REV_FCH_MUX_OPTION_S = REV_MUX_OPTION_r).
- 29 + The mobile station shall store the forward Dedicated Control Channel
30 multiplex option (FOR_DCCH_MUX_OPTION_S = FOR_DCCH_MUX_OPTION_r).
- 31 + The mobile station shall store the reverse Dedicated Control Channel
32 multiplex option (REV_DCCH_MUX_OPTION_S = REV_DCCH_MUX_OPTION_r).
- 33 • The mobile station shall store the set of number of bits per frame of the forward
34 Fundamental Channel and Dedicated Control Channel [FOR_NUM_BITS_S =
35 FOR_NUM_BITS_r].
- 36 • The mobile station shall store the set of number of bits per frame of the reverse
37 Fundamental Channel and Dedicated Control Channel [REV_NUM_BITS_S =
38 REV_NUM_BITS_r].

- 1 • If a service option connection has been omitted from the service option connection
2 records, the Layer 3 shall terminate the call control instance (currently existing or
3 pending instantiation) identified by the connection reference corresponding to the
4 omitted service option connection.
- 5 • If this is the first Service Configuration Record received from the base station in a
6 *Service Connect Message*, *General Handoff Direction Message*, or *Universal Handoff*
7 *Direction Message* and accepted by the mobile station since entering the *Traffic*
8 *Channel substate*, the mobile station shall also identify the Call Control instance
9 currently identified by NULL by the connection reference assigned to the first
10 service option connection, CON_REF_T; otherwise, the mobile station shall identify
11 the Call Control instance corresponding to the first service option connection listed
12 in this Service Configuration information record by the NULL identifier.
- 13 • The mobile station shall delete all instances of current service option connection
14 records. For each of the NUM_CON_REC_T occurrences of the service option
15 connection record (SO_CON_REC[i]), the mobile station shall perform the following:
- 16 - The mobile station shall store the service option connection reference
17 (SO_CON_REC_S[i].CON_REF = CON_REF_T).
- 18 - The mobile station shall store the service option
19 (SO_CON_REC_S[i].SERVICE_OPTION = SERVICE_OPTION_T).
- 20 - The mobile station shall store the forward traffic channel traffic type
21 (SO_CON_REC_S[i].FOR_TRAFFIC = FOR_TRAFFIC_T).
- 22 - The mobile station shall store the reverse traffic channel traffic type
23 (SO_CON_REC_S[i].REV_TRAFFIC = REV_TRAFFIC_T).
- 24 - The mobile station shall store the encryption mode indicator for user
25 information privacy (SO_CON_REC_S[i].UI_ENCRYPT_MODE =
26 UI_ENCRYPT_MODE_T).
- 27 - The mobile station shall store the service reference identifier
28 (SO_CON_REC_S[i].SR_ID = SR_ID_T).
- 29 - If RLP_INFO_INCL_T equals '1', the mobile station shall store the Radio Link
30 Protocol block of bits (SO_CON_REC_S[i].RLP_BLOB = RLP_BLOB_T).
- 31 - If QOS_PARAMS_INCL_T equals '1', the mobile station shall store the QoS
32 parameters block (SO_CON_REC_S[i].QOS_PARAMS = QOS_PARAMS_T).
- 33 • If FCH_CC_INCL_T equals '1', the mobile station shall perform the following:
- 34 - The mobile station shall store the indicator for 5ms frames on Fundamental
35 Channel as follows: if FCH_FRAME_SIZE_T equals '1', the mobile station shall set
36 FCH_5MS_FRAMES_S = '1'; otherwise, it is set to '0'.

- 1 - The mobile station shall store the Forward Fundamental Channel Radio
2 Configuration (FOR_FCH_RC_s = FOR_FCH_RC_r).
- 3 - The mobile station shall store the Reverse Fundamental Channel Radio
4 Configuration (REV_FCH_RC_s = REV_FCH_RC_r).
- 5 • If DCCH_CC_INCL_r equals '1', the mobile station shall perform the following:
- 6 - The mobile station shall store the indicator for 5ms frames on Dedicated Control
7 Channel as follows: If DCCH_FRAME_SIZE_r equals '10' or '11', the mobile
8 station shall set DCCH_5MS_FRAMES_s = '1'; otherwise, it is set to '0'.
- 9 - The mobile station shall store the Forward Dedicated Control Channel Radio
10 Configuration (FOR_DCCH_RC_s = FOR_DCCH_RC_r).
- 11 - The mobile station shall store the Reverse Dedicated Control Channel Radio
12 Configuration (REV_DCCH_RC_s = REV_DCCH_RC_r).
- 13 • If FOR_SCH_CC_INCL_r equals '1', the mobile station shall store the
14 NUM_FOR_SCH_r occurrences of the Forward Supplemental Channel channel
15 configuration records as follows:
- 16 - The mobile station shall store the Forward Supplemental Channel Identification
17 (FOR_SCH_ID[FOR_SCH_ID_r]_s = FOR_SCH_ID_r).
- 18 - The mobile station shall store the Forward Supplemental Channel Multiplex
19 Option (FOR_SCH_MUX[FOR_SCH_ID_r]_s = FOR_SCH_MUX_r).
- 20 - The mobile station shall store the Forward Supplemental Channel Radio
21 Configuration (FOR_SCH_RC[FOR_SCH_ID_r]_s = SCH_RC_r).
- 22 - The mobile station shall store the Forward Supplemental Channel Coding Type
23 (FOR_SCH_CODING[FOR_SCH_ID_r]_s = CODING_r).
- 24 + If FRAME_40_USED_r and FRAME_80_USED_r are both equal to '0', the
25 mobile station shall set FOR_SCH_FRAME_LENGTH_s[FOR_SCH_ID_r] to '00'
26 (i.e., 20 ms frame length).
- 27 - If FRAME_40_USED_r is equal to '1', the mobile station shall set
28 FOR_SCH_FRAME_LENGTH_s[FOR_SCH_ID_r] to '01' (i.e., 40 ms frame length).
- 29 - If FRAME_80_USED_r is equal to '1', the mobile station shall set
30 FOR_SCH_FRAME_LENGTH_s[FOR_SCH_ID_r] to '10' (i.e., 80 ms frame length).
- 31 - F_MAX_RATE_IDX_s[FOR_SCH_ID_r] = MAX_RATE_r.
- 32 • If REV_SCH_CC_INCL_r equals '1', the mobile station shall store the NUM_REV_SCH_r
33 occurrences of the Reverse Supplemental Channel channel configuration records as
34 follows:
- 35 - The mobile station shall store the Reverse Supplemental Channel Identification
36 (REV_SCH_ID[REV_SCH_ID_r]_s = REV_SCH_ID_r).
- 37 - The mobile station shall store the Reverse Supplemental Channel Multiplex
38 Option (REV_SCH_MUX[REV_SCH_ID_r]_s = REV_SCH_MUX_r).

- 1 - The mobile station shall store the Reverse Supplemental Channel Radio
2 Configuration (REV_SCH_RC[REV_SCH_ID_r]_s = SCH_RC_r).
- 3 - The mobile station shall store the Reverse Supplemental Channel Coding Type
4 (REV_SCH_CODING[REV_SCH_ID_r]_s = CODING_r).
- 5 - If FRAME_40_USED_r and FRAME_80_USED_r are both equal to '0', the mobile
6 station shall set REV_SCH_FRAME_LENGTH_s[REV_SCH_ID_r] to '00' (i.e., 20 ms
7 frame length).
- 8 - If FRAME_40_USED_r is equal to '1', the mobile station shall set
9 REV_SCH_FRAME_LENGTH_s[REV_SCH_ID_r] to '01' (i.e., 40 ms frame length).
- 10 - If FRAME_80_USED_r is equal to '1', the mobile station shall set
11 REV_SCH_FRAME_LENGTH_s[REV_SCH_ID_r] to '10' (i.e., 80 ms frame length).
- 12 - R_MAX_RATE_IDX_s[REV_SCH_ID_r] = MAX_RATE_r.
- 13 • If FOR_PDCH_CC_INCL_r equals '1', the mobile station shall perform the following:
- 14 - The mobile station shall store the Forward Packet Data Channel multiplex
15 option (FOR_PDCH_MUX_OPTION_s = FOR_PDCH_MUX_OPTION_r).
- 16 - The mobile station shall store the Forward Packet Data Channel Radio
17 Configuration (FOR_PDCH_RC_s = FOR_PDCH_RC_r).
- 18 • If REV_PDCH_CC_INCL_r equals '1', the mobile station shall store the following:
- 19 - The Reverse Packet Data Channel multiplex option for the higher data rates
20 (REV_PDCH_MUX_OPTION_HIGH_RATE_s =
21 REV_PDCH_MUX_OPTION_HIGH_RATE_r).
- 22 - The Reverse Packet Data Channel multiplex option for the lower data rates
23 (REV_PDCH_MUX_OPTION_LOW_RATE_s =
24 REV_PDCH_MUX_OPTION_LOW_RATE_r).
- 25 - The Reverse Packet Data Channel Radio Configuration (REV_PDCH_RC_s =
26 REV_PDCH_RC_r).

27 2.6.4.1.13 Processing the Non-Negotiable Service Configuration Record

28 The mobile station shall update the Non-Negotiable Service Configuration information
29 record currently in use as follows:

- 30 • If FPC_INCL_r equals '1', the mobile station shall perform the following:
- 31 - The mobile station shall store the Power Control Subchannel indicator
32 (FPC_PRI_CHAN_s = FPC_PRI_CHAN_r).
- 33 - The mobile station shall store the forward power control operation mode
34 (FPC_MODE_NO_SCH_s = FPC_MODE_r).
- 35 - The mobile station shall set FPC_MODE_s = FPC_MODE_NO_SCH_s if there is no
36 forward Supplemental Channel assignment in progress (see 2.6.6.2.5.1.1).
- 37 - If FPC_OLPC_FCH_INCL_r equals '1', the mobile station shall perform the
38 following:

- 1 + The mobile station shall store the Fundamental Channel target Frame Error
2 Rate ($FPC_FCH_FER_s = FPC_FCH_FER_r$).
- 3 + The mobile station shall store the minimum Fundamental Channel Outer
4 Loop E_b/N_t setpoint ($FPC_FCH_MIN_SETPT_s = FPC_FCH_MIN_SETPT_r$).
- 5 + The mobile station shall store the maximum Fundamental Channel Outer
6 Loop E_b/N_t setpoint ($FPC_FCH_MAX_SETPT_s = FPC_FCH_MAX_SETPT_r$).
- 7 - If $FPC_OLPC_DCCH_INCL_r$ equals '1', the mobile station shall perform the
8 following:
- 9 + The mobile station shall store the Dedicated Control Channel target Frame
10 Error Rate ($FPC_DCCH_FER_s = FPC_DCCH_FER_r$).
- 11 + The mobile station shall store the minimum Dedicated Control Channel
12 Outer Loop E_b/N_t setpoint ($FPC_DCCH_MIN_SETPT_s =$
13 $FPC_DCCH_MIN_SETPT_r$).
- 14 + The mobile station shall store the maximum Dedicated Control Channel
15 Outer Loop E_b/N_t setpoint ($FPC_DCCH_MAX_SETPT_s =$
16 $FPC_DCCH_MAX_SETPT_r$).
- 17 • If $GATING_RATE_INCL_r$ equals '1', the mobile station shall store the Reverse Pilot
18 Channel gating rate ($PILOT_GATING_RATE_s = PILOT_GATING_RATE_r$).
- 19 - If $FOR_SCH_INCL_r$ equals '1', the mobile station shall store the $NUM_FOR_SCH_r$
20 occurrences of the Forward Supplemental Channel information as follows:
- 21 - The mobile station shall store the Forward Supplemental Channel Multiframe
22 Offset ($FOR_SCH_FRAME_OFFSET[FOR_SCH_ID_r]_s =$
23 $FOR_SCH_FRAME_OFFSET_r$).
- 24 • If $REV_SCH_CC_INCL_r$ equals '1', the mobile station shall store the $NUM_REV_SCH_r$
25 occurrences of the Reverse Supplemental Channel information as follows:
- 26 - The mobile station shall store the Reverse Supplemental Channel Multiframe
27 Offset ($REV_SCH_FRAME_OFFSET[REV_SCH_ID_r]_s =$
28 $REV_SCH_FRAME_OFFSET_r$).
- 29 • The mobile station shall determine the Logical-to-Physical Mapping to be used as
30 follows:
- 31 - If LPM_IND_r equals '00' and an F-PDCH is assigned, the mobile station shall
32 reset the Logical-to-Physical Mapping to their default values as specified in
33 Table 2.6.4.2-2 but with the following modification for requirement 1 stated in
34 Table 2.6.4.2-2:
- 35 + The mobile station shall set the SR_ID field to the value specified in the
36 Service Configuration information record.

- 1 - If LPM_IND_r equals '00' and P_REV_IN_USE_s is greater than six and an F-PDCH
2 is not assigned, the mobile station shall reset the Logical-to-Physical Mapping to
3 their default values as specified in Table 2.6.4.2-1 but with the following
4 modification for requirement 1 stated in Table 2.6.4.2-1:
- 5 + The mobile station shall set the SR_ID field to the value specified in the
6 Service Configuration information record.
- 7 - If LPM_IND_r equals '00' and P_REV_IN_USE_s is equal to or less than six, the
8 mobile station shall reset the Logical-to-Physical Mapping to their default values
9 as follows:
- 10 + Default number of Logical-to-Physical Mapping entries
11 (NUM_LPM_ENTRIES_s = '0100').
- 12 + Default Table(0) Logical-to-Physical Mapping service reference identifier
13 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].SR_ID_s = '000').
- 14 + Default Table(0) Logical-to-Physical Mapping logical resource identifier
15 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].LOGICAL_RESOURCE_s =
16 '0001').
- 17 + Default Table(0) Logical-to-Physical Mapping physical resource identifier:
- 18 ○ If CH_IND_s is equal to '01' or '11', the mobile station shall set
19 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].PHYSICAL_RESOURCE_s to
20 '0000'.
- 21 ○ If CH_IND_s is equal to '10', the mobile station shall set
22 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].PHYSICAL_RESOURCE_s to
23 '0001'.
- 24 + Default Table(0) Logical-to-Physical Mapping forward mapping indicator
25 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].FORWARD_FLAG_s = '1').
- 26 + Default Table(0) Logical-to-Physical Mapping reverse mapping indicator
27 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].REVERSE_FLAG_s = '1').
- 28 + Default Table(0) Logical-to-Physical Mapping priority
29 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].PRIORITY_s = '0000').
- 30 + Default Table(1) Logical-to-Physical Mapping service reference identifier
31 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].SR_ID_s = '001').
- 32 + Default Table(1) Logical-to-Physical Mapping logical resource identifier
33 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].LOGICAL_RESOURCE_s =
34 '0000').
- 35 + Default Table(1) Logical-to-Physical Mapping physical resource identifier:
- 36 ○ If CH_IND_s is equal to '01' or '11', the mobile station shall set
37 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].PHYSICAL_RESOURCE_s to
38 '0000'.

- 1 ○ If CH_IND_s is equal to '10', the mobile station shall set
2 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].PHYSICAL_RESOURCE_s to
3 '0001'.
- 4 + Default Table(1) Logical-to-Physical Mapping forward mapping indicator
5 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].FORWARD_FLAG_s = '1').
- 6 + Default Table(1) Logical-to-Physical Mapping reverse mapping indicator
7 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].REVERSE_FLAG_s = '1').
- 8 + Default Table(1) Logical-to-Physical Mapping priority
9 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].PRIORITY_s = '0000').
- 10 + Default Table(2) Logical-to-Physical Mapping service reference identifier
11 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].SR_ID_s = '001').
- 12 + Default Table(2) Logical-to-Physical Mapping logical resource identifier
13 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].LOGICAL_RESOURCE_s =
14 '0000').
- 15 + Default Table(2) Logical-to-Physical Mapping physical resource identifier
16 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].PHYSICAL_RESOURCE_s to
17 '0010').
- 18 + Default Table(2) Logical-to-Physical Mapping forward mapping indicator
19 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].FORWARD_FLAG_s = '1').
- 20 + Default Table(2) Logical-to-Physical Mapping reverse mapping indicator
21 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].REVERSE_FLAG_s = '1').
- 22 + Default Table(2) Logical-to-Physical Mapping priority
23 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].PRIORITY_s = '0000').
- 24 + Default Table(3) Logical-to-Physical Mapping service reference identifier
25 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].SR_ID_s = '001').
- 26 + Default Table(3) Logical-to-Physical Mapping logical resource identifier
27 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].LOGICAL_RESOURCE_s =
28 '0000').
- 29 + Default Table(3) Logical-to-Physical Mapping physical resource identifier
30 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].PHYSICAL_RESOURCE_s to
31 '0011').
- 32 + Default Table(3) Logical-to-Physical Mapping forward mapping indicator
33 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].FORWARD_FLAG_s = '1').
- 34 + Default Table(3) Logical-to-Physical Mapping reverse mapping indicator
35 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].REVERSE_FLAG_s = '1').
- 36 + Default Table(3) Logical-to-Physical Mapping priority
37 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].PRIORITY_s = '0000').

- 1 - If LPM_IND_r equals '01', the mobile station shall use the Logical-to-Physical
2 Mapping included in this Non-Negotiable Service Configuration Record. The
3 mobile station shall perform the following: The mobile station shall delete the
4 Logical-to-Physical Mapping currently in use. The mobile station shall store the
5 number of Logical-to-Physical Mapping entries (NUM_LPM_ENTRIES_s =
6 NUM_LPM_ENTRIES_r). For each ith record of the NUM_LPM_ENTRIES_r Logical-
7 to-Physical Mapping records included in the received Non-Negotiable Service
8 Configuration Record:
- 9 + The mobile station shall store the Logical-to-Physical Mapping service
10 reference identifier (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].SR_ID_s =
11 SR_ID_r).
- 12 + The mobile station shall store the Logical-to-Physical Mapping logical
13 resource identifier
14 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].LOGICAL_RESOURCE_s =
15 LOGICAL_RESOURCE_r).
- 16 + The mobile station shall store the Logical-to-Physical Mapping Physical
17 Channel
18 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].PHYSICAL_RESOURCE_s =
19 PHYSICAL_RESOURCE_r).
- 20 + The mobile station shall store the Logical-to-Physical Mapping forward
21 mapping indicator
22 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].FORWARD_FLAG_s =
23 FORWARD_FLAG_r).
- 24 + The mobile station shall store the Logical-to-Physical Mapping reverse
25 mapping indicator
26 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].REVERSE_FLAG_s =
27 REVERSE_FLAG_r).
- 28 + The mobile station shall store the Logical-to-Physical Mapping priority
29 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].PRIORITY_s = PRIORITY_r).
- 30 - If LPM_IND_r equals '10', the mobile station shall use the Logical-to-Physical
31 Mapping currently in use.
- 32 • For each of the NUM_REC_r occurrences of the service-specific records included in
33 the Non-negotiable Service Configuration Record, the mobile station shall perform
34 the following:
- 35 - The mobile station shall store the Short Data Burst service option number
36 omitted indicator (SDB_SO_OMIT_s [SR_ID_r] = SDB_SO_OMIT_r).
- 37 • The mobile station shall store the following:
- 38 - USE_FLEX_NUM_BITS_s = USE_FLEX_NUM_BITS_r
- 39 - USE_VAR_RATE_s = USE_VAR_RATE_r

- 1 - If $USE_VAR_RATE_R$ is equal to '1', then the mobile station shall store the
2 following:
3 + $R_INC_RATE_ALLOWED_S = R_INC_RATE_ALLOWED_R$
4 + $F_INC_RATE_ALLOWED_S = F_INC_RATE_ALLOWED_R$
- 5 - If $USE_FLEX_NUM_BITS_R$ or $USE_VAR_RATE_R$ is equal to '1', then the mobile
6 station shall store the following:
7 + $USE_ERAM_S = USE_ERAM_R$
- 8 • If $NUM_BITS_TABLES_INCL_R$ is included and is equal to '1', the mobile station shall
9 store $NUM_BITS_TABLES_COUNT+1$ instances of the Flexible Rate Table
10 (NUM_RECS triplets of (NUM_BITS_IDX , NUM_BITS , CRC_LEN_IDX) corresponding
11 to each $NUM_BITS_TABLE_ID$) as follows:
- 12 - For each of the NUM_RECS occurrences of the three field record consisting of
13 NUM_BITS_IDX , NUM_BITS , and CRC_LEN_IDX the mobile station shall store
14 the following
15 + $NUM_BITS_S[NUM_BITS_TABLE_ID_R][NUM_BITS_IDX_R] = NUM_BITS_R$;
16 + $CRC_LEN_IDX_S[NUM_BITS_TABLE_ID_R][NUM_BITS_IDX_R] = CRC_LEN_IDX_R$;
- 17 • If $USE_OLD_FLEX_MAPPING_R$ is included and equal to '0', the mobile station shall
18 store the following:
- 19 - $FFCH_NBIT_TABLE_ID_S = FFCH_NBIT_TABLE_ID_R$.
20 - $RFCH_NBIT_TABLE_ID_S = RFCH_NBIT_TABLE_ID_R$.
21 - $FSCH_NBIT_TABLE_ID_S[1] = FSCH0_NBIT_TABLE_ID_R$.
22 - $FSCH_NBIT_TABLE_ID_S[2] = FSCH1_NBIT_TABLE_ID_R$.
23 - $RSCH_NBIT_TABLE_ID_S[1] = RSCH0_NBIT_TABLE_ID_R$.
24 - $RSCH_NBIT_TABLE_ID_S[2] = RSCH1_NBIT_TABLE_ID_R$.
25 - $FDCCH_NBIT_TABLE_ID_S = FDCCH_NBIT_TABLE_ID_R$.
26 - If $FDCCH_NBIT_TABLE_ID_S$ is not equal to '0000', then the mobile station shall
27 store $FDCCH_NBITS_IDX_S = FDCCH_NBITS_IDX_R$.
28 - $RDCCH_NBIT_TABLE_ID_S = RDCCH_NBIT_TABLE_ID_R$.
29 - If $RDCCH_NBIT_TABLE_ID_S$ is not equal to '0000', then the mobile station shall
30 store $RDCCH_NBITS_IDX_S = RDCCH_NBITS_IDX_R$.
- 31 • Otherwise, the mobile station shall use the previously stored values for the above
32 variables.
- 33 • If $USE_FLEX_NUM_BITS_R$ is equal to '0', the mobile station shall store the following:
- 34 - $FFCH_NBIT_TABLE_ID_S = '0000'$.
35 - $RFCH_NBIT_TABLE_ID_S = '0000'$.
36 - $FSCH_NBIT_TABLE_ID_S[1] = '0000'$.

- 1 - FSCH_NBIT_TABLE_ID_s[2] = '0000'.
- 2 - RSCH_NBIT_TABLE_ID_s[1] = '0000'.
- 3 - RSCH_NBIT_TABLE_ID_s[2] = '0000'.
- 4 - FDCCH_NBIT_TABLE_ID_s = '0000'.
- 5 - FDCCH_NBITS_IDX_s = '0000'.
- 6 - RDCCH_NBIT_TABLE_ID_s = '0000'.
- 7 - FDCCH_NBITS_IDX_s = '0000'.
- 8 • If VAR_TABLES_INCL_r is included and is equal to '1', the mobile station shall store
- 9 VAR_RATE_TABLES_COUNT+1 instances of the Variable Rate Mask Table
- 10 (NUM_RECS pairs of (NUM_BITS_IDX, MASK) corresponding to each
- 11 VAR_RATE_TABLE_ID) as follows:
- 12 - For each of the NUM_RECS + 1 occurrences of the two-field record consisting of
- 13 NUM_BITS_IDX and MASK the mobile station shall store the following:
- 14 + MASK_s[VAR_RATE_TABLE_ID_r][NUM_BITS_IDX_r] = MASK_r;
- 15 - If FSCH_VAR_TABLE_ID_s[1] is not equal to '000', then the mobile station shall
- 16 store the following:
- 17 + For row=1, ..., 15
- 18 ○ For i=1, ..., row,
- 19 If the *i*th bit position in MASK_s[FSCH_VAR_TABLE_ID_s[1]][row] is equal to
- 20 '1', then the mobile station shall set
- 21 VAR_FSCH_RATE_OFFSET_s[1][row][i] to i,
- 22 otherwise, the mobile shall set VAR_FSCH_RATE_OFFSET_s[1][row][i] to
- 23 '0'.
- 24 - If FSCH_VAR_TABLE_ID_s[2] is not equal to '000', then the mobile station shall
- 25 store the following:
- 26 + For row=1, ..., 15
- 27 ○ For i=1, ..., row,
- 28 If the *i*th bit position in MASK_s[FSCH_VAR_TABLE_ID_s[2]][row] is equal to
- 29 '1', then the mobile station shall set
- 30 VAR_FSCH_RATE_OFFSET_s[2][row][i] to i,
- 31 otherwise, the mobile shall set VAR_FSCH_RATE_OFFSET_s[2][row][i] to
- 32 '0'.
- 33 - If RSCH_VAR_TABLE_ID_s[1] is not equal to '000', then the mobile station shall
- 34 store the following:
- 35 + For row=1, ..., 15
- 36 ○ For i=1, ..., row,

- 1 If the i^{th} bit position in $\text{MASK}_s[\text{RSCH_VAR_TABLE_ID}_s[1]][\text{row}]$ is equal to
2 '1', then the mobile station shall set
3 $\text{VAR_RSCH_RATE_OFFSET}_s[1][\text{row}][i]$ to i ,
4 otherwise, the mobile shall set $\text{VAR_RSCH_RATE_OFFSET}_s[1][\text{row}][i]$ to
5 '0'.
- 6 - If $\text{RSCH_VAR_TABLE_ID}_s[2]$ is not equal to '000', then the mobile station shall
7 store the following:
8 + For $\text{row}=1, \dots, 15$
9 o For $i=1, \dots, \text{row}$,
- 10 If the i^{th} bit position in $\text{MASK}_s[\text{RSCH_VAR_TABLE_ID}_s[2]][\text{row}]$ is equal to
11 '1', then the mobile station shall set
12 $\text{VAR_RSCH_RATE_OFFSET}_s[2][\text{row}][i]$ to i ,
13 otherwise, the mobile shall set $\text{VAR_RSCH_RATE_OFFSET}_s[2][\text{row}][i]$ to
14 '0'.
- 15 • If $\text{USE_OLD_VAR_MAPPING}_r$ is included and equal to '0', the mobile station shall
16 store the following:
17 - $\text{FSCH_VAR_TABLE_ID}_s[1] = \text{FSCH0_VAR_TABLE_ID}_r$.
18 - $\text{FSCH_VAR_TABLE_ID}_s[2] = \text{FSCH1_VAR_TABLE_ID}_r$.
19 - $\text{RSCH_VAR_TABLE_ID}_s[1] = \text{RSCH0_VAR_TABLE_ID}_r$.
20 - $\text{RSCH_VAR_TABLE_ID}_s[2] = \text{RSCH1_VAR_TABLE_ID}_r$.
21 • Otherwise, use the previously stored values for the above four variables.
 - 22 • If USE_VAR_RATE_r is equal to '0', the mobile station shall store the following:
23 - $\text{FSCH_VAR_TABLE_ID}_s[1] = \text{'000'}$.
24 - $\text{FSCH_VAR_TABLE_ID}_s[2] = \text{'000'}$.
25 - $\text{RSCH_VAR_TABLE_ID}_s[1] = \text{'000'}$.
26 - $\text{RSCH_VAR_TABLE_ID}_s[2] = \text{'000'}$.
 - 27 • If LTU_TABLES_INCL_r is included and is equal to '1', then the mobile station shall
28 store $\text{NUM_LTU_TABLES} + 1$ instances of the LTU Table which determines the
29 number of LTUs per frame for convolutionally encoded supplemental channels for
30 each number of bits per frame. Each LTU Table is identified by its LTU_TABLE_ID .
31 - For each of the $\text{NUM_ROWS} + 1$ rows of the LTU Table, the mobile station shall
32 store the following:
33 + $\text{LTU_TAB}_s[\text{LTU_TABLE_ID}_r][\text{NBITS_IDX}_r] = \text{NUM_LTUS}_r$
 - 34 • If $\text{USE_OLD_LTU_MAPPING}_r$ is included and is equal to '0', then the mobile station
35 shall store the following:
36 - $\text{FSCH_LTU_TAB_ID}_s[1] = \text{FSCH0_LTU_TAB_ID}_r$

- 1 - FSCH_LTU_TAB_IDS[2] = FSCH1_LTU_TAB_ID_r
- 2 - RSCH_LTU_TAB_IDS[1] = RSCH0_LTU_TAB_ID_r
- 3 - RSCH_LTU_TAB_IDS[2] = RSCH1_LTU_TAB_ID_r
- 4 • Else (if USE_OLD_LTU_MAPPING_r is included and is equal to '1'), the mobile station
- 5 shall use the previously stored values for the above four variables.
- 6 • If LTU_INFO_INCL_r is equal to '0', then the mobile station shall store the following:
- 7 - FSCH_LTU_TAB_IDS[1] = '000'
- 8 - FSCH_LTU_TAB_IDS[2] = '000'
- 9 - RSCH_LTU_TAB_IDS[1] = '000'
- 10 - RSCH_LTU_TAB_IDS[2] = '000'
- 11 • If PARTITION_TABLES_INCL_r is included and is equal to '1', then the mobile station
- 12 shall store NUM_PARTITION_TABLES + 1 instances of the Partition Table which
- 13 determines the number of bits allocated to each service per FCH or DCCH frame as
- 14 follows. Each Partition Table is identified by its PARTITION_TABLE_ID.
- 15 - For each of the NUM_ROWS+1 rows of the Partition Table, the mobile station
- 16 shall store the following:
- 17 + PART_TABS[PARTITION_TABLE_ID_r][CATEGORY_r].MUX_HEADER_LEN =
- 18 MUX_HEADER_LEN_r
- 19 + PART_TABS[PARTITION_TABLE_ID_r][CATEGORY_r].MUX_HEADER =
- 20 MUX_HEADER_r
- 21 + PART_TABS[PARTITION_TABLE_ID_r][CATEGORY_r]. NUM_PARTITIONS =
- 22 NUM_PARTITIONS_r
- 23 + For i=1, ..., NUM_PARTITIONS+1; the mobile station shall store the
- 24 following:
- 25 ○ PART_TABS[PARTITION_TABLE_ID_r][CATEGORY_r]. PARTITION_SR_ID[i] =
- 26 SR_ID_r
- 27 ○ PART_TABS[PARTITION_TABLE_ID_r][CATEGORY_r]. PARTITION_NBITS[i] =
- 28 SRV_NUM_BITS_r
- 29 • Else (if PARTITION_TABLES_INCL_r is included and is equal to '0'), the mobile
- 30 station shall use the previously stored values for the PART_TABS.
- 31 • If USE_OLD_PART_MAPPING_r is included and is equal to '0', then the mobile station
- 32 shall store the following:
- 33 - FFCH_PART_TAB_IDS = FFCH_PART_TAB_ID_r
- 34 - RFCH_PART_TAB_IDS = RFCH_PART_TAB_ID_r
- 35 - FDCCH_PART_TAB_IDS = FDCCH_PART_TAB_ID_r
- 36 - RDCCH_PART_TAB_IDS = RDCCH_PART_TAB_ID_r

- 1 • If USE_FLEX_NUM_BITS_S is equal to '0', then the mobile station shall store the
2 following:
- 3 - FFCH_PART_TAB_ID_S = '000'
- 4 - RFCH_PART_TAB_ID_S = '000'
- 5 - FDCCH_PART_TAB_ID_S = '000'
- 6 - RDCCH_PART_TAB_ID_S = '000'
- 7 • If SWITCHING_PARM_S_INCL_T is included and equal to '1', set
8 NUM_SOFT_SWITCHING_FRAMES_CHM_S to
9 NUM_SOFT_SWITCHING_FRAMES_CHM_T + 1, and
10 NUM_SOFT_SWITCHING_FRAMES_CHM_S to
11 NUM_SOFT_SWITCHING_FRAMES_CHM_T + 1.
- 12 • If RPC_INCL_T is equal to '1' and the mobile station supports any Radio
13 Configuration greater than 2, the mobile station shall perform the following:
- 14 - If RPC_ADJ_REC_TYPE is equal to '0000', the mobile station shall update the
15 Reverse Channel Adjustment Gain Table (see [2]) containing an offset relative to
16 the Reverse Pilot Channel power for each reverse link code channel received in
17 this message.
- 18 - If RPC_ADJ_REC_TYPE is equal to '0001' or '0010', the mobile station shall
19 update the Reverse Link Attribute Adjustment Gain Table (see [2]) containing an
20 offset relative to the Reverse Pilot Channel power for each transmission rate,
21 frame length, coding type received in this message.
- 22 - If RPC_ADJ_REC_TYPE is equal to '0011', at the action time of the message, the
23 mobile station shall update the Reverse Link Attribute Adjustment Gain Table
24 (see [2]) containing an offset relative to the Reverse Pilot Channel power for the
25 R-CQICH.
- 26 - If RPC_ADJ_REC_TYPE is equal to '0100', the mobile station shall do the
27 following:
- 28 + At the first R-PDCH frame boundary after the action time of the message, the
29 mobile station shall update the Reverse Link Attribute Adjustment Gain
30 Table (see [2]) containing an offset relative to the Reverse Pilot Channel
31 power for any combination of the following channels:
- 32 ○ R-REQCH
- 33 ○ R-SPICH
- 34 ○ R-PDCCH possibly for each encoder packet size, or for the boosted and
35 non boosted modes
- 36 ○ R-PDCH possibly for each encoder packet size, or for the boosted and
37 non boosted modes, or for each encoder packet size and transmission
38 round

- 1 + At the action time of the message, the mobile station shall update the
2 Reverse Link Attribute Adjustment Gain Table (see [2]) containing an offset
3 relative to the Reverse Pilot Channel power for the R-ACKCH.
- 4 + If REV_SPICH_ADJ_INCL_T is equal to '1', the mobile station shall set
5 REV_SPICH_EP_SIZE_S to REV_SPICH_EP_SIZE_T+1.
- 6 • The mobile station shall determine the BCMC Logical-to-Physical Mapping to be
7 used as follows:
- 8 - If BCMC_LPM_INCL_T equals '0', the mobile station shall delete the BCMC
9 Logical-to-Physical Mapping currently in use.
- 10 - If BCMC_LPM_IND_T is included and equals '01', the mobile station shall use the
11 BCMC Logical-to-Physical Mapping included in this Non-Negotiable Service
12 Configuration Record. The mobile station shall perform the following:
- 13 + The mobile station shall delete the BCMC Logical-to-Physical Mapping
14 currently in use.
- 15 + The mobile station shall store the BCMC Logical-to-Physical Mapping entry
16 for each BCMC_FLOW_ID (see 2.6.13.11) included in NNSCR.

17 For each *i*th record of the BCMC Logical-to-Physical Mapping records included in
18 the received Non-Negotiable Service Configuration Record:

- 19 + The mobile station shall store the BCMC Logical-to-Physical Mapping BCMC
20 flow identifier
21 (BCMC_LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].BCMC_FLOW_ID_S = *i*th
22 occurrence of BCMC_FLOW_ID (BCMC flow identifier). See section
23 2.6.13.11).
- 24 + The mobile station shall store the BCMC Logical-to-Physical Mapping
25 Physical Channel
26 (BCMC_LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].PHYSICAL_RESOURCE
27 E_S = PHYSICAL_RESOURCE_T).
- 28 + The mobile station shall store the BCMC Logical-to-Physical Mapping
29 forward mapping indicator
30 (BCMC_LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].FORWARD_FLAG_S =
31 FORWARD_FLAG_T).
- 32 + The mobile station shall store the BCMC Logical-to-Physical Mapping reverse
33 mapping indicator
34 (BCMC_LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].REVERSE_FLAG_S =
35 REVERSE_FLAG_T).
- 36 + The mobile station shall store the BCMC Logical-to-Physical Mapping
37 BSR_ID included indicator
38 (BCMC_LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].BSR_ID_INCL_S =
39 BSR_ID_INCL_T).

- 1 + If the BSR_ID_INCL_r is set to '1', the mobile station shall store the following:
- 2 ○ BCMC Logical-to-Physical Mapping BSR_ID
- 3 (BCMC_LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].BSR_ID_s =
- 4 BSR_ID_r).
- 5 + If the BSR_ID_INCL_r is set to '0', the mobile station shall store the following:
- 6 ○ BCMC Logical-to-Physical Mapping Forward Traffic Channel traffic type
- 7 (BCMC_LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].FOR_TRAFFIC_s =
- 8 FOR_TRAFFIC_r).
- 9 ○ BCMC Logical-to-Physical Mapping Reverse Traffic Channel traffic type
- 10 (BCMC_LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].REV_TRAFFIC_s =
- 11 REV_TRAFFIC_r).
- 12 - If BCMC_LPM_IND_r is included and equals '10', the mobile station shall use the
- 13 BCMC Logical-to-Physical Mapping currently in use.
- 14 • If a BCMC_FLOW_ID (See 2.6.13.11) has been omitted from the BCMC Logical-to-
- 15 Physical Mapping, the mobile station shall perform the following:
- 16 - Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE,*
- 17 *cause= FLOW_NOT_AVAILABLE, reason_ind)* to the BCMC Service Layer, where
- 18 reason_ind is set to CALL_RELEASE.
- 19 - Layer 3 shall terminate the call control instance identified by the
- 20 BCMC_FLOW_ID corresponding to the omitted BCMC flow
- 21 • If a BCMC_FLOW_ID (See 2.6.13.11) has been added to the BCMC Logical-to-
- 22 Physical Mapping, the mobile station shall perform the following:
- 23 - Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=SUCCESS)*
- 24 to the BCMC Service Layer.
- 25 - Layer 3 shall instantiate a call control instance and identify it by the
- 26 BCMC_FLOW_ID corresponding to the this BCMC flow
- 27 • If REV_PDCH_PARMS_INCL_r is equal to '1', then the mobile station shall store the
- 28 following:
- 29 - If REV_PDCH_PARMS_1_INCL_r is equal to '1', the mobile station shall set:
- 30 + REV_PDCH_MAX_AUTO_TPR_s to REV_PDCH_MAX_AUTO_TPR_r, and
- 31 + REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_s to
- 32 REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_r+1.
- 33 - If REV_PDCH_OPER_PARMS_INCL_r is equal to '1', the mobile station shall set:
- 34 + REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_s =
- 35 REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_r+1,
- 36 + REV_PDCH_DEFAULT_PERSISTENCE_s =
- 37 REV_PDCH_DEFAULT_PERSISTENCE_r,
- 38 + REV_PDCH_RESET_PERSISTENCE_s = REV_PDCH_RESET_PERSISTENCE_r,

- 1 + REV_PDCH_GRANT_PRECEDENCE_s = REV_PDCH_GRANT_PRECEDENCE_r.
- 2 + REV_PDCH_ALWAYS_ACK_FINAL_ROUND_s =
- 3 REV_PDCH_ALWAYS_ACK_FINAL_ROUND_r.
- 4 + REV_PDCH_MSIB_SUPPORTED_s = REV_PDCH_MSIB_SUPPORTED_r, and
- 5 + REV_PDCH_SOFT_SWITCHING_RESET_IND_s =
- 6 REV_PDCH_SOFT_SWITCHING_RESET_IND_r.
- 7 - REV_PDCH_BOOST_PARAMS_INCL_s to REV_PDCH_BOOST_PARAMS_INCL_r.
- 8 - If REV_PDCH_BOOST_PARAMS_INCL_s is equal to '1', the mobile station shall set
- 9 REV_PDCH_NUM_ARQ_ROUNDS_BOOST_s to
- 10 REV_PDCH_NUM_ARQ_ROUNDS_BOOST_r+1, and
- 11 REV_PDCH_BOOST_OVERSHOOT_s to REV_PDCH_BOOST_OVERSHOOT_r.
- 12 - REV_REQCH_ENABLED_s to REV_REQCH_ENABLED_r.
- 13 - If REV_REQCH_ENABLED_s is equal to '0', the mobile station shall set
- 14 REV_PDCH_REQCH_TRIGGER_s to NULL.
- 15 - If REV_REQCH_ENABLED_s is equal to '1', the mobile station shall set
- 16 REV_REQCH_PARAMS_INCL_s to REV_REQCH_PARAMS_INCL_r; otherwise, the
- 17 mobile station shall set REV_REQCH_PARAMS_INCL_s to '0'.
- 18 - If REV_REQCH_PARAMS_INCL_s is equal to '1', the mobile station shall store the
- 19 following:
- 20 + REV_REQCH_QUICK_REPEAT_ALLOWED_s to
- 21 REV_REQCH_QUICK_REPEAT_ALLOWED_r.
- 22 + REV_REQCH_POWER_REPORTS_PARAMS_INCL_s to
- 23 REV_REQCH_POWER_REPORTS_PARAMS_INCL_r.
- 24 + If REV_REQCH_POWER_REPORTS_PARAMS_INCL_s is equal to '1', the mobile
- 25 station shall store the following:
- 26 ○ REV_REQCH_POWER_HEADROOM_INCREASE_s to
- 27 REV_REQCH_POWER_HEADROOM_INCREASE_r.
- 28 ○ REV_REQCH_POWER_HEADROOM_DECREASE_s to
- 29 REV_REQCH_POWER_HEADROOM_DECREASE_r.
- 30 ○ REV_REQCH_HEADROOM_DURATION_s to
- 31 REV_REQCH_HEADROOM_DURATION_r.
- 32 ○ REV_REQCH_MAX_POWER_UPDATE_DURATION_s to
- 33 REV_REQCH_MAX_POWER_UPDATE_DURATION_r.
- 34 - REV_PDCH_CRC_PARAMS_INCL_s to REV_PDCH_CRC_PARAMS_INCL_r.
- 35 - If REV_PDCH_CRC_PARAMS_INCL_s is equal to '1', the mobile station shall store
- 36 the following:
- 37 + REV_PDCH_INIT_TARGET_TPR_s to REV_PDCH_INIT_TARGET_TPR_r.

- 1 + REV_PDCH_MAX_TARGET_TPR_s to REV_PDCH_MAX_TARGET_TPR_r.
- 2 + REV_PDCH_QUICK_START_THRESH_s to
- 3 REV_PDCH_QUICK_START_THRESH_r.
- 4 + The mobile station shall set ($k = 0$).
- 5 + For $i = 1$ to $(11 \times (\text{REV_PDCH_EP_MAP_LEN}_r + 1))$, if
- 6 REV_PDCH_EP_MAP_r[i]=1, the mobile station shall set:
- 7 o ($k = k+1$),
- 8 o REV_PDCH_STEP_UP_s[i] to (the k^{th} occurrence of
- 9 REV_PDCH_STEP_UP_r)/32, and
- 10 o REV_PDCH_STEP_DOWN_s[i] to (the k^{th} occurrence of
- 11 REV_PDCH_STEP_UP_r)/32.
- 12 - The mobile station shall set ($k = 0$).
- 13 - For $i = 0$ to 6, the mobile station shall perform the following:
- 14 + If REV_PDCH_SR_ID_MAP_r[i]=0, the mobile station shall set
- 15 o REV_PDCH_BOOST_ALLOWED_s[i] to NULL, and
- 16 o REV_PDCH_AUTO_ALLOWED_s[i] to NULL
- 17 + Otherwise, the mobile station shall perform the following:
- 18 o The mobile station shall set ($k = k+1$)
- 19 o REV_PDCH_BOOST_ALLOWED_s[i] to the k^{th} occurrence of
- 20 REV_PDCH_BOOST_ALLOWED_r, and
- 21 o REV_PDCH_AUTO_ALLOWED_s[i] to the k^{th} occurrence of
- 22 REV_PDCH_AUTO_ALLOWED_r
- 23 - If REV_REQCH_PARAMS_INCL_s is equal to '1', for $i = 0$ to 6, if
- 24 REV_PDCH_SR_ID_MAP_r[i]= '0', the mobile station shall set:
- 25 + REV_REQCH_USE_DEFAULT_TAB_s[i] to NULL,
- 26 + REV_PDCH_BUFFER_SIZE_s[i] to NULL,
- 27 + REV_REQCH_BUF_QUANT_PARM_1_s[i] to NULL,
- 28 + REV_REQCH_BUF_QUANT_PARM_2_s[i] to NULL,
- 29 + REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_MIN_DURATION to NULL,
- 30 + REV_PDCH_REQCH_TRIGGER_s[i]. REV_REQCH_USE_POWER_REPORTS to
- 31 NULL,
- 32 + REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_USE_BUFFER_REPORTS to
- 33 NULL,

- 1 + REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_USE_WATERMARKS to
2 NULL,
- 3 - The mobile station shall set (k = 0).
- 4 - If REV_REQCH_PARAMS_INCL_s is equal to '1', the mobile station shall perform
5 the following:
- 6 + For i = 0 to 7, if either of the following conditions is true:
- 7 ○ i < 7, and REV_PDCH_SR_ID_MAP[i]='1', or
- 8 ○ i=7,
- 9 the mobile station shall perform the following:
- 10 ○ The mobile station shall set (k = k+1).
- 11 ○ The mobile station shall set
12 REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_MIN_DURATION to
13 REV_REQCH_MIN_DURATION_r × 16, using the kth occurrence of
14 REV_REQCH_MIN_DURATION_r;
- 15 ○ The mobile station shall set REV_PDCH_REQCH_TRIGGER_s[i].
16 REV_REQCH_USE_POWER_REPORTS to the kth occurrence of
17 REV_REQCH_USE_POWER_REPORTS_r;
- 18 ○ The mobile station shall set
19 REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_USE_BUFFER_REPORT
20 S to the kth occurrence of REV_REQCH_USE_BUFFER_REPORTS_r;
- 21 ○ The mobile station shall set
22 REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_USE_WATERMARKS to
23 the kth occurrence of REV_REQCH_USE_WATERMARKS_r;
- 24 ○ If any of the following conditions are true,
- 25 ◇ REV_PDCH_REQCH_TRIGGER_s[i].
26 REV_REQCH_USE_BUFFER_REPORTS is equal to '1'.
- 27 ◇ REV_PDCH_REQCH_TRIGGER_s[i].
28 REV_REQCH_USE_POWER_REPORTS is equal to '1'.
- 29 ◇ REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_USE_WATERMARKS
30 is equal to '1'.
- 31 The mobile station shall perform the following:
- 32 ◇ The mobile station shall set REV_REQCH_USE_DEFAULT_TAB_s[i] to
33 the kth occurrence of REV_REQCH_USE_DEFAULT_TAB_r.

- 1 ◇ If REV_REQCH_USE_DEFAULT_TAB_s[i] is equal to '000', then, for j =
2 1 to 13, the mobile station shall set REV_PDCH_BUFFER_SIZE_s[i][j]
3 to
4 $2 \times \text{REV_REQCH_BUF_QUANT_PARAM_1}_r \times j^2 +$
5 $\text{REV_REQCH_BUF_QUANT_PARAM_2}_r \times j,$
6 using the kth occurrences of REV_REQCH_BUF_QUANT_PARAM_1_r,
7 and REV_REQCH_BUF_QUANT_PARAM_2_r.
- 8 ◇ If REV_REQCH_USE_DEFAULT_TAB_s[i] is not equal to '000', then, for
9 j = 1 to 13, the mobile station shall set
10 REV_PDCH_BUFFER_SIZE_s[i][j] to the buffer size value specified in
11 the jth row of the buffer size table corresponding to
12 REV_REQCH_USE_DEFAULT_TAB_s[i].
- 13 ○ If REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_USE_WATERMARKS is
14 equal to '1', the mobile station shall store the following:
- 15 ◇ REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_HIGH_WATERMARK
16 to $\text{REV_REQCH_HIGH_WATERMARK_1}_r \times$
17 $8^{\text{REV_REQCH_HIGH_WATERMARK_2}_r},$ using the kth occurrences of
18 REV_REQCH_HIGH_WATERMARK_1_r and
19 REV_REQCH_HIGH_WATERMARK_2_r.
- 20 ◇ REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_LOW_WATERMARK
21 to $\text{REV_REQCH_LOW_WATERMARK_1}_r \times$
22 $8^{\text{REV_REQCH_LOW_WATERMARK_2}_r},$ using the kth occurrences of
23 REV_REQCH_LOW_WATERMARK_1_r and
24 REV_REQCH_LOW_WATERMARK_2_r.
- 25 ◇ REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_CEILING to
26 $\text{REV_REQCH_CEILING_1}_r \times 8^{\text{REV_REQCH_CEILING_2}_r},$
27 using the kth occurrences of REV_REQCH_CEILING_1_r and
28 REV_REQCH_CEILING_2_r.
- 29 ◇ REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_FLOOR_s[i] to
30 $\text{REV_REQCH_FLOOR_1}_r \times 8^{\text{REV_REQCH_FLOOR_2}_r},$
31 using the kth occurrences of REV_REQCH_FLOOR_1_r, and
32 REV_REQCH_FLOOR_2_r.

33 2.6.4.1.14 Processing the Security Mode Command Message

34 The mobile station shall process the received *Security Mode Command Message* as follows:

- 35 • The mobile station shall set D_SIG_ENCRYPT_MODE_s to D_SIG_ENCRYPT_MODE_r.
- 36 • If MSG_INTEGRITY_SUP is set to '0', the mobile station shall perform the following:
- 37 - If D_SIG_ENCRYPT_MODE_r is not equal to '000', the mobile station shall
38 perform the following:
- 39 + Set ENCRYPT_MODE_s to '11'

- 1 + Form a 128-bit pattern by concatenating the CMEAKEY with a copy of itself
2 (the CMEAKEY is associated with the AUTHR of the *Origination Message* or
3 *Page Response Message*, or the CMEAKEY associated with the AUTHU
4 generated during Unique Challenge-Response procedure as described in
5 2.3.12.1.4).
- 6 + Set ENC_KEY[KEY_ID] to the 128-bit pattern.
- 7 + Set TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
8 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to $1 + 256 \times$
9 NEW_SSEQ_H if either of the following conditions is true:
- 10 ○ The NEW_SSEQ_H field is included in the last *Origination Message* or
11 *Page Response Message* and TX_EXT_SSEQ[0][KEY_ID] and
12 TX_EXT_SSEQ[1][KEY_ID] have not been initialized by the last *Channel*
13 *Assignment Message*, *Extended Channel Assignment Message*, or an
14 earlier f-dsch *Security Mode Command Message* (see 2.3.12.4.1.3).
- 15 ○ This message is a response to a *Security Mode Request Message* (see
16 2.3.12.4.1.3) that includes an NEW_SSEQ_H field.
- 17 • If MSG_INTEGRITY_SUP is set to '1' and CHANGE_KEYS_r is set to '1', the mobile
18 station shall perform the following:
- 19 - Set KEY_ID to SDU_KEY_ID provided by the LAC Layer (see [4]).
- 20 - Set ENCRYPT_MODE_s to '11'.
- 21 - If KEY_ID is equal to '00' or '01', the mobile station shall perform the following:
22 + Set TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
23 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to $1 + 256 \times$
24 NEW_SSEQ_H included in the *Origination Message*, *Page Response Message*,
25 or *Security Mode Request Message*).
- 26 + Form a 128-bit pattern by concatenating the CMEAKEY with a copy of itself
27 (the CMEAKEY is associated with the AUTHR of the *Origination Message* or
28 *Page Response Message*, or the CMEAKEY associated with the AUTHU
29 generated during the Unique Challenge-Response procedure as described in
30 2.3.12.1.4).
- 31 + Set ENC_KEY[KEY_ID] to the 128-bit pattern.
- 32 + Set INT_KEY[KEY_ID] to the 128-bit pattern.
- 33 + Set LAST_2G_KEY_ID_s to KEY_ID.
- 34 - If KEY_ID is equal to '10' or '11', the mobile station shall perform the following:
35 + Set TX_EXT_SSEQ[0][KEY_ID][0], TX_EXT_SSEQ[1][KEY_ID],
36 RX_EXT_SSEQ[0][KEY_ID][0], and RX_EXT_SSEQ[1][KEY_ID] to $1 + 256 \times$
37 NEW_SSEQ_H included in the *Authentication Response Message* or *Security*
38 *Mode Request Message*).
- 39 + Set ENC_KEY[KEY_ID] to the latest CK generated by AKA.

- 1 + Set INT_KEY[KEY_ID] to the latest IK generated by AKA.
- 2 + Set LAST_3G_KEY_ID_s to KEY_ID.
- 3 + If the mobile station supports R-UIM, then the mobile shall set USE_UAK_s to
- 4 USE_UAK_r; otherwise, the mobile station shall perform the following:
- 5 ○ Set USE_UAK_s to '0'.
- 6 ○ If USE_UAK_r is equal to '1', then the mobile station shall send a *Mobile*
- 7 *Station Reject Order* with ORDQ equal to '00010100' (UAK not
- 8 supported).
- 9 - Send a *Security Mode Completion Order*.
- 10 • For each of the service option connections specified by the CON_REF field included
- 11 in this message, the mobile station shall set the user information encryption mode
- 12 in the corresponding service option connection record (SO_CON_REC_s[i]) to
- 13 UI_ENCRYPT_MODE_r) (i.e., set SO_CON_REC_s[i].UI_ENCRYPT_MODE to
- 14 UI_ENCRYPT_MODE_r where SO_CON_REC_s[i].CON_REF = CON_REF_r).
- 15 • For each of the service option connections specified by the CON_REF field included
- 16 in this message, at the action time of the message the mobile station shall start
- 17 encrypting user information (e.g., voice and data) using the encryption algorithm
- 18 specified by SO_CON_REC_s[i].UI_ENCRYPT_MODE where
- 19 SO_CON_REC_s[i].CON_REF = CON_REF_r (see Table 3.7.4.5-1).
- 20 • If ENC_KEY_SIZE_r is included, the mobile station shall set ENC_KEY_SIZE_s to
- 21 ENC_KEY_SIZE_r.
- 22 • If ENC_KEY_SIZE_r is included and not set to reserved value and if current key
- 23 strength is greater than the desired key strength specified by ENC_KEY_SIZE_r
- 24 according to table 3.7.4.5-2, mobile station shall perform the key strength reduction
- 25 algorithm procedures to reduce the key strength of ENC_KEY[KEY_ID] according to
- 26 ENC_KEY_SIZE_r as described in 2.3.12.5.4. The current key strength is 64 bit if
- 27 KEY_ID is equal to '00' or '01' and is 128 bit if KEY_ID is equal to '10' or '11'.
- 28 • If C_SIG_ENCRYPT_MODE is included, the mobile station shall set
- 29 C_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_r.

30 2.6.4.1.15 Processing the Handoff Supplementary Information Solicit Message

31 If the mobile station receives a *Handoff Supplementary Information Solicit Message* from the

32 base station, it shall transmit a *Handoff Supplementary Information Notification Message* to

33 the base station. If the mobile station is capable of obtaining Overhead Messages of

34 neighboring sectors while in traffic channel state and if supplementary information for a

35 pilot requested in the *Handoff Supplementary Information Solicit Message* is available, then

36 the mobile station should include the supplementary information for this pilot.

37 2.6.4.2 Traffic Channel Initialization Substate

38 In this substate, the mobile station verifies that it can receive the Forward Traffic Channel

39 and begins transmitting on the Reverse Traffic Channel.

1 If this substate is entered from the *Traffic Channel Substate* of the *Mobile Station Control* on
 2 the *Traffic Channel State* with an Initialization Failure indication, the mobile station shall
 3 perform the procedures as specified in 2.6.4.2.1, and shall not perform any of the
 4 remaining procedures in this section.

5 Otherwise, upon entering the *Traffic Channel Initialization Substate*, the mobile station shall
 6 perform the following:

- 7 • The mobile station shall perform registration initialization as specified in
 8 2.6.5.5.4.1.
- 9 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to reset the
 10 acknowledgment procedures as specified in [4].
- 11 • The mobile station shall initialize Forward Traffic Channel power control as
 12 specified in 2.6.4.1.1.1.
- 13 • The mobile station shall initialize the list TAG_OUTSTANDING_LIST to be empty.
- 14 • If P_REV_IN_USE_s is less than seven, the mobile station shall set CS_SUPPORTED_s
 15 to '0'.
- 16 • If P_REV_IN_USE_s is less than nine, the mobile station shall set
 17 FOR_PDCH_SUPPORTED_s to '0'.
- 18 • The mobile station shall set USE_ERAM_s to '0'.
- 19 • The mobile station shall set the following variables to their initial default values
 20 given below:
 - 21 - If the mobile station had included the FOR_PDCH Capability Type-specific fields
 22 in the *Origination Message* or *Page Response Message*, the mobile station shall
 23 store one plus the value included in the ACK_DELAY field of the message as
 24 ACK_DELAY and the value included in the NUM_ARQ_CHAN field of the
 25 message as NUM_ARQ_CHAN.
 - 26 - Default power control step size
 27 (PWR_CNTL_STEP_s = '000')
 - 28 - Default Reverse Supplemental Channel power offset adjustment relative to
 29 Reverse Pilot Channel power
 30 + RLGAIN_SCH_PILOT_s [0]= '000000'
 - 31 + RLGAIN_SCH_PILOT_s [1]= '000000'
 - 32 - Default Reverse Discontinuous Transmission Duration on Reverse
 33 Supplemental Code Channel (REV_DTX_DURATION_s = '0000')
 - 34 - Default Reverse Discontinuous Transmission Duration on Reverse
 35 Supplemental Channel (REV_SCH_DTX_DURATION_s = '0000')
 - 36 - Default channel on which the mobile station is to perform the primary inner
 37 loop estimation and the base station is to multiplex the Power Control
 38 Subchannel:

- 1 + If CH_IND_S is equal to '01' or if EXT_CH_IND_S indicates that F-FCH is
2 assigned and F-DCCH is not assigned, the mobile station shall set
3 FPC_PRI_CHAN_S to '0'.
- 4 + If CH_IND_S is equal to '10' or if EXT_CH_IND_S indicates that F-DCCH is
5 assigned and F-FCH is not assigned, the mobile station shall set
6 FPC_PRI_CHAN_S to '1'.
- 7 + If EXT_CH_IND_S indicates that neither F-FCH nor F-DCCH is assigned, the
8 mobile station shall set FPC_PRI_CHAN_S to NULL.
- 9 - Default forward power control operation mode used except during the forward
10 Supplemental Channel interval
11 (FPC_MODE_NO_SCH_S = '000')
- 12 - Default forward power control operation mode used during the forward
13 Supplemental Channel interval set as follows:
14 If RC 8 is assigned on the reverse fundamental channel, or RC 11 or RC 12 is
15 assigned on the forward fundamental channel,
16 set (FPC_MODE_SCH_S = '010')
- 17 Otherwise
18 set (FPC_MODE_SCH_S = '000')
- 19 - Default forward power control operation mode
20 (FPC_MODE_S = '000')
- 21 - Slotted timer (T_SLOTTED_S = T_{74m})
- 22 - Reduced slot cycle mode enabled indicator (RSC_MODE_ENABLED = NO).
- 23 - Radio environment reporting mode enabled indicator (RER_MODE_ENABLED =
24 NO).
- 25 - Tracking zone mode enabled indicator (TKZ_MODE_ENABLED = NO).
- 26 - Tracking zone mode pending indicator (TKZ_MODE_PENDING = NO).
- 27 - Default Reverse Pilot Channel gating (PILOT_GATING_USE_RATE='0')
- 28 - Default begin preamble for Reverse Supplemental Code Channels
29 (BEGIN_PREAMBLE_S = '000')
- 30 - Default resume preamble for Reverse Supplemental Code Channels
31 (RESUME_PREAMBLE_S = '000')
- 32 - Default start time for Reverse Supplemental Code Channel assignment
33 (REV_START_TIME_S = NULL)
- 34 - Default retry delays:
- 35 + RETRY_DELAY_S[010] = 0
- 36 + RETRY_DELAY_S[011] = 0

- 1 - Default neighbor pilot strength measurement threshold offset
2 ($T_MULCHAN_S = '000'$)
- 3 - Default start time for forward Supplemental Code Channel Assignment
4 ($FOR_START_TIME_S = NULL$)
- 5 - Default number of Reverse Supplemental Code Channels
6 ($NUM_REV_CODES_S = '000'$)
- 7 - Default reverse use T_ADD abort indicator
8 ($USE_T_ADD_ABORT_S = '0'$)
- 9 - Default *Supplemental Channel Request Message* sequence number
10 ($SCRM_SEQ_NUM_S = NULL$)
- 11 - Default indicator to ignore reverse Supplemental Code Channel assignment
12 ($IGNORE_SCAM_S = '0'$)
- 13 - Default indicator to ignore reverse Supplemental Channel assignment
14 ($IGNORE_ESCAM_S = '0'$)
- 15 - Default search period for the candidate search
16 ($SEARCH_PERIOD_S = '1111'$)
- 17 - Default search window size for the Candidate Frequency Search Set
18 ($CF_SRCH_WIN_N_S = SRCH_WIN_N_S$)
- 19 - Default search window size for the Remaining Set on the CDMA Candidate
20 Frequency ($CF_SRCH_WIN_R_S = SRCH_WIN_R_S$)
- 21 - Default pilot PN sequence offset increment for the CDMA Candidate Frequency
22 ($CF_PILOT_INC_S = PILOT_INC_S$)
- 23 - Default Candidate Frequency search priorities included indicator
24 ($CF_SEARCH_PRIORITY_INCL_S = '0'$)
- 25 - Default Candidate Frequency search window size included indicator
26 ($CF_SRCH_WIN_NGHBR_INCL_S = '0'$)
- 27 - Default Candidate Frequency search window offset included indicator
28 ($CF_SRCH_OFFSET_INCL_S = '0'$)
- 29 - Default periodic search indicator
30 ($PERIODIC_SEARCH_S = '0'$)
- 31 - Default return-if-handoff-fail indicator
32 ($RETURN_IF_HANDOFF_FAIL_S = '0'$)
- 33 - Default total pilot E_C/I_0 threshold
34 ($MIN_TOTAL_PILOT_EC_IO_S = '00000'$)
- 35 - Default total pilot E_C threshold
36 ($SF_TOTAL_EC_THRESH_S = '11111'$)
- 37 - Default total pilot E_C/I_0 threshold
38 ($SF_TOTAL_EC_IO_THRESH_S = '11111'$)

- 1 - Default received power difference threshold
2 (DIFF_RX_PWR_THRESHS = '00000')
- 3 - Default maximum wait time on the CDMA Target Frequency
4 (TF_WAIT_TIMES = '1111')
- 5 - Default Candidate Frequency Search Set
6 (Candidate Frequency Search Set is empty)
- 7 - Default Candidate Frequency CDMA band
8 (CF_CDMABANDS = NULL)
- 9 - Default Candidate Frequency CDMA channel
10 (CF_CDMACHS = NULL)
- 11 - Default indicator for 5ms frames on Fundamental Channel
12 (FCH_5MS_FRAMES_S = '0')
- 13 - Default indicator for 5ms frames on Dedicated Control Channel
14 (DCCH_5MS_FRAMES_S = '0')
- 15 - Default start time unit for Supplemental Channel
16 (START_TIME_UNITS = '000')
- 17 - Default Forward Supplemental Channel FER report indicator
18 (FOR_SCH_FER_REPS = '0')
- 19 - Default Forward Supplemental Channel Configuration parameters:
- 20 + Set the Forward Supplemental Channel frame length
21 FOR_SCH_FRAME_LENGTHS[0] to NULL.
- 22 + Set the Forward Supplemental Channel Multiplex Option FOR_SCH_MUXS[0]
23 to NULL.
- 24 + Set the Forward Supplemental Channel Radio Configuration
25 FOR_SCH_RCS[0] to NULL.
- 26 + Set the Forward Supplemental Channel Coding Type FOR_SCH_CODINGS[0]
27 to NULL.
- 28 + Set QOF_IDS[0][SCCL_INDEXS][i] to NULL, for all integer values of i from 0 to
29 15.
- 30 + Set FOR_SCH_CC_INDEXS [0][SCCL_INDEXS][i] to NULL, for all integer
31 values of i from 0 to 15.
- 32 + Set the Forward Supplemental Channel frame length
33 FOR_SCH_FRAME_LENGTHS[1] to NULL.
- 34 + Set the Forward Supplemental Channel Multiplex Option FOR_SCH_MUXS[1]
35 to NULL.
- 36 + Set the Forward Supplemental Channel Radio Configuration
37 FOR_SCH_RCS[1] to NULL.

- 1 + Set the Forward Supplemental Channel Coding Type FOR_SCH_CODING_s[1]
2 to NULL.
- 3 + Set QOF_ID_s[1][SCCL_INDEX_s][i] to NULL, for all integer values of i from 0 to
4 15.
- 5 + Set FOR_SCH_CC_INDEX_s [1][SCCL_INDEX_s][i] to NULL, for all integer
6 values of i from 0 to 15.
- 7 - Call Origination Transaction Identifier
8 (TAG_s = '0000').
- 9 - Default Reverse Supplemental Channel Configuration parameters:
10 + REV_WALSH_ID_s[0][0000] = 1
11 + REV_WALSH_ID_s[0][0001] = 1
12 + REV_WALSH_ID_s[0][0010] = 1
13 + REV_WALSH_ID_s[0][0011] = 1
14 + REV_WALSH_ID_s[0][0100] = 0
15 + REV_WALSH_ID_s[0][0101] = 0
16 + REV_WALSH_ID_s[0][0110] = 0
17 + REV_WALSH_ID_s[1][0000] = 1
18 + REV_WALSH_ID_s[1][0001] = 1
19 + REV_WALSH_ID_s[1][0010] = 1
20 + REV_WALSH_ID_s[1][0011] = 0
21 + REV_WALSH_ID_s[1][0100] = 0
22 + REV_WALSH_ID_s[1][0101] = 0
23 + REV_WALSH_ID_s[1][0110] = 0
- 24 + Set the Reverse Supplemental Channel frame length
25 REV_SCH_FRAME_LENGTH_s[0] to NULL.
- 26 + Set the Reverse Supplemental Channel Multiplex Option REV_SCH_MUX_s[0]
27 to NULL.
- 28 + Set the Reverse Supplemental Channel Radio Configuration
29 REV_SCH_RC_s[0] to NULL.
- 30 + Set the Reverse Supplemental Channel Coding Type REV_SCH_CODING_s[0]
31 to NULL.
- 32 + Set the Reverse Supplemental Channel frame length
33 REV_SCH_FRAME_LENGTH_s[1] to NULL.
- 34 + Set the Reverse Supplemental Channel Multiplex Option REV_SCH_MUX_s[1]
35 to NULL.

- 1 + Set the Reverse Supplemental Channel Radio Configuration
- 2 REV_SCH_RC_S[1] to NULL.
- 3 + Set the Reverse Supplemental Channel Coding Type REV_SCH_CODING_S[1]
- 4 to NULL.
- 5 • If P_REV_IN_USE_S is greater than six and the ASSIGN_MODE_R field of the *Channel*
- 6 *Assignment Message* or *Extended Channel Assignment Message* is equal to '000' or
- 7 '100', then the mobile station shall initialize the logical to physical mapping table
- 8 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE) according to the requirements in Table
- 9 2.6.4.2-1:

10

11 **Table 2.6.4.2-1. Default Logical to Physical Mapping Table, ASSIGN_MODE_R equal to**
 12 **'000' or '100'**

SR_ID	LOGICAL_RESOURCE	PHYSICAL_RESOURCE	FORWARD_FLAG	REVERSE_FLAG	PRIORITY
000	0001	(shall be set according to requirement 2)	1	1	0000
(shall be set according to requirement 1)	0000	(shall be set according to requirement 3)	1	1	0000

13

Where requirement 1 is as follows:

14

- + The SR_ID field shall be set to NULL.

15

Requirement 2 is as follows:

16

- + If CH_IND_S is equal to '01', the PHYSICAL_RESOURCE field shall be set to '0000'.

17

18

- + If CH_IND_S is equal to '10', the PHYSICAL_RESOURCE field shall be set to '0001'.

19

20

- + If CH_IND_S is equal to '11', there shall be two entries in the default LPM table where the PHYSICAL_RESOURCE field shall be set to '0000' and '0001' respectively.

21

22

23

Requirement 3 is as follows:

24

- + If CH_IND_S is equal to '01':

- 1 ○ If the Radio Configuration in use is less than three, the
2 PHYSICAL_RESOURCE field shall be set to '0000'; otherwise, there shall
3 be three entries in the default LPM table where the
4 PHYSICAL_RESOURCE field shall be set to '0000', '0010', and '0011'
5 respectively.
- 6 + If CH_IND_s is equal to '10':
- 7 ○ There shall be three entries in the default LPM table where the
8 PHYSICAL_RESOURCE field shall be set to '0001', '0010', and '0011'
9 respectively.
- 10 + If CH_IND_s is equal to '11':
- 11 ○ There shall be four entries in the default LPM table where the
12 PHYSICAL_RESOURCE field shall be set to '0000', '0001', '0010', and
13 '0011' respectively.
- 14 • If the ASSIGN_MODE_r field of the *Extended Channel Assignment Message* is equal to
15 '101', then the mobile station shall initialize the logical to physical mapping table
16 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE) according to the requirements in Table
17 2.6.4.2-2:

18 **Table 2.6.4.2-2. Default Logical to Physical Mapping Table, ASSIGN_MODE_r equal to**
19 **'101'**

SR_ID	LOGICAL_RESOURCE	PHYSICAL_RESOURCE	FORWARD_FLAG	REVERSE_FLAG	PRIORITY
000	0001	(shall be set according to requirement 2)	(shall be set according to requirement 2)	(shall be set according to requirement 2)	0000
(shall be set according to requirement 1)	0000	(shall be set according to requirement 3)	(shall be set according to requirement 3)	(shall be set according to requirement 3)	0000

20 Where requirement 1 is as follows:

- 21 + The SR_ID field shall be set to NULL.

22 Requirement 2 is as follows:

- 23 + If EXT_CH_IND_s is equal to '00001', then there shall be two entries in the
24 default LPM table where the mobile station shall set:
- 25 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
26 REVERSE_FLAG to '0' for the first entry, and
- 27 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '0', and
28 REVERSE_FLAG to '1' for the second entry.

- 1 + If EXT_CH_IND_s is equal to '00010', then there shall be two entries in the
2 default LPM table where the mobile station shall set:
- 3 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
4 REVERSE_FLAG to '0' for the first entry, and
- 5 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '0', and
6 REVERSE_FLAG to '1' for the second entry.
- 7 + If EXT_CH_IND_s is equal to '00011', then the mobile station shall set
8 PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
9 REVERSE_FLAG to '1'.
- 10 + If EXT_CH_IND_s is equal to '00100', then the mobile station shall set
11 PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '1', and
12 REVERSE_FLAG to '1'.
- 13 + If EXT_CH_IND_s is equal to '00101', then there shall be two entries in the
14 default LPM table where the mobile station shall set:
- 15 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
16 REVERSE_FLAG to '1' for the first entry, and
- 17 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '0', and
18 REVERSE_FLAG to '1' for the second entry.
- 19 + If EXT_CH_IND_s is equal to '00110', then there shall be two entries in the
20 default LPM table where the mobile station shall set:
- 21 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
22 REVERSE_FLAG to '1' for the first entry, and
- 23 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '1', and
24 REVERSE_FLAG to '1' for the second entry.
- 25 + If EXT_CH_IND_s is equal to '01000', then the mobile station shall set
26 PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
27 REVERSE_FLAG to '1'.
- 28 + If EXT_CH_IND_s is equal to '01001', then there shall be two entries in the
29 default LPM table where the mobile station shall set:
- 30 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
31 REVERSE_FLAG to '1' for the first entry, and
- 32 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '0', and
33 REVERSE_FLAG to '1' for the second entry.
- 34 + If EXT_CH_IND_s is equal to '01010', then there shall be two entries in the
35 default LPM table where the mobile station shall set:
- 36 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
37 REVERSE_FLAG to '1' for the first entry, and
- 38 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '0', and
39 REVERSE_FLAG to '1' for the second entry.

- 1 + If EXT_CH_IND_s is equal to '01011', then there shall be two entries in the
2 default LPM table where the mobile station shall set:
- 3 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '0', and
4 REVERSE_FLAG to '1' for the first entry, and
- 5 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
6 REVERSE_FLAG to '1' for the second entry.
- 7 + If EXT_CH_IND_s is equal to '01100', then there shall be two entries in the
8 default LPM table where the mobile station shall set:
- 9 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '0', and
10 REVERSE_FLAG to '1' for the first entry, and
- 11 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '1', and
12 REVERSE_FLAG to '1' for the second entry.
- 13 + If EXT_CH_IND_s is equal to '01101', then there shall be three entries in the
14 default LPM table where the mobile station shall set:
- 15 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '0', and
16 REVERSE_FLAG to '1' for the first entry, and
- 17 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
18 REVERSE_FLAG to '1' for the second entry, and
- 19 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '0', and
20 REVERSE_FLAG to '1' for the third entry.
- 21 + If EXT_CH_IND_s is equal to '01110', then there shall be three entries in the
22 default LPM table where the mobile station shall set:
- 23 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '0', and
24 REVERSE_FLAG to '1' for the first entry, and
- 25 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
26 REVERSE_FLAG to '1' for the second entry, and
- 27 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '1', and
28 REVERSE_FLAG to '1' for the third entry.

29 Requirement 3 is as follows:

- 30 + If EXT_CH_IND_s is equal to '00001', then there shall be four entries in the
31 default LPM table where the mobile station shall set:
- 32 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '0', and
33 REVERSE_FLAG to '1' for the first entry,
- 34 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '0', and
35 REVERSE_FLAG to '1' for the second entry,
- 36 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '0', and
37 REVERSE_FLAG to '1' for the third entry, and

- 1 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
2 REVERSE_FLAG to '0' for the fourth entry.
- 3 + If EXT_CH_IND_s is equal to '00010', then there shall be four entries in the
4 default LPM table where the mobile station shall set:
- 5 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '0', and
6 REVERSE_FLAG to '1' for the first entry,
- 7 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '0', and
8 REVERSE_FLAG to '1' for the second entry,
- 9 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '0', and
10 REVERSE_FLAG to '1' for the third entry, and
- 11 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
12 REVERSE_FLAG to '0' for the fourth entry.
- 13 + If EXT_CH_IND_s is equal to '00011', then there shall be four entries in the
14 default LPM table where the mobile station shall set:
- 15 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
16 REVERSE_FLAG to '1' for the first entry,
- 17 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '1', and
18 REVERSE_FLAG to '1' for the second entry,
- 19 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '1', and
20 REVERSE_FLAG to '1' for the third entry, and
- 21 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
22 REVERSE_FLAG to '0' for the fourth entry.
- 23 + If EXT_CH_IND_s is equal to '00100', then there shall be four entries in the
24 default LPM table where the mobile station shall set:
- 25 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '1', and
26 REVERSE_FLAG to '1' for the first entry,
- 27 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '1', and
28 REVERSE_FLAG to '1' for the second entry,
- 29 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '1', and
30 REVERSE_FLAG to '1' for the third entry, and
- 31 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
32 REVERSE_FLAG to '0' for the fourth entry.
- 33 + If EXT_CH_IND_s is equal to '00101', then there shall be five entries in the
34 default LPM table where the mobile station shall set:
- 35 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
36 REVERSE_FLAG to '1' for the first entry,
- 37 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '0', and
38 REVERSE_FLAG to '1' for the second entry,

- 1 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '1', and
2 REVERSE_FLAG to '1' for the third entry,
- 3 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '1', and
4 REVERSE_FLAG to '1' for the fourth entry, and
- 5 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
6 REVERSE_FLAG to '0' for the fifth entry.
- 7 + If EXT_CH_IND_s is equal to '00110', then there shall be five entries in the
8 default LPM table where the mobile station shall set:
- 9 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
10 REVERSE_FLAG to '1' for the first entry,
- 11 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '1', and
12 REVERSE_FLAG to '1' for the second entry,
- 13 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '1', and
14 REVERSE_FLAG to '1' for the third entry,
- 15 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '1', and
16 REVERSE_FLAG to '1' for the fourth entry, and
- 17 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
18 REVERSE_FLAG to '0' for the fifth entry.
- 19 + If EXT_CH_IND_s is equal to '01000', then there shall be one entry in the
20 default LPM table where the mobile station shall set:
- 21 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
22 REVERSE_FLAG to '1' for the third entry:
- 23 + If EXT_CH_IND_s is equal to '01001', then there shall be two entries in the
24 default LPM table where the mobile station shall set:
- 25 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '0', and
26 REVERSE_FLAG to '1' for the first entry,
- 27 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
28 REVERSE_FLAG to '1' for the fourth entry.
- 29 + If EXT_CH_IND_s is equal to '01010', then there shall be four entries in the
30 default LPM table where the mobile station shall set:
- 31 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '0', and
32 REVERSE_FLAG to '1' for the first entry,
- 33 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
34 REVERSE_FLAG to '1' for the fourth entry.
- 35 + If EXT_CH_IND_s is equal to '01011', then there shall be four entries in the
36 default LPM table where the mobile station shall set:
- 37 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
38 REVERSE_FLAG to '1' for the first entry,

- 1 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '1', and
2 REVERSE_FLAG to '0' for the second entry,
- 3 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '1', and
4 REVERSE_FLAG to '0' for the third entry, and
- 5 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
6 REVERSE_FLAG to '1' for the fourth entry.
- 7 + If EXT_CH_IND_s is equal to '01100', then there shall be four entries in the
8 default LPM table where the mobile station shall set:
- 9 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '1', and
10 REVERSE_FLAG to '1' for the first entry,
- 11 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '1', and
12 REVERSE_FLAG to '0' for the second entry,
- 13 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '1', and
14 REVERSE_FLAG to '0' for the third entry, and
- 15 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
16 REVERSE_FLAG to '1' for the fourth entry.
- 17 + If EXT_CH_IND_s is equal to '01101', then there shall be five entries in the
18 default LPM table where the mobile station shall set:
- 19 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
20 REVERSE_FLAG to '1' for the first entry,
- 21 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '0', and
22 REVERSE_FLAG to '1' for the second entry,
- 23 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '1', and
24 REVERSE_FLAG to '0' for the third entry,
- 25 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '1', and
26 REVERSE_FLAG to '0' for the fourth entry, and
- 27 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
28 REVERSE_FLAG to '1' for the fifth entry.
- 29 + If EXT_CH_IND_s is equal to '01110', then there shall be five entries in the
30 default LPM table where the mobile station shall set:
- 31 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
32 REVERSE_FLAG to '1' for the first entry,
- 33 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '1', and
34 REVERSE_FLAG to '1' for the second entry,
- 35 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '1', and
36 REVERSE_FLAG to '0' for the third entry,
- 37 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '1', and
38 REVERSE_FLAG to '0' for the fourth entry, and

- 1 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
2 REVERSE_FLAG to '1' for the fifth entry.
- 3 • If P_REV_IN_USE_s is equal to or less than six, the mobile station shall initialize the
4 logical to physical mapping table (LOGICAL_TO_PHYSICAL_MAPPING_TABLE) as
5 follows:
- 6 - Default number of Logical-to-Physical Mapping entries
7 (NUM_LPM_ENTRIES_s = '0100')
- 8 - Default Table(0) Logical-to-Physical Mapping service reference identifier
9 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].SR_ID_s = '000')
- 10 - Default Table(0) Logical-to-Physical Mapping logical resource identifier
11 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].LOGICAL_RESOURCE_s = '0001')
- 12 - Default Table(0) Logical-to-Physical Mapping physical resource identifier:
13 + If CH_IND_s is equal to '01' or '11', the mobile station shall set
14 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].PHYSICAL_RESOURCE_s to
15 '0000'.
16 + If CH_IND_s is equal to '10', the mobile station shall set
17 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].PHYSICAL_RESOURCE_s to
18 '0001'.
- 19 - Default Table(0) Logical-to-Physical Mapping forward mapping indicator
20 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].FORWARD_FLAG_s = '1')
- 21 - Default Table(0) Logical-to-Physical Mapping reverse mapping indicator
22 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].REVERSE_FLAG_s = '1')
- 23 - Default Table(0) Logical-to-Physical Mapping priority
24 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].PRIORITY_s = '0000')
- 25 - Default Table(1) Logical-to-Physical Mapping service reference identifier
26 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].SR_ID_s = '001')
- 27 - Default Table(1) Logical-to-Physical Mapping logical resource identifier
28 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].LOGICAL_RESOURCE_s = '0000')
- 29 - Default Table(1) Logical-to-Physical Mapping physical resource identifier:
30 + If CH_IND_s is equal to '01' or '11', the mobile station shall set
31 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].PHYSICAL_RESOURCE_s to
32 '0000'.
33 + If CH_IND_s is equal to '10', the mobile station shall set
34 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].PHYSICAL_RESOURCE_s to
35 '0001'.
- 36 - Default Table(1) Logical-to-Physical Mapping forward mapping indicator
37 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].FORWARD_FLAG_s = '1')

- 1 - Default Table(1) Logical-to-Physical Mapping reverse mapping indicator
2 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].REVERSE_FLAG_s = '1')
- 3 - Default Table(1) Logical-to-Physical Mapping priority
4 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].PRIORITY_s = '0000')
- 5 - Default Table(2) Logical-to-Physical Mapping service reference identifier
6 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].SR_ID_s = '001')
- 7 - Default Table(2) Logical-to-Physical Mapping logical resource identifier
8 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].LOGICAL_RESOURCE_s = '0000')
- 9 - Default Table(2) Logical-to-Physical Mapping physical resource identifier
10 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].PHYSICAL_RESOURCE_s to
11 '0010').
- 12 - Default Table(2) Logical-to-Physical Mapping forward mapping indicator
13 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].FORWARD_FLAG_s = '1')
- 14 - Default Table(2) Logical-to-Physical Mapping reverse mapping indicator
15 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].REVERSE_FLAG_s = '1')
- 16 - Default Table(2) Logical-to-Physical Mapping priority
17 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].PRIORITY_s = '0000')
- 18 - Default Table(3) Logical-to-Physical Mapping service reference identifier
19 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].SR_ID_s = '001')
- 20 - Default Table(3) Logical-to-Physical Mapping logical resource identifier
21 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].LOGICAL_RESOURCE_s = '0000')
- 22 - Default Table(3) Logical-to-Physical Mapping physical resource identifier
23 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].PHYSICAL_RESOURCE_s to
24 '0011').
- 25 - Default Table(3) Logical-to-Physical Mapping forward mapping indicator
26 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].FORWARD_FLAG_s = '1')
- 27 - Default Table(3) Logical-to-Physical Mapping reverse mapping indicator
28 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].REVERSE_FLAG_s = '1')
- 29 - Default Table(3) Logical-to-Physical Mapping priority
30 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].PRIORITY_s = '0000')
- 31 • If BCMC_ON_TRAFFIC_SUP_s is set to '1', the mobile station shall set
32 AUTO_REQ_TRAF_ALLOWED_IND_s to '1'.
- 33 • The mobile station shall disable the T_{MS_Slotted} timer, and set SLOTTED_s to YES.
- 34 • The mobile station shall set REV_SPICH_EP_SIZE_s to 5.
- 35 • If FOR_PDCH_PARAMS_INCL_s is equal to '0', the mobile station shall perform the
36 following:
- 37 - The mobile station shall set RLGAIN_ACKCH_PILOT_s to 0.
- 38 - The mobile station shall set RLGAIN_CQICH_PILOT_s to 0.

- 1 • If REV_PDCH_PARMS_INCL_s is equal to '0', the mobile station shall perform the
2 following:
- 3 - The mobile station shall set RLGAIN_SPICH_PILOT_s to 0.
4 - The mobile station shall set RLGAIN_REQCH_PILOT_s to 0.
5 - The mobile station shall set RLGAIN_PDCCH_PILOT_s to 0.
6 - The mobile station shall set REV_PDCH_MAX_AUTO_TPR_s to 8 (1dB).
7 - The mobile station shall set
8 REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_s to 9.
9 - The mobile station shall set REV_PDCH_DEFAULT_PERSISTENCE_s to '0'.
10 - The mobile station shall set REV_PDCH_RESET_PERSISTENCE_s to '0'.
11 - The mobile station shall set REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_s to 3.
12 - The mobile station shall set REV_PDCH_NUM_ARQ_ROUNDS_BOOST_s to 3.
13 - The mobile station shall set REV_PDCH_MSIB_SUPPORTED_s to '0'.
14 - The mobile station shall set REV_PDCH_SOFT_SWITCHING_RESET_IND_s to '0'.
15 - The mobile station shall set REV_PDCH_TABLE_SEL_s to '0'.
16 • The mobile station shall set REV_PDCH_BUFFER_SIZE_s to NULL.
17 • For i = 0 to 7, the mobile station shall set_s to
18 REV_REQCH_BUF_QUANT_PARM_1_s[i] to NULL and
19 REV_REQCH_BUF_QUANT_PARM_2_s[i] to NULL.
20 • The mobile station shall set REV_REQCH_POWER_HEADROOM_INCREASE_s to
21 NULL.
22 • The mobile station shall set REV_REQCH_USE_POWER_REPORTS_s to NULL.
23 • The mobile station shall set REV_REQCH_POWER_HEADROOM_DECREASE_s to
24 NULL.
25 • The mobile station shall set REV_REQCH_HEADROOM_DURATION_s to NULL.
26 • The mobile station shall set REV_REQCH_MAX_POWER_UPDATE_DURATION_s to
27 NULL.
28 • The mobile station shall set REV_PDCH_INIT_TARGET_TPR_s to 0 (0dB).
29 • The mobile station shall set REV_PDCH_MAX_TARGET_TPR_s to 0 (0dB).
30 • The mobile station shall set REV_PDCH_QUICK_START_THRESH_s to 72 (9dB).
31 • The mobile station shall set REV_REQCH_QUICK_REPEAT_ALLOWED_s to NULL.
32 • The mobile station shall set REV_PDCH_GRANT_PRECEDENCE_s to '1'.
33 • The mobile station shall set REV_PDCH_ALWAYS_ACK_FINAL_ROUND_s to '0'.
34 • For i = 1 to (11 × (REV_PDCH_EP_MAP_LEN_r + 1)), the mobile station shall perform
35 the following:

- 1 - If $i \leq 11$, the mobile station shall perform the following:
- 2 + The mobile station shall set $REV_PDCH_STEP_UP_S[i]$ and
- 3 $REV_PDCH_STEP_DOWN_S[i]$ as specified on the i^{th} row of Table 2.6.4.2-3.
- 4 - Otherwise, the mobile station shall set $REV_PDCH_STEP_UP_S[i]$ to 0, and it shall
- 5 set $REV_PDCH_STEP_DOWN_S[i]$ to 0.
- 6 • For $i = 0$ to 6, the mobile station shall perform the following:
- 7 - $REV_PDCH_BOOST_ALLOWED[i]_S$ to '0'.
- 8 - $REV_PDCH_AUTO_ALLOWED[i]_S$ to '1'.
- 9 • The mobile station shall set $REV_REQCH_ENABLED_S$ to '0'.
- 10 • The mobile station shall set $REV_PDCH_REQCH_TRIGGER_S$ to NULL.
- 11 • The mobile station shall set $REV_PDCH_BOOST_OVERSHOOT_S$ to 0.

12 **Table 2.6.4.2-3. Default REV_PDCH_STEP_UP and REV_PDCH_STEP_DOWN tables**

EP_SIZE	REV_PDCH_STEP_UP	REV_PDCH_STEP_DOWN
192	3	0
408	1.75	0.0625
792	0.9375	0.09375
1560	0.5	0.125
3096	0.28125	0.15625
4632	0.15625	0.1875
6168	0.125	0.21875
9240	0.0625	0.28125
12312	0.03125	0.375
15384	0.03125	0.59375
18456	0	0.875

- 13 • The mobile station shall set $USE_CH_CFG_RRM_S$ to '0'.
- 14 • If the $ASSIGN_MODE_R$ field from the *Channel Assignment Message* equals '000', the
- 15 mobile station shall set $SERV_NEG_S$ to disabled.
- 16 • If the $ASSIGN_MODE_R$ field from the *Channel Assignment Message* equals '100', the
- 17 mobile station shall set $SERV_NEG_S$ to enabled.
- 18 • If RC 8 is assigned on the reverse fundamental channel, or RC 11 or RC 12 is
- 19 assigned on the forward fundamental channel, the mobile station shall initialize RC
- 20 parameters as described in section 2.6.16.
- 21 • The mobile station shall determine the service configuration as follows:
- 22 - If $SERV_NEG_S$ equals disabled, the initial service configuration shall include
- 23 Multiplex Option 1 and Radio Configuration 1 for both the Forward and Reverse
- 24 Traffic Channels, and shall include no service option connections.

- 1 - If $SERV_NEG_S$ equals enabled, and if $GRANTED_MODE_S$ equals '00', the initial
2 service configuration shall include the multiplex option and radio configuration
3 for the Forward and Reverse Traffic Channels as specified by
4 $DEFAULT_CONFIG_S$, and shall include no service option connections.
- 5 - If $SERV_NEG_S$ equals enabled and $GRANTED_MODE_S$ equals '01' or '10':
- 6 + If the mobile station enters the *Traffic Channel Initialization Substate* because
7 of receiving the *Channel Assignment Message*, the initial service
8 configuration shall include the default Forward and Reverse Traffic Channel
9 multiplex options and transmission rates corresponding to the service option
10 requested by the mobile station in the *Origination Message*, in the case of a
11 mobile station originated call, or the *Page Response Message*, in the case of
12 a mobile station terminated, and shall include no service option connections.
- 13 + If the mobile station enters the *Traffic Channel Initialization Substate* because
14 of receiving the *Extended Channel Assignment Message*, the initial service
15 configuration shall include the default Forward and Reverse Traffic Channel
16 multiplex options that are derived from the radio configurations
17 corresponding to the Table 3.7.2.3.2.21-7, and shall include no service
18 option connections.
- 19 - If $SERV_NEG_S$ equals enabled and $GRANTED_MODE_S$ equals '11', the mobile
20 station shall begin to use the stored service configuration corresponding to
21 $SYNC_ID_S$ as the current service configuration and shall begin to process
22 Forward and Reverse Traffic Channel frames accordingly. The set of service
23 option connections to be restored are determined as follows:
- 24 + If $SR_ID_RESTORE_S$ equals '111', the mobile station shall restore all the
25 service option connections from the stored service configuration.
- 26 + If $SR_ID_RESTORE_S$ equals '000', the mobile station shall restore the service
27 option connections indicated by $SR_ID_RESTORE_BITMAP_S$ from the stored
28 service configuration.
- 29 + Otherwise, the mobile station shall restore the service option connection
30 corresponding to $SR_ID_RESTORE_S$ from the stored service configuration.
- 31 - If $SERV_NEG_S$ equals disabled, the mobile station shall perform the following:
- 32 + If the call is mobile station originated and the *Origination Message* requests a
33 special service option, the mobile station shall set SO_REQ_S to the special
34 service option number.
- 35 + If the call is mobile station originated and the *Origination Message* does not
36 request a special service option, the mobile station shall set SO_REQ_S to 1
37 (the default service option number).
- 38 + If the call is mobile station terminated, the mobile station shall set SO_REQ_S
39 to the service option number requested in the *Page Response Message*.

40 While in the *Traffic Channel Initialization Substate*, the mobile station shall perform the
41 following:

- 1 • The mobile station shall monitor Forward Traffic Channels associated with one or
2 more pilots in the Active Set.
- 3 • The mobile station shall perform pilot strength measurements as specified in
4 2.6.6.2.2, but shall not send *Pilot Strength Measurement Messages* or *Extended Pilot*
5 *Strength Measurement Messages*.
- 6 • The mobile station shall perform registration timer maintenance as specified in
7 2.6.5.5.4.2.
- 8 • If the bits of TMSI_CODE_{s-p} are not all equal to '1' and if System Time (in 80 ms
9 units) exceeds TMSI_EXP_TIME_{s-p} × 2¹², the mobile station shall set all the bits of
10 TMSI_CODE_{s-p} to '1' within T_{66m} seconds.
- 11 • If the full-TMSI timer expires or has expired, the mobile station shall set all the bits
12 of TMSI_CODE_{s-p} to '1'. The mobile station shall update the registration variables
13 as described in 2.6.5.5.2.5.
- 14 • If the Forward Packet Data Channel is assigned, whenever the mobile station
15 transmitter is disabled, the MS shall set FPDCH_DTX_INDICATOR_s to '1'.
- 16 • If the Forward Packet Data Channel is assigned, whenever the mobile station
17 transmitter is enabled, the mobile station shall perform the following procedures:
- 18 - The MS shall set FPDCH_DTX_INDICATOR_s to '0'.
- 19 - If the mobile station transmitter has been disabled for at least
20 TX_DISABLED_TIMER_s, the mobile station shall send SIG-
21 HandoffPDCH.Indication (handoff_type = ASSIGN) primitive to the MAC layer.

22 If the mobile station does not support the assigned CDMA Channel (see [2]) or all of the
23 assigned Forward Traffic code channels (see [2]), the mobile station shall enter the *System*
24 *Determination Substate* of the *Mobile Station Initialization* State with an error indication (see
25 2.6.1.1).

26 If the mobile station supports the assigned CDMA Channel and the assigned Forward
27 Traffic code channels, the mobile station shall perform the following:

- 28 • The mobile station shall tune to the assigned CDMA Channel.
- 29 • The mobile station shall set its code channel for the assigned Forward Traffic code
30 channel.
- 31 • The mobile station shall set its Forward and Reverse Traffic Channel frame offsets
32 to the assigned frame offset as determined by FRAME_OFFSET_s.
- 33 • The mobile station shall set its Forward and Reverse Traffic Channel long code
34 masks to the public long code mask (see [2]).

35 If all of the following conditions are true:

- 36 • F-CPCCH is assigned, and
37 • EARLY_RL_TRANSMIT_IND_s equals '1',

38 the mobile station shall perform the following:

- 1 • The mobile station shall adjust its transmit power as specified in [2].
- 2 • The mobile station shall transmit the Traffic Channel preamble as specified in [2]
- 3 and Layer 3 shall send an *acquiring dedicated channel* indication to Layer 2 (see [4]).
- 4 • If CH_IND_s equals '00', the mobile station shall commence R-CQICH reporting as
- 5 specified in [2].
- 6 • If the mobile station receives a period of (N_{18m} × 1.25) ms with sufficient signal
- 7 quality on the Forward Common Power Control Subchannel assigned to this mobile
- 8 station within T_{79m} seconds after entering this substate, the mobile station shall
- 9 perform the following additional functions while it remains in the *Traffic Channel*
- 10 *Initialization Substate*:
- 11 - The mobile station shall perform Forward Traffic Channel supervision as
- 12 specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the
- 13 mobile station shall enter the *System Determination Substate* of the *Mobile*
- 14 *Station Initialization State* with a system lost indication (see 2.6.1.1).
- 15 - The mobile station shall process Forward Traffic Channel signaling traffic and
- 16 shall discard other types of Forward Traffic Channel traffic.
- 17 • If the mobile station does not receive a period of (N_{18m} × 1.25) ms with sufficient
- 18 signal quality on the Forward Common Power Control Subchannel assigned to this
- 19 mobile station within T_{79m} seconds after entering this substate, the mobile station
- 20 shall perform the following:
- 21 - The mobile station shall disable its transmitter.
- 22 - The mobile station shall discard any messages queued for transmission, and
- 23 those messages received and pending processing.
- 24 - The mobile station shall remain in this substate and perform the procedures
- 25 below.

26 If all of the following conditions are true:

- 27 • F-CPCCH is assigned, and
- 28 • EARLY_RL_TRANSMIT_IND_s equals '0', or EARLY_RL_TRANSMIT_IND_s equals '1'
- 29 and the T_{79m} timer has expired,.

30 the mobile station shall perform the following:

- 31 • If the mobile station receives a period of (N_{18m} × 1.25) ms with sufficient signal
- 32 quality on the Forward Common Power Control Subchannel assigned to this mobile
- 33 station within T_{50m} seconds after entering this substate, the mobile station shall
- 34 perform the following additional functions while it remains in the *Traffic Channel*
- 35 *Initialization Substate*:
- 36 - The mobile station shall perform Forward Traffic Channel supervision as
- 37 specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the
- 38 mobile station shall enter the *System Determination Substate* of the *Mobile*
- 39 *Station Initialization State* with a system lost indication (see 2.6.1.1).

- 1 - The mobile station shall adjust its transmit power as specified in [2].
- 2 - The mobile station shall transmit the Traffic Channel preamble as specified in
3 [2], and Layer 3 shall send an *acquiring dedicated channel* indication to Layer 2
4 (see [4]).
- 5 - If CH_IND_s equals '00', the mobile station shall commence R-CQICH reporting
6 as specified in [2].
- 7 - The mobile station shall process Forward Traffic Channel signaling traffic and
8 shall discard other types of Forward Traffic Channel traffic.
- 9 - If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating
10 an acknowledgment failure, the mobile station shall perform the following:
- 11 + If the Direct Channel Assignment call setup procedure was used and
12 DIRECT_CH_ASSIGN_RECOVER_IND_s is set to '1', the mobile station shall
13 perform the following:
- 14 ○ If any of the following conditions is met:
- 15 ◇ The mobile station is able to select the last pilot mobile station was
16 monitoring before entering *Mobile Station Control on the Traffic*
17 *Channel State* and the pilot has sufficient signal strength, or
- 18 ◇ The mobile station is able to select a pilot with sufficient signal
19 strength that is listed in NGHBR_REC_LIST, the ACCESS_ENTRY_HO
20 field of the NGHBR_REC corresponding to the selected pilot is equal
21 to '1' and the mobile station has sufficient information to monitor
22 BCCH or PCH from base station corresponding to the selected pilot.
- 23 Then the mobile station shall enter the Update Overhead Information
24 Substate of the System Access State with a direct channel assignment
25 failure indication on the selected pilot.
- 26 ○ Otherwise, the mobile station shall enter the System Determination
27 Substate of the Mobile Station Initialization State with a system lost
28 indication (see 2.6.1.1).
- 29 + Otherwise, the mobile station shall disable its transmitter and enter the
30 *System Determination Substate* of the *Mobile Station Initialization State* with a
31 system lost indication (see 2.6.1.1).
- 32 • If the mobile station does not receive a period of ($N_{18m} \times 1.25$) ms with sufficient
33 signal quality on the Forward Common Power Control Subchannel assigned to this
34 mobile station within T_{50m} seconds after entering this substate, the mobile station
35 shall perform the following:
- 36 • If the Direct Channel Assignment call setup procedure was used and
37 DIRECT_CH_ASSIGN_RECOVER_IND_s is set to '1', the mobile station shall perform
38 the following:
- 39 - If any of the following conditions is met:

- 1 + The mobile station is able to select the last pilot mobile station was
2 monitoring before entering *Mobile Station Control on the Traffic Channel State*
3 and the pilot has sufficient signal strength, or
- 4 + The mobile station is able to select a pilot with sufficient signal strength that
5 is listed in NGHBR_REC_LIST, and the ACCESS_ENTRY_HO field of the
6 NGHBR_REC corresponding to the selected pilot is equal to '1' and the
7 mobile station has sufficient information to monitor BCCH or PCH from base
8 station corresponding to the selected pilot.

9 Then the mobile station shall enter the *Update Overhead Information Substate* of
10 the *System Access State* with a direct channel assignment failure indication on
11 the selected pilot.

- 12 - Otherwise, the mobile station shall enter the *System Determination Substate* of
13 the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).
- 14 • Otherwise, the mobile station shall enter the *System Determination Substate* of the
15 *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

16 If all of the following conditions are true:

- 17 • F-CPCCH is not assigned, and
- 18 • EARLY_RL_TRANSMIT_IND_S equals '1' and
- 19 • the mobile station is capable of early reverse link transmission,

20 the mobile station shall perform the following:

- 21 • The mobile station shall adjust its transmit power as specified in [2].
- 22 • The mobile station shall transmit the Traffic Channel preamble as specified in [2],
23 and Layer 3 shall send an acquiring dedicated channel indication to Layer 2 (see
24 [4]).
- 25 • If CH_INDs equals '00', the mobile station shall commence R-CQICH reporting as
26 specified in [2].
- 27 • If the mobile station receives a period of ($N_{5m} \times 20$) ms with sufficient signal quality
28 on the physical channel corresponding to FPC_PRI_CHAN_S within T_{79m} seconds
29 after entering this substate, the mobile station shall perform the following additional
30 functions while it remains in the *Traffic Channel Initialization Substate*:
 - 31 - The mobile station shall perform Forward Traffic Channel supervision as
32 specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the
33 mobile station shall enter the *System Determination Substate* of the *Mobile*
34 *Station Initialization State* with a system lost indication (see 2.6.1.1).
 - 35 - The mobile station shall process Forward Traffic Channel signaling traffic and
36 shall discard other types of Forward Traffic Channel traffic.
- 37 • If the mobile station does not receive a period of ($N_{5m} \times 20$) ms with sufficient signal
38 quality on the physical channel corresponding to FPC_PRI_CHAN_S within T_{79m}
39 seconds after entering this substate, the mobile station shall perform the following:

- 1 - The mobile station shall disable its transmitter.
- 2 - The mobile station shall discard any messages queued for transmission, and
- 3 those messages received and pending processing.
- 4 - The mobile station shall remain in this substate and perform the procedures
- 5 below.

6 If all of the following conditions are true:

- 7 • F-CPCCH is not assigned, and
- 8 • EARLY_RL_TRANSMIT_IND_s equals '0', or EARLY_RL_TRANSMIT_IND_s equals '1'
- 9 and the T_{79m} timer has expired,

10 the mobile station shall perform the following:

- 11 • If the mobile station receives a period of (N_{5m} × 20) ms with sufficient signal quality
- 12 on the physical channel corresponding to FPC_PRI_CHAN_s within T_{50m} seconds
- 13 after entering this substate, the mobile station shall perform the following additional
- 14 functions while it remains in the *Traffic Channel Initialization Substate*:
 - 15 - The mobile station shall perform Forward Traffic Channel supervision as
 - 16 specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the
 - 17 mobile station shall enter the *System Determination Substate* of the *Mobile*
 - 18 *Station Initialization State* with a system lost indication (see 2.6.1.1).
 - 19 - The mobile station shall adjust its transmit power as specified in [2].
 - 20 - The mobile station shall transmit the Traffic Channel preamble as specified in
 - 21 [2], and Layer 3 shall send an *acquiring dedicated channel* indication to Layer 2
 - 22 (see [4]).
 - 23 - If CH_IND_s equals '00', the mobile station shall commence R-CQICH reporting
 - 24 as specified in [2].
 - 25 - The mobile station shall process Forward Traffic Channel signaling traffic and
 - 26 shall discard other types of Forward Traffic Channel traffic.
 - 27 - If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating
 - 28 an acknowledgment failure, the mobile station shall perform the following:
 - 29 + If the Direct Channel Assignment call setup procedure was used and
 - 30 DIRECT_CH_ASSIGN_RECOVER_IND_s is set to '1', the mobile station shall
 - 31 perform the following:
 - 32 ○ If any of the following conditions is met:
 - 33 ◇ The mobile station is able to select the last pilot mobile station was
 - 34 monitoring before entering *Mobile Station Control on the Traffic*
 - 35 *Channel State* and the pilot has sufficient signal strength, or

- 1 ◇ The mobile station is able to select a pilot with sufficient signal
2 strength that is listed in NGHBR_REC_LIST, and the
3 ACCESS_ENTRY_HO field of the NGHBR_REC corresponding to the
4 selected pilot is equal to '1' and the mobile station has sufficient
5 information to monitor BCCH or PCH from base station
6 corresponding to the selected pilot.

7 Then the mobile station shall enter the *Update Overhead Information*
8 *Substate* of the *System Access State* with a direct channel assignment
9 failure indication on the selected pilot.

- 10 ○ Otherwise, the mobile station shall enter the *System Determination*
11 *Substate* of the *Mobile Station Initialization State* with a system lost
12 indication (see 2.6.1.1).

- 13 + Otherwise, the mobile station shall disable its transmitter and enter the
14 *System Determination Substate* of the *Mobile Station Initialization State* with a
15 system lost indication (see 2.6.1.1).

- 16 • If the mobile station does not receive a period of $(N_{5m} \times 20)$ ms with sufficient
17 signal quality on the physical channel corresponding to FPC_PRI_CHAN_s within
18 T_{50m} seconds after entering this substate, the mobile station shall perform the
19 following:

- 20 • If the Direct Channel Assignment call setup procedure was used and
21 DIRECT_CH_ASSIGN_RECOVER_IND_s is set to '1', the mobile station shall perform
22 the following:

- 23 - If all of the following conditions are met:

- 24 + The mobile station is able to select the last pilot mobile station was
25 monitoring before entering *Mobile Station Control on the Traffic Channel State*
26 and the pilot has sufficient signal strength, or

- 27 + The mobile station is able to select a pilot with sufficient signal strength that
28 is listed in NGHBR_REC_LIST, and the ACCESS_ENTRY_HO field of the
29 NGHBR_REC corresponding to the selected pilot is equal to '1' and the
30 mobile station has sufficient information to monitor BCCH or PCH from base
31 station corresponding to the selected pilot.

32 Then the mobile station shall enter the *Update Overhead Information*
33 *Substate* of the *System Access State* with a direct channel assignment failure
34 indication on the selected pilot.

- 35 - Otherwise, the mobile station shall enter the *System Determination Substate* of
36 the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

- 37 • Otherwise, the mobile station shall enter the *System Determination Substate* of the
38 *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

39 The mobile station shall then perform the procedures specified in 2.6.4.2.2.

1 2.6.4.2.1 Return to Traffic Channel Initialization Substate with Initialization Failure
2 Indication

3 If F-CPCCH is assigned, the mobile station shall perform the following:

- 4 • The mobile station shall perform the following functions while it remains in the
5 *Traffic Channel Initialization Substate*:
 - 6 - The mobile station shall perform Forward Traffic Channel supervision as
7 specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the
8 mobile station shall enter the *System Determination Substate* of the *Mobile*
9 *Station Initialization State* with a system lost indication (see 2.6.1.1).
 - 10 - The mobile station shall continue transmitting the Traffic Channel preamble as
11 specified in [2], the mobile station shall continue R-CQICH reporting as specified
12 in [2], and Layer 3 shall send an *acquiring dedicated channel* indication to Layer
13 2 (see [4]).
 - 14 - The mobile station shall process Forward Traffic Channel signaling traffic and
15 shall discard other types of Forward Traffic Channel traffic.
 - 16 - If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating
17 an acknowledgment failure, the mobile station shall perform the following:
 - 18 + If the Direct Channel Assignment call setup procedure was used and
19 DIRECT_CH_ASSIGN_RECOVER_IND_s is set to '1', the mobile station shall
20 perform the following:
 - 21 ○ If any of the following conditions is met:
 - 22 ◇ The mobile station is able to select the last pilot mobile station was
23 monitoring before entering *Mobile Station Control on the Traffic*
24 *Channel State* and the pilot has sufficient signal strength, or
 - 25 ◇ The mobile station is able to select a pilot with sufficient signal
26 strength that is listed in NGHBR_REC_LIST, and the
27 ACCESS_ENTRY_HO field of the NGHBR_REC corresponding to the
28 selected pilot is equal to '1' and the mobile station has sufficient
29 information to monitor BCCH or PCH from base station
30 corresponding to the selected pilot.
 - 31 Then the mobile station shall enter the *Update Overhead Information*
32 *Substate* of the *System Access State* with a direct channel assignment
33 failure indication on the selected pilot.
 - 34 ○ Otherwise, the mobile station shall enter the *System Determination*
35 *Substate* of the *Mobile Station Initialization State* with a system lost
36 indication (see 2.6.1.1).
 - 37 + Otherwise, the mobile station shall disable its transmitter and enter the
38 *System Determination Substate* of the *Mobile Station Initialization State* with a
39 system lost indication (see 2.6.1.1).

40 If F-CPCCH is not assigned, the mobile station shall perform the following:

- 1 • The mobile station shall perform the following functions while it remains in the
2 *Traffic Channel Initialization Substate*:
- 3 - The mobile station shall perform Forward Traffic Channel supervision as
4 specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the
5 mobile station shall enter the *System Determination Substate* of the *Mobile*
6 *Station Initialization State* with a system lost indication (see 2.6.1.1).
- 7 - The mobile station shall continue transmitting the Traffic Channel preamble as
8 specified in [2], and Layer 3 shall send an *acquiring dedicated channel* indication
9 to Layer 2 (see [4]). Furthermore, if CH_IND_s equals '00', the mobile station
10 shall continue R-CQICH reporting as specified in [2].
- 11 - The mobile station shall process Forward Traffic Channel signaling traffic and
12 shall discard other types of Forward Traffic Channel traffic.
- 13 - If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating
14 an acknowledgment failure, the mobile station shall perform the following:
- 15 + If the Direct Channel Assignment call setup procedure was used and
16 DIRECT_CH_ASSIGN_RECOVER_IND_s is set to '1', the mobile station shall
17 perform the following:
- 18 ○ If any of the following conditions is met:
- 19 ◇ The mobile station is able to select the last pilot mobile station was
20 monitoring before entering *Mobile Station Control on the Traffic*
21 *Channel State* and the pilot has sufficient signal strength, or
- 22 ◇ The mobile station is able to select a pilot with sufficient signal
23 strength that is listed in NGHBR_REC_LIST, and the
24 ACCESS_ENTRY_HO field of the NGHBR_REC corresponding to the
25 selected pilot is equal to '1' and the mobile station has sufficient
26 information to monitor BCCH or PCH from base station
27 corresponding to the selected pilot.
- 28 Then the mobile station shall enter the *Update Overhead Information*
29 *Substate* of the *System Access State* with a direct channel assignment
30 failure indication on the selected pilot.
- 31 ○ Otherwise, the mobile station shall enter the *System Determination*
32 *Substate* of the *Mobile Station Initialization State* with a system lost
33 indication (see 2.6.1.1).
- 34 + Otherwise, the mobile station shall disable its transmitter and enter the
35 *System Determination Substate* of the *Mobile Station Initialization State* with a
36 system lost indication (see 2.6.1.1).

37 The mobile station shall then perform the procedures specified in 2.6.4.2.2.

2.6.4.2.2 Exiting the Traffic Channel Initialization Substate

The mobile station should provide diversity combining of the Forward Fundicated Channels associated with pilots in the Active Set if the mobile station receives multiple pilots in the *Extended Channel Assignment Message*.

If Layer 3 does not receive a *forward dedicated channel acquired* indication from Layer 2 (see [4]) within T_{51m} seconds after the transmitter was last enabled, the mobile station shall perform the following:

- If the Direct Channel Assignment call setup procedure was used and $DIRECT_CH_ASSIGN_RECOVER_IND_S$ is set to '1', the mobile station shall perform the following:
 - If any of the following conditions is met:
 - + The mobile station is able to select the last pilot mobile station was monitoring before entering *Mobile Station Control on the Traffic Channel State* and the pilot has sufficient signal strength, or
 - + The mobile station is able to select a pilot with sufficient signal strength that is listed in $NGHBR_REC_LIST$, and the $ACCESS_ENTRY_HO$ field of the $NGHBR_REC$ corresponding to the selected pilot is equal to '1' and the mobile station has sufficient information to monitor BCCH or PCH from base station corresponding to the selected pilot.

Then the mobile station shall enter the *Update Overhead Information Substate* of the *System Access State* with a direct channel assignment failure indication on the selected pilot.

- Otherwise, the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).
- Otherwise, the mobile station shall disable its transmitter and enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

After the first occurrence of receiving a period of $(N_{5m} \times 20)$ ms with sufficient signal quality on the physical channel corresponding to $FPC_PRI_CHAN_S$ or a period of $(N_{18m} \times 1.25)$ ms with sufficient signal quality on the Forward Common Power Control Subchannel assigned to this mobile station, if one of the following conditions is met:

- Layer 3 has received a *forward dedicated channel acquired* indication from Layer 2 within T_{51m} seconds after the transmitter was last enabled, or
- The mobile station supports transmission of fixed Traffic Channel preamble, and $FIXED_PREAMBLE_TRANSMIT_IND_S$ equals '1', and the mobile station has transmitted the Traffic Channel preamble for the duration corresponding to $FIXED_NUM_PREAMBLE_S$ as specified by the Table 3.7.2.3.2.21-13

the mobile station shall perform the following:

- If CH_IND_S is equal to '01', the mobile station shall begin transmitting on the Reverse Fundamental Channel.

- 1 • If CH_IND_s is equal to '11' and FUNDICATED_BCNC_IND_s equals '0', or if CH_IND_s
2 is equal to '11' and FUNDICATED_BCNC_IND_s equals '1' and
3 REV_FCH_ASSIGNED_s is equal to '1', the mobile station shall begin transmitting on
4 the Reverse Fundamental Channel.
- 5 • If CH_IND_s is equal to '10' or '11', the mobile station shall begin transmitting on the
6 Reverse Dedicated Control Channel when the mobile station has user data or
7 signaling traffic to send on the Reverse Dedicated Control Channel.
- 8 • If CH_IND_s equals '00', the mobile station shall perform the following:
- 9 - If EXT_CH_IND_s signals the allocation of a R-FCH, the mobile station shall
10 begin transmitting on the Reverse Fundamental Channel.
- 11 - If EXT_CH_IND_s signals the allocation of a R-DCCH, the mobile station shall
12 begin transmitting on the Reverse Dedicated Control Channel when the mobile
13 station has user data or signaling traffic to send on the Reverse Dedicated
14 Control Channel.
- 15 - If EXT_CH_IND_s signals the allocation of a R-PDCH, the mobile station shall
16 begin transmitting on the Reverse Packet Data Channel when the mobile station
17 has user data or signaling traffic to send on the Reverse Packet Data Channel.
- 18 • If SERV_NEG_s equals disabled, the mobile station shall activate the *SO Negotiation*
19 *Subfunction*.
- 20 • If SERV_NEG_s equals enabled and the GRANTED_MODE_s is '00', '01', or '11', the
21 mobile station shall activate the *Normal Service Subfunction*.
- 22 • If SERV_NEG_s equals enabled and the GRANTED_MODE_s is '10', the mobile station
23 shall activate the *Waiting for Service Connect Message Subfunction*.
- 24 • The mobile station shall perform the following:
- 25 - If SERV_NEG_s equals enabled and GRANTED_MODE_s is equal to '11', the
26 mobile station shall perform the following:
- 27 + The mobile station shall restore the stored service configuration as specified
28 in 2.6.4.1.2.2.5.2.
- 29 + For the first service option connection (with corresponding connection
30 reference CON_REF_j) listed in this stored Service Configuration information
31 record, Layer 3 shall instantiate a Call Control instance (as specified in
32 2.6.10) with the received BYPASS_ALERT_ANSWER_s. The mobile station
33 shall identify this Call Control instance by the corresponding CON_REF_j and
34 also identify this Call Control instance by the NULL identifier.

- 1 + For each of the remaining service option connection (with corresponding
2 connection reference CON_REF_i) that will be restored from the stored service
3 configuration record, Layer 3 shall instantiate a Call Control instance (as
4 specified in 2.6.10) with a 'restore indication'. The mobile station shall
5 identify each of these Call Control instances by the corresponding
6 CON_REF_i.
- 7 + The mobile station shall store the synchronization identifier corresponding to
8 the restored service configuration as SYNC_ID_S.
- 9 - Otherwise, the mobile station shall perform the following:
- 10 + If the BCRC_ORIG_ONLY_IND field is not included or is included and set to
11 '0' in the *Origination Message*, *Page Response Message*, or *Reconnect*
12 *Message*, the Layer 3 shall instantiate a Call Control instance (as specified in
13 2.6.10) for each service instance being initiated.
- 14 + The Layer 3 shall assign a default identifier of NULL to the Call Control
15 instance corresponding to the SR_ID field of the *Origination Message*, *Page*
16 *Response Message*, or *Reconnect Message*.
- 17 + If P_REV_IN_USE_S is greater than or equal to 11, the mobile station shall set
18 a call control timer to a value of T_{42m} seconds.
- 19 • The Layer 3 shall enter the *Traffic Channel Substate*.

20 2.6.4.3 Traffic Channel Substate

21 In this substate, the mobile station may exchange Traffic Channel frames with the base
22 station in accordance with the current service configuration. The mobile station may
23 perform the gating operation of Reverse Pilot Channel.

24 The mobile station can be in the *Active Mode* or *Control Hold Mode* while in this substate.

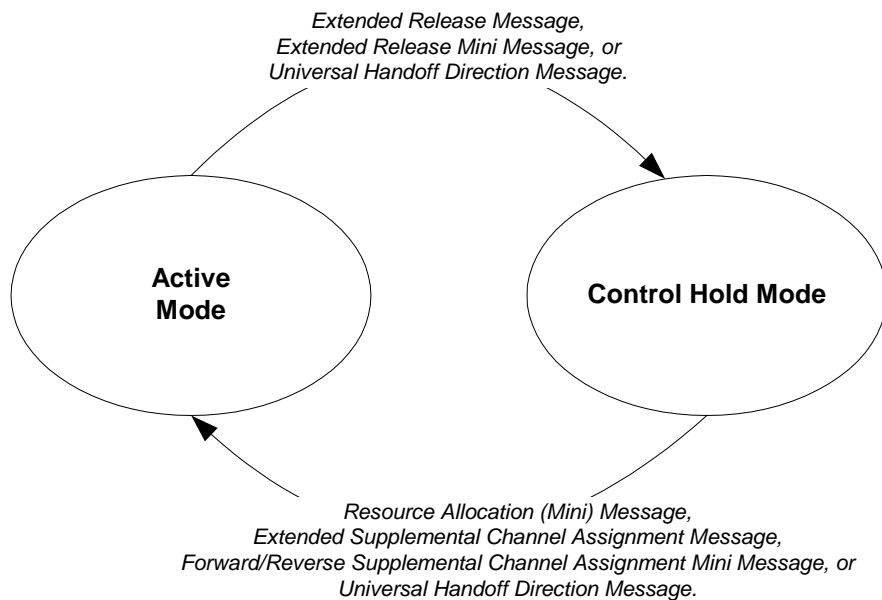

25 The following are the attributes when the mobile station is in the *Active Mode* of *Traffic*
26 *Channel Substate*:

- 27 • PILOT_GATING_USE_RATE is set to '0' (i.e., the reverse pilot (r-pich) is not gated).
28 • Flow of data traffic is permitted by the Multiplex Sublayer.

29 The following are the attributes when the mobile station is in the *Control Hold Mode* of
30 *Traffic Channel Substate*:

- 31 • PILOT_GATING_USE_RATE is set to '1'.
32 • The reverse pilot (r-pich) may be gated (if PILOT_GATING_RATE_S is not equal to
33 '00').
34 • If a Forward Packet Data Channel is not assigned, then the flow of data traffic is
35 blocked by the Multiplex Sublayer.
36 • If a Forward Packet Data Channel is assigned, then the flow of both data traffic and
37 signaling traffic is blocked by the Multiplex Sublayer.

- 1 Figure 2.6.4.3-1 shows the valid transitions between the modes of a *Traffic Channel Substate* when a F-PDCH is not assigned in Control Hold Mode and the over-the-air Upper
- 2 Layer Signaling Messages that trigger transitions between these modes.
- 3

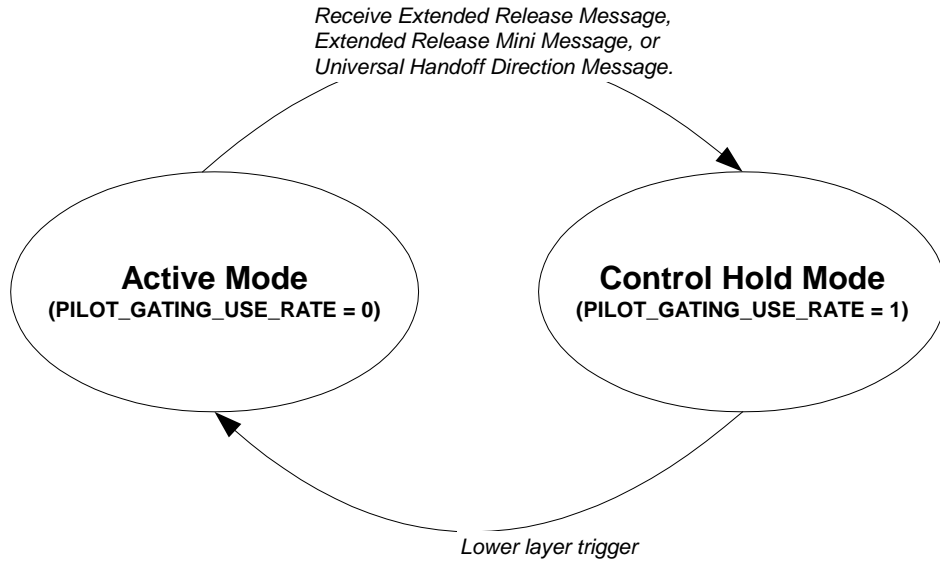

Note: The mode transition occurs when the fields are set appropriately

4

5 **Figure 2.6.4.3-1. Mobile Station Modes When a F-PDCH is not Assigned in Control**

6 **Hold Mode**

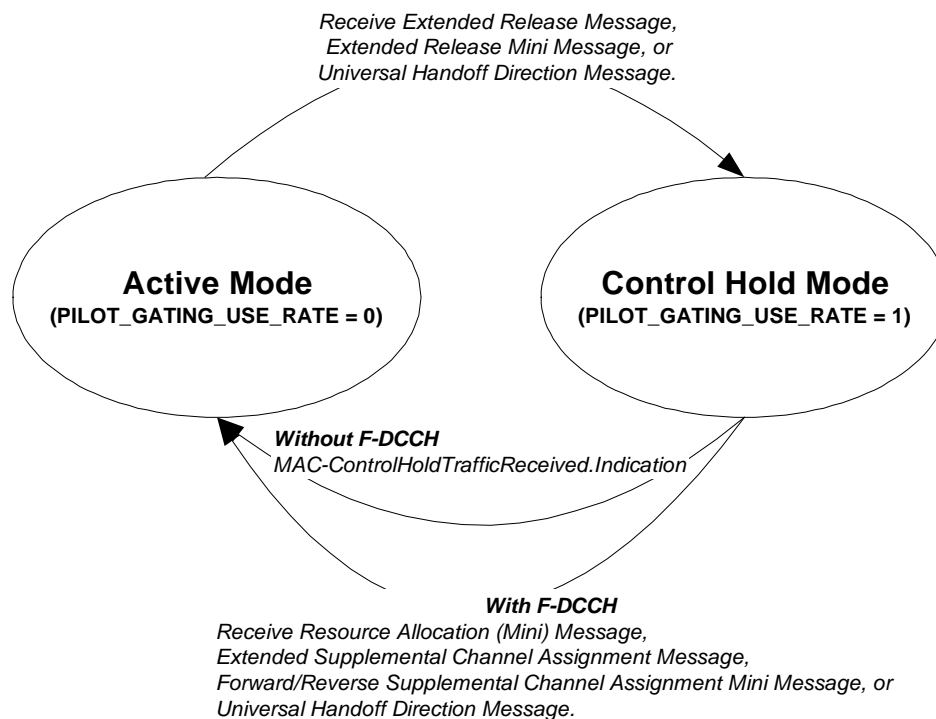

- 7 Figures 2.6.4.3-2 and 2.6.4.3-3 show the valid transitions between the modes of a *Traffic*
- 8 *Channel Substate* when a F-PDCH is assigned in Control Hold Mode and the triggers that
- 9 cause transitions between these modes.

Note: The mode transition occurs when the fields are set appropriately

Figure 2.6.4.3-2. Mobile Station Modes When a F-PDCH is Assigned in Control Hold Mode: Mobile Station Initiated Exit from Control Hold.

Note: The mode transition occurs when the fields are set appropriately

Figure 2.6.4.3-3. Mobile Station Modes when a F-PDCH is Assigned in Control Hold: Base Station Initiated Exit from Control Hold.

Upon entering the *Traffic Channel Substate*, the mobile station shall perform the following:

- If $SERV_NEG_s$ equals enabled, the call is mobile station originated, and $GRANTED_MODE_s$ is equal to '00' or '01', the mobile station should initiate service negotiation to request a service configuration in accordance with the requirements for the active service subfunction (see 2.6.4.1.2.2).

While in the *Traffic Channel Substate*, the mobile station shall perform the following:

- If $FIXED_PREAMBLE_TRANSMIT_IND_s$ equals '1' and Layer 3 does not receive a *forward dedicated channel acquired* indication from Layer 2 (see [4]) within T_{80m} seconds after entering the *Traffic Channel Substate* of the *Mobile Station Control on the Traffic Channel State*, the mobile station shall set $FIXED_PREAMBLE_TRANSMIT_IND_s$ to '0' and re-enter the *Traffic Channel Initialization Substate* of the *Mobile Station Control on the Traffic Channel State* with an Initialization Failure indication.
- If the call control timer expires, the mobile station shall perform the following for each call control instance without associated CON_REF :
 - The mobile station shall terminate the call control instance.
 - The mobile station shall send an indication to the affected service instance indicating that the call control instance has been terminated.

- 1 • The mobile station shall perform Forward Traffic Channel supervision as specified
2 in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the Layer 3 shall
3 terminate all Call Control instances, and shall enter the *System Determination*
4 *Substate* of the *Mobile Station Initialization State* with a system lost indication (see
5 2.6.1.1).
- 6 • The mobile station may send a *Pilot Strength Measurement Mini Message* to report
7 pilot strength order change information, periodic pilot strength information, or
8 threshold based pilot strength information, as specified in the *Mobile Assisted Burst*
9 *Operation Parameters Message* (see 2.6.6.2.5.2).
- 10 • The mobile station shall adjust its transmit power as specified in [2].
- 11 • The mobile station shall perform Forward Traffic Channel power control as specified
12 in 2.6.4.1.1.
- 13 • The mobile station shall perform handoff processing as specified in 2.6.6.
- 14 • The mobile station shall process Forward and Reverse Traffic Channel frames in
15 accordance with requirements for the active service subfunction (see 2.6.4.1.2.2).
- 16 • The mobile station shall perform registration timer maintenance as specified in
17 2.6.5.5.4.2.
- 18 • If the mobile station is directed to send a *Data Burst Message*, the mobile station
19 shall send a *Data Burst Message*. If PILOT_GATING_USE_RATE is set to '1', the
20 mobile station may request to transition to the *Active Mode*
21 (PILOT_GATING_USE_RATE set to '0') prior to sending the *Data Burst Message*.
- 22 • If a Forward Packet Data Channel is not assigned and the mobile station has user
23 data to send and PILOT_GATING_USE_RATE is equal to '1', then the mobile station
24 may send a *Resource Request Message*, *Resource Request Mini Message*,
25 *Supplemental Channel Request Message*, or *Supplemental Channel Request Mini*
26 *Message* to request for continuous reverse pilot transmission and user traffic
27 transmission.
- 28 • When a Forward Packet Data Channel is assigned, PILOT_GATING_USE_RATE is
29 equal to '1', and the mobile station has data or signaling messages to send, the
30 mobile station shall set PILOT_GATING_USE_RATE to '0'.
- 31 • When a Forward Packet Data Channel is assigned, PILOT_GATING_USE_RATE is
32 equal to '1', and the mobile station receives MAC-
33 ControlHoldTrafficReceived.Indication, the mobile station shall set
34 PILOT_GATING_USE_RATE to '0' at the *transition_time* indicated in MAC-
35 ControlHoldTrafficReceived.Indication.
- 36 • If the mobile station receives SIG-RemoveFPDCHLeg.Request(*index*), then, at the
37 first 20 ms boundary (relative to System Time plus FRAME_OFFSET_s × 1.25 ms)
38 occurring at least 20 ms after the reception of this indication, for the specified
39 member of the F-PDCH reduced active set indicated by *index*, where *index* is the
40 index of the member in the F-PDCH reduced active set, the mobile station shall
41 perform the following procedures:

- 1 - the mobile station shall set FOR_PDCH_INCL_s to '0', and remove this pilot from
2 the F-PDCH reduced active set, and
- 3 - if this is the last pilot in the F-PDCH reduced active set, Layer 3 shall send SIG-
4 HandoffPDCH.Indication (handoff_type = ASSIGN) to the MAC layer.
- 5 • If the mobile station is directed by the user to request a new service configuration,
6 the mobile station shall initiate service negotiation or service option negotiation in
7 accordance with the requirements for the active service subfunction (see
8 2.6.4.1.2.2).
- 9 • The mobile station may send a *Service Option Control Message* or *Service Option*
10 *Control Order* to invoke a service option specific function in accordance with the
11 requirements for the active service subfunction (see 2.6.4.1.2.2).
- 12 • If the mobile station is directed by the user to request a private long code transition
13 and has the long code mask (see 2.3.12.3), the mobile station shall send a *Long*
14 *Code Transition Request Order* (ORDQ = '00000001') in assured mode.
- 15 • If the mobile station is directed by the user to request a public long code transition,
16 the mobile station shall send a *Long Code Transition Request Order* (ORDQ =
17 '00000000') in assured mode.
- 18 • If the mobile station supports BCMC operation, it shall perform the procedures as
19 specified in 2.6.13.
- 20 • If the mobile station is directed by the user to originate a call or if the mobile station
21 is to monitor BCMC on traffic channel, the mobile station shall perform the
22 following:
- 23 - If this is an emergency call origination, the mobile station shall perform the
24 following:
- 25 + If it can be indicated to the base station within an existing Call Control
26 instance, the mobile station shall send an indication to this Call Control
27 instance that the user has originated an emergency call.
- 28 + Otherwise, the mobile station shall perform the following:
- 29 ○ For each service instance being initiated in the *Enhanced Origination*
30 *Message*, the mobile station shall perform the following:
- 31 ◇ increment the stored value of TAG_s to the next unused integer value,
32 ◇ add TAG_s to the list TAG_OUTSTANDING_LIST,
33 ◇ associate the TAG_s value to the corresponding service instance. and
34 ◇ set an enhanced origination timer associated with TAG_s to a value of
35 T_{42m} seconds.
- 36 ○ The mobile station shall send an *Enhanced Origination Message* to the
37 base station, with the TAG or ADD_TAG field of each call included in the
38 message set to its associated TAG_s.

- 1 ○ Upon sending the *Enhanced Origination Message* and prior to receiving a
2 Layer 3 response from the base station, if the mobile station is directed
3 by the user to cancel this call, the mobile station shall perform the
4 following:
- 5 ◇ The mobile station shall send a *Call Cancel Message* to the base
6 station, with each TAG or ADD_TAG field included in the message set
7 to the TAG value in the list TAG_OUTSTANDING_LIST corresponding
8 to the call(s) being cancelled.
- 9 ◇ The mobile station shall remove the TAG field corresponding to each
10 call being cancelled from the list TAG_OUTSTANDING_LIST.
- 11 + If the enhanced origination timer expires, the mobile station shall remove
12 the associated TAG field corresponding to this call from
13 TAG_OUTSTANDING_LIST.
- 14 - Otherwise, the mobile station shall perform the following:
- 15 + If this is a packet data call origination⁶¹, the mobile station shall first
16 determine the following conditions:
- 17 ○ If RETRY_DELAY_s[001] is not 0, the mobile station shall not send the
18 *Enhanced Origination Message* until after the system time stored in
19 RETRY_DELAY_s[001].
- 20 ○ If RETRY_DELAY_s[101] is not 0, the mobile station shall not send the
21 *Enhanced Origination Message* until after the system time stored in
22 RETRY_DELAY_s[101].
- 23 + If this contains BCMC origination, the mobile station shall determine the
24 following conditions:
- 25 ○ If BCMC_RETRY_DELAY_LISTs[i].RETRY_DELAY is not zero for the
26 BCMC flow corresponding to
27 BCMC_RETRY_DELAY_LISTs[i].BCMC_FLOW_ID, the mobile station shall
28 not include the BCMC flow (See section 2.6.13.11) in the *Enhanced*
29 *Origination Message* until after the system time stored in
30 BCMC_RETRY_DELAY_LISTs[i].RETRY_DELAY.
- 31 + If the above conditions do not prohibit the mobile station from sending an
32 *Enhanced Origination Message* at this time, the mobile station shall perform
33 the following:

⁶¹ Packet data origination refers to origination with SO 60, SO 61 or any service option in Service Option Group 4 and 5 in ~~39~~[53]

- 1 ○ If P_REV_IN_USE_s is greater than or equal to 11 and the *Enhanced*
2 *Origination Message* is being sent to perform packet data dormant
3 handoff, the mobile station shall include all dormant packet data service
4 instances (see [42]) up to the limit specified by
5 MAX_ADD_SERV_INSTANCE_s.
- 6 ○ For each service instance being initiated in the *Enhanced Origination*
7 *Message*, the mobile station shall perform the following:
- 8 ◇ increment the stored value of TAG_s to the next unused integer value,
9 ◇ add TAG_s to the list TAG_OUTSTANDING_LIST,
10 ◇ associate the TAG_s value to the corresponding service instance, and
11 ◇ set an enhanced origination timer associated with TAG_s to a value of
12 T_{42m} seconds.
- 13 ○ The mobile station shall send an *Enhanced Origination Message* to the
14 base station, with the TAG or ADD_TAG field of each call included in the
15 message set to its associated TAG_s.
- 16 + Upon sending the *Enhanced Origination Message* and prior to receiving a
17 Layer 3 response from the base station, if the mobile station is directed by
18 the user to cancel this call, the mobile station shall perform the following:
- 19 ○ The mobile station shall send a *Call Cancel Message* to the base station,
20 with each TAG or ADD_TAG field included in the message set to the TAG
21 value in the list TAG_OUTSTANDING_LIST corresponding to the call(s)
22 being cancelled.
- 23 ○ The mobile station shall disable the enhanced origination timer and shall
24 remove the TAG field corresponding to each call being cancelled from the
25 list TAG_OUTSTANDING_LIST.
- 26 + If the enhanced origination timer expires, the mobile station shall remove
27 the associated TAG field from TAG_OUTSTANDING_LIST.
- 28 • If the Layer 3 receives a “call release request” from a Call Control instance, Layer 3
29 shall perform the following:
- 30 • If there are no other active or pending calls, the Layer 3 shall enter the *Release*
31 *Substate* with a mobile station release indication (see 2.6.4.4).
- 32 - Otherwise, the mobile station shall perform the following:
- 33 + The mobile station shall send a Service Request Message, Resource Release
34 *Request Message*, or a *Resource Release Request Mini Message* to the base
35 station requesting to release the service option connection.
- 36 + If the mobile station sends a Resource Release Request Message or a
37 *Resource Release Request Mini Message*, it shall set the purge service
38 indicator field to ‘0’.

- 1 • If the Layer 3 receives a request to release a BCMC call [*BCMC-Stop-*
2 *Monitor.Request(BCMC_FLOW_ID)*] from Upper Layer, Layer 3 shall perform the
3 following:
- 4 - If there are no other active or pending calls, the Layer 3 shall enter the *Release*
5 *Substate* with a mobile station release indication (see 2.6.4.4).
- 6 - Otherwise, the mobile station shall send a *Resource Release Request Message* to
7 the base station requesting to release the BCMC flow (See section 2.6.13.11).
- 8 • If the Layer 3 receives a “call inactive indication” from a Call Control instance, Layer
9 3 shall perform the following:
- 10 - If there are no other active or pending calls, the Layer 3 shall enter the *Release*
11 *Substate* with a service inactive indication (see 2.6.4.4).
- 12 - Otherwise, the mobile station shall perform the following:
- 13 + The mobile station shall send a Service Request Message, Resource Release
14 Request Message, or a Resource Release Request Mini Message to the base
15 station requesting to release the service option connection and purge the
16 service.
- 17 + If the mobile station sends a Resource Release Request Message or a
18 Resource Release Request Mini Message, it shall set the purge service
19 indicator field to ‘1’.
- 20 • If the mobile station is directed by the user to power down, the Layer 3 shall send a
21 “release indication” to all Call Control instances, and shall enter the *Release*
22 *Substate* with a power-down indication (see 2.6.4.4).
- 23 • If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating an
24 acknowledgment failure, then:
- 25 - If $RESQ_ENABLED_S$ is equal to ‘1’ and $FPC_PRI_CHAN_S$ is equal to ‘0’, the
26 mobile station shall perform the following:
27 + disable its transmitter, and
28 + enable the rescue delay timer with an initial value of $(RESQ_DELAY_TIME_S \times$
29 80) ms.
- 30 - Otherwise, the layer 3 shall terminate all Call Control instances, and the mobile
31 station shall disable its transmitter and shall enter the *System Determination*
32 *Substate* of the *Mobile Station Initialization State* with a system lost indication (see
33 2.6.1.1).
- 34 • The mobile station shall perform the following:
- 35 - The mobile station may send the *Resource Request Message* or *Resource Request*
36 *Mini Message* in accordance with requirements for the currently connected
37 service option whenever $RETRY_DELAY_S[RETRY_TYPE]$ is equal to 0, where,
38 $RETRY_TYPE$ is equal to ‘010’.

- 1 - The mobile station shall not send the *Resource Request Message* or *Resource*
2 *Request Mini Message* whenever $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ is set to *infinity*,
3 where, RETRY_TYPE is equal to '010'.
- 4 - If USE_CH_CFG_RRM_s is equal to '0', the mobile station shall set CH_IND_INCL
5 to '0' in the *Resource Request Message* and *Resource Request Mini Message*;
6 otherwise, the mobile station may request a channel configuration in the
7 *Resource Request Message* or *Resource Request Mini Message*.
- 8 - If $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ is not 0 or *infinity*, the mobile station shall not
9 send the *Resource Request Message* or *Resource Request Mini Message* until
10 after the system time stored in $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$, where,
11 RETRY_TYPE is equal to '010'.
- 12 - The mobile station may send the *Supplemental Channel Request Message* or
13 *Supplemental Channel Request Mini Message* whenever
14 $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ is set to '0', where, RETRY_TYPE is equal to '011'.
- 15 - The mobile station shall not send the *Supplemental Channel Request Message* or
16 *Supplemental Channel Request Mini Message* whenever
17 $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ is set to *infinity*, where, RETRY_TYPE is equal to
18 '011'.
- 19 • If $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ is not 0 or *infinity*, the mobile station shall not
20 send the *Supplemental Channel Request Message* or *Supplemental Channel Request*
21 *Mini Message* until after the system time stored in $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$,
22 where, RETRY_TYPE is equal to '011'.
- 23 • The mobile station shall not send a Short Data Burst (see ~~30~~[53], [42]) whenever
24 $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ is set to *infinity*, where, RETRY_TYPE is equal to
25 '100' or '101'.
- 26 • If $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ is not 0 or *infinity*, where, RETRY_TYPE is equal to
27 '100' or '101', the mobile station shall not send a Short Data Burst (see ~~30~~[53],
28 [42]) until the maximum of the system time stored in $\text{RETRY_DELAY}_s[100]$ and
29 $\text{RETRY_DELAY}_s[101]$.
- 30 – At the system time stored in $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$, the mobile station
31 shall reset $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ to 0, where RETRY_TYPE is equal to
32 '001', '010', '011', '100' or '101'.
- 33 • The mobile station may send a *Resource Release Request Message* or a *Resource*
34 *Release Request Mini Message* to request for reverse pilot gating operation to be
35 performed or to request a service option connection to be disconnected. The mobile
36 station may send a *Resource Release Request Message* to request one or more
37 BCMC flows to be disconnected.
- 38 • The mobile station may send a *Shared Channel Configuration Order* ($\text{ORDQ} =$
39 '00000000') to request for R-FCH assignment. The mobile station may send a
40 *Shared Channel Configuration Order* ($\text{ORDQ} = '00000001'$) to request release of the
41 R-FCH.

- 1 • When the Reverse Packet Data Channel is assigned, the mobile station shall not
2 send a *Supplemental Channel Request Message* or *Supplemental Channel Request*
3 *Mini Message* containing a request for Reverse Supplemental Channel assignment.
- 4 • The mobile station may enter the *Release Substate* with a service inactive indication
5 (see 2.6.4.4) if the service corresponding to the packet data service option instance
6 is inactive at the mobile station.
- 7 • If Layer 3 receives a “substate timer expired indication” from a Call Control
8 instance, the Layer 3 shall perform the following:
- 9 - If there are no other active or pending calls, the Layer 3 shall terminate this Call
10 Control instance; and the mobile station shall disable its transmitter and enter
11 the *System Determination Substate* of the *Mobile Station Initialization State* with a
12 system lost indication (see 2.6.1.1).
- 13 - Otherwise, the mobile station shall send a *Service Request Message*, *Resource*
14 *Release Request Message*, or a *Resource Release Request Mini Message*.
- 15 • If there are no active or pending calls, the Layer 3 shall enter the *Release Substate*
16 with a mobile station release indication.
- 17 • If Layer 3 receives a ‘message rejected indication’ from a Call Control instance,
18 mobile station shall send a *Mobile Station Reject Order* (ORDQ set to the applicable
19 reason code as determined from Table 2.7.3-1) within T_{56m} seconds as follows:
- 20 - If $P_REV_IN_USE_s$ is equal to or greater than seven, the mobile station shall
21 include the CON_REF_INCL field with this message and shall perform the
22 following: if the corresponding Call Control instance is identified by NULL, the
23 mobile station shall either set the CON_REF_INCL field of the message to ‘0’ or
24 set the CON_REF_INCL field to ‘1’ and set the CON_REF field to the connection
25 reference of the service option connection corresponding to this Call Control
26 instance; otherwise, the mobile station shall set the CON_REF_INCL field of the
27 message to ‘1’ and the CON_REF field of the message to the connection
28 reference of the service option connection corresponding to this Call Control
29 instance.
- 30 • If Layer 3 is requested by the upper layers to query base station identification
31 number, SID, NID, and LAT/LONG related information for one or more pilots, and
32 $PILOT_INFO_REQ_SUPPORTED_s$ equals ‘1’, mobile station shall send a *Base Station*
33 *Status Request Message* with a “Pilot Information” record type to the base station.
- 34 • If the mobile station needs to suspend its CDMA Traffic Channel processing for
35 applications other than a PUF probe, hard handoff, or periodic search, then, prior to
36 suspending its CDMA Traffic Channel processing, the mobile station shall perform
37 the following:
- 38 - If $CDMA_OFF_TIME_REP_SUP_IND_s$ is equal to ‘1’ and the total time it needs to
39 suspend processing the CDMA Traffic Channel is longer than
40 $CDMA_OFF_TIME_REP_THRESHOLD_s$, the mobile station shall send a *CDMA*

- 1 *Off Time Report Message*. Otherwise, the mobile shall not send a *CDMA Off Time*
2 *Report Message*.
- 3 • The mobile station may send a *CDMA Off Time Report Message* with
4 CDMA_OFF_TIME_ENABLE set to '0' to cancel a previously reported CDMA Traffic
5 Channel processing suspension.
 - 6 • The mobile station shall update RC_PARAMS_RECORD_s as described in section
7 2.6.17.
 - 8 • If the mobile station performs a hard handoff, it shall initialize RC parameters as
9 described in section 2.6.16.
 - 10 • If the mobile station receives R-SCH burst assignment with RC08, then the mobile
11 station shall perform the following:
 - 12 - Set REV_FCH_BLANKING_DUTYCYCLE_IN_USE to '000' at the start time of the
13 burst assignment.
 - 14 - Set REV_FCH_BLANKING_DUTYCYCLE_IN_USE to
15 REV_FCH_BLANKING_DUTYCYCLE_s at the end of the burst assignment.
 - 16 • If the mobile station receives a message which is included in the following list and
17 every message field value is within its permissible range, the mobile station shall
18 process the message as described below and in accordance with the message's
19 action time (see 2.6.4.1.5).
 - 20 1. *Alert With Information Message*: If P_REV_IN_USE_s is less than seven, the Layer
21 3 shall deliver this message to the Call Control instance; otherwise, the Layer 3
22 shall deliver this message to the Call Control instance identified by NULL.
 - 23 2. *Reserved*
 - 24 3. *Audit Order*
 - 25 4. *Authentication Challenge Message*: The Layer 3 shall send a "reset waiting for
26 order substate timer indication" to all Call Control instances. The mobile
27 station shall process the message and shall respond as specified in 2.3.12.1.4
28 within T_{32m} seconds, regardless of the value of AUTH_s.
 - 29 5. *Authentication Request Message*: The mobile station shall process the message
30 and shall respond as specified in 2.3.12.5.2.
 - 31 6. *Base Station Challenge Confirmation Order*: The Layer 3 shall send a "reset
32 waiting for order substate timer indication" to all Call Control instances. The
33 mobile station shall process the message and shall respond with an *SSD*
34 *Update Confirmation Order* or *SSD Update Rejection Order* as specified in
35 2.3.12.1.5 within T_{32m} seconds.
 - 36 7. *Base Station Status Response Message*: The Layer 3 shall deliver the
37 information contained in this message to the Upper Layer entity that requested
38 for this information.
 - 39 8. *Call Assignment Message*: The mobile station shall process this message as

1 follows:

- 2 - If RESPONSE_IND_r equals '1', then for each of the TAG_r or ADD_TAG_r fields
 3 that matches any of the TAG values contained in the list
 4 TAG_OUTSTANDING_LIST, the mobile station shall perform the following:
- 5 + If ACCEPT_IND_r or ADD_ACCEPT_IND_r associated with the TAG_r or
 6 ADD_TAG_r equals '0', the mobile station shall disable the enhanced
 7 origination timer associated with TAG_r and shall remove the TAG value
 8 specified by TAG_r from the list TAG_OUTSTANDING_LIST.
 - 9 + If ACCEPT_IND_r or ADD_ACCEPT_IND_r associated with the TAG_r or
 10 ADD_TAG_r equals '1' and USE_OLD_SERV_CONFIG_r field associated
 11 with this TAG is not set to '1', the mobile station shall perform the
 12 following:
 - 13 ○ If there already exists or currently pending instantiation a Call
 14 Control instance identified by CON_REF_r or ADD_CON_REF_r
 15 associated with the TAG_r or ADD_TAG_r, the mobile station shall send
 16 a *Mobile Station Reject Order* with ORDQ field set to '00010010' (a call
 17 control instance is already present with the specified identifier), with
 18 the CON_REF field of the order set to the CON_REF_r or
 19 ADD_CON_REF_r.
 - 20 ○ Otherwise, Layer 3 shall instantiate a Call Control instance (as
 21 specified in 2.6.10) at the action time of the message. The mobile
 22 station shall identify this Call Control instance by CON_REF_r or
 23 ADD_CON_REF_r associated with the TAG_r or ADD_TAG_r. If a service
 24 option connection corresponding to this call has not been
 25 established, the mobile station should wait for the base station to
 26 initiate service negotiation to establish the service option connection.
 - 27 ○ The mobile station shall disable the enhanced origination timer
 28 corresponding to this TAG and shall remove the TAG value from the
 29 list TAG_OUTSTANDING_LIST.
 - 30 + If ACCEPT_IND_r equals '1' and USE_OLD_SERV_CONFIG_r field is
 31 included and is set to '1', the mobile station shall perform the following:
 - 32 ○ At the action time of this message, the mobile station shall restore
 33 the indicated service option connection record(s) from the stored
 34 service configuration, where the service option connection records to
 35 be restored are determined as follows:
 - 36 ○ If SR_ID_r equals '111', the mobile station shall restore all remaining
 37 service option connection records from the stored service
 38 configuration; otherwise, the mobile station shall restore the service
 39 option connection record corresponding to the SR_ID_r received in this
 40 message.

- 1 ○ Layer 3 shall instantiate a Call Control instance (as specified in
2 2.6.10) for each of the restored service option connections with a
3 ‘restore indication’ and Layer 3 shall identify each of these Call
4 Control instances by the value of the CON_REF field corresponding to
5 the restored service option connection.
- 6 ○ The mobile station shall disable the enhanced origination timer
7 corresponding to TAG_r and shall remove the TAG value specified by
8 TAG_r from the list TAG_OUTSTANDING_LIST.
- 9 - If RESPONSE_IND_r equals ‘1’, then for each of the and TAG_r or ADD_TAG_r
10 fields that does not match with any of the TAG values contained in the list
11 TAG_OUTSTANDING_LIST, the mobile station shall send a *Mobile Station*
12 *Reject Order* with ORDQ field set to ‘00010011’ (TAG received does not
13 match TAG stored), with the TAG field of the order set to the TAG_r or
14 ADD_TAG_r, and the CON_REF field of the order set to CON_REF_r or
15 ADD_CON_REF_r.
- 16 - If RESPONSE_IND_r equals ‘0’ and USE_OLD_SERV_CONFIG_r field is not
17 included or is included and is set to ‘0’, the mobile station shall perform the
18 following for each of the CON_REF_r or ADD_CON_REF_r:
- 19 + If there already exists or currently pending instantiation a Call Control
20 instance identified by CON_REF_r or ADD_CON_REF_r, the mobile station
21 shall send a *Mobile Station Reject Order* with ORDQ field set to
22 ‘00010010’ (a call control instance is already present with the specified
23 identifier), with the CON_REF field of the order set to the CON_REF_r or
24 ADD_CON_REF_r.
- 25 + Otherwise, if the mobile station does not accept this call assignment, the
26 mobile station shall send a *Mobile Station Reject Order* with ORDQ field
27 set to ‘00010000’ (call assignment not accepted), with the CON_REF field
28 of the order set to the CON_REF_r or ADD_CON_REF_r.
- 29 + Otherwise, at the action time of the message, the mobile station shall
30 store the bypass indicator (BYPASS_ALERT_ANSWER_s =
31 BYPASS_ALERT_ANSWER_r) and the Layer 3 shall instantiate a Call
32 Control instance (as specified in 2.6.10). The mobile station shall
33 identify this Call Control instance by the CON_REF_r or ADD_CON_REF_r.
34 If a service option connection corresponding to this call has not been
35 established, the mobile station should wait for the base station to initiate
36 service negotiation to establish the service option connection.
- 37 - If RESPONSE_IND_r equals ‘0’ and USE_OLD_SERV_CONFIG_r field is
38 included and is set to ‘1’, the mobile station shall perform the following:
- 39 + At the action time of this message, the mobile station shall restore the
40 indicated service option connection record(s) from the stored service
41 configuration, where the service option connection records to be restored
42 are determined as follows:

- 1 ○ If SR_ID_r equals '111', the mobile station shall restore all remaining
2 service option connection records from the stored service
3 configuration; otherwise, the mobile station shall restore the service
4 option connection record corresponding to the SR_ID_r received in this
5 message.
- 6 + If SR_ID_r equals '111', the mobile station shall perform the following:
- 7 ○ For the first remaining service option connection (with corresponding
8 connection reference CON_REF_i) listed in this stored Service
9 Configuration information record, Layer 3 shall instantiate a Call
10 Control instance (as specified in 2.6.10) with the received
11 BYPASS_ALERT_ANSWER_s. The mobile station shall identify this Call
12 Control instances by the corresponding CON_REF_i.
- 13 ○ For each of the remaining service option connections, Layer 3 shall
14 instantiate a Call Control instance (as specified in 2.6.10) for each of
15 the restored service option connections with a 'restore indication' and
16 Layer 3 shall identify each of these Call Control instances by the
17 value of the CON_REF field corresponding to the restored service
18 option connection.
- 19 + If SR_ID_r is not equal to '111', Layer 3 shall instantiate a Call Control
20 instance (as specified in 2.6.10) with the received
21 BYPASS_ALERT_ANSWER_s for the service option connection record
22 corresponding to the SR_ID_r received in this message.
- 23 9. *Candidate Frequency Search Control Message:* The mobile station shall process
24 the message as specified in 2.6.6.2.5.1.
- 25 10. *Candidate Frequency Search Request Message:* The mobile station shall process
26 the message as specified in 2.6.6.2.5.1.
- 27 11. *Continuous DTMF Tone Order:* Support of this order by the mobile station is
28 optional. If P_REV_IN_USE_s is less than seven, the Layer 3 shall deliver this
29 message to the Call Control instance; otherwise, the Layer 3 shall perform the
30 following: if CON_REF_INCL_r equals '0', the Layer 3 shall deliver this message
31 to the Call Control instance identified by NULL; otherwise, the Layer 3 shall
32 deliver this message to the Call Control instance identified by CON_REF_r.
- 33 12. *Data Burst Message*
- 34 13. *Extended Alert With Information Message:* The mobile station shall perform the
35 following: If CON_REF_INCL_r equals '0', the Layer 3 shall deliver this message
36 to the Call Control instance identified by NULL; otherwise, the Layer 3 shall
37 deliver this message to the Call Control instance identified by CON_REF_r.
- 38 14. *Extended Flash With Information Message:* The mobile station shall perform the
39 following: If CON_REF_INCL_r equals '0', the Layer 3 shall deliver this message
40 to the Call Control instance identified by NULL; otherwise, the Layer 3 shall
41 deliver this message to the Call Control instance identified by CON_REF_r.

- 1 15. *Extended Handoff Direction Message*: The Layer 3 shall send a “reset waiting for
2 order substate timer indication” to all Call Control instances. The mobile
3 station shall process the message as specified in 2.6.6.2.5.1.
- 4 16. *Extended Neighbor List Update Message*: The mobile station shall process the
5 message as specified in 2.6.6.2.5.1.
- 6 17. *Extended Release Message*: The mobile station shall process the message as
7 specified in 2.6.4.1.9.
- 8 18. *Extended Release Mini Message*: The mobile station shall process the message
9 as specified in 2.6.4.1.9.
- 10 19. *Forward Supplemental Channel Assignment Mini Message*: The mobile station
11 shall process the message as specified in 2.6.6.2.5.1.
- 12 20. *Flash With Information Message*: If P_REV_IN_USE_S is less than seven, the Layer
13 3 shall deliver this message to the Call Control instance; otherwise, the Layer 3
14 shall deliver this message to the Call Control instance identified by NULL.
- 15 21. *Extended Supplemental Channel Assignment Message*: The mobile station shall
16 process the message as specified in 2.6.6.2.5.1.
- 17 22. *General Handoff Direction Message*: The Layer 3 shall send a “reset waiting for
18 order substate timer indication” to all Call Control instances. The mobile
19 station shall process the message as specified in 2.6.6.2.5.1.
- 20 23. *In-Traffic System Parameters Message*: The mobile station shall process the
21 message as specified in 2.6.4.1.4.
- 22 24. *Local Control Order*
- 23 25. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter
24 and record the reason for the *Lock Until Power-Cycled Order* in the mobile
25 station’s semi-permanent memory (LCKRSN_P_{S-P} equals the least-significant
26 four bits of ORDQ_T). The mobile station should notify the user of the locked
27 condition. The Layer 3 shall terminate all Call Control instances, and shall
28 enter the *System Determination Substate* of the *Mobile Station Initialization State*
29 with a lock indication (see 2.6.1.1), and shall not enter the *System Access State*
30 again until after the next mobile station power-up or until it has received an
31 *Unlock Order*. This requirement shall take precedence over any other mobile
32 station requirement specifying entry to the *System Access State*.
- 33 26. *Long Code Transition Request Order*: The mobile station shall process the
34 message as specified in 2.6.4.1.6.
- 35 27. *Maintenance Order*: If P_REV_IN_USE_S is less than seven, the Layer 3 shall
36 deliver this message to the Call Control instance; otherwise, the Layer 3 shall
37 perform the following: if CON_REF_INCL_T equals ‘0’, the Layer 3 shall deliver
38 this message to the Call Control instance identified by NULL; otherwise, the
39 Layer 3 shall deliver this message to the Call Control instance identified by
40 CON_REF_T.

- 1 28. *Maintenance Required Order*: The mobile station shall record the reason for the
2 *Maintenance Required Order* in the mobile station's semi-permanent memory
3 (MAINTRSN_{s-p} equals the least-significant four bits of ORDQ_r). The mobile
4 station shall remain in the unlocked condition. The mobile station should
5 notify the user of the maintenance required condition.
- 6 29. *Message Encryption Mode Order*: The mobile station shall process the message
7 as specified in 2.3.12.2.
- 8 30. *Mobile Station Registered Message*: The mobile station shall process the
9 message as specified in 2.6.5.5.4.3.
- 10 31. *Mobile Assisted Burst Operation Parameters Message*: The mobile station shall
11 process the message as specified in 2.6.6.2.5.1.
- 12 32. *Neighbor List Update Message*: The mobile station shall process the message as
13 specified in 2.6.6.2.5.1.
- 14 33. *Outer Loop Report Request Order*: The mobile station shall send the *Outer Loop*
15 *Report Message* in assured mode to the base station.
- 16 34. *Parameter Update Order*: The Layer 3 shall send a "reset waiting for order
17 substate timer indication" to all Call Control instances. The mobile station
18 shall increment COUNT_{s-p} (see 2.3.12.1.3). The mobile station shall send a
19 *Parameter Update Confirmation Order* within T_{56m} seconds. The mobile station
20 shall set the ORDQ field of the *Parameter Update Confirmation Order* to the
21 same value as the ORDQ field of the *Parameter Update Order*.
- 22 35. *Periodic Pilot Measurement Request Order*: The mobile station shall process the
23 order as specified in 2.6.6.2.5.1.
- 24 36. *Pilot Measurement Request Order*: The mobile station shall process the order as
25 specified in 2.6.6.2.5.1.
- 26 37. *Power Control Message*: The mobile station shall process the message as
27 specified in 2.6.4.1.1.3.
- 28 38. *Power Control Parameters Message*: The mobile station shall process the
29 message as specified in 2.6.4.1.1.2.
- 30 39. *Power Up Function Message*: The mobile station shall process the message as
31 specified in 2.6.4.1.7.1.
- 32 40. *Power Up Function Completion Message*: The mobile station shall process the
33 message as specified in 2.6.4.1.7.3.
- 34 41. *Rate Change Message*: The mobile station shall process the message as
35 specified in 2.6.4.1.1.4.
- 36 42. *Release Order*: The Layer 3 shall send a "release indication" to all Call Control
37 instances, and shall enter the *Release Substate* with a base station release
38 indication (see 2.6.4.4).
- 39 43. *Resource Allocation Message*: The mobile station shall process the message as
40 specified in 2.6.4.1.10.

- 1 44. *Resource Allocation Mini Message*: The mobile station shall process the message
2 as specified in 2.6.4.1.10.
- 3 45. *Retrieve Parameters Message*: The mobile station shall send, within T_{56m}
4 seconds, a *Parameters Response Message*.
- 5 46. *Retry Order*: The mobile station shall process the order as follows:
- 6 - If $RETRY_TYPE_R$ is equal to '000', the mobile station shall set
7 $RETRY_DELAY_S[RETRY_TYPE]$ to 0, where $RETRY_TYPE$ is equal to '001',
8 '010', '011', '100', or '101'.
 - 9 - If $RETRY_TYPE_R$ is equal to '001', '100', or '101', then the mobile station
10 shall perform the following:
 - 11 + If $RETRY_DELAY_R$ is equal to '00000000', then the mobile station shall
12 set $RETRY_DELAY_S[RETRY_TYPE_R]$ to 0.
 - 13 + If $RETRY_DELAY_R$ is not equal to '00000000', the mobile station shall set
14 $RETRY_DELAY_S[RETRY_TYPE_R]$ as follows:
 - 15 ○ If the most significant bit of the $RETRY_DELAY_R$ is 0, set
16 $RETRY_DELAY_UNIT_S$ to 1000ms. If the most significant bit of the
17 $RETRY_DELAY_R$ is '1', set $RETRY_DELAY_UNIT_S$ to 60000ms.
 - 18 ○ The mobile station shall set $RETRY_DELAY_VALUE_S$ to the seven
19 least significant bits of $RETRY_DELAY_R$.
 - 20 ○ The mobile station shall store the next system time 80 ms boundary
21 + $RETRY_DELAY_VALUE_S \times RETRY_DELAY_UNIT_S$ ms as
22 $RETRY_DELAY_S[RETRY_TYPE_R]$.
 - 23 - If $RETRY_TYPE_R$ is equal to '010' or '011', the mobile station shall perform
24 the following:
 - 25 + If $RETRY_DELAY_R[RETRY_TYPE_R]$ is '00000000', then the mobile station
26 shall set $RETRY_DELAY_S[RETRY_TYPE_R]$ to 0.
 - 27 + If $RETRY_DELAY_R[RETRY_TYPE_R]$ is '11111111', then the mobile station
28 shall set $RETRY_DELAY_S[RETRY_TYPE_R]$ to *infinity*.
 - 29 + If $RETRY_DELAY_R[RETRY_TYPE_R]$ is not equal to '00000000' or
30 '11111111', the mobile station shall store the next system time 80 ms
31 boundary + $RETRY_DELAY_R[RETRY_TYPE_R] \times 320$ ms as
32 $RETRY_DELAY_S[RETRY_TYPE_R]$.
- 33 47. *Reverse Supplemental Channel Assignment Mini Message*: The mobile station
34 shall process the message as specified in 2.6.6.2.5.1.
- 35 48. *Security Mode Command Message*: The mobile station shall process the
36 message as specified in 2.6.4.1.14.
- 37 49. *Send Burst DTMF Message*: Support of this message by the mobile station is
38 optional. If $P_REV_IN_USE_S$ is less than seven, the Layer 3 shall deliver this
39 message to the Call Control instance; otherwise, the Layer 3 shall perform the

- 1 following: if CON_REF_INCL_r equals '0', the Layer 3 shall deliver this message
 2 to the Call Control instance identified by NULL; otherwise, the Layer 3 shall
 3 deliver this message to the Call Control instance identified by CON_REF_r.
- 4 50. *Service Connect Message*: The mobile station shall process the message in
 5 accordance with the requirements for the active service subfunction (see
 6 2.6.4.1.2.2) if the message is not rejected due to the following conditions:
- 7 - If the CC_INFO_INCL field is included in this message and is set to '1', the
 8 mobile station shall perform the following for each of the
 9 NUM_CALLS_ASSIGN call assignments included in this message:
 - 10 + If there already exists or currently pending instantiation a Call Control
 11 instance identified by CON_REF_r, the mobile station shall send a *Mobile*
 12 *Station Reject Order* with ORDQ field set to '00010010' (a call control
 13 instance is already present with the specified identifier), with the CON_REF
 14 field of the order set to CON_REF_r.
 - 15 + If RESPONSE_IND_r equals '1' and TAG_r does not match any of the TAG
 16 values contained in the list TAG_OUTSTANDING_LIST, the mobile station
 17 shall send a *Mobile Station Reject Order* with ORDQ field set to '00010011'
 18 (TAG received does not match TAG stored), with the TAG field of the order
 19 set to TAG_r, and the CON_REF field of the order set to CON_REF_r.
 - 20 + If the mobile station does not accept this call assignment, the mobile station
 21 shall send a *Mobile Station Reject Order* with ORDQ field set to '00010000'
 22 (call assignment not accepted), with the CON_REF field of the order set to
 23 CON_REF_r.
- 24 51. *Service Option Control Message*: The mobile station shall process the message
 25 in accordance with the requirements for the active service subfunction (see
 26 2.6.4.1.2.2).
- 27 52. *Service Option Control Order*: The mobile station shall process the message in
 28 accordance with the requirements for the active service subfunction (see
 29 2.6.4.1.2.2).
- 30 53. *Service Option Request Order*: The mobile station shall process the message in
 31 accordance with the requirements for the active service subfunction (see
 32 2.6.4.1.2.2).
- 33 54. *Service Option Response Order*: The mobile station shall process the message in
 34 accordance with the requirements for the active service subfunction (see
 35 2.6.4.1.2.2).
- 36 55. *Service Redirection Message*: The mobile station shall process the message as
 37 follows:
 38 If RECORD_TYPE_r is equal to '00000000', the mobile station shall perform the
 39 following:
 40 - The mobile station shall set RETURN_IF_FAIL_s = RETURN_IF_FAIL_r.

- 1 - If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of
2 TMSI_CODE_{s-p} to '1'.
- 3 - The mobile station shall disable the full-TMSI timer.
- 4 - The Layer 3 shall send a "release indication" to all Call Control instances,
5 and shall enter the Release Substate with an NDSS off indication (see
6 2.6.4.4).
- 7 If RECORD_TYPE_r is not equal to '00000000', REDIRECT_TYPE_r is '1', and the
8 mobile station supports the band class and operating mode specified in the
9 message, the mobile station shall perform the following:
- 10 - The mobile station shall store the redirection record received in the message
11 as REDIRECT_REC_s.
- 12 - The mobile station shall enable NDSS_ORIG_s and shall record the dialed
13 digits (if any) corresponding to the last MS originated call.
- 14 - The mobile station shall set RETURN_IF_FAIL_s = RETURN_IF_FAIL_r.
- 15 - If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of
16 TMSI_CODE_{s-p} to '1'.
- 17 - The mobile station shall disable the full-TMSI timer.
- 18 - The Layer 3 shall send a "release indication" to all Call Control instances,
19 and shall enter the *Release Substate* with a redirection indication (see
20 2.6.4.4). Otherwise, the mobile station shall discard the message and send a
21 *Mobile Station Reject Order* (ORDQ set to the applicable reason code as
22 determined from Table 2.7.3-1) within T_{56m} seconds.
- 23 56. *Service Request Message*: The mobile station shall process the message in
24 accordance with the requirements for the active service subfunction (see
25 2.6.4.1.2.2).
- 26 57. *Service Response Message*: The mobile station shall process the message in
27 accordance with the requirements for the active service subfunction (see
28 2.6.4.1.2.2).
- 29 58. *Set Parameters Message*: If the mobile station can set all of the parameters
30 specified by the PARAMETER_ID fields in the message, the mobile station shall
31 set them; otherwise, the mobile station shall send, within T_{56m} seconds, a
32 *Mobile Station Reject Order*.
- 33 59. *SSD Update Message*: The Layer 3 shall send a "reset waiting for order substate
34 timer indication" to all Call Control instances. The mobile station shall process
35 the message and respond with a *Base Station Challenge Order* as specified in
36 2.3.12.1.5 within T_{32m} seconds.
- 37 60. *Status Request Message*: The mobile station shall send, within T_{56m} seconds, a
38 *Status Response Message*. If the message does not specify any qualification
39 information (QUAL_INFO_TYPE_r is equal to '00000000'), the mobile station

1 shall include the requested information records in the *Status Response*
 2 *Message*. If the message specifies a band class (QUAL_INFO_TYPE_r is equal to
 3 '0000001'), the mobile station shall only include the requested information
 4 records for the specified band class (BAND_CLASS_r) in the *Status Response*
 5 *Message*. If the message specifies a band class and an operating mode
 6 (QUAL_INFO_TYPE_r is equal to '0000010'), the mobile station shall only
 7 include the requested information records for the specified band class
 8 (BAND_CLASS_r) and operating mode (OP_MODE_r) in the *Status Response*
 9 *Message*.

10 If the message specifies a band class or a band class and an operating mode
 11 which is not supported by the mobile station, the mobile station shall send a
 12 *Mobile Station Reject Order* with ORDQ set to '0000110' (message requires a
 13 capability that is not supported by the mobile station).

14 If the mobile station supports processing of
 15 RC_BITMAP_CAPABILITY_EXT_ALLOWED, it shall set
 16 RC_BITMAP_CAPABILITY_EXT_ALLOWED_s to
 17 RC_BITMAP_CAPABILITY_EXT_ALLOWED, and include the requested
 18 information records in the *Status Response Message*.

19 If the response to this message exceeds the allowable length, the mobile station
 20 shall send a *Mobile Station Reject Order* with ORDQ set to '00001000' (response
 21 message would exceed the allowable length).

22 If the message specifies an information record which is not supported by the
 23 mobile station for the specified band class and operating mode, the mobile
 24 station shall send a *Mobile Station Reject Order* with ORDQ set to '00001001'
 25 (information record is not supported for the specified band class and operating
 26 mode).

- 27 61. *Status Request Order*: If CDMABAND_s is equal to '00000', the mobile station
 28 shall send a *Status Message* within T_{56m} seconds. The mobile station shall
 29 respond with information corresponding to the current band class and
 30 operating mode.
- 31 62. *Supplemental Channel Assignment Message*: The mobile station shall process
 32 the message as specified in 2.6.6.2.5.1.
- 33 63. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and
 34 code as follows:
- 35 - The mobile station shall store the length of the TMSI zone field by setting
 36 ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r,
 - 37 - The mobile station shall store the assigning TMSI zone number by setting
 38 the ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
 39 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
 - 40 - The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
 41 TMSI_CODE_r.

- 1 The mobile station shall set the TMSI expiration time by setting
 2 TMSI_EXP_TIME_{s-p} to TMSI_EXP_TIME_r. The mobile station shall disable the
 3 full-TMSI timer. The mobile station shall then respond with a *TMSI Assignment*
 4 *Completion Message* within T_{56m} seconds.
- 5 64. *Universal Handoff Direction Message*: The Layer 3 shall send a “reset waiting for
 6 order substate timer indication” to all Call Control instances. The mobile
 7 station shall process the message as specified in 2.6.6.2.5.1.
- 8 65. *User Zone Reject Message*: The mobile station shall process this message as
 9 specified in 2.6.9.2.2.
- 10 66. *User Zone Update Message*: The mobile station shall process this message as
 11 specified in 2.6.9.2.2.
- 12 67. *BCMC Order*. The mobile station shall process this message as follows:
 13 - If ORDQ_r is set to ‘00000000’, the mobile station shall perform the following
 14 for each of the BCMC flows that the base station is responding to:
 15 + If CLEAR_ALL_RETRY_DELAY_r equals ‘1’, the mobile station shall delete
 16 the currently stored BCMC Retry Delay List.
 17 + If CLEAR_RETRY_DELAY_r equals ‘1’, the mobile station shall delete the
 18 entry in the BCMC_RETRY_DELAY_LIST_{s[i]} corresponding to
 19 BCMC_FLOW_ID (See section 2.6.13.11) in this message.
 20 + If ALL_BCMC_REASON_r or BCMC_REASON_r equals ‘0000’, Layer 3 shall
 21 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE, cause=*
 22 *FLOW_NOT_AVAILABLE, reason_ind=CURRENT_SYS)* for each of the
 23 corresponding BCMC_FLOW_ID to the BCMC Service Layer.
 24 + If ALL_BCMC_REASON_r or BCMC_REASON_r equals ‘0001’, Layer 3 shall
 25 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE, cause=*
 26 *FLOW_NOT_TRANSMITTED, reason_ind=CURRENT_SYS)* for each of the
 27 corresponding BCMC_FLOW_ID to the BCMC Service Layer.
 28 + If ALL_BCMC_REASON_r or BCMC_REASON_r equals ‘0010’, Layer 3 shall
 29 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE, cause=*
 30 *FLOW_TRANSMITTED_IN_IDLE, reason_ind=CURRENT_SYS)* for each of
 31 the corresponding BCMC_FLOW_ID to the BCMC Service Layer.
 32 + If ALL_BCMC_REASON_r or BCMC_REASON_r equals ‘0011’, Layer 3 shall
 33 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = SUCCESS,*
 34 *cause = REGISTRATION_ACCEPTED, reason_ind = CURRENT_SYS)* for
 35 each of the corresponding BCMC_FLOW_ID to the BCMC Service Layer.
 36 + If ALL_BCMC_REASON_r or BCMC_REASON_r equals ‘0100’, Layer 3 shall
 37 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE, cause=*
 38 *AUTHORIZATION_FAILURE, reason_ind=CURRENT_SYS)* for each of the
 39 corresponding BCMC_FLOW_ID to the BCMC Service Layer.

- 1 + If ALL_BCMC_REASON_r or BCMC_REASON_r equals '0101', the mobile
 2 station shall perform the following:
- 3 ○ Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID,*
 4 *result=FAILURE, cause= RETRY_LATER, reason_ind=CURRENT_SYS)*
 5 for each of the corresponding BCMC_FLOW_ID to the BCMC Service
 6 Layer.
 - 7 ○ For each of the corresponding BCMC_FLOW_ID, if there is a
 8 BCMC_RETRY_DELAY_LIST_s[i].BCMC_FLOW_ID which is same as
 9 BCMC_FLOW_ID (See section 2.6.13.11), the mobile station shall set
 10 BCMC_RETRY_DELAY_LIST_s[i].RETRY_DELAY to current system
 11 time plus ALL_BCMC_RETRY_DELAY_r/BCMC_RETRY_DELAY;
 12 otherwise, the mobile station shall add new
 13 BCMC_RETRY_DELAY_LIST_s[i] to the BCMC Retry Delay List and
 14 shall set BCMC_RETRY_DELAY_LIST_s[i].BCMC_FLOW_ID to the
 15 BCMC_FLOW_ID, BCMC_RETRY_DELAY_LIST_s[i].RETRY_DELAY to
 16 current system time plus
 17 ALL_BCMC_RETRY_DELAY_r/BCMC_RETRY_DELAY_r.

18 68. *In-Traffic BCMC Service Parameters Message:* The mobile station shall process
 19 this message as follows:

20 The mobile station shall store the following parameters:

- 21 - Autonomous BCMC request on traffic channel allowed indicator
 22 (AUTO_REQ_TRAF_ALLOWED_IND_s = AUTO_REQ_TRAF_ALLOWED_IND_r).
- 23 - BCMC in idle state supported indicator
 24 (BCMC_ON_IDLE_SUP_IND_s = BCMC_ON_IDLE_SUP_IND_r).
- 25 - Only traffic state BCMC flows included indicator
 26 (BCMC_FLOWS_ON_TRAFFIC_ONLY_IND_s = BCMC_FLOWS_ON_TRAFFIC_
 27 ONLY_IND_r) if BCMC_FLOWS_ON_TRAFFIC_ONLY_IND_r is included;
 28 otherwise, BCMC_FLOWS_ON_TRAFFIC_ONLY_IND_s = '1'.
- 29 - Length of time stamp for use on r-csch
 30 (ACH_TIME_STAMP_SHORT_LENGTH_s = ACH_TIME_STAMP_SHORT_LEN
 31 GTH_r) if NON_DEFAULT_VALUE_INCLUDED_r equals '1'; otherwise,
 32 ACH_TIME_STAMP_SHORT_LENGTH_s shall be set to 10.
- 33 - Length of time stamp
 34 (TIME_STAMP_LONG_LENGTH_s = TIME_STAMP_LONG_LENGTH_r) if
 35 NON_DEFAULT_VALUE_INCLUDED_r equals '1'; otherwise,
 36 TIME_STAMP_LONG_LENGTH_s shall be set to 52.
- 37 - Unit for time stamp length (TIME_STAMP_UNIT_s = TIME_STAMP_UNIT_r) if
 38 NON_DEFAULT_VALUE_INCLUDED_r equals '1'; otherwise,
 39 TIME_STAMP_UNIT_s shall be set to 6.
- 40 - For i=1 to the number of flows included in this message, store the
 41 following:

- 1 + BCMC_FLOW_LIST_S[i].BCMC_FLOW_ID = ith occurrence of
2 BCMC_FLOW_ID (BCMC flow identifier) . See section 2.6.13.11.
- 3 + If AUTH_SIGNATURE_REQUIRED_R equals '1',
4 BCMC_FLOW_LIST_S[i].AUTH_SIGNATURE_REQ_IND = ith occurrence
5 of AUTH_SIGNATURE_REQ_IND_R(Authorization signature required
6 indication).
- 7 + BCMC_FLOW_LIST_S[i].BCMC_FLOW_ON_TRAFFIC_IDLE_IND = ith
8 occurrence of BCMC_FLOW_ON_TRAFFIC_IDLE_IND_R (BCMC flow on
9 traffic state or idle state supported identifier) if
10 BCMC_FLOW_ON_TRAFFIC_IDLE_IND_R is included; otherwise,
11 BCMC_FLOW_LIST_S[i].BCMC_FLOW_ON_TRAFFIC_IDLE_IND = '01'.
- 12 69. *Shared Channel Configuration Order:* The mobile station shall process this
13 message as follows:
- 14 - If ORDQ_R is set to '00000000', the mobile station shall perform the following:
- 15 + The mobile station shall set REV_FCH_ASSIGNED_S to '1'.
- 16 + If CH_IND_S is equal to '11', the mobile station shall begin transmitting
17 on the Reverse Fundamental Channel.
- 18 + If CH_IND_S is equal to '00' and EXT_CH_IND_S is equal to '01111',
19 '10001', '10011', or '10101', the mobile station shall begin transmitting
20 on the Reverse Fundamental Channel and do the following:
- 21 ○ If EXT_CH_IND_S is equal to '01111', store EXT_CH_IND_S = '00110'
22 ○ If EXT_CH_IND_S is equal to '10001', store EXT_CH_IND_S = '10010'
23 ○ If EXT_CH_IND_S is equal to '10011', store EXT_CH_IND_S = '01110'
24 ○ If EXT_CH_IND_S is equal to '10101', store EXT_CH_IND_S = '10110'
- 25 - If ORDQ_R is set to '00000001', the mobile station shall do the following:
- 26 + The mobile station shall set REV_FCH_ASSIGNED_S to '0'.
- 27 + If CH_IND_S is equal to '11', the mobile station shall stop transmitting on
28 the Reverse Fundamental Channel.
- 29 + If CH_IND_S is equal to '00' and EXT_CH_IND_S is equal to '00110',
30 '10010', '01110', or '10110', the mobile station shall stop transmitting
31 on the Reverse Fundamental Channel and do the following:
- 32 ○ If EXT_CH_IND_S is equal to '00110', store EXT_CH_IND_S = '01111'
33 ○ If EXT_CH_IND_S is equal to '10010', store EXT_CH_IND_S = '10001'
34 ○ If EXT_CH_IND_S is equal to '01110', store EXT_CH_IND_S = '10011'
35 ○ If EXT_CH_IND_S is equal to '10110', store EXT_CH_IND_S = '10101'

- 1 70. *Service Status Order*: For each of the SERVICE_STATUS field included in this
2 message, the mobile station shall indicate the status to corresponding service
3 instance. For each of the SERVICE_STATUS field set to '001' (service request
4 rejected), the mobile station shall perform the following:
- 5 - The mobile station shall terminate the call control instance corresponding to
6 the SR_ID associated with this SERVICE_STATUS field.
 - 7 - The mobile station shall send an indication to the affected service instance
8 indicating that the call control instance has been terminated.
 - 9 - If a TAG is associated with the SR_ID corresponding to this
10 SERVICE_STATUS field, the mobile station shall remove the TAG value from
11 the TAG_OUTSTANDING_LIST and disable the corresponding enhanced
12 origination timer
- 13 71. *Radio Configuration Parameters Message*: If any of the field of the message is
14 set to an invalid value, then the mobile station shall send a *Mobile Station*
15 *Reject Order* with the ORDQ field set to '00000100' (message field not in valid
16 range). Otherwise, the mobile station shall perform the following:
- 17 - If FOR_FCH_ACK_MASK_RL_BLANKING_r is included, the mobile station
18 shall perform the following:
 - 19 + Set FOR_FCH_ACK_MASK_RL_BLANKING_s to
20 FOR_FCH_ACK_MASK_RL_BLANKING_r.
 - 21 - If FOR_FCH_ACK_MASK_NO_RL_BLANKING_r is included, the mobile station
22 shall perform the following:
 - 23 + Set FOR_FCH_ACK_MASK_NO_RL_BLANKING_s to
24 FOR_FCH_ACK_MASK_NO_RL_BLANKING_r.
 - 25 - If REV_FCH_ACK_MASK_r is included, the mobile station shall set
26 REV_FCH_ACK_MASK_s to REV_FCH_ACK_MASK_r.
 - 27 - If FOR_SCH_ACK_MASK_RL_BLANKING_r is included, the mobile station
28 shall perform the following:
 - 29 + Set FOR_SCH_ACK_MASK_RL_BLANKING_s to
30 FOR_SCH_ACK_MASK_RL_BLANKING_r.
 - 31 - If FOR_SCH_ACK_MASK_NO_RL_BLANKING_r is included, the mobile station
32 shall perform the following:
 - 33 + Set FOR_SCH_ACK_MASK_NO_RL_BLANKING_s to
34 FOR_SCH_ACK_MASK_NO_RL_BLANKING_r.
 - 35 - If REV_SCH_ACK_MASK_r is included, the mobile station shall set
36 REV_SCH_ACK_MASK_s to REV_SCH_ACK_MASK_r.
 - 37 - The mobile station shall set FOR_N2M_IND_s to FOR_N2M_IND_r.
 - 38 - The mobile station shall set FPC_MODE_NO_SCH_s to FPC_MODE_r.

- 1 - The mobile station shall set $FPC_MODE_S = FPC_MODE_NO_SCH_S$ if there is
2 no forward Supplemental Channel burst in progress (see 2.6.6.2.5.1.1).The
3 mobile station shall set RPC_MODE_S to RPC_MODE_R .
- 4 - The mobile station shall set $PWR_CNTL_STEP_S$ to $PWR_CNTL_STEP_R$.
- 5 - The mobile station shall set $FOR_FCH_BLANKING_DUTYCYCLE_S$ to
6 $FOR_FCH_BLANKING_DUTYCYCLE_R$.
- 7 - The mobile station shall perform the following:
- 8 - Set $REV_FCH_BLANKING_DUTYCYCLE_S$ to
9 $REV_FCH_BLANKING_DUTYCYCLE_R$.
- 10 - If the mobile station does not have R-SCH burst assigned with RC08, then
11 set $REV_FCH_BLANKING_DUTYCYCLE_IN_USE$ to
12 $REV_FCH_BLANKING_DUTYCYCLE_R$.
- 13 - If $REV_ACKCH_GAIN_ADJ_ACS1_R$ is included, the mobile station shall
14 perform the following:
- 15 + Set $REV_ACKCH_GAIN_ADJ_ACS1_S$ to $REV_ACKCH_GAIN_ADJ_ACS1_R$.
- 16 - If $REV_ACKCH_GAIN_ADJ_ACS2PLUS_R$ is included, the mobile station shall
17 perform the following:
- 18 + Set $REV_ACKCH_GAIN_ADJ_ACS2PLUS_S$ to
19 $REV_ACKCH_GAIN_ADJ_ACS2PLUS_R$.
- 20 - If $NUM_RC_PARAMS_RECORDS$ is set to non-zero value, the mobile station
21 shall update $RC_PARAMS_RECORD_S[i]$ as follows:
- 22 + If entry for $PILOT_PN_R$ exists then $RC_PARAMS_RECORD_S[i]$ is the
23 existing entry, otherwise $RC_PARAMS_RECORD_S[i]$ is a new entry with
24 $REV_SCH_ACK_CH_WALSH[00]$, $REV_SCH_ACK_BIT[00]$,
25 $REV_SCH_ACK_CH_WALSH[01]$, and $REV_SCH_ACK_BIT[01]$ fields set to
26 NULL.
- 27 + Set $RC_PARAMS_RECORD_S[i].PILOT_PN$ to $PILOT_PN_R$.
- 28 + Set $RC_PARAMS_RECORD_S[i].QOF_SET_IN_USE$ to $QOF_SET_IN_USE_R$.
- 29 + If $REV_SCH0_ACK_CH_WALSH$ is included, the mobile station shall set
30 $RC_PARAMS_RECORD_S[i].REV_SCH_ACK_CH_WALSH[00]$ to
31 $REV_SCH0_ACK_CH_WALSH_R$.
- 32 + If $REV_SCH0_ACK_BIT$ is included, the mobile station shall set
33 $RC_PARAMS_RECORD_S[i].REV_SCH_ACK_BIT[00]$ to
34 $REV_SCH0_ACK_BIT_R$.
- 35 + If $REV_SCH1_ACK_CH_WALSH$ is included, the mobile station shall set
36 $RC_PARAMS_RECORD_S[i].REV_SCH_ACK_CH_WALSH[01]$ to
37 $REV_SCH1_ACK_CH_WALSH_R$.

- 1 + If REV_SCH1_ACK_BIT is included, the mobile station shall set
2 RC_PARAMS_RECORD_s[i].REV_SCH_ACK_BIT[01] to
3 REV_SCH1_ACK_BIT_r.
- 4 + Set RC_PARAMS_RECORD_s[i].FOR_FCH_CCSH_INTERLEAVER_TYPE to
5 FOR_FCH_CCSH_INTERLEAVER_TYPE_r.

6 72. *Alternative Technology Information Message:* The mobile shall store all the
7 Radio Interface records contained in the message.

8 73. *General Extension Message:* The mobile station shall process this message
9 as specified in section 2.6.18.

- 10 - If the mobile station receives a message that is not included in the above
11 list, cannot be processed, or requires a capability which is not supported,
12 the mobile station shall discard the message and send a *Mobile Station*
13 *Reject Order* (ORDQ set to the applicable reason code as determined from
14 Table 2.7.3-1) within T_{56m} seconds. If the mobile station receives a Call
15 Control message (see 2.6.10) which is directed to a Call Control instance
16 that does not exist, the mobile station shall send a *Mobile Station Reject*
17 *Order* with ORDQ field set to '00010001' (no call control instance present
18 with the specified identifier) to the base station within T_{56m} seconds.
- 19 - If the bits of TMSI_CODE_{s-p} are not all equal to '1', and if System Time (in
20 80 ms units) exceeds TMSI_EXP_TIME_{s-p} × 2¹², the mobile station shall set
21 all the bits of TMSI_CODE_{s-p} to '1' within T_{66m} seconds.
- 22 - If the full-TMSI timer expires or has expired, the mobile station shall set all
23 the bits of TMSI_CODE_{s-p} to '1'. The mobile station shall update the
24 registration variables as described in 2.6.5.5.2.5.
- 25 - If the Forward Packet Data Channel is assigned, whenever the mobile
26 station transmitter is disabled, the MS shall set FPDCH_DTX_INDICATOR_s
27 to '1'.
- 28 - If the Forward Packet Data Channel is assigned, whenever the mobile
29 station transmitter is enabled, the mobile station shall perform the
30 following procedures:
 - 31 + The MS shall set FPDCH_DTX_INDICATOR_s to '0'..
 - 32 + If the mobile station transmitter has been disabled for at least
33 TX_DISABLED_TIMER_s, the mobile station shall send SIG-
34 HandoffPDCH.Indication (handoff_type = ASSIGN) primitive to the MAC
35 layer.

36 2.6.4.4 Release Substate

37 In this substate, the mobile station confirms the disconnect of all calls and physical
38 channels.

1 Upon entering the *Release Substate*, the mobile station shall perform the following:

- 2 • The mobile station shall set the substate timer for T_{55m} seconds.
- 3 • If the mobile station enters the *Release Substate* with a power-down indication, the
4 mobile station shall send a *Release Order* (ORDQ = '00000001'), and shall perform
5 power-down registration procedures (see 2.6.5.5.4.4). The Layer 3 shall terminate
6 all Call Control instances.
- 7 • If the mobile station enters the *Release Substate* with a mobile station release
8 indication, the mobile station shall send a *Release Order* as follows:
 - 9 - If the mobile station supports operation in the reduced slot cycle mode following
10 release from the traffic channel, the mobile station shall set ORDQ to
11 '00000011', RETURN_CAUSE_s to '0000', and perform the following:
 - 12 + If T_SLOTTED_s is equal to 0, the mobile station shall perform the following:
 - 13 ○ Set the RSC_MODE_IND field as specified in 2.7.3.5. If RSC_MODE_IND
14 is set to '1', then:
 - 15 ◇ Set RSC_MODE_ENABLED to YES.
 - 16 ◇ Set the RSC_END_TIME_UNIT and RSC_END_TIME_VALUE fields as
17 specified in 2.7.3.5, and store the system time specified by these
18 fields as RSC_END_TIME.
 - 19 ◇ Set the RSCI field as specified in 2.7.3.5 and store it as RSCI_s; if
20 RSCI_s is equal to '0111', set SLOTTED_s to NO.
 - 21 ◇ Set IGNORE_QPCH_s to '1'.
 - 22 + Otherwise, the mobile station shall set the RSC_MODE_IND field to '0'.
 - 23 - Otherwise, the mobile station shall set ORDQ to '00000000', and set
24 RETURN_CAUSE_s to '0000'.
 - 25 • If the mobile station enters the *Release Substate* with a service inactive indication,
26 the mobile station shall send a *Release Order* (ORDQ = '00000010'), and set
27 RETURN_CAUSE_s to '0000'.
 - 28 • If the mobile station enters the *Release Substate* with a base station release
29 indication, the mobile station shall send a *Release Order* (ORDQ = '00000000'). The
30 Layer 3 shall terminate all Call Control instances. The mobile station shall disable
31 its transmitter, set RETURN_CAUSE_s to '0000', and shall perform the procedures as
32 specified in 2.6.4.4.1.
 - 33 • If the mobile station entered the *Release Substate* with a base station extended
34 release indication, the mobile station shall perform the following:
 - 35 - The mobile station shall send an *Extended Release Response Message* to the
36 base station as follows:
 - 37 + If the RSC_MODE_SUPPORTED field in the received *Extended Release*
38 *Message* was set to '1' and the mobile station requests operation in the

- 1 reduced slot cycle mode, the mobile station shall set the RSC_MODE_IND
2 field to '1' and perform the following:
- 3 ○ Set RSC_MODE_ENABLED to YES.
 - 4 ○ Set the RSC_END_TIME_UNIT and RSC_END_TIME_VALUE fields as
5 specified in 2.7.2.3.2.25, and store the system time specified by these
6 fields as RSC_END_TIME. The value of RSC_END_TIME shall be no later
7 than the system time specified by MAX_RSC_END_TIME_UNIT_r and
8 MAX_RSC_END_TIME_VALUE_r received in the *Extended Release*
9 *Message*.
 - 10 ○ Set the RSCI field as specified in 2.7.2.3.2.25 and store it as RSCI_s; if
11 RSCI_s is equal to '0111', set SLOTTED_s to NO.
 - 12 ○ Set IGNORE_QPCH_s to IGNORE_QPCH_r received in the *Extended Release*
13 *Message*.
- 14 + Otherwise, the mobile station shall set the RSC_MODE_IND field to '0'.
- 15 - The Layer 3 shall terminate all Call Control instances.
 - 16 - The mobile station shall disable its transmitter, set RETURN_CAUSE_s to '0000',
17 and shall perform the procedures as specified in 2.6.4.4.1.
 - 18 • If the mobile station entered the *Release Substate* with a base station extended
19 release with mini message indication, then the mobile station shall perform the
20 following:
 - 21 - The mobile station shall send an *Extended Release Response Mini Message* to
22 the base station.
 - 23 - The Layer 3 shall terminate all Call Control instances.
 - 24 - The mobile station shall disable its transmitter, set RETURN_CAUSE_s to '0000',
25 and shall perform the procedures as specified in 2.6.4.4.1.
 - 26 • If the mobile station enters the *Release Substate* with a redirection indication, the
27 mobile station shall send a *Release Order* (ORDQ = '00000000') and shall enter the
28 *System Determination Substate* of the *Mobile Station Initialization State* with a
29 redirection indication (see 2.6.1.1). The Layer 3 shall terminate all Call Control
30 instances.
 - 31 • If the mobile station enters the *Release Substate* with an NDSS off indication, the
32 mobile station shall send a *Release Order* (ORDQ = '00000000'), and shall enter the
33 *System Determination Substate* of the *Mobile Station Initialization State* with an NDSS
34 off indication (see 2.6.1.1). The Layer 3 shall terminate all Call Control instances.
 - 35 • While in the *Release Substate*, the mobile station shall perform the following:
 - 36 • If the substate timer expires, the Layer 3 shall terminate all Call Control instances,
37 and the mobile station shall disable its transmitter and shall enter the *System*
38 *Determination Substate* of the *Mobile Station Initialization State* with a release
39 indication (see 2.6.1.1).

- 1 • The mobile station shall perform Forward Traffic Channel supervision as specified
2 in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the Layer 3 shall
3 terminate all Call Control instances, and shall enter the *System Determination*
4 *Substate* of the *Mobile Station Initialization State* with a release indication (see
5 2.6.1.1).
- 6 • The mobile station shall adjust its transmit power as specified in [2].
- 7 • The mobile station shall perform Forward Traffic Channel power control as specified
8 in 2.6.4.1.1.
- 9 • The mobile station shall perform handoff processing as specified in 2.6.6.
- 10 • If the Fundamental Channel is present, the mobile station shall transmit null
11 traffic, except when transmitting signaling traffic, on the Reverse Fundamental
12 Channel.
- 13 • The mobile station shall process Forward Traffic Channel signaling traffic and shall
14 discard other types of Forward Traffic Channel traffic.
- 15 • The mobile station shall perform registration timer maintenance as specified in
16 2.6.5.5.4.2.
- 17 • If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating an
18 acknowledgment failure, the Layer 3 shall terminate all Call Control instances, and
19 the mobile station shall disable its transmitter and enter the *System Determination*
20 *Substate* of the *Mobile Station Initialization State* with a release indication (see
21 2.6.1.1).
- 22 • If the Layer 3 receives an “enter traffic channel substate indication” from a Call
23 Control instance, the Layer 3 shall enter the *Traffic Channel substate*.
- 24 • If Layer 3 receives a ‘message rejected indication’ from a Call Control instance,
25 mobile station shall send a *Mobile Station Reject Order* (ORDQ set to the applicable
26 reason code as determined from Table 2.7.3-1) within T_{56m} seconds as follows:
- 27 - If $P_REV_IN_USE_s$ is equal to or greater than seven, the mobile station shall
28 include the CON_REF_INCL field with this message and shall perform the
29 following: if the corresponding Call Control instance is identified by NULL, the
30 mobile station shall either set the CON_REF_INCL field of the message to ‘0’ or
31 set the CON_REF_INCL field to ‘1’ and set the CON_REF field to the connection
32 reference of the service option connection corresponding to this Call Control
33 instance; otherwise, the mobile station shall set the CON_REF_INCL field of the
34 message to ‘1’ and the CON_REF field of the message to the connection
35 reference of the service option connection corresponding to this Call Control
36 instance.
- 37 • If the mobile station receives a message which is included in the following list, and
38 if every message field value is within its permissible range, the mobile station shall
39 process the message as described below and in accordance with the message’s
40 action time (see 2.6.4.1.5):

- 1 1. *Alert With Information Message*: If $P_REV_IN_USE_s$ is less than seven, the Layer
2 3 shall deliver this message to the Call Control instance; otherwise, the Layer 3
3 shall deliver this message to the Call Control instance identified by NULL.
- 4 2. *Authentication Request Message*: The mobile station shall process the message
5 and shall respond as specified in 2.3.12.5.2.
- 6 3. *Candidate Frequency Search Control Message*: The mobile station shall process
7 the message as specified in 2.6.6.2.5.1.
- 8 4. *Candidate Frequency Search Request Message*: The mobile station shall
9 process the message as specified in 2.6.6.2.5.1.
- 10 5. *Data Burst Message*
- 11 6. *Extended Alert With Information Message*: The mobile station shall perform the
12 following: If $CON_REF_INCL_r$ equals '0', the Layer 3 shall deliver this message
13 to the Call Control instance identified by NULL; otherwise, the Layer 3 shall
14 deliver this message to the Call Control instance identified by CON_REF_r .
- 15 7. *Extended Handoff Direction Message*: The mobile station shall process the
16 message as specified in 2.6.6.2.5.1.
- 17 8. *Extended Neighbor List Update Message*: The mobile station shall process the
18 message as specified in 2.6.6.2.5.1.
- 19 9. *Extended Supplemental Channel Assignment Message*: The mobile station shall
20 process the message as specified in 2.6.6.2.5.1.
- 21 10. *General Handoff Direction Message*: The mobile station shall process the
22 message as specified in 2.6.6.2.5.1.
- 23 11. *In-Traffic System Parameters Message*: The mobile station shall process the
24 message as specified in 2.6.4.1.4.
- 25 12. *Local Control Order*
- 26 13. *Mobile Assisted Burst Operation Parameters Message*: The mobile station shall
27 process the message as specified in 2.6.6.2.5.1.
- 28 14. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter
29 and record the reason for the *Lock Until Power-Cycled Order* in the mobile
30 station's semi-permanent memory ($LCKRSN_{S-p}$ equals the least-significant
31 four bits of $ORDQ_r$). The mobile station should notify the user of the locked
32 condition. The Layer 3 shall terminate all Call Control instances. The Layer 3
33 shall enter the *System Determination Substate* of the *Mobile Station Initialization*
34 *State* with a lock indication (see 2.6.1.1), and shall not enter the *System Access*
35 *State* again until after the next mobile station power-up or until it has received
36 an *Unlock Order*. This requirement shall take precedence over any other mobile
37 station requirement specifying entry to the *System Access State*.
- 38 15. *Maintenance Required Order*: The mobile station shall record the reason for the
39 *Maintenance Required Order* in the mobile station's semi-permanent memory
40 ($MAINTRSN_{S-p}$ equals the least-significant four bits of $ORDQ_r$). The mobile

- 1 station shall remain in the unlocked condition. The mobile station should
2 notify the user of the maintenance required condition.
- 3 16. *Mobile Station Registered Message*: The mobile station shall process the
4 message as specified in 2.6.5.5.4.3.
- 5 17. *Neighbor List Update Message*: The mobile station shall process the message as
6 specified in 2.6.6.2.5.1.
- 7 18. *Outer Loop Report Request Order*: The mobile station shall send the *Outer Loop*
8 *Report Message* in assured mode to the base station.
- 9 19. *Power Control Message*: The mobile station shall process the message as
10 specified in 2.6.4.1.1.3.
- 11 20. *Power Control Parameters Message*: The mobile station shall process the
12 message as specified in 2.6.4.1.1.2.
- 13 21. *Power Up Function Message*: The mobile station shall process the message as
14 specified in 2.6.4.1.7.1.
- 15 22. *Power Up Function Completion Message*: The mobile station shall process the
16 message as specified in 2.6.4.1.7.3.
- 17 23. *Rate Change Message*: The mobile station shall process the message as
18 specified in 2.6.4.1.1.4.
- 19 24. *Release Order*: The mobile station shall disable its transmitter. The Layer 3
20 shall terminate all Call Control instances. The mobile station shall set
21 RSC_MODE_ENABLED to NO. If the mobile station enters the *Release Substate*
22 with a power-down indication, the mobile station may power down; otherwise,
23 the mobile station shall perform the procedures as specified in 2.6.4.4.1.
- 24 25. *Retrieve Parameters Message*: The mobile station shall send, within T_{56m}
25 seconds, a *Parameters Response Message*.
- 26 26. *Retry Order*: The mobile station shall process the order as follows:
- 27 - If $RETRY_TYPE_R$ is equal to '000', the mobile station shall set
28 $RETRY_DELAY_S[RETRY_TYPE]$ to 0, where $RETRY_TYPE$ is equal to '001',
29 '010', '011', '100', or '101'.
- 30 - If $RETRY_TYPE_R$ is equal to '001', '100', or '101', then the mobile station
31 shall perform the following:
- 32 + If $RETRY_DELAY_R$ is equal to '00000000', then the mobile station shall
33 set $RETRY_DELAY_S[RETRY_TYPE_R]$ to 0.
- 34 + If $RETRY_DELAY_R$ is not equal to '00000000', the mobile station shall set
35 $RETRY_DELAY_S[RETRY_TYPE_R]$ as follows:
- 36 ○ If the most significant bit of the $RETRY_DELAY_R$ is 0, set
37 $RETRY_DELAY_UNIT_S$ to 1000ms. If the most significant bit of the
38 $RETRY_DELAY_R$ is '1', set $RETRY_DELAY_UNIT_S$ to 60000ms.

- 1 ○ The mobile station shall set $RETRY_DELAY_VALUE_S$ to the seven
2 least significant bits of $RETRY_DELAY_R$.
- 3 ○ The mobile station shall store the next system time 80 ms boundary
4 + $RETRY_DELAY_VALUE_S \times RETRY_DELAY_UNIT_S$ ms as
5 $RETRY_DELAY_S[RETRY_TYPE_R]$.
- 6 27. *Service Option Control Message*: The mobile station shall process the message
7 in accordance with the requirements for the active service subfunction (see
8 2.6.4.1.2.2).
- 9 28. *Service Option Control Order*: The mobile station shall process the message in
10 accordance with the requirements for the active service subfunction (see
11 2.6.4.1.2.2).
- 12 29. *Service Redirection Message*: The mobile station shall disable its transmitter. If
13 the mobile station enters the *Release Substate* with a power-down indication,
14 the mobile station may power down (if powering down, the Layer 3 shall
15 terminate all Call Control instances); otherwise, the mobile station shall
16 process the message as follows:
17 - If $RECORD_TYPE_R$ is '00000000', the mobile station shall perform the
18 following:
19 + The mobile station shall set $RETURN_IF_FAIL_S = RETURN_IF_FAIL_R$.
20 + If $DELETE_TMSI_R$ is equal to '1', the mobile station shall set all the
21 bits of $TMSI_CODE_{S-p}$ to '1'.
22 + The mobile station shall disable the full-TMSI timer.
23 + The Layer 3 shall terminate all Call Control instances, and shall
24 enter the *System Determination Substate of the Mobile Station*
25 *Initialization State* with an NDSS off indication (see 2.6.1.1).
26 - If $RECORD_TYPE$ is not equal to '00000000', $REDIRECT_TYPE_R$ is '1',
27 and the mobile station supports the band class and operating mode
28 specified in the message, the mobile station shall perform the following:
29 + The mobile station shall store the redirection record received in the
30 message as $REDIRECT_REC_S$.
31 + The mobile station shall set $RETURN_IF_FAIL_S = RETURN_IF_FAIL_R$.
32 + If $DELETE_TMSI_R$ is equal to '1', the mobile station shall set all the
33 bits of $TMSI_CODE_{S-p}$ to '1'.
34 + The mobile station shall disable the full-TMSI timer.
35 + The Layer 3 shall terminate all Call Control instances, and shall
36 enter the *System Determination Substate of the Mobile Station*
37 *Initialization State* with a redirection indication (see 2.6.1.1).

- Otherwise, the mobile station shall discard the message and send a *Mobile Station Reject Order* (ORDQ set to the applicable reason code as determined from Table 2.7.3-1) within T_{56m} seconds.

30. *Status Request Message*: The mobile station shall send, within T_{56m} seconds, a Status Response Message. If the message does not specify any qualification information (QUAL_INFO_TYPE_r is equal to '00000000'), the mobile station shall include the requested information records in the *Status Response Message*. If the message specifies a band class (QUAL_INFO_TYPE_r is equal to '00000001'), the mobile station shall only include the requested information records for the specified band class (BAND_CLASS_r) in the *Status Response Message*. If the message specifies a band class and an operating mode (QUAL_INFO_TYPE_r is equal to '00000010'), the mobile station shall only include the requested information records for the specified band class (BAND_CLASS_r) and operating mode (OP_MODE_r) in the *Status Response Message*. If the message specifies a band class or a band class and an operating mode which are not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00000110' (message requires a capability that is not supported by the mobile station). If the response to this message exceeds the allowable length, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00001000' (response message would exceed the allowable length). If the message specifies an information record which is not supported by the mobile station for the specified band class and operating mode, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00001001' (information record is not supported for the specified band class and operating mode).
31. *Status Request Order*: If CDMABAND_s is equal to '00000', the mobile station shall send, a *Status Message* within T_{56m} seconds. The mobile station shall respond with information corresponding to the current band class and operating mode.
32. *Supplemental Channel Assignment Message*: The mobile station shall process the message as specified in 2.6.6.2.5.1.
33. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code as follows:
- The mobile station shall store the length of the TMSI zone field by setting ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r;
 - The mobile station shall store the assigning TMSI zone number by setting the ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
 - The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to TMSI_CODE_r.

The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p} to TMSI_EXP_TIME_r. The mobile station shall disable the

- 1 full-TMSI timer. The mobile station shall then respond with a *TMSI Assignment*
2 *Completion Message* within T_{56m} seconds.
- 3 34. *Universal Handoff Direction Message*: The mobile station shall process the
4 message as specified in 2.6.6.2.5.1.
- 5 35. *User Zone Reject Message*: The mobile station shall process this message as
6 specified in 2.6.9.2.2.
- 7 36. *User Zone Update Message*: The mobile station shall process this message as
8 specified in 2.6.9.2.2.
- 9 37. *Extended Release Message*:
- 10 - If USE_EXT_CH_IND is equal to '0' and CH_IND is equal to '111' or the
11 physical channels indicated by the two least significant bits of CH_IND
12 includes all the physical channels (FCH, DCCH, or both) currently being
13 processed by the mobile station, then the mobile station shall perform the
14 following:
- 15 + If the mobile station supports operation in the reduced slot cycle mode
16 following release of the traffic channel, the mobile station shall perform
17 the following:
- 18 o If RSC_MODE_ENABLED is equal to YES, the mobile station shall
19 perform the following:
- 20 o If RSC_MODE_SUPPORTED_r is equal to '1', the mobile station
21 shall perform the following:
- 22 - Set RSC_END_TIME to the earlier of the current value of
23 RSC_END_TIME, and the system time specified by
24 MAX_RSC_END_TIME_UNIT_r and
25 MAX_RSC_END_TIME_VALUE_r.
- 26 - Set IGNORE_QPCH_s to IGNORE_QPCH_r.
- 27 o If RSC_MODE_SUPPORTED_r is equal to '0', the mobile station
28 shall set RSC_MODE_ENABLED to NO.
- 29 o If RSC_MODE_ENABLED is equal to NO, the mobile station shall
30 perform the following:
- 31 o If REQ_RSCI_INCL_r is included and set to '1', and the mobile
32 station sent a *Release Order* with ORDQ equal to '0000011', the
33 mobile station shall send an *Extended Release Response Message*
34 with the RSC_MODE_IND field set to '1', and perform the
35 following:
- 36 - Set RSC_MODE_ENABLED to YES.
- 37 - Set the RSC_END_TIME_UNIT and RSC_END_TIME_VALUE
38 fields as specified in 2.7.2.3.2.25, and store the system time

specified by these fields as RSC_END_TIME. The value of RSC_END_TIME shall be no later than the system time specified by MAX_RSC_END_TIME_UNIT_r and MAX_RSC_END_TIME_VALUE_r received in the *Extended Release Message*.

- Set the RSCI field as specified in 2.7.2.3.2.25 and store it as RSCI_s; if RSCI_s is equal to '0111', set SLOTTED_s to NO.
- Set IGNORE_QPCH_s to IGNORE_QPCH_r.

- + The mobile station shall disable its transmitter.
- + The Layer 3 shall terminate all Call Control instances.
- + If the mobile station enters the *Release Substate* with a power-down indication, the mobile station may power down; otherwise, the mobile station shall perform the procedures as specified in 2.6.4.4.1.

- Otherwise, the mobile station shall discard the *Extended Release Message* and send a *Mobile Station Reject Order* with ORDQ field set to '0000010' (message not accepted in this state) within T_{56m} seconds.
- If the mobile station receives a message that is not included in the above list or cannot be processed, the mobile station shall discard the message and send a *Mobile Station Reject Order* (ORDQ set to the applicable reason code as determined from Table 2.7.3-1) within T_{56m} seconds. If the mobile station receives a Call Control message (see 2.6.10) which is directed to a Call Control instance that does not exist, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to '00010001' (no call control instance present with the specified identifier) to the base station within T_{56m} seconds.
- If the bits of TMSI_CODE_{s-p} are not all equal to '1', and if System Time (in 80 ms units) exceeds TMSI_EXP_TIME_{s-p} × 2¹², the mobile station shall set all the bits of TMSI_CODE_{s-p} to '1' within T_{66m} seconds.
- If the full-TMSI timer expires or has expired, the mobile station shall set all the bits of TMSI_CODE_{s-p} to '1'. The mobile station shall update the registration variables as described in 2.6.5.5.2.5.

2.6.4.4.1 Procedures for Exiting the Release Substate

The mobile station shall perform the following procedures in the order listed below.

If the mobile station received an *Extended Release Message* with the RER_MODE_ENABLED field set to '1', then the mobile station shall set RER_MODE_ENABLED to YES, RER_COUNT to 0, and shall perform the following:

- The mobile station shall store the following:
 - Maximum number of *Radio Environment Messages* that the mobile station is permitted to transmit while in radio environment reporting mode

- 1 (RER_MAX_NUM_MSG_s = *infinity*, if RER_MAX_NUM_MSG_IDX_r is equal to
2 '111'; otherwise, RER_MAX_NUM_MSG_s = 2^{RER_MAX_NUM_MSG_IDX_r}).
- 3 - Maximum number of pilots to maintain in RER_PILOT_LIST
4 (MAX_RER_PILOT_LIST_SIZE_s = MAX_RER_PILOT_LIST_SIZE_r).
- 5 - System identification for radio environment reporting mode (RER_SID_s = SID_s).
- 6 - Network identification for radio environment reporting mode (RER_NID_s = NID_s).
- 7 • The mobile station shall initialize the radio environment report pilot list
8 (RER_PILOT_LIST) to contain the set of pilots that made up the Active Set on the
9 Traffic Channel.
- 10 • The mobile station shall enable the radio environment report timer with an initial
11 value of *infinity* if RER_TIME_r is equal to '111'; otherwise, the mobile station shall
12 enable the radio environment report timer with an initial value of 2^{RER_TIME_r}
13 seconds if RER_TIME_UNIT_r is equal to '00', or 2^{RER_TIME_r} minutes if
14 RER_TIME_UNIT_r is equal to '01', or 2^{RER_TIME_r} hours if RER_TIME_UNIT_r is equal
15 to '10'.

16 If the mobile station received an *Extended Release Message* with the TKZ_MODE_ENABLED
17 field set to '1', then the mobile station shall set TKZ_COUNT to 0, and shall perform the
18 following:

- 19 • The mobile station shall store the following:
- 20 - Tracking zone identifier (TKZ_ID_s = TKZ_ID_r).
- 21 - Tracking zone list length (TKZ_LIST_LEN_s = TKZ_LIST_LEN_r).
- 22 - TKZ timer (TKZ_TIMER_s = TKZ_TIMER_r).
- 23 - Maximum number of *Radio Environment Messages* that the mobile station is
24 permitted to transmit while in tracking zone mode (TKZ_MAX_NUM_MSG_s =
25 *infinity*, if TKZ_MAX_NUM_MSG_IDX_r is equal to '111'; otherwise,
26 TKZ_MAX_NUM_MSG_s = 2^{TKZ_MAX_NUM_MSG_IDX_r}).
- 27 - System identification for tracking zone mode (TKZ_SID_s = SID_s).
- 28 - Network identification for tracking zone mode (TKZ_NID_s = NID_s).
- 29 - Tracking zone update period (TKZ_UPDATE_PRD_s = TKZ_UPDATE_PRD_r).
- 30 • If RER_MODE_ENABLED is equal to NO, the mobile station shall set
31 TKZ_MODE_ENABLED to YES; otherwise, the mobile station shall set
32 TKZ_MODE_PENDING to YES.
- 33 • If TKZ_MODE_ENABLED is equal to YES, the mobile station shall perform the
34 following:
- 35 - Initialize the tracking zone list (TKZ_LIST) to contain TKZ_ID_s.

- 1 - Enable the tracking zone update timer with an initial value of infinity if
2 TKZ_UPDATE_PRD_s is equal to '1111'; otherwise, the mobile station shall enable
3 the tracking zone update timer with an initial value of $2^{TKZ_UPDATE_PRD_s} + 6$
4 seconds.

5 The mobile station shall perform the following procedures to determine whether to enter
6 the *Mobile Station Idle State* or *System Determination Substate* of the *Mobile Station*
7 *Initialization State*.

8 If the mobile station received an *Extended Release Message* with
9 DIRECT_TO_IDLE_INFO_INCL field equal to '1' and RELEASE_TYPE_r equal to '011', the
10 mobile station shall enter the *System Determination Substate* of the *Mobile Station*
11 *Initialization Substate* with a release indication (see 2.6.1.1).

12 If the mobile station received an *Extended Release Message* with
13 DIRECT_TO_IDLE_INFO_INCL field equal to '1', RELEASE_TYPE_r equal to a value other
14 than '011', and all the following conditions are met:

- 15 • The system indicated by this message is a preferred system according to system
16 selection process of the mobile station, and
- 17 • If the BAND_CLASS field is included in this message, the mobile station supports
18 the band class capability specified by this field, and
- 19 • If the SR1_TD_MODE field is included in this message, the mobile station supports
20 the transmit diversity capability specified by this field, and
- 21 • The mobile station is able to select one of the pilots in the DIRECT TO IDLE record
22 of the *Extended Release Message* with sufficient signal strength to enter *Mobile*
23 *Station Idle State*.

24 then, the mobile station shall perform the following:

- 25 • If RELEASE_TYPE_r equals '000', the mobile station shall perform the following:
 - 26 - If FREQ_INCL_r equals '1', the mobile station shall set CDMABAND_s to
27 BAND_CLASS_r and CDMACH_s to CDMA_FREQ_r.
 - 28 - The mobile station shall store the following:
 - 29 + PAGECH_s = PAGE_CH_r
 - 30 + PRAT_s = PRAT_r
 - 31 - The mobile station shall then perform the following:
 - 32 + Set its code channel to PAGECH_s,
 - 33 + Set the Paging Channel data rate as determined by PRAT_s,
 - 34 + The mobile station shall enter the *Mobile Station Idle State* on the CDMA
35 Channel specified by CDMABAND_s and CDMACH_s and acquire the specified
36 Paging Channel. If BCMC_INFO_INCL_r is included and is equal to '1', the
37 mobile station may start monitoring the BCMC flows corresponding to the
38 BCMC_FLOW_IDS (See section 2.6.13.11) included in this message after
39 entering the *Mobile Station Idle State* as specified in section 2.6.13, using the

- 1 BCMC flow information included in this message.
- 2 • If RELEASE_TYPE_r equals '001', the mobile station shall perform the following:
- 3 - If FREQ_INCL_r equals '1', the mobile station shall set CDMABAND_s to
- 4 BAND_CLASS_r and CDMACH_s to CDMA_FREQ_r.
- 5 - The mobile station shall store the following:
- 6 + BCCH_s = SR1_BCCH_CODE_CHAN_NON_TD_r
- 7 + BCCH_CODE_RATE_s = SR1_CRAT_NON_TD_r
- 8 + BRAT_s = SR1_BRAT_NON_TD_r
- 9 - The mobile station shall then perform the following:
- 10 + Set its Primary Broadcast Control Channel code channel to BCCH_s,
- 11 + Set the Primary Broadcast Control Channel data rate as determined by
- 12 BRAT_s,
- 13 + Set the Primary Broadcast Control Channel code rate as determined by
- 14 BCCH_CODE_RATE_s,
- 15 + The mobile station shall enter the *Mobile Station Idle State* on the CDMA
- 16 Channel specified by CDMABAND_s and CDMACH_s and acquire the specified
- 17 Primary Broadcast Control Channel. If BCMC_INFO_INCL_r is included and is
- 18 equal to '1', the mobile station may start monitoring the BCMC flows
- 19 corresponding to the BCMC_FLOW_IDs (See section 2.6.13.11) included in
- 20 this message after entering the *Mobile Station Idle State* as specified in
- 21 section 2.6.13, using the BCMC flow information included in this message.
- 22 • If RELEASE_TYPE_r equals '010', the mobile station shall perform the following:
- 23 - If FREQ_INCL_r equals '1', the mobile station shall set CDMABAND_s to
- 24 BAND_CLASS_r and CDMACH_s to CDMA_FREQ_r.
- 25 - The mobile station shall store the following:
- 26 + BCCH_s = SR1_BCCH_CODE_CHAN_TD_r
- 27 + BCCH_CODE_RATE_s = SR1_CRAT_TD_r
- 28 + BRAT_s = SR1_BRAT_TD_r
- 29 - The mobile station shall then perform the following:
- 30 + Set its Primary Broadcast Control Channel code channel to BCCH_s,
- 31 + Set the Primary Broadcast Control Channel data rate as determined by
- 32 BRAT_s,
- 33 + Set the Primary Broadcast Control Channel code rate as determined by
- 34 BCCH_CODE_RATE_s,
- 35 + The mobile station shall enter the *Mobile Station Idle State* on the CDMA
- 36 Channel specified by CDMABAND_s and CDMACH_s and acquire the specified
- 37 Primary Broadcast Control Channel that supports Transmit Diversity. If

1 BCMC_INFO_INCL_T is included and is equal to '1', the mobile station may
 2 start monitoring the BCMC flows corresponding to the BCMC_FLOW_IDS
 3 (See section 2.6.13.11) included in this message after entering the *Mobile*
 4 *Station Idle State* as specified in section 2.6.13, using the BCMC flow
 5 information included in this message.

6 Otherwise, the mobile station shall perform the following:

- 7 • If RELEASE_TO_IDLE_INDs is equal to '0', the mobile station shall enter the System
 8 Determination Substate of the Mobile Station Initialization State with a release
 9 indication (see 2.6.1.1).
- 10 • If RELEASE_TO_IDLE_IND_S is equal to '1', the mobile station shall perform the
 11 following:
 - 12 – If the mobile station has stored BCCH information (BCCH Walsh Code, BCCH
 13 data rate, and BCCH code rate) for a base station which has sufficient pilot
 14 strength, the mobile station shall restore the BCCH information to BCCH_S,
 15 BRAT_S and BCCH_CODE_RATE_S, and then perform the following:
 - 16 + Set its Primary Broadcast Control Channel code channel to BCCH_S,
 - 17 + Set the Primary Broadcast Control Channel data rate as determined by
 18 BRAT_S,
 - 19 + Set the Primary Broadcast Control Channel code rate as determined by
 20 BCCH_CODE_RATE_S,
 - 21 + The mobile station shall enter the *Mobile Station Idle State*.
 - 22 – Otherwise, the mobile station shall perform the following:
 - 23 + If the mobile station has stored PCH information (PCH number and PCH
 24 data rate) for a base station which has sufficient pilot strength, the mobile
 25 station shall restore the PCH information to PAGECH_S and PRAT_S, and then
 26 perform the following:
 - 27 o Set its code channel to PAGECH_S,
 - 28 o Set the Paging Channel data rate as determined by PRAT_S,
 - 29 o The mobile station shall enter the *Mobile Station Idle State*,
 - 30 + Otherwise, the mobile station shall perform the following:
 - 31 o If IDLE_SID is equal to SID_S, IDLE_CDMABAND is equal to
 32 CDMABAND_S, IDLE_NID is equal to NID_S, and IDLE_P_REV is equal to
 33 P_REV_S, and the mobile station decides to enter the *Mobile Station Idle*
 34 *State*, the mobile station shall perform the following:
 - 35 ◇ The mobile station shall set CDMACH_S to IDLE_CDMA_CHAN.
 - 36 ◇ If IDLE_BCCH_CHAN is equal to '1', the mobile station shall perform
 37 the following:
 - 38 – Set its Primary Broadcast Control Channel code channel to

- 1 BCCH_s,
- 2 – Set the Primary Broadcast Control Channel data rate as
- 3 determined by BRAT_s,
- 4 – Set the Primary Broadcast Control Channel code rate as
- 5 determined by BCCH_CODE_RATE_s,
- 6 – The mobile station shall enter the *Mobile Station Idle State*.
- 7 ◇ If IDLE_BCCH_CHAN is equal to '0', the mobile station shall perform
- 8 the following:
- 9 – Set its code channel to PAGECH_s,
- 10 – Set the Paging Channel data rate as determined by PRAT_s,
- 11 – The mobile station shall enter the *Mobile Station Idle State*.
- 12 o Otherwise, the mobile station shall enter the *System Determination*
- 13 *Substate* of the *Mobile Station Initialization State* with a release indication
- 14 (see 2.6.1.1).

15 2.6.5 Registration

16 2.6.5.1 Forms of Registration

17 Registration is the process by which the mobile station notifies the base station of its

18 location, status, identification, slot cycle, and other characteristics. The mobile station

19 informs the base station of its location and status so that the base station can efficiently

20 page the mobile station when establishing a mobile station terminated call. For operation

21 in the slotted mode, the mobile station supplies the SLOT_CYCLE_INDEX parameter so

22 that the base station can determine which slots the mobile station is monitoring. The

23 mobile station supplies the station class mark and the protocol revision number so that the

24 base station knows the capabilities of the mobile station.

25 The CDMA system supports 12 different forms of registration:

- 26 1. Power-up registration. The mobile station registers when it powers on, switches
- 27 from using a different frequency block designator, switches from using a different
- 28 band class, switches from using an alternative operating mode, or upon the
- 29 insertion of an R-UIM into a powered-on ME.
- 30 2. Power-down registration. The mobile station registers when it powers off if
- 31 previously registered in the current serving system.
- 32 3. Timer-based registration. The mobile station registers when a timer expires.
- 33 4. Distance-based registration. The mobile station registers when the distance
- 34 between the current base station and the base station in which it last registered
- 35 exceeds a threshold.
- 36 5. Zone-based registration. The mobile station registers when it enters a new zone.
- 37 6. Parameter-change registration. The mobile station registers when certain of its
- 38 stored parameters change or when it enters a new system.

- 1 7. Ordered registration. The mobile station registers when the base station requests it.
- 2 8. Implicit registration. When a mobile station successfully sends an *Origination*
3 *Message, Reconnect Message, Call Recovery Request Message, or Page Response*
4 *Message*, the base station can infer the mobile station's location. This is considered
5 an implicit registration.
- 6 9. Traffic Channel registration. Whenever the base station has registration information
7 for a mobile station that has been assigned to a Traffic Channel, the base station
8 can notify the mobile station that it is registered.
- 9 10. User Zone Registration. The mobile station registers when it selects an active User
10 Zone (see 2.6.9.1.2).
- 11 11. Encryption/Message Integrity re-sync required registration. The mobile station
12 registers when extended encryption is turned on and the mobile station determines
13 that it can not decrypt any messages from the base station (see 2.3.12.4.1.3) or the
14 mobile station registers when message integrity is supported and the mobile station
15 determines that it can not validate the MACI of any messages from the base station.
- 16 12. BCMC registration. BCMC registration is performed by a mobile station currently
17 monitoring or desiring to monitor a BCMC flow.

18 The first five forms of registration, User Zone Registration, and Encryption/Message
19 Integrity re-sync required registration, as a group, are called autonomous registration and
20 are enabled by roaming status (see 2.6.5.3). Parameter-change registration is independent
21 of roaming status. Ordered registration is initiated by the base station through an *Order*
22 *Message*. Implicit registration does not involve the exchange of any registration messages
23 between the base station and the mobile station. The base station can obtain registration
24 information by sending the *Status Request Message* to the mobile station on either the f-
25 csch or the f-dsch. The base station can obtain limited registration information by sending
26 the *Status Request Order* to the mobile station on the f-dsch. The mobile station can be
27 notified that it is registered through the *Mobile Station Registered Message*.

28 Any of the various forms of autonomous registration and parameter-change registration
29 can be enabled or disabled. The forms of registration that are enabled and the
30 corresponding registration parameters are communicated in the *System Parameters*
31 *Message* on the Paging Channel, or the *ANSI-41 System Parameters Message* on the Primary
32 Broadcast Control Channel.

33 In addition, the mobile station may enable or disable autonomous registration for each type
34 of roaming described in 2.6.5.3.

35 2.6.5.1.1 Power-Up Registration

36 Power-up registration is performed when the mobile station is turned on. To prevent
37 multiple registrations when power is quickly turned on and off, or when the R-UIM is
38 quickly inserted and removed, the mobile station delays either T_{57m} seconds or MS
39 implementation specific value before registering, after entering the *Mobile Station Idle State*.

1 The mobile station shall maintain a power-up/initialization timer. While the power-
 2 up/initialization timer is active, the mobile station shall not make registration access
 3 attempts.

4 Power-up registration is performed when the mobile station changes to a different operating
 5 mode (see 2.6.5.5.1.1), or as indicated by [40]. A power-up registration is also performed
 6 when the mobile station changes band classes, serving system, or frequency block
 7 designator if the conditions stated in 2.6.5.5.1.1 are met.

8 2.6.5.1.2 Power-Down Registration

9 Power-down registration is performed when the user directs the mobile station to power off.
 10 If power-down registration is performed, the mobile station does not power off until after
 11 completing the registration attempt.

12 The mobile station does not perform power-down registration if it has not previously
 13 registered in the system that corresponds to the current SID_s and NID_s (see 2.6.5.5.2.4).

14 2.6.5.1.3 Timer-Based Registration

15 Timer-based registration causes the mobile station to register at regular intervals. Its use
 16 also allows the system to automatically deregister mobile stations that did not perform a
 17 successful power-down registration. Timer-based registration uses a Paging Channel or a
 18 Forward Common Control Channel slot counter (equivalent to a timer with time increments
 19 of 80 ms). Timer-based registration is performed when the counter reaches a maximum
 20 value (REG_COUNT_MAX_s) that is controlled by the base station via the REG_PRD field of
 21 the *System Parameters Message* or *ANSI-41 System Parameters Message*. The base station
 22 disables timer-based registration by setting REG_PRD to zero.

23 If EXT_REG_PRD_INCL_s is set to '1', and mobile station has set the EXT_REG_PRD_USED
 24 field to '1' in recent implicit or explicit registration; then mobile station shall use
 25 EXT_REG_PRD in place of REG_PRD.

26 The mobile station shall maintain a timer-based registration counter (REG_COUNT_s). The
 27 mobile station shall compute and store the timer expiration count (REG_COUNT_MAX_s) as
 28 follows:

- 29 • If EXT_REG_PRD_SUPPORTED_p = '1' and EXT_REG_PRD_INCL_s = '1', the MS shall
 30 set REG_COUNT_MAX_s to a value which is a power of two and between
 31 $\lfloor 2^{\text{REG_PRD}/4} \rfloor$ and $\lfloor 2^{\text{EXT_REG_PRD}} \rfloor \times 14 \times 3600 / 0.08$; Otherwise, the mobile
 32 station shall set REG_COUNT_MAX_s = $\lfloor 2^{\text{REG_PRD}/4} \rfloor$.

33 The mobile station shall maintain an indicator of timer-based registration timer enable
 34 status (COUNTER_ENABLED_s).

35 The counter is reset after each successful registration.

36 Whenever the mobile station changes COUNTER_ENABLED_s from NO to YES, it shall set
 37 REG_COUNT_s as follows:

38 If the mobile station supports the procedure described in section 2.6.5.1.3.1 and the
 39 conditions for suppression of randomization of timer-based registration are met, the mobile
 40 station shall set REG_COUNT_s to 0; otherwise, the mobile station shall set REG_COUNT_s

1 based upon the value of TBR_RAND_WINDOW_s as shown in Table 2.6.5.1.3-1. When
 2 setting REG_COUNT_s to a pseudorandom value, the mobile station shall use the
 3 pseudorandom number generator specified in 2.6.7.2.

4 **Table 2.6.5.1.3-1. Percentage of Randomization for Timer-based registration**

Value of TBR_RAND_WINDOW (binary)	Meaning	REG_COUNT _s
00	0% randomization	0
01	25% randomization	Pseudorandom value between 0 and $\lfloor \text{REG_COUNT_MAX}_s/4 \rfloor - 1$
10	50% randomization	Pseudorandom value between 0 and $\lfloor \text{REG_COUNT_MAX}_s/2 \rfloor - 1$
11	100% randomization	Pseudorandom value between 0 and $(\text{REG_COUNT_MAX}_s - 1)$

5 If the mobile station is operating in the non-slotted mode, it shall increment the timer-
 6 based registration counter once per 80 ms whenever COUNTER_ENABLED_s equals YES. If
 7 the mobile station is operating in slotted mode, it may increment the timer-based
 8 registration counter when it begins to monitor the Paging Channel (see 2.6.2.1.1.3) or the
 9 Forward Common Control Channel. A mobile station operating in the slotted mode shall
 10 increment the counter by the same amount that the counter would have been incremented
 11 if the mobile station had been operating in the non-slotted mode.⁶²

12 2.6.5.1.3.1 Timer-Based Registration based on Frequency of Implicit Registrations

13 A mobile station may support a procedure to prevent unnecessary timer-based
 14 registrations when implicit registrations are sent frequently.

15 If the mobile station supports this procedure, the mobile station shall set REG_COUNT_s to
 16 0 when it changes COUNTER_ENABLED_s from NO to YES if all of the following conditions
 17 for suppression of randomization of timer-based registrations are met:

- 18 • the mobile station has been powered on for the past $\lfloor 2^{\text{REG_PRD}/4} \rfloor \times 0.32$ seconds,
- 19 • in every period of $\lfloor 2^{\text{REG_PRD}/4} \rfloor \times 0.08$ consecutive seconds in the past
 20 $\lfloor 2^{\text{REG_PRD}/4} \rfloor \times 0.32$ seconds the mobile station sent at least one *Origination*
 21 *Message*, *Page Response Message*, or *Reconnect Message*, or the
 22 mobile station was in the *Mobile Station Control on the Traffic Channel State* for at
 23 least part of the period,

⁶² For example, if the mobile station uses a 2.56 second slot cycle, then it may increment the counter by 32 every time it becomes active.

- 1 • TBR_RAND_SUPPR_ENABLE_s is equal to '1'.
- 2 • If either of the following two conditions are true:
 - 3 - the mobile station was not in the *Mobile Station Control on the Traffic Channel*
 - 4 *State* at any time during the past $\lfloor 2^{\text{REG_PRD}/4} \rfloor \times 0.32$ seconds, or
 - 5 - the mobile station was in the *Mobile Station Control on the Traffic Channel State*
 - 6 during the past $\lfloor 2^{\text{REG_PRD}/4} \rfloor \times 0.32$ seconds, but it was not continuously in
 - 7 the *Mobile Station Control on the Traffic Channel State* for the entire duration of
 - 8 the past $\lfloor 2^{\text{REG_PRD}/4} \rfloor \times 0.32$ seconds.

9 2.6.5.1.4 Distance-Based Registration

10 Distance-based registration causes a mobile station to register when the distance between
 11 the current base station and the base station in which it last registered exceeds a
 12 threshold. The mobile station determines that it has moved a certain distance by
 13 computing a distance measure based on the difference in latitude and longitude between
 14 the current base station and the base station where the mobile station last registered. If
 15 this distance measure exceeds the threshold value, the mobile station registers.

16 The mobile station stores the base station latitude (BASE_LAT_REG_{s-p}), the base station
 17 longitude (BASE_LONG_REG_{s-p}) and the registration distance (REG_DIST_REG_{s-p}), of the
 18 base station to which the first access probe (for a *Registration Message*, *Origination*
 19 *Message*, *Reconnect Message*, *Call Recovery Request Message*, or *Page Response Message*
 20 sent on the r-csch) was transmitted after entering the *System Access State*. The mobile
 21 station shall compute the current base station's distance from the last registration point
 22 (DISTANCE) as:

$$23 \quad \text{DISTANCE} = \lfloor \frac{\sqrt{(\Delta\text{lat})^2 + (\Delta\text{long})^2}}{16} \rfloor,$$

24 where

$$25 \quad \Delta\text{lat} = \text{BASE_LAT}_s - \text{BASE_LAT_REG}_{s-p}$$

26 and

$$27 \quad \Delta\text{long} = (\text{BASE_LONG}_s - \text{BASE_LONG_REG}_{s-p}) \times \cos(\pi/180 \times \text{BASE_LAT_REG}_{s-p}/14400).$$

28 The mobile station shall compute DISTANCE with an error of no more than $\pm 5\%$ of its true
 29 value when $|\text{BASE_LAT_REG}_{s-p}/14400|$ is less than 60 and with an error of no more than
 30 $\pm 7\%$ of its true value when $|\text{BASE_LAT_REG}_{s-p}/14400|$ is between 60 and 70.⁶³

⁶³ BASE_LAT and BASE_LONG are given in units of 1/4 seconds. BASE_LAT/14400 and
 BASE_LONG/14400 are in units of degrees.

2.6.5.1.5 Zone-Based Registration

Registration zones are groups of base stations within a given system and network. A base station's zone assignment is identified by the REG_ZONE field of the *System Parameters Message*, *ANSI-41 System Parameters Message* or *Mobile Station Registered Message*.

Zone-based registration causes a mobile station to register whenever it determines it is in a new zone (see 2.6.5.5.2.1), not on its internally stored list of visited registration zones. A zone is added to the list whenever a registration (including implicit registration) occurs, and is deleted upon expiration of a timer. After a system access, timers are enabled for every zone except one that was successfully registered by the access.

A mobile station can be registered in more than one zone. Zones are uniquely identified by a zone number (REG_ZONE) plus the SID and NID of the zone.

The mobile station shall store a list of the zones in which the mobile station has registered (ZONE_LIST_s). Each entry in ZONE_LIST_s shall include the zone number (REG_ZONE) and the (SID, NID) pair for the zone. The mobile station shall be capable of storing at least N_{9m} entries in ZONE_LIST_s. A base station shall be considered to be in ZONE_LIST_s only if the base station's REG_ZONE, SID and NID are found in an entry in ZONE_LIST_s. The mobile station provides storage for one entry of ZONE_LIST_s in semi-permanent memory, ZONE_LIST_{s-p} (see 2.3.4).

The mobile station shall maintain a zone list entry timer for each entry in ZONE_LIST_s. When an entry in ZONE_LIST_s is removed from the list, the corresponding zone list entry timer shall be disabled. The timer duration shall be as determined from the stored value of ZONE_TIMER_s using Table 3.7.2.3.2.1-1. The mobile station shall provide a means to examine each timer's value while the timer is active, so that the age of list entries can be compared.

If the mobile station supports one of more band classes that contain multiple frequency block designators, the mobile station shall maintain an identifier of the frequency block designator for each entry in ZONE_LIST_s (see [45]). When the mobile station adds a zone to ZONE_LIST_s, the mobile station shall include the identifier for the frequency block designator.⁶⁴

If the mobile station supports multiple band classes, the mobile station shall maintain an identifier of the band class for each entry in ZONE_LIST_s (see [45]). When the mobile station adds a zone to ZONE_LIST_s, the mobile station shall include the identifier for the band class.

The base station controls the maximum number of zones in which a mobile station may be considered registered, by means of the TOTAL_ZONES field of the *System Parameters Message*, *ANSI-41 System Parameters Message* or *Mobile Station Registered Message*. When an entry is added to the zone list, or if TOTAL_ZONES is decreased, the mobile station

⁶⁴ The mobile station need not maintain a separate identifier for Band Class 0, as the least significant bit of the SID identifies the serving system.

1 removes entries from the zone list if there are more entries than allowed by the setting of
2 TOTAL_ZONES.

3 Whenever ZONE_LIST_s contains more than TOTAL_ZONES_s entries, the mobile station
4 shall delete the excess entries according to the following rules:

- 5 • If TOTAL_ZONES_s is equal to zero, the mobile station shall delete all entries.
- 6 • If TOTAL_ZONES_s is not equal to zero, the mobile station shall delete those entries
7 having active zone list entry timers, starting with the oldest entry, as determined by
8 the timer values, and continuing in order of decreasing age until no more than
9 TOTAL_ZONES_s entries remain.

10 The mobile station shall store a list of the systems/networks in which the mobile station
11 has registered (SID_NID_LIST_s). Each entry in SID_NID_LIST_s shall include the (SID, NID)
12 pair for the system/network. The mobile station shall be capable of storing N_{10m} entries in
13 SID_NID_LIST_s. A base station shall be considered to be in the SID_NID_LIST_s only if the
14 base station's SID and NID are found in an entry in SID_NID_LIST_s. The mobile station
15 shall provide storage for one entry of SID_NID_LIST_s in semi-permanent memory
16 (SID_NID_LIST_{s-p}).

17 If the mobile station supports one or more band classes that contain multiple frequency
18 block designators, the mobile station shall maintain an identifier of the frequency block
19 designator for each entry in SID_NID_LIST_s (see [45]). When the mobile station adds an
20 entry to SID_NID_LIST_s, the mobile station shall include the identifier for the frequency
21 block designator.

22 If the mobile station supports multiple band classes, the mobile station shall maintain an
23 identifier of the band class for each entry in SID_NID_LIST_s (see [45]). When the mobile
24 station adds an entry to SID_NID_LIST_s, the mobile station shall include the identifier for
25 the band class.

26 The mobile station shall maintain a SID/NID list entry timer for each entry in
27 SID_NID_LIST_s. When an entry in SID_NID_LIST_s is removed from the list, the
28 corresponding SID/NID list entry timer shall be disabled. The timer duration shall be as
29 determined from the stored value of ZONE_TIMER_s using Table 3.7.2.3.2.1-1. The mobile
30 station shall provide a means to examine each timer's value while the timer is active, so
31 that the age of list entries can be compared.

32 Whenever SID_NID_LIST_s contains more than N_{10m} entries, the mobile station shall delete
33 the excess entries according to the following rule:

- 34 • The mobile station shall delete those entries having active SID/NID list entry timers,
35 starting with the oldest entry, as determined by the timer values, and continuing in
36 order of decreasing age.

37 Whenever MULT_SIDS_s is equal to '0' and SID_NID_LIST contains entries with different
38 SIDs, the mobile station shall delete the excess entries according to the following rules:

- 39 • If the SID/NID entry timer for any entry is disabled, the mobile station shall delete
40 all entries not having the same SID as the entry whose timer is disabled;

- Otherwise, the mobile station shall delete all entries not having the same SID as the newest entry in SID_NID_LIST, as determined by the timer values.

Whenever MULT_NIDS_s is equal to '0', and SID_NID_LIST contains more than one entry for any SID, the mobile station shall delete the excess entries for each SID according to the following rules:

- If the SID/NID entry timer for any entry is disabled, the mobile station shall delete all entries for that SID except the entry whose timer is disabled;
- For all other SIDs, the mobile station shall delete all entries for each SID except the newest entry, as determined by the timer values.

2.6.5.1.6 Parameter-Change Registration

Parameter-change registration is performed when a mobile station modifies any of the following stored parameters:

- The preferred slot cycle index (SLOT_CYCLE_INDEX_p)
- The station class mark (SCM_p)
- The call termination enabled indicators (MOB_TERM_HOME_p, MOB_TERM_FOR_SID_p, and MOB_TERM_FOR_NID_p)

Parameter-change registration may be performed when a mobile station modifies the following stored parameter:

- DEVICE_CHARACTERISTIC_p

Parameter-change registration is also performed when any of the following capabilities supported by the mobile station changes:

- The band classes
- The band subclasses
- The power classes
- The radio configurations
- The operating modes
- Transmit diversity (OTD or STS)
- Quick Paging Channel
- Spreading Rate 3 common channels support
- Encryption capability

Parameter-change registration is performed whenever there is no entry in the mobile station's SID_NID_LIST_s that matches the base station's SID and NID.

1 Parameter-change registration is independent of the roaming status of the mobile station.⁶⁵

2 Whenever a parameter changes, the mobile station shall delete all entries from
3 SID_NID_LIST_s.

4 2.6.5.1.7 Ordered Registration

5 The base station can command the mobile station to register by sending a *Registration*
6 *Request Order*. Ordered registration is performed in the *Mobile Station Order and Message*
7 *Processing Operation* (2.6.2.4). Requirements are specified in 2.6.5.5.2.3.

8 2.6.5.1.8 Implicit Registration

9 Whenever an *Origination Message*, *Reconnect Message*, *Call Recovery Request Message*, or
10 *Page Response Message* is sent, the base station can infer the location of the mobile
11 station. This is considered an implicit registration. Requirements are specified in
12 2.6.5.5.3.

13 2.6.5.1.9 Traffic Channel Registration

14 While a mobile station is assigned a Traffic Channel, the mobile station is notified that it is
15 registered through the *Mobile Station Registered Message*. Requirements are specified in
16 2.6.5.5.4.3.

17 2.6.5.1.10 User Zone Registration

18 User Zone registration is performed when the mobile station selects an active User Zone
19 (see 2.6.9.2.1).

20 2.6.5.1.11 Encryption/Message Integrity Re-sync Required Registration

21 Encryption/Message Integrity re-sync required registration is performed when the mobile
22 station determines that it can not decrypt any message or validate the MACI of any
23 message from the base station (see 2.3.12.4.1.3). This type of registration is needed for the
24 mobile station to recover from any encryption/message integrity out-of-sync scenario.

25 2.6.5.1.12 BCMC Registration

26 BCMC registration is performed when the mobile station is to monitor a BCMC flow that is
27 being transmitted from a band class or frequency different than where the mobile station
28 currently resides. The BCMC registration is also used when the mobile station desires to
29 monitor a BCMC flow configured for transmission which is currently not being transmitted.
30 Requirements are specified in 2.6.13.3.

31 BCMC registration is performed by a mobile station currently monitoring or desiring to
32 monitor a BCMC flow; it is performed for the following reasons:

33 1) When the mobile station is to monitor a BCMC flow given by BCMC_FLOW_ID, if the
34 band class or frequency where this BCMC flow is being transmitted is different from the
35 band class or frequency where the mobile station currently resides, the mobile station

⁶⁵ The indicator REG_ENABLED does not govern parameter-change registration.

- 1 performs a BCMC registration to inform the base station so that the base station can
2 determine in which frequency to page the mobile station.
- 3 2) The BCMC registration is also used when the mobile station desires to monitor a BCMC
4 flow configured for transmission which is currently not being transmitted, the mobile
5 station performs a BCMC registration to request transmission of that flow.
- 6 3) When the mobile station is currently monitoring a BCMC flow and the base station turns
7 on the registration required flag in the *BCMC Service Parameters Message*, the mobile
8 station performs a BCMC registration. Requirements are specified in 2.6.13.3.

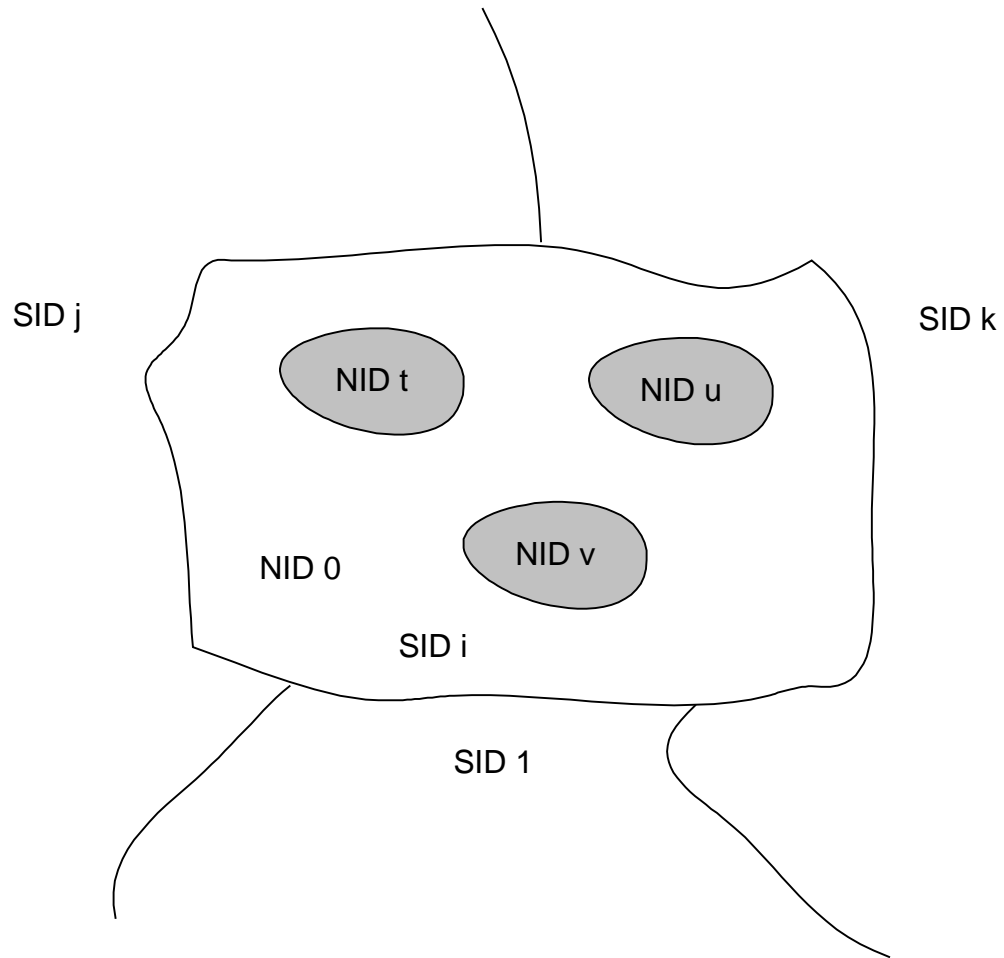

9 2.6.5.2 Systems and Networks

10 A base station is a member of a cellular or PCS system and a network. A network is a
11 subset of a system.

12 Systems are labeled with an identification called the system identification or SID; networks
13 within a system are given a network identification or NID. A network is uniquely identified
14 by the pair (SID, NID). The SID number 0 is a reserved value. The NID number 0 is a
15 reserved value indicating all base stations that are not included in a specific network. The
16 NID number 65535 ($2^{16}-1$) is a reserved value the mobile station may use for roaming
17 status determination (see 2.6.5.3) to indicate that the mobile station considers the entire
18 SID (regardless of NID) as home (non-roaming).

19 Figure 2.6.5.2-1 shows an example of systems and networks. SID i contains three
20 networks labeled t , u , and v . A base station in system i that is not in one of these three
21 networks is in NID 0.

22

1
2 **Figure 2.6.5.2-1. Systems and Networks Example**

3 2.6.5.3 Roaming

4 The mobile station has a list of one or more home (non-roaming) (SID, NID) pairs. A mobile
5 station is roaming if the stored (SID_s, NID_s) pair (received in the *System Parameters*
6 *Message* on the Paging Channel, or the *ANSI-41 System Parameters Message* on the Primary
7 Broadcast Control Channel) does not match one of the mobile station's non-roaming (SID,
8 NID) pairs. Two types of roaming are defined: A mobile station is a foreign NID roamer if
9 the mobile station is roaming and there is some (SID, NID) pair in the mobile station's (SID,
10 NID) list for which SID is equal to SID_s. A mobile station is a foreign SID roamer if there is
11 no (SID, NID) pair in the mobile station's (SID, NID) list for which SID is equal to SID_s⁶⁶.

⁶⁶ For example, suppose a mobile station has the following SID, NID list: (2, 3), (2, 0), (3, 1). If the base station (SID, NID) pair is (2, 3), then the mobile station is not roaming because the (SID, NID) pair is in the list. If the base station (SID, NID) pair is (2, 7), then the mobile station is a foreign NID
(footnote continued on next page)

1 The mobile station may use the special NID value 65535 to indicate that the mobile station
 2 considers all NIDs within a SID to be non-roaming (i.e., that the mobile station is not
 3 roaming when operating with any base station in that system).

4 The mobile station shall store three 1-bit parameters in its permanent memory (see 2.3.8).
 5 These parameters are MOB_TERM_HOME_p, MOB_TERM_FOR_SID_p, and MOB_TERM-
 6 _FOR_NID_p. The mobile station shall set MOB_TERM_HOME_p to '1' if the mobile station is
 7 configured to receive mobile station terminated calls when using a home (SID, NID) pair;
 8 otherwise, the mobile station shall set MOB_TERM_HOME_p to '0'. The mobile station shall
 9 set MOB_TERM_FOR_SID_p to '1' if the mobile station is configured to receive mobile station
 10 terminated calls when it is a foreign SID roamer; otherwise MOB_TERM_FOR_SID_p shall be
 11 set to '0'. The mobile station shall set MOB_TERM_FOR_NID_p to '1' if the mobile station is
 12 configured to receive mobile station terminated calls when it is a foreign NID roamer;
 13 otherwise the mobile station shall set MOB_TERM_FOR_NID_p to '0'.

14 The mobile station determines the registration status using these parameters and the
 15 HOME_REG, FOR_NID_REG, and FOR_SID_REG fields of the *System Parameters Message*
 16 or *ANSI-41 System Parameters Message*.

17 The mobile station shall store a mobile station call termination enabled indicator,
 18 MOB_TERM_s. The mobile station shall set MOB_TERM_s to YES if any of the following
 19 conditions is met:

- 20 • The mobile station is not roaming, and MOB_TERM_HOME_p is equal to '1'; or
- 21 • The mobile station is a foreign NID roamer and MOB_TERM_FOR_NID_p is equal to
 22 '1'; or
- 23 • The mobile station is a foreign SID roamer and MOB_TERM_FOR_SID_p is equal to
 24 '1';

25 otherwise the mobile station shall set MOB_TERM_s to NO.

26 The mobile station shall store a registration status indicator, REG_ENABLED_s. The mobile
 27 station shall set the indicator REG_ENABLED_s to YES if any of the following conditions is
 28 met for the mobile station:

- 29 • The mobile station is not roaming, and both HOME_REG_s and MOB_TERM_HOME_p
 30 are equal to '1'; or
- 31 • The mobile station is a foreign NID roamer and both FOR_NID_REG_s and
 32 MOB_TERM_FOR_NID_p are equal to '1'; or
- 33 • The mobile station is a foreign SID roamer and both FOR_SID_REG_s and
 34 MOB_TERM_FOR_SID_p are equal to '1';

35 otherwise the mobile station shall set REG_ENABLED_s to NO.

roamer, because the SID 2 is in the list, but the (SID, NID) pair (2, 7) is not in the list. If the base
 station (SID, NID) pair is (4, 0), then the mobile station is a foreign SID roamer, because SID 4 is not
 in the list.

1 The mobile station performs autonomous registrations if REG_ENABLED_s is YES.

2 2.6.5.4 Registration Timers and Indicators

3 The mobile station shall provide the following registration timers:

- 4 • Power-up/initialization timer (see 2.6.5.1.1).
- 5 • Timer-based registration timer (see 2.6.5.1.3).
- 6 • Zone list entry timers (see 2.6.5.1.5).
- 7 • SID/NID list entry timers (see 2.6.5.1.5).
- 8 • BCMC frequency registration timer (see 2.6.13).
- 9 • BCMC registration required timer (see 2.6.13).

10 The mobile station shall provide a means of enabling and disabling each timer. When a
11 timer is disabled, it shall not be considered expired. A timer that has been enabled is
12 referred to as active.

13 2.6.5.5 Registration Procedures

14 2.6.5.5.1 Actions in the Mobile Station Initialization State

15 2.6.5.5.1.1 Power-Up or Change to a Different Operating Mode, Band Class, Serving 16 System, Frequency Block Designator, or R-UIM Insertion.

17 Upon power-up, the mobile station shall perform the following actions:

- 18 • Delete all entries of ZONE_LIST_s.
- 19 • If ZONE_LIST_{s-p} contains an entry, copy the entry to ZONE_LIST_s and disable the
20 corresponding entry timer.
- 21 • Delete all entries of SID_NID_LIST_s.
- 22 • If SID_NID_LIST_{s-p} contains an entry, copy the entry to SID_NID_LIST_s and disable
23 the corresponding entry timer.
- 24 • Set the registered flag (REGISTERED_s) to NO.
- 25 • Set timer-based registration enable status (COUNTER_ENABLED_s) to NO.
- 26 • Set autonomous registration enable status (REG_ENABLED_s) to NO.
- 27 • Set RETURN_CAUSE_s to '0000'.
- 28 • Set KEY_ID, LAST_2G_KEY_ID_s, and LAST_3G_KEY_ID_s to '00'.
- 29 • Set ENC_KEY[i] and INT_KEY[i] to NULL, where i ranges from '00' to '11'.
- 30 • Set D_SIG_ENCRYPT_MODE_s and C_SIG_ENCRYPT_MODE_s to '000'.
- 31 • Set RESTORE_KEYS to '0'.
- 32 • If the UIM contains IK and CK, the mobile station shall set KEY_ID to '10',
33 RESTORE_KEYS to '1', INT_KEY[KEY_ID] to IK, ENC_KEY[KEY_ID] to CK,

1 TX_EXT_SSEQ[.][KEY_ID] and TX_EXT_SSEQ[.][KEY_ID] to any 24-bit value
 2 multiplied by 256.

3 If any of the following conditions is true:

- 4 • BYPASS_REG_IND_S is equal to '00' and the mobile station has switched from using
 5 CDMA
 - 6 – in a different band class, or
 - 7 – in a different serving system in a band class that supports multiple serving
 8 systems (e.g., Band Class 0), or
 - 9 – in a different frequency block designator in a band class that supports
 10 frequency block designator allocations (e.g. Band Class 1)
- 11 • BYPASS_REG_IND_S is equal to '01' and, for a reason other than processing the
 12 *Extended CDMA Channel List Message*, the mobile station has switched from using
 13 CDMA)
 - 14 – in a different band class, or
 - 15 – in a different serving system in a band class that supports multiple serving
 16 systems (e.g., Band Class 0), or
 - 17 – in a different frequency block designator in a band class that supports
 18 frequency block designator allocations (e.g. Band Class 1)
- 19 • BYPASS_REG_IND_S is equal to '10', SID_S is different than REG_SID_S and the mobile
 20 station has switched from using CDMA
 - 21 – in a different band class, or
 - 22 – in a different serving system in a band class that supports multiple serving
 23 systems (e.g., Band Class 0), or
 - 24 – in a different frequency block designator in a band class that supports
 25 frequency block designator allocations (e.g. Band Class 1)

26 the mobile station shall perform the following actions:

- 27 • Set timer-based registration enable status (COUNTER_ENABLED_S) to NO.
- 28 • Set autonomous registration enable status (REG_ENABLED_S) to NO.
- 29 • Set RETURN_CAUSE_S to '0000'.
- 30 • Set the registered flag (REGISTERED_S) to NO.
- 31 • Set KEY_ID, LAST_2G_KEY_ID_S, and LAST_3G_KEY_ID_S to '00'.
- 32 • Set ENC_KEY[i] and INT_KEY[i] to NULL, where i ranges from '00' to '11'.
- 33 • Set RESTORE_KEYS to '0'.
- 34 • If the UIM contains IK and CK, the mobile station shall set KEY_ID to '10',
 35 RESTORE_KEYS to '1', INT_KEY[KEY_ID] to IK, ENC_KEY[KEY_ID] to CK,
 36 TX_EXT_SSEQ[.][KEY_ID] and TX_EXT_SSEQ[.][KEY_ID] to any 24-bit value
 37 multiplied by 256.

1 2.6.5.5.1.2 Timer Maintenance

2 While in the *Mobile Station Initialization State*, the mobile station shall update all active
3 registration timers (see 2.6.5.4). If any timer expires while in this state, the mobile station
4 shall preserve the expiration status so that further action can be taken in the *Mobile Station*
5 *Idle State*.

6 2.6.5.5.1.3 Entering the Mobile Station Idle State

7 Before entering the *Mobile Station Idle State* from the *Mobile Station Initialization State*, the
8 mobile station shall perform the following action:

- 9 • If REGISTERED_s is equal to NO, enable the power-up/initialization timer with an
10 expiration time of either T_{57m} seconds or MS implementation specific value (see
11 2.6.5.1.1) only when the mobile station is entering this state with a power-up
12 indication.

13 2.6.5.5.2 Actions in the Mobile Station Idle State

14 Requirements in this section and its subsections apply only when the mobile station is in
15 the *Mobile Station Idle State*.

16 2.6.5.5.2.1 Idle Registration Procedures

17 These procedures are performed whenever the mobile station is in the *Mobile Station Idle*
18 *State* (see 2.6.2.1.3).

19 While in the *Mobile Station Idle State*, the mobile station shall update all active registration
20 timers (see 2.6.5.4).

21 If the power-up/initialization timer has expired or is disabled, the mobile station shall
22 perform the following actions in the order given. If any action necessitates a registration,
23 the mobile station shall enter the *Update Overhead Information Substate* of the *System*
24 *Access State* (see 2.6.3) with a registration indication.

- 25 1. The timer-based registration timer shall be enabled (COUNTER_ENABLED_s = YES)
26 and the timer count (REG_COUNT_s) shall be set to a pseudorandom number as
27 specified in 2.6.5.1.3, if the following conditions are met:
 - 28 a. COUNTER_ENABLED_s is equal to NO; and
 - 29 b. The stored configuration parameters are current (see 2.6.2.2); and
 - 30 c. REG_ENABLED_s is equal to YES; and
 - 31 d. REG_PRD_s is not equal to zero.
- 32 2. If any zone list entry timer (see 2.6.5.1.5) has expired, the mobile station shall
33 delete the corresponding entry from ZONE_LIST_s.
- 34 3. If any SID/NID list entry timer (see 2.6.5.1.5) has expired, the mobile station shall
35 delete the corresponding entry from SID_NID_LIST_s.
- 36 4. The mobile station shall perform power-up registration, as specified in 2.6.5.1.1, if
37 all the following conditions are met:

- 1 a. POWER_UP_REG_S is equal to '1'; and
- 2 b. The stored configuration parameters are current (see 2.6.2.2); and
- 3 c. REGISTERED_S is equal to NO, and
- 4 d. REG_ENABLED_S is equal to YES.
- 5 5. The mobile station shall perform parameter-change registration (see 2.6.5.1.6) if all
- 6 the following conditions are met:
 - 7 a. PARAMETER_REG_S is equal to '1'; and
 - 8 b. The stored configuration parameters are current (see 2.6.2.2); and
 - 9 c. There is no entry of SID_NID_LIST_S whose SID and NID fields match the stored
 - 10 SID_S and NID_S.
- 11 6. The mobile station shall perform timer-based registration (see 2.6.5.1.3) if all the
- 12 following conditions are met:
 - 13 a. COUNTER_ENABLED_S is equal to YES; and
 - 14 b. The stored configuration parameters are current (see 2.6.2.2); and
 - 15 c. REG_ENABLED_S is equal to YES; and
 - 16 d. REG_COUNT_S is greater than or equal to REG_COUNT_MAX_S.
- 17 7. The mobile station shall perform distance-based registration (see 2.6.5.1.4) if all the
- 18 following conditions are met:
 - 19 a. REG_DIST_S is not equal to zero; and
 - 20 b. The stored configuration parameters are current (see 2.6.2.2); and
 - 21 c. REG_ENABLED_S is equal to YES; and
 - 22 d. The current base station's distance from the base station in which the mobile
 - 23 station last registered (see 2.6.5.1.4) is greater than or equal to
 - 24 REG_DIST_REG_{S-p}.
- 25 8. The mobile station shall perform zone-based registration (see 2.6.5.1.5) if all the
- 26 following conditions are met:
 - 27 a. TOTAL_ZONES_S is not equal to zero; and
 - 28 b. The stored configuration parameters are current (see 2.6.2.2); and
 - 29 c. REG_ENABLED_S is equal to YES; and
 - 30 d. There is no entry of ZONE_LIST_S whose SID, NID and REG_ZONE fields match
 - 31 the stored SID_S, NID_S and REG_ZONE_S.
- 32 9. The mobile station shall perform User Zone registration (see 2.6.5.1.10) if it selects
- 33 an active User Zone (see 2.6.9.1.2).
- 34 10. The mobile station shall perform encryption/message integrity re-sync required
- 35 registration (see 2.6.5.1.11) if all the following conditions are met:

- 1 a. REG_SECURITY_RESYNC is equal to YES or REGISTER_IN_IDLE_S is equal to '1';
2 and
3 b. None of the above registrations have been performed since the last entering of
4 the *Mobile Station Idle State*.

5 2.6.5.5.2.2 Processing the Registration Fields of the System Parameters Message and ANSI-
6 41 System Parameters Message

7 When the mobile station processes the *System Parameters Message* or *ANSI-41 System*
8 *Parameters Message*, it shall perform the following actions:

- 9 1. If REG_PRD_S is equal to zero, the mobile station shall set COUNTER_ENABLED_S to
10 NO.
11 2. If REG_PRD_S is not equal to zero, the mobile station shall set REG_COUNT_MAX_S as
12 specified in 2.6.5.1.3.
13 3. The mobile station shall update its roaming status and set REG_ENABLED_S as
14 specified in 2.6.5.3.
15 4. If ZONE_LIST_S contains more than TOTAL_ZONES_S entries, the mobile station shall
16 delete the excess entries according to the rules specified in 2.6.5.1.5.
17 5. If MULT_SIDS_S is equal to '0' and SID_NID_LIST contains entries with different
18 SIDs, delete the excess entries according to the rules specified in 2.6.5.1.5.
19 6. If MULT_NIDS_S is equal to '0' and SID_NID_LIST contains more than one entry for
20 any SID, delete the excess entries according to the rules specified in 2.6.5.1.5.

21 2.6.5.5.2.3 Ordered Registration

22 Ordered registration is performed after receiving a *Registration Request Order* while in the
23 *Mobile Station Order and Message Processing Operation* (see 2.6.2.4).

24 The mobile station shall enter the *Update Overhead Information Substate* of the *System*
25 *Access State* with a registration indication within T_{33m} seconds after the *Registration*
26 *Request Order* is received.

27 2.6.5.5.2.4 Power Off

28 These procedures are performed when the mobile station is directed by the user to power
29 off.

30 The mobile station shall perform the following actions:

- 31 • If an entry of ZONE_LIST_S does not have an active timer, copy that entry to
32 ZONE_LIST_{S-p}; otherwise, delete any entry in ZONE_LIST_{S-p}.
33 • If an entry of SID_NID_LIST_S does not have an active timer, copy that entry to
34 SID_NID_LIST_{S-p}; otherwise, delete any entry in SID_NID_LIST_{S-p}.

1 The mobile station shall perform power-down registration (see 2.6.5.1.2) by entering the
 2 *System Access State* with a registration indication within T_{33m} seconds after the user
 3 directs the mobile station to power off, if all the following conditions are true:

- 4 • REG_ENABLED_s equals YES; and
- 5 • POWER_DOWN_REG_s equals '1'; and
- 6 • There is an entry of SID_NID_LIST_s for which the SID and NID fields are equal to
 7 SID_s and NID_s; and
- 8 • The power-up/initialization timer (see 2.6.5.1.1) is disabled or has expired.

9 2.6.5.5.2.5 Full-TMSI Timer Expiration

10 When the mobile station sets all the bits of TMSI_CODE_{s-p} to '1' upon expiration of the full-
 11 TMSI timer (see 2.6.2), the mobile station shall delete all entries from SID_NID_LIST_s and
 12 ZONE_LIST_s.

13 2.6.5.5.3 Actions in the System Access State

14 Requirements in this section and its subsections apply only when the mobile station is in
 15 the *System Access State*.

16 2.6.5.5.3.1 Successful Access, Registration, or Implicit Registration

17 These procedures shall be performed after the mobile station receives confirmation of
 18 delivery of a *Registration Message*, *Origination Message*, *Reconnect Message*, *Call Recovery*
 19 *Request Message*, or *Page Response Message* sent on the r-csch .

- 20 • Disable the power-up/initialization timer (see 2.6.5.1.1).
- 21 • Set DIGITAL_REG_{s-p} to '00000001'.
- 22 • Set REG_COUNT_s to zero.
- 23 • Set REGISTERED_s to YES.
- 24 • If an explicit or implicit registration was sent, set SLOT_CYCLE_INDEX_REG to the
 25 slot cycle index the mobile station included in the message.
- 26 • If BYPASS_REG_IND_s is equal to '00', the mobile station shall perform the following:
 - 27 - Delete all entries from ZONE_LIST_s belonging to a different band class (see [45])
 28 than CDMABAND_s.
 - 29 - If CDMABAND_s contains multiple serving systems, delete all entries from
 30 ZONE_LIST_s that have a SID from a different serving system than SERVSYS_s.
 - 31 - If CDMABAND_s contains multiple frequency block designators, delete all entries
 32 from ZONE_LIST_s belonging to a different frequency block designator (see [45])
 33 than the frequency block designator associated with REG_SID_s.
 - 34 • Add REG_REG_ZONE_s, REG_SID_s, and REG_NID_s to ZONE_LIST_s if not already in
 35 the list. If required, include the band class identifier and block identifier for the
 36 current band and frequency block designator as specified in 2.6.5.1.5.

- 1 • Disable the zone list entry timer for the entry of $ZONE_LIST_s$ containing
2 $REG_REG_ZONE_s$, REG_SID_s , and REG_NID_s . For any other entry of $ZONE_LIST_s$
3 whose entry timer is not active, enable the entry timer with the duration specified
4 by $REG_ZONE_TIMER_s$ (see 2.6.5.1.5).
- 5 • If $ZONE_LIST_s$ contains more than $TOTAL_ZONES_s$ entries, delete the excess
6 entries according to the rules specified in 2.6.5.1.5.
- 7 • If $BYPASS_REG_IND_s$ is equal to '00', the mobile station shall perform the following:
 - 8 - Delete all entries from $SID_NID_LIST_s$ belonging to a different band class (see
9 [45]) than $CDMABAND_s$.
 - 10 - If $CDMABAND_s$ contains multiple serving systems, delete all entries from
11 $SID_NID_LIST_s$ that have a SID from a different serving system than $SERVSYS_s$.
 - 12 - If $CDMABAND_s$ contains multiple frequency block designators, delete all entries
13 from $SID_NID_LIST_s$ belonging to a different frequency block designator (see
14 [45]) than the frequency block designator associated with REG_SID_s .
- 15 • Add REG_SID_s and REG_NID_s to $SID_NID_LIST_s$ if not already in the list. If
16 required, include the band class identifier and block identifier for the current band
17 and frequency block designator as specified in 2.6.5.1.5.
- 18 • Disable the SID/NID list entry timer for the entry of $SID_NID_LIST_s$ containing
19 REG_SID_s , and REG_NID_s . For any other entry of $SID_NID_LIST_s$ whose entry
20 timer is not active, enable the entry timer with the duration specified in 2.6.5.1.5.
- 21 • If $SID_NID_LIST_s$ contains more than N_{10m} entries, delete the excess entries
22 according to the rules specified in 2.6.5.1.5.
- 23 • If $MULT_SIDS_s$ is equal to '0' and SID_NID_LIST contains entries with different
24 REG_SID_s , delete the excess entries according to the rules specified in 2.6.5.1.5.
- 25 • If $MULT_NIDS_s$ is equal to '0' and SID_NID_LIST contains more than one entry for
26 any SID, delete the excess entries according to the rules specified in 2.6.5.1.5.
- 27 • Set the stored location of last registration ($BASE_LAT_REG_{s-p}$ and $BASE_LONG_$
28 REG_{s-p}) to the current base station's location ($BASE_LAT_s$ and $BASE_LONG_s$). Set
29 the stored registration distance ($REG_DIST_REG_{s-p}$) to the current base station's
30 registration distance (REG_DIST_s).
- 31 • Set $REG_SECURITY_RESYNC$ to NO.
- 32 • Set $REGISTER_IN_IDLE_s$ to '0'.

33 These procedures shall be performed after the mobile station receives confirmation of
34 delivery of any other message:

- 35 • Set $DIGITAL_REG_{s-p}$ to '00000001'.
- 36 • If $BYPASS_REG_IND_s$ is equal to '00', the mobile station shall perform the following:
 - 37 - Delete all entries from $ZONE_LIST_s$ belonging to a different band class (see [45])
38 than $CDMABAND_s$.

- 1 - If CDMABAND_s contains multiple serving systems, delete from ZONE_LIST_s all
2 entries from ZONE_LIST_s that have a SID from a different serving system than
3 SERVSYS_s.
- 4 - If CDMABAND_s contains multiple frequency block designators, delete all entries
5 from ZONE_LIST_s belonging to a different frequency block designator (see [45])
6 than the frequency block designator associated with SID_s.
- 7 • For any entry of ZONE_LIST_s not matching REG_ZONE_s, SID_s, and NID_s and not
8 having an active entry timer, enable the entry timer with the duration specified by
9 ZONE_TIMER_s (see 2.6.5.1.5).
- 10 • If BYPASS_REG_IND_s is equal to '00', the mobile station shall perform the following:
- 11 - Delete all entries from SID_NID_LIST_s belonging to a different band class (see
12 [45]) than CDMABAND_s.
- 13 - If CDMABAND_s contains multiple serving systems, delete from SID_NID_LIST_s
14 all entries from SID_NID_LIST_s that have a SID from a different serving system
15 than SERVSYS_s.
- 16 - If CDMABAND_s contains multiple frequency block designators, delete all entries
17 from SID_NID_LIST_s belonging to a different frequency block designator (see
18 [45]) than the frequency block designator associated with SID_s.
- 19 • For any entry of SID_NID_LIST_s not matching SID_s and NID_s and not having an
20 active entry timer, enable the entry timer with the duration specified by
21 ZONE_TIMER_s (see 2.6.5.1.5).

22 2.6.5.5.3.2 Unsuccessful Access

23 These procedures are performed when the mobile station declares an access attempt failure
24 when in the *System Access State* (see 2.6.3).

25 The mobile station shall perform the following actions:

- 26 • Set DIGITAL_REG_{s-p} to '00000001'.
- 27 • If an explicit or implicit registration was sent, set SLOT_CYCLE_INDEX_REG to
28 min(SLOT_CYCLE_INDEX_REG, slot cycle index the mobile station included in the
29 message).
- 30 • If BYPASS_REG_IND_s is equal to '00', the mobile station shall perform the following:
- 31 - Delete all entries from ZONE_LIST_s belonging to a different band class (see [45])
32 than CDMABAND_s.
- 33 - If CDMABAND_s contains multiple serving systems, delete from ZONE_LIST_s all
34 entries from ZONE_LIST_s that have a SID from a different serving system than
35 SERVSYS_s.
- 36 - If CDMABAND_s contains multiple frequency block designators, delete all entries
37 from ZONE_LIST_s belonging to a different frequency block designator (see [45])
38 than the frequency block designator associated with SID_s.

- 1 • For any entry of $ZONE_LIST_s$ not matching REG_ZONE_s , SID_s , and NID_s and not
2 having an active entry timer, enable the entry timer with the duration specified by
3 $ZONE_TIMER_s$ (see 2.6.5.1.5).
- 4 • If $BYPASS_REG_IND_s$ is equal to '00', the mobile station shall perform the following:
 - 5 - Delete all entries from $SID_NID_LIST_s$ belonging to a different band class (see
6 [45]) than $CDMABAND_s$.
 - 7 - If $CDMABAND_s$ contains multiple serving systems, delete from $SID_NID_LIST_s$
8 all entries from $SID_NID_LIST_s$ that have a SID from a different serving system
9 than $SERVSYS_s$.
 - 10 - If $CDMABAND_s$ contains multiple frequency block designators, delete all entries
11 from $SID_NID_LIST_s$ belonging to a different frequency block designator (see
12 [45]) than the frequency block designator associated with SID_s .
- 13 • For any entry of $SID_NID_LIST_s$ not matching SID_s and NID_s and not having an
14 active entry timer, enable the entry timer with the duration specified by
15 $ZONE_TIMER_s$ (see 2.6.5.1.5).

16 2.6.5.5.3.3 Power Off

17 These procedures are performed when the mobile station is directed by the user to power
18 off.

19 The mobile station shall perform the following actions:

- 20 • If an entry of $ZONE_LIST_s$ does not have an active timer, copy that entry to
21 $ZONE_LIST_{s-p}$; otherwise, delete any entry in $ZONE_LIST_{s-p}$.
- 22 • If an entry of $SID_NID_LIST_s$ does not have an active timer, copy that entry to
23 $SID_NID_LIST_{s-p}$; otherwise, delete any entry in $SID_NID_LIST_{s-p}$.

24 2.6.5.5.4 Actions in the Mobile Station Control on the Traffic Channel State

25 Requirements in this section and its subsections apply only when the mobile station is in
26 the *Mobile Station Control on the Traffic Channel State*.

27 2.6.5.5.4.1 Traffic Channel Initialization

28 Upon entering the *Traffic Channel Initialization Substate* of the *Mobile Station Control on the*
29 *Traffic Channel State*, the mobile station shall set $COUNTER_ENABLED_s$ to NO, shall set
30 $TBR_RAND_SUPPR_ENABLE_s$ to '0', and shall set $TBR_RAND_WINDOW_s$ to '11'.

31 2.6.5.5.4.2 Timer Maintenance

32 While in the *Mobile Station Control on the Traffic Channel State*, the mobile station shall
33 update all active registration timers.

34 If a zone list entry timer expires, the mobile station shall delete the corresponding entry
35 from $ZONE_LIST_s$. If a SID/NID list entry timer expires, the mobile station shall delete the
36 corresponding entry from $SID_NID_LIST_s$.

2.6.5.5.4.3 Processing the Mobile Station Registered Message

The mobile station receives the *Mobile Station Registered Message* on the Forward Traffic Channel when the mobile station is considered registered for the base station whose location and other parameters are included in the message.

The mobile station shall store the following parameters:

- System identification ($SID_s = SID_r$)
- Network identification ($NID_s = NID_r$)
- Registration zone ($REG_ZONE_s = REG_ZONE_r$)
- Number of registration zones to be retained ($TOTAL_ZONES_s = TOTAL_ZONES_r$)
- Zone timer length ($ZONE_TIMER_s = ZONE_TIMER_r$)
- Multiple SID storage indicator ($MULT_SIDS_s = MULT_SIDS_r$)
- Multiple NID storage indicator ($MULT_NIDS_s = MULT_NIDS_r$)
- Base station latitude ($BASE_LAT_s = BASE_LAT_r$)
- Base station longitude ($BASE_LONG_s = BASE_LONG_r$)
- Registration distance ($REG_DIST_s = REG_DIST_r$)

The mobile station shall perform the following actions:

- Set $DIGITAL_REG_{s-p}$ to '00000001'.
- Add REG_ZONE_s , SID_s , and NID_s to $ZONE_LIST_s$ if not already in the list. If required, include the band class identifier and block identifier for the current band and frequency block designator as specified in 2.6.5.1.5.
- If $BYPASS_REG_IND_s$ is equal to '00', delete all entries from $ZONE_LIST_s$ belonging to a different band class (see [45]) than $CDMABAND_s$.
- Disable the zone list entry timer for the entry of $ZONE_LIST_s$ containing REG_ZONE_s , SID_s , and NID_s . For any other entry of $ZONE_LIST_s$ whose entry timer is not active, enable the entry timer with the duration specified by $ZONE_TIMER_s$ (see 2.6.5.1.5).
- If $ZONE_LIST_s$ contains more than $TOTAL_ZONES_s$ entries, delete the excess entries according to the rules specified in 2.6.5.1.5.
- If $BYPASS_REG_IND_s$ is equal to '00', delete all entries from $SID_NID_LIST_s$ belonging to a different band class (see [45]) than $CDMABAND_s$.
- Add SID_s and NID_s to $SID_NID_LIST_s$ if not already in the list. If required, include the band class identifier and block identifier for the current band and frequency block designator as specified in 2.6.5.1.5.
- Disable the SID/NID list entry timer for the entry of $SID_NID_LIST_s$ containing SID_s , and NID_s . For any other entry of $SID_NID_LIST_s$ whose entry timer is not active, enable the entry timer with the duration specified in 2.6.5.1.5.

- 1 • If $SID_NID_LIST_s$ contains more than N_{10m} entries, delete the excess entries
2 according to the rules specified in 2.6.5.1.5.
- 3 • If $MULT_SIDS_s$ is equal to '0' and SID_NID_LIST contains entries with different
4 SIDs, delete the excess entries according to the rules specified in 2.6.5.1.5.
- 5 • If $MULT_NIDS_s$ is equal to '0' and SID_NID_LIST contains more than one entry for
6 any SID, delete the excess entries according to the rules specified in 2.6.5.1.5.
- 7 • Set the stored location of last registration ($BASE_LAT_REG_{s-p}$ and $BASE_LONG_$
8 REG_{s-p}) to the base station's location ($BASE_LAT_s$ and $BASE_LONG_s$). Set the
9 stored registration distance ($REG_DIST_REG_{s-p}$) to the base station's registration
10 distance (REG_DIST_s).
- 11 • Update its roaming status and set MOB_TERM_s as specified in 2.6.5.3. The mobile
12 station should indicate to the user whether the mobile station is roaming.

13 2.6.5.5.4.4 Power Off

14 These procedures are performed when the mobile station is directed by the user to power
15 off.

16 The mobile station shall perform the following actions:

- 17 • If an entry of $ZONE_LIST_s$ does not have an active timer, copy that entry to
18 $ZONE_LIST_{s-p}$; otherwise, delete the entry in $ZONE_LIST_{s-p}$ if $ZONE_LIST_{s-p}$
19 contains an entry.
- 20 • If an entry of $SID_NID_LIST_s$ does not have an active timer, copy that entry to
21 $SID_NID_LIST_{s-p}$; otherwise, delete the entry in $SID_NID_LIST_{s-p}$ if $SID_NID_LIST_{s-p}$
22 contains an entry.

23 2.6.6 Handoff Procedures

24 This section presents an overview and mobile station requirements for handoffs occurring
25 while the mobile station is in the *Mobile Station Control on the Traffic Channel State* (see
26 2.6.4). Mobile station requirements for handoffs occurring while the mobile station is in
27 the *Mobile Station Idle State* are specified in 2.6.2.1.4.

28 2.6.6.1 Overview

29 2.6.6.1.1 Types of Handoff

30 The mobile station supports the following three handoff procedures while in the *Mobile*
31 *Station Control on the Traffic Channel State*:

- 32 • *Soft Handoff*: A handoff in which the mobile station commences communications
33 with a new base station without interrupting communications with the old base
34 station. Soft handoff can only be used between CDMA Channels having identical
35 Frequency Assignments. Soft handoff provides diversity of Forward Traffic
36 Channels and Reverse Traffic Channel paths on the boundaries between base
37 stations.

- *CDMA-to-CDMA Hard Handoff*: A handoff in which the mobile station is transitioned between disjoint sets of base stations, different band classes, different Frequency Assignments, or different frame offsets.

The mobile station shall support soft handoffs on the same Frequency Assignment (see 2.6.6.2.7). The mobile station shall support CDMA-to-CDMA hard handoffs between band classes on which it supports CDMA operation (see 2.6.6.2.8).

2.6.6.1.2 Pilot Sets

Within section 2.6.6 the term pilot refers to a Pilot Channel identified by a pilot sequence offset (see [2]), a Walsh function or a quasi-orthogonal function (see [2]), and a Frequency Assignment (see [2]). A pilot is associated with the Forward Traffic Channels in the same Forward CDMA Channel. All pilots in a pilot set have the same CDMA Frequency Assignment.

The mobile station searches for pilots on the current CDMA Frequency Assignment to detect the presence of CDMA Channels and to measure their strengths. When the mobile station detects a pilot of sufficient strength that is not associated with any of the Forward Traffic Channels assigned to it, it sends a *Pilot Strength Measurement Message* or an *Extended Pilot Strength Measurement Message* to the base station⁶⁷. The base station can then assign a Forward Traffic Channel associated with that pilot to the mobile station and direct the mobile station to perform a handoff.

If the mobile station is capable of obtaining Overhead Messages of neighboring sectors while in traffic channel state, then the mobile station may include pilots from the PSMM_SIGNATURE field of the *Access Point Identification Message* in the *Pilot Strength Measurement Message*.

The pilot search parameters and the rules for *Pilot Strength Measurement Message* or *Extended Pilot Strength Measurement Message* transmission are expressed in terms of the following sets of pilots:

- *Active Set*: The pilots associated with the Forward Traffic Channels assigned to the mobile station.
- *Candidate Set*: The pilots that are not currently in the Active Set but have been received by the mobile station with sufficient strength to indicate that the associated Forward Traffic Channels could be successfully demodulated.
- *Neighbor Set*: The pilots that are not currently in the Active Set or the Candidate Set and are likely candidates for handoff.

⁶⁷ The mobile station may send a Handoff Supplementary Information Notification message to the base station if a message that mobile station is sending includes a Pilot for which the base station may require supplementary information. For example, the mobile station may send this message along with PSMM or EPSMM message.

- *Remaining Set*: The set of all possible pilots in the current system on the current CDMA Frequency Assignment, excluding the pilots in the Neighbor Set, the Candidate Set, and the Active Set. This set of possible pilots consists of pilots whose pilot PN sequence offset indices are integer multiples of $PILOT_INC_S$.

The base station may direct the mobile station to search for pilots on a different CDMA frequency to detect the presence of CDMA Channels and to measure their strengths. The mobile station reports the results of the search to the base station using the *Candidate Frequency Search Report Message*. Depending upon the pilot strength measurements reported in the *Candidate Frequency Search Report Message*, the base station can direct the mobile station to perform an inter-frequency hard handoff.

The pilot search parameters are expressed in terms of the following sets of pilots on the CDMA Candidate Frequency:

- *Candidate Frequency Neighbor Set*: A list of pilots on the CDMA Candidate Frequency.
- *Candidate Frequency Search Set*: A subset of the Candidate Frequency Neighbor Set that the base station may direct the mobile station to search.

2.6.6.2 Requirements

2.6.6.2.1 Pilot Search

For the pilot sets defined in 2.6.6.1.2, the base station sets the search window (range of PN offsets) in which the mobile station is to search for usable multipath components (i.e., multipath components that the mobile station can use for demodulation of the associated Forward Traffic Channel) of the pilots in the set.

Search performance criteria are defined in [11].

This search shall be governed by the following:

- *Active Set and Candidate Set*: The search procedures for pilots in the Active Set and Candidate Set shall be identical. The search window size⁶⁸ for each pilot in the Active Set and Candidate Set shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to $SRCH_WIN_A_S$. The mobile station should center the search window for each pilot of the Active Set and Candidate Set around the earliest arriving usable multipath component of the pilot. If the mobile station receives a value greater than or equal to 13 for $SRCH_WIN_A_r$, it may store and use the value 13 in $SRCH_WIN_A_S$.

⁶⁸ The table defines the entire search range. For example, $SRCH_WIN_A_S = 6$ corresponds to a 28 PN chip search window or ± 14 PN chips around the search window center.

- *Neighbor Set:* If SRCH_WIN_NGHR_INCL_S is equal to '1', the search window size for each pilot in the Neighbor Set shall be the number of PN chips specified in Table 2.6.6.2.1-1, corresponding to SRCH_WIN_NGHR_S associated with the pilot being searched. If SRCH_WIN_NGHR_INCL_S is equal to '0', the search window size for each pilot in the Neighbor Set shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to SRCH_WIN_N_S. If SRCH_OFFSET_INCL_S is equal to '1', the search window offset for each pilot in the Neighbor Set shall be the number of PN chips specified in Table 2.6.6.2.1-2, corresponding to SRCH_OFFSET_NGHR_S associated with the pilot being searched. If SRCH_OFFSET_INCL_S is equal to '0', the search window offset for each pilot in the Neighbor Set shall be zero PN chip. The mobile station should center the search

1 window for each pilot in the Neighbor Set around the pilot's PN sequence offset plus
 2 the corresponding search window offset, using timing defined by the mobile
 3 station's time reference (see [2]). If SEARCH_PRIORITY_INCL_s is equal to '1', the
 4 mobile station should use SEARCH_PRIORITY_s for the corresponding pilot to
 5 schedule its neighbor search. If the mobile station supports hopping pilot beacons
 6 and the TIMING_INCL field of the NGHBR_REC for the corresponding pilot is equal
 7 to '1', then the mobile station shall use the information included in the
 8 NGHBR_TX_OFFSET, NGHBR_TX_DURATION, and NGHBR_TX_PERIOD fields of
 9 the NGHBR_REC for the corresponding pilot to schedule the time for searching the
 10 neighbor. If ADD_PILOT_REC_INCL field of the NGHBR_REC for the corresponding
 11 pilot is equal to '1', the mobile station shall use the information included in the
 12 NGHBR_PILOT_REC field for searching the neighbor.

- 13 • *Remaining Set:* The search window size for each pilot in the Remaining Set shall be
 14 the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to
 15 SRCH_WIN_R_s. The mobile station should center the search window for each pilot
 16 in the Remaining Set around the pilot's PN sequence offset, using timing defined by
 17 the mobile station's time reference (see [2]). The mobile station should only search
 18 for Remaining Set pilots whose pilot PN sequence offset indices are equal to integer
 19 multiples of PILOT_INC_s.
- 20 • *Candidate Frequency Search Set:* If CF_SRCH_WIN_NGHBR_INCL_s is equal to '1',
 21 the search window size for each pilot in the Candidate Frequency Search Set shall
 22 be the number of PN chips specified in Table 2.6.6.2.1-1, corresponding to
 23 SRCH_WIN_NGHBR_s associated with the pilot being searched. If
 24 CF_SRCH_WIN_NGHBR_INCL_s is equal to '0', the search window size for each pilot
 25 in the Candidate Frequency Search Set shall be the number of PN chips specified in
 26 Table 2.6.6.2.1-1 corresponding to CF_SRCH_WIN_N_s. If CF_SRCH_OFFSET_INCL_s
 27 is equal to '1', the search window offset for each pilot in the Candidate Frequency
 28 Search Set shall be the number of PN chips specified in Table 2.6.6.2.1-2,
 29 corresponding to SRCH_OFFSET_NGHBR_s associated with the pilot being searched.
 30 If CF_SRCH_OFFSET_INCL_s is equal to '0', the search window offset for each pilot in
 31 the Candidate Frequency Search Set shall be zero PN chips. The mobile station
 32 should center the search window for each pilot in the Candidate Frequency Search
 33 Set around the pilot's PN sequence offset plus the corresponding search window
 34 offset using timing defined by the mobile station's time reference (see [2]). If
 35 CF_SEARCH_PRIORITY_INCL_s is equal to '1', the mobile station should use
 36 SEARCH_PRIORITY_s associated with each pilot to schedule a search of its
 37 Candidate Frequency Search Set.

38 2.6.6.2.2 Pilot Strength Measurements

39 The mobile station assists the base station in the handoff process and in the Reverse
 40 Supplemental Code Channel operation and in the Reverse Supplemental Channel operation
 41 by measuring and reporting the strengths of received pilots.

42 For an SR1 pilot, the mobile station should use the searcher element (see [2]) to compute
 43 the strength of a pilot (PS) by adding the ratios of received pilot energy per chip, E_C , to total

1 received spectral density (noise and signals), I_o , of at most k usable multipath components,
 2 where k is the number of demodulating elements (see [2]) supported by the mobile station.

3 For an SR3 pilot, the pilot strength is given by

$$4 \quad \frac{1}{3} \times \left(\left(\frac{E_c}{I_o} \right)_{\text{Primary}} + \frac{\left(\frac{E_c}{I_o} \right)_1}{\Delta_1} + \frac{\left(\frac{E_c}{I_o} \right)_2}{\Delta_2} \right) \text{ where:}$$

5 - $\left(\frac{E_c}{I_o} \right)_{\text{Primary}}$ is the pilot E_c/I_o measured on the Primary carrier (computed as
 6 specified above for SR1 pilots),

7 - $\left(\frac{E_c}{I_o} \right)_1$ is the pilot E_c/I_o measured on the pilot on the lower frequency of the two
 8 remaining SR3 frequencies (computed as specified above for SR1 pilots), and Δ_1 is
 9 the pilot power level on the lower frequency of the two remaining SR3 frequencies
 10 relative to that of the primary SR3 pilot, i.e. $\Delta_1 = 10^{(-\text{SR3_PILOT_POWER1}/10)}$.

11 - $\left(\frac{E_c}{I_o} \right)_2$ is the pilot E_c/I_o measured on the pilot on the higher frequency of the two
 12 remaining SR3 frequencies (computed as specified above for SR1 pilots), and Δ_2 is
 13 the pilot power level on the higher frequency of the two remaining SR3 frequencies
 14 relative to that of the primary SR3 pilot, i.e. $\Delta_2 = 10^{(-\text{SR3_PILOT_POWER2}/10)}$.

15 2.6.6.2.3 Handoff Drop Timer

16 The mobile station shall maintain a handoff drop timer for each pilot in the Active Set and
 17 Candidate Set.

18 If $P_REV_IN_USE_s$ is less than or equal to three or $SOFT_SLOPE_s$ is equal to '000000', the
 19 mobile station shall perform the following:

- 20 • For the Candidate Set, the mobile station shall start the timer whenever the
 21 strength of the corresponding pilot becomes less than T_DROP_s . The mobile station
 22 shall reset and disable the timer if the strength of the corresponding pilot exceeds
 23 T_DROP_s .
- 24 • For the Active Set, the mobile station shall start the timer whenever the strength of
 25 the corresponding pilot becomes less than T_DROP_s . The mobile station shall reset
 26 and disable the timer if the strength of the corresponding pilot exceeds T_DROP_s .

27 If $P_REV_IN_USE_s$ is greater than three and $SOFT_SLOPE_s$ is not equal to '000000', the
 28 mobile station shall perform the following:

- 1 • For the Candidate Set, the mobile station shall start the timer whenever the
2 strength of the corresponding pilot becomes less than T_DROP_s. The mobile station
3 shall reset and disable the timer if the strength of the corresponding pilot exceeds
4 T_DROP_s.
- 5 • For the Active Set, the mobile station shall sort the N_A pilots in the Active Set in
6 order of increasing strengths, i.e., PS₁ < PS₂ < PS₃ < ... < PS_{N_A} where the strength
7 PS is as defined in 2.6.6.2.2. The mobile station shall start the timer whenever the
8 strength PS_i satisfies the following inequality:

$$9 \quad 10 \times \log_{10} PS_i < \max\left(\frac{SOFT_SLOPE_s}{8} \times 10 \times \log_{10} \sum_{j>i} PS_j + \frac{DROP_INTERCEPT_s}{2}, -\frac{T_DROP_s}{2}\right)$$

10 $i = 1, 2, \dots, PS_{N_A-1}$

11 For the Active Set, the mobile station shall start the timer even if the timer has previously
12 expired. The mobile station shall reset and disable the timer whenever the above inequality
13 is not satisfied for the corresponding pilot.

14 If T_TDROP_RANGE_s is equal to '0000' or if P_REV_IN_USE_s is less than 9, then the mobile
15 station shall perform the following:

- 16 • If T_TDROP_s equals zero, the mobile station shall consider the timer expired within
17 100 ms of enabling it.
- 18 • Otherwise, the mobile station shall consider the timer expired within 10% of the
19 timer expiration value shown in Table 2.6.6.2.3-1 corresponding to T_TDROP_s. If
20 T_TDROP_s changes, the mobile station shall begin using the new value for all
21 handoff drop timers within 100 ms.

22
23 **Table 2.6.6.2.3-1. Handoff Drop Timer Expiration Values**

T_TDROP	Timer Expiration (seconds)	T_TDROP	Timer Expiration (seconds)
0	0.1	8	27
1	1	9	39
2	2	10	55
3	4	11	79
4	6	12	112
5	9	13	159
6	13	14	225
7	19	15	319

24
25 Otherwise, the mobile shall perform the following:

- 1 • The mobile station shall select the timer expiration value as follows:
- 2 - The mobile station shall select the timer expiration value greater than or equal
- 3 to the minimum drop timer value computed as:
- 4 $\max (0.1 \text{ seconds, range-based minimum timer expiration value }),$
- 5 where the range-based minimum timer expiration value equals:
- 6 $(\text{nominal timer expiration value}) - (\text{timer expiration range value}),$
- 7 where:
- 8 + the nominal timer expiration value is the timer expiration value in Table
- 9 2.6.6.2.3-1 corresponding to T_TDROP_S and,
- 10 + the timer expiration range value is the timer expiration range value in Table
- 11 2.6.6.2.3-2 corresponding to $T_TDROP_RANGE_S$.
- 12 - The mobile station shall select the timer expiration value less than or equal to
- 13 the maximum drop timer value which equals:
- 14 $(\text{nominal timer expiration value}) + (\text{timer expiration range value}),$
- 15 where:
- 16 + the nominal timer expiration value is the timer expiration value in Table
- 17 2.6.6.2.3-1 corresponding to T_TDROP_S and,
- 18 + the timer expiration range value is the timer expiration range value in Table
- 19 2.6.6.2.3-2 corresponding to $T_TDROP_RANGE_S$.
- 20 • If the mobile station selected a timer expiration value of 0.1s then the mobile station
- 21 shall consider the timer expired within 100 ms of enabling it.
- 22

23 **Table 2.6.6.2.3-2. Handoff Drop Timer Expiration Range Values**

T_TDROP_RANGE [binary]	Timer Expiration Range (seconds)	T_TDROP_RANGE [binary]	Timer Expiration Range (seconds)
0000	0	1000	27
0001	1	1001	39
0010	2	1010	55
0011	4	1011	79
0100	6	1100	112
0101	9	1101	159
0110	13	1110	225
0111	19	1111	319

1 The mobile station shall indicate the status of the handoff drop timer for all pilots in the
 2 Active Set and Candidate Set when transmitting a *Pilot Strength Measurement Message* or
 3 an *Extended Pilot Strength Measurement Message*.

4 2.6.6.2.4 Pilot PN Phase

5 The mobile station shall measure the arrival time, PILOT_ARRIVAL, for each pilot reported
 6 to the base station. The pilot arrival time shall be the time of occurrence, as measured at
 7 the mobile station antenna connector, of the earliest arriving usable multipath component
 8 of the pilot (for SR3 pilots, it is based on the earliest arriving usable multipath component
 9 from all three carriers). The arrival time shall be measured relative to the mobile station's
 10 time reference (see [2]) in units of PN chips. The mobile station shall compute the reported
 11 pilot PN phase, PILOT_PN_PHASE, as

$$12 \quad \text{PILOT_PN_PHASE} = (\text{PILOT_ARRIVAL} + (64 \times \text{PILOT_PN})) \bmod 2^{15},$$

13 where PILOT_PN is the PN sequence offset index of the pilot (see [2]).

14 2.6.6.2.5 Handoff Messages

15 2.6.6.2.5.1 Processing of Forward Traffic Channel Handoff Messages

16 If the mobile station receives any of the following messages, then the mobile station shall
 17 process the message as described.

18 1. *Pilot Measurement Request Order*: The mobile station shall send, within T_{56m}
 19 seconds, a *Pilot Strength Measurement Message* if $P_REV_IN_USE_s$ is less than seven
 20 or a *Extended Pilot Strength Measurement Message* if $P_REV_IN_USE_s$ is equal to or
 21 greater than seven.

22 2. Reserved

23 3. *Neighbor List Update Message*: If $P_REV_IN_USE_s$ is greater than or equal to eight,
 24 the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set
 25 to '0000010' (message not accepted in this state); otherwise, the mobile station
 26 shall process the message as specified in 2.6.6.2.6.3 and set
 27 SEARCH_PRIORITY_INCL_s, SRCH_WIN_NGHR_INCL_s, and SRCH_OFFSET_INCL_s
 28 to '0', and set TIMING_INCL for each of the neighboring base stations in the
 29 *Neighbor List Update Message* to '0'.

30 4. *Extended Handoff Direction Message*: The mobile station shall process the message as
 31 follows:

32 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set
 33 to '00000110' (capability not supported), if the mobile station does not support the
 34 band class specified in the *Extended Handoff Direction Message*.

35 If the mobile station does not send a *Mobile Station Reject Order* in response to the
 36 *Extended Handoff Direction Message*, the mobile station shall perform the following at
 37 the action time of the message:

- 38 • The mobile station shall send a *Handoff Completion Message* or an *Extended*
 39 *Handoff Completion Message* as specified in 2.6.6.2.5.2. If the RC assigned on the

- 1 reverse fundamental channel or supplemental channel is less than RC08 the mobile
2 station shall set RC_BITMAP_CAPABILITY_EXT_ALLOWED_s to '0'.
- 3 • Update the Active Set, Candidate Set, and Neighbor Set in accordance with the
4 *Extended Handoff Direction Message* processing (see 2.6.6.2.6.1, 2.6.6.2.6.2, and
5 2.6.6.2.6.3).
 - 6 • The mobile station shall delete all pilots that are not listed in the Active Set from the
7 Active Set of the Supplemental Channel for the Forward Supplemental Channel
8 Assignment (if any). If these deleted pilots include all pilots in the Active Set of the
9 Supplemental Channel, the mobile station shall cancel the Forward Supplemental
10 Channel Assignment.
 - 11 • Discontinue use of all Forward Traffic Channels associated with pilots not listed in
12 the *Extended Handoff Direction Message*.
 - 13 • The mobile station shall update the Code Channel List, CODE_CHAN_LIST_s, as
14 specified in 2.6.8.
 - 15 • If the mobile station is currently processing Forward Supplemental Code Channels,
16 then it shall continue processing the Forward Supplemental Code Channels using
17 the updated Code Channel List, CODE_CHAN_LIST_s.
 - 18 • The mobile station shall set IGNORE_SCAM_s and IGNORE_ESCAM_s to '0'.
 - 19 • If HARD_INCLUDED is equal to '1', perform the following actions:
20 – If FRAME_OFFSET_r is not equal to FRAME_OFFSET_s, change the frame
21 offset on all of the code channels of the Forward Traffic Channel and of the
22 Reverse Traffic Channel.
23 – If RESET_L2_r is equal to '1', Layer 3 shall send a L2-Supervision.Request
24 primitive to Layer 2 to reset the acknowledgment procedures as specified in
25 [4]. The acknowledgment procedures shall be reset immediately after the
26 action time of the *Extended Handoff Direction Message*.
27 – If RESET_FPC_r is equal to '1', initialize the Forward Traffic Channel power
28 control counters as specified in 2.6.4.1.1.1.
29 – If SERV_NEG_TYPE_r is equal to '1', set SERV_NEG_s to enabled; otherwise set
30 SERV_NEG_s to disabled.
31 – Use the long code mask as follows:
32 + If PRIVATE_LCM_r equals '1', the mobile station shall use the Private Long
33 Code Mask as specified in 2.3.6.
34 + If PRIVATE_LCM_r equals '0', the mobile station shall use the Public Long
35 Code Mask derived from PLCM_TYPE_s as specified in 2.3.6.
36 + The mobile station shall indicate to the user the voice privacy mode
37 status.
38 – Process the ENCRYPT_MODE field as specified in 2.3.12.2.
 - 39 • Store the following parameters from the current configuration:

- 1 – Serving Frequency Assignment ($SF_CDMACH_S = CDMACH_S$)
- 2 – Serving Frequency band class ($SF_BAND_CLASS_S = BAND_CLASS_S$)
- 3 – Serving Frequency frame offset ($SF_FRAME_OFFSET_S = FRAME_OFFSET_S$)
- 4 • If $HARD_INCLUDED$ is not equal to '1', set $NUM_PREAMBLE_S = '000'$.
- 5 • Store the following parameters from the *Extended Handoff Direction Message*:
- 6 – *Extended Handoff Direction Message* sequence number ($HDM_SEQ_S =$
7 HDM_SEQ_T)
- 8 – If $SEARCH_INCLUDED$ is equal to '1', then store the following:
- 9 + Search window size for the Active Set and Candidate Set
10 ($SRCH_WIN_A_S = SRCH_WIN_A_T$)
- 11 + Pilot detection threshold ($T_ADD_S = T_ADD_T$)
- 12 + Pilot drop threshold ($T_DROP_S = T_DROP_T$)
- 13 + Active Set versus Candidate Set comparison threshold
14 ($T_COMP_S = T_COMP_T$)
- 15 + Drop timer value ($T_TDROP_S = T_TDROP_T$)
- 16 – If $HARD_INCLUDED$ is equal to '1', then store the following:
- 17 + Frame offset ($FRAME_OFFSET_S = FRAME_OFFSET_T$)
- 18 + Nominal power setting of the target cell ($NOM_PWR_S = NOM_PWR_T$)
- 19 + Hard handoff traffic channel preamble count required before transmitting
20 *Handoff Completion Message* or *Extended Handoff Completion Message*
21 ($NUM_PREAMBLE_S = NUM_PREAMBLE_T$)
- 22 + CDMA band class ($CDMABAND_S = BAND_CLASS_T$)
- 23 + Frequency assignment ($CDMACH_S = CDMA_FREQ_T$)
- 24 + Nominal power setting of the target cell (If $CDMABAND_S = '00000'$ or
25 $CDMABAND_S = '00011'$, then $NOM_PWR_EXT_S = '0'$; otherwise,
26 $NOM_PWR_EXT_S = NOM_PWR_EXT_T$)
- 27 – One occurrence of $PILOT_PN$ and PWR_COMB_IND for each included
28 member of the Active Set.
- 29 – If ADD_LENGTH is not equal to '000', then store the following:
- 30 + Protocol revision level ($P_REV_S = P_REV_T$)
- 31 + Protocol revision level currently in use ($P_REV_IN_USE_S =$ the minimum
32 value of P_REV_S and $MOB_P_REV_P$ of the current band class)
- 33 – Disable return on failure ($RETURN_IF_HANDOFF_FAIL_S = '0'$)
- 34 • Perform a soft or hard handoff depending on the following conditions:

- 1 – If any of the following conditions is true, the mobile station shall perform a
2 hard handoff:
- 3 + HARD_INCLUDED is set to ‘1’ and either BAND_CLASS_r is not equal to
4 SF_CDMABAND_s, CDMA_FREQ_r is not equal to SF_CDMACH_s, or
5 FRAME_OFFSET_r is not equal to SF_FRAME_OFFSET_s, or
- 6 + The set of pilots specified by the message is disjoint from the Active Set
7 prior to the action time of the message.
- 8 – If the mobile station performs a hard handoff, it shall perform the following:
- 9 + If a Periodic Serving Frequency Pilot Report Procedure is in progress, abort
10 the procedure (see 2.6.6.2.12).
- 11 + If a Candidate Frequency periodic search is in progress, abort the periodic
12 search (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4) and set PERIODIC_SEARCH_s to
13 ‘0’.
- 14 + The mobile station shall cancel the Forward Supplemental Channel
15 assignment or the Reverse Supplemental Channel assignment (if any).
- 16 + Perform the actions specified in 2.6.6.2.8.1. If the message specifies more
17 than one pilot, the mobile station shall also perform the actions specified in
18 2.6.6.2.7.1 and 2.6.6.2.7.2.
- 19 – Otherwise, the mobile station shall perform a soft handoff as specified in
20 2.6.6.2.7.

21 5. *Candidate Frequency Search Request Message*: The mobile station shall process the
22 message as follows:

23 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set
24 to ‘0000110’ (capability not supported), if the following condition is true:

- 25 • SEARCH_MODE_r is not equal to ‘0000’, and the mobile station does not support
26 the capability specified by SEARCH_MODE_r.

27 If none of the above conditions is true, the mobile station shall perform the actions
28 described in the remainder of this section to process the *Candidate Frequency*
29 *Search Request Message*.

30 If SEARCH_MODE_r is equal to ‘0000’, the mobile station shall process the
31 *Candidate Frequency Search Request Message* as follows:

- 32 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
33 set to ‘00001100’ (invalid Frequency Assignment), if the Frequency Assignment
34 specified in the message is the same as the Serving Frequency (BAND_CLASS_r is
35 equal to CDMABAND_s and CDMA_FREQ_r is equal to CDMACH_s).
- 36 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
37 set to ‘00001010’ (search set not specified), if SEARCH_TYPE_r is equal to ‘01’ or
38 ‘11’, and one of the following conditions is true:

- 1 – PILOT_UPDATE_r is equal to ‘0’ and the Candidate Frequency Search Set
2 before the action time of the *Candidate Frequency Search Request Message* is
3 empty, or
- 4 – PILOT_UPDATE_r is equal to ‘1’ and the message specifies an empty search
5 set.
- 6 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
7 set to ‘00001101’ (search period too short), if SEARCH_TYPE_r is equal to ‘11’
8 and *search_period* is less than $(\max(fwd_time, rev_time) + T_{71m})$ seconds, where
9 *search_period*, *fwd_time* and *rev_time* are defined below.
- 10 (In the following, if PILOT_UPDATE_r is equal to ‘1’, *rec_search_set* is the set of
11 pilots specified in the *Candidate Frequency Search Request Message* with the
12 corresponding SEARCH_SET field set to ‘1’; otherwise, *rec_search_set* is the
13 Candidate Frequency Search Set before the action time of the *Candidate*
14 *Frequency Search Request Message*.)
- 15 *search_period* = time period corresponding to SEARCH_PERIOD_r shown in
16 Table 2.6.6.2.8.3.2-1
- 17 *fwd_time* = the mobile station’s estimate of the total length of time, in
18 seconds, for which the mobile station will need to suspend its
19 current Forward Traffic Channel processing in order to tune
20 to the Candidate Frequency, to search *rec_search_set*, and to
21 re-tune to the Serving Frequency; if the mobile station
22 searches *rec_search_set* in multiple visits, *fwd_time* is the
23 total time for all visits to the Candidate Frequency in a search
24 period (see 2.6.6.2.8.3.2)
- 25 *rev_time* = the mobile station’s estimate of the total length of time, in
26 seconds, for which the mobile station will need to suspend its
27 current Reverse Traffic Channel processing in order to tune to
28 the Candidate Frequency, to search *rec_search_set*, and to re-
29 tune to the Serving Frequency; if the mobile station searches
30 *rec_search_set* in multiple visits, *rev_time* is the total time for
31 all visits to the Candidate Frequency in a search period
- 32 • If the mobile station does not send a *Mobile Station Reject Order* in response to
33 the *Candidate Frequency Search Request Message*, it shall perform the following:
- 34 – The mobile station shall send a *Candidate Frequency Search Response*
35 *Message* in assured mode, within T_{56m} seconds of receiving the *Candidate*
36 *Frequency Search Request Message*. The mobile station shall set the fields of
37 the *Candidate Frequency Search Response Message* as follows:

- 1 + The mobile station shall set TOTAL_OFF_TIME_FWD and
2 TOTAL_OFF_TIME_REV to its estimate of the total number of frames or
3 power control groups for which it will need to suspend its current
4 Forward Traffic Channel processing and Reverse Traffic Channel
5 processing, respectively, in order to tune to the Candidate Frequency, to
6 search *rec_search_set*, and to re-tune to the Serving Frequency (see
7 2.6.6.2.8.3.2). If the mobile station searches *rec_search_set* in multiple
8 visits to the Candidate Frequency, the mobile station shall report the
9 total number of frames or power control groups in all visits in a search
10 period for which it will need to suspend its current Forward Traffic
11 Channel and the Reverse Traffic Channel processing.
- 12 + The mobile station shall set MAX_OFF_TIME_FWD and
13 MAX_OFF_TIME_REV to its estimate of the maximum number of frames
14 or power control groups for which it will need to suspend its current
15 Forward Traffic Channel processing and Reverse Traffic Channel
16 processing, respectively, during any single visit to tune to the Candidate
17 Frequency, to search a subset of *rec_search_set*, and to re-tune to the
18 Serving Frequency.⁶⁹
- 19 + The mobile station shall set PCG_OFF_TIMES to '1' if
20 TOTAL_OFF_TIME_FWD, MAX_OFF_TIME_FWD, TOTAL_OFF_TIME_REV
21 and MAX_OFF_TIME_REV are expressed in units of power control
22 groups. If these time estimates are expressed in units of frames, the
23 mobile station shall set PCG_OFF_TIMES to '0'. The mobile station shall
24 not use power control groups as the unit of duration if P_REV_IN_USE_s
25 is less than six.
- 26 + If ALIGN_TIMING_r is equal to '1', the mobile station shall set
27 ALIGN_TIMING_USED to '1' to indicate if it will align its search as
28 requested by the base station; otherwise, the mobile station shall set
29 ALIGN_TIMING_USED to '0'. If ALIGN_TIMING_USED is set to '1', the
30 mobile station shall set MAX_NUM_VISITS to the maximum number of
31 visits per search period minus one. If MAX_NUM_VISITS is not equal to
32 0, the mobile station shall set INTER_VISIT_TIME, in units of frames or
33 power control groups, to its estimate of the time between the beginning
34 of consecutive visits to the Candidate Frequency within the same search
35 period.
- 36 – When the message takes effect, the mobile station shall perform the
37 following actions:

⁶⁹ If the mobile station searches the entire Candidate Frequency Search Set in a single visit to the Candidate Frequency, TOTAL_OFF_TIME_FWD will be equal to MAX_OFF_TIME_FWD, and TOTAL_OFF_TIME_REV will be equal to MAX_OFF_TIME_REV.

- 1 + If any periodic search is in progress, the mobile station shall abort it (see
2 2.6.6.2.8.3.4 and 2.6.6.2.10.4).
- 3 + Store the following parameters from the *Candidate Frequency Search*
4 *Request Message*:
- 5 o *Candidate Frequency Search Request Message* sequence number
6 (CFSRM_SEQ_s = CFSRM_SEQ_r)
 - 7 o Periodic search flag: If SEARCH_TYPE_r is equal to '11', the mobile
8 station shall set PERIODIC_SEARCH_s to '1'; otherwise, the mobile
9 station shall set PERIODIC_SEARCH_s to '0'.
 - 10 o Search period on the Candidate Frequency
11 (SEARCH_PERIOD_s = SEARCH_PERIOD_r)
 - 12 o Candidate Frequency search mode
13 (SEARCH_MODE_s = SEARCH_MODE_r)
 - 14 o Band class for the Candidate Frequency
15 (CF_CDMABAND_s = BAND_CLASS_r)
 - 16 o CDMA Channel number for the CDMA Candidate Frequency
17 (CF_CDMACH_s = CDMA_FREQ_r)
 - 18 o Serving Frequency total pilot E_c threshold
19 (SF_TOTAL_EC_THRESH_s = SF_TOTAL_EC_THRESH_r)
 - 20 o Serving Frequency total pilot E_c/I_o threshold
21 (SF_TOTAL_EC_IO_THRESH_s = SF_TOTAL_EC_IO_THRESH_r)
 - 22 o Received power difference threshold
23 (DIFF_RX_PWR_THRESH_s = DIFF_RX_PWR_THRESH_r)
 - 24 o Candidate Frequency Total pilot E_c/I_o threshold
25 (MIN_TOTAL_PILOT_EC_IO_s = MIN_TOTAL_PILOT_EC_IO_r)
 - 26 o Pilot detection threshold on the CDMA Candidate Frequency
27 (CF_T_ADD_s = CF_T_ADD_r)
 - 28 o Maximum time on the CDMA Target Frequency that the mobile
29 station may wait to receive a period of (N_{11m} × 20) ms with sufficient
30 signal quality on the physical channel corresponding to
31 FPC_PRI_CHAN_s
32 (TF_WAIT_TIME_s = TF_WAIT_TIME_r)
 - 33 o Pilot PN sequence offset increment on the CDMA Candidate
34 Frequency (CF_PILOT_INC_s = CF_PILOT_INC_r)
 - 35 o Search window for pilots in the Neighbor Set on the CDMA Candidate
36 Frequency (CF_SRCH_WIN_N_s = CF_SRCH_WIN_N_r)
 - 37 o Search window for pilots in the Remaining Set on the CDMA
38 Candidate Frequency (CF_SRCH_WIN_R_s = CF_SRCH_WIN_R_r)

- 1 o If PILOT_UPDATE is equal to '1', the mobile station shall perform the
2 following:
- 3 ◇ Set CF_SEARCH_PRIORITY_INCL_S and
4 CF_SRCH_WIN_NGHR_INCL_S to the values corresponding to
5 CF_NGHR_SRCH_MODE shown in Table 2.6.6.2.5.1-1,
6 ◇ Set CF_SRCH_OFFSET_INCL_S to CF_SRCH_OFFSET_INCL_R.
- 7 o If PILOT_UPDATE is equal to '1', the mobile station shall replace the
8 Candidate Frequency Neighbor Set with all neighbor pilots specified
9 in the *Candidate Frequency Search Request Message*. Specifically,
10 the mobile station shall store the following:
- 11 ◇ Set the NGHR_PN field of the Candidate Frequency Neighbor Set
12 Pilot Record to NGHR_PN_R.
- 13 ◇ Set the ADD_PILOT_REC_INCL field of the Candidate Frequency
14 Neighbor Set Pilot Record to ADD_PILOT_REC_INCL_R. If
15 ADD_PILOT_REC_INCL_R is equal to '1', the mobile station shall
16 store the following:
- 17 – Set the NGHR_PILOT_REC_TYPE field of the Candidate
18 Frequency Neighbor Set Pilot Record to
19 NGHR_PILOT_REC_TYPE_R.
- 20 – If NGHR_PILOT_REC_TYPE_R equals '000', the mobile station
21 shall set the TD_POWER_LEVEL and TD_MODE fields of the
22 Candidate Frequency Neighbor Set Pilot Record to
23 TD_POWER_LEVEL_R and TD_MODE_R, respectively.
- 24 – If NGHR_PILOT_REC_TYPE_R is equal to '001', the mobile
25 station shall
26 + Set the AUX_PILOT_QOF field of the Candidate Frequency
27 Neighbor Set Pilot Record to QOF_R.
- 28 + Set the AUX_PILOT_WALSH_CODE field of the Candidate
29 Frequency Neighbor Set Pilot Record to
30 AUX_PILOT_WALSH_R with the Walsh Code length specified
31 by WALSH_LENGTH_R.
- 32 – If NGHR_PILOT_REC_TYPE_R is equal to '010', the mobile
33 station shall:
34 + Set the AUX_PILOT_TD_QOF field of the Candidate
35 Frequency Neighbor Set Pilot Record to QOF_R.
- 36 + Set the AUX_PILOT_WALSH_CODE field of the Candidate
37 Frequency Neighbor Set Pilot Record to AUX_WALSH_R with
38 the Walsh Code length specified by WALSH_LENGTH_R.

- 1 + Set the AUX_TD_POWER_LEVEL field of the Candidate
 2 Frequency Neighbor Set Pilot Record to
 3 AUX_TD_POWER_LEVEL_r.
- 4 + Set the TD_MODE field of the Candidate Frequency
 5 Neighbor Set Pilot Record to TD_MODE_r.
- 6 - If NGHBR_PILOT_REC_TYPE_r is equal to '011', the mobile
 7 station shall:
- 8 + Set the SR3_PRIMARY_PILOT field of Candidate Frequency
 9 Neighbor Set Pilot Record to SR3_PRIMARY_PILOT_r.
- 10 + Set the SR3_PILOT_POWER1 field of Candidate Frequency
 11 Neighbor Set Pilot Record to SR3_PILOT_POWER1_r.
- 12 + Set the SR3_PILOT_POWER2 field of Candidate Frequency
 13 Neighbor Set Pilot Record to SR3_PILOT_POWER2_r.
- 14 - If NGHBR_PILOT_REC_TYPE_r is equal to '100', the mobile
 15 station shall:
- 16 + Set the SR3_PRIMARY_PILOT field of Candidate Frequency
 17 Neighbor Set Pilot Record to SR3_PRIMARY_PILOT_r.
- 18 + Set the SR3_PILOT_POWER1 field of Candidate Frequency
 19 Neighbor Set Pilot Record to SR3_PILOT_POWER1_r.
- 20 + Set the SR3_PILOT_POWER2 field of Candidate Frequency
 21 Neighbor Set Pilot Record to SR3_PILOT_POWER2_r.
- 22 + Set the AUX_PILOT_QOF field of Candidate Frequency
 23 Neighbor Set Pilot Record to QOF_r.
- 24 + Set the AUX_PILOT_WALSH_CODE field of Candidate
 25 Frequency Neighbor Set Pilot Record to
 26 AUX_PILOT_WALSH_r with the Walsh Code length specified
 27 by WALSH_LENGTH_r.
- 28 + If ADD_INFO_INCL1_r is equal to '1', set the
 29 AUX_PILOT_QOF1 field of Candidate Frequency Neighbor
 30 Set Pilot Record to QOF1_r and set the
 31 AUX_PILOT_WALSH_CODE1 field of Candidate Frequency
 32 Neighbor Set Pilot Record to AUX_PILOT_WALSH1_r with
 33 the Walsh Code length specified by WALSH_LENGTH1_r;
 34 otherwise, set the AUX_PILOT_QOF1 field of Candidate
 35 Frequency Neighbor Set Pilot Record to QOF_r and set the
 36 AUX_PILOT_WALSH_CODE1 field of Candidate Frequency
 37 Neighbor Set Pilot Record to AUX_PILOT_WALSH_r with the
 38 Walsh Code length specified by WALSH_LENGTH_r.
- 39 + If ADD_INFO_INCL2_r is equal to '1', set the
 40 AUX_PILOT_QOF2 field of Candidate Frequency Neighbor

- 1 Set Pilot Record to QOF_{2r} and set the
2 AUX_PILOT_WALSH_CODE2 field of Candidate Frequency
3 Neighbor Set Pilot Record to AUX_PILOT_WALSH_{2r} with
4 the Walsh Code length specified by WALSH_LENGTH_{2r};
5 otherwise, set the AUX_PILOT_QOF2 field of Candidate
6 Frequency Neighbor Set Pilot Record to QOF_r and set the
7 AUX_PILOT_WALSH_CODE2 field of Candidate Frequency
8 Neighbor Set Pilot Record to AUX_PILOT_WALSH_r with the
9 Walsh Code length specified by WALSH_LENGTH_r.
- 10 o If PILOT_UPDATE is equal to '1' and CF_SEARCH_PRIORITY_INCL_s is
11 equal to '1', the mobile station shall store the search priority
12 (SEARCH_PRIORITY_s = SEARCH_PRIORITY_r) associated with each of
13 the neighboring base stations contained in the Candidate Frequency
14 Neighbor Set.
- 15 o If PILOT_UPDATE is equal to '1' and CF_SRCH_WIN_NGHBR_INCL_s
16 is equal to '1', the mobile station shall perform the following:
- 17 ◇ Store the neighbor pilot channel search window size
18 (SRCH_WIN_NGHBR_s = SRCH_WIN_NGHBR_r) associated with
19 each of the neighboring base stations contained in the Candidate
20 Frequency Neighbor Set,
- 21 ◇ If CF_SRCH_OFFSET_INCL_r equals '1', store the neighbor pilot
22 channel search window offset (SRCH_OFFSET_NGHBR_s =
23 SRCH_OFFSET_NGHBR_r) associated with each of the neighboring
24 base stations contained in the Candidate Frequency Neighbor
25 Set.
- 26 o If PILOT_UPDATE is equal to '1', the mobile station shall replace the
27 Candidate Frequency Search Set with all flagged pilots (those with
28 the corresponding SEARCH_SET field set to '1') specified in the
29 *Candidate Frequency Search Request Message*.
- 30 + If ALIGN_TIMING_r is equal to '1' and the mobile station will align its
31 search as requested by the base station, the mobile station shall set
32 ALIGN_TIMING_USED_s to '1' and SEARCH_OFFSET_s to
33 SEARCH_OFFSET_r; otherwise, the mobile station shall set
34 ALIGN_TIMING_USED_s to '0' and SEARCH_OFFSET_s to '000000'.
- 35 + If the mobile station sets the PCG_OFF_TIMES field of the *Candidate*
36 *Frequency Search Response Message* to '1', it shall set
37 SEARCH_TIME_RESOLUTION_s to 0.00125; otherwise, it shall set
38 SEARCH_TIME_RESOLUTION_s to 0.02.
- 39 + If SEARCH_TYPE_r is equal to '01', the mobile station shall perform a
40 single search of the Candidate Frequency Search Set, as described in
41 2.6.6.2.8.3.1. If SEARCH_TYPE_r is equal to '11', the mobile station shall
42 perform the periodic search procedures, as described in 2.6.6.2.8.3.2.

Table 2.6.6.2.5.1-1. Search Parameter Settings

NGHBR_SRCH_ -MODE CF_NGHBR_ SRCH_MODE	SEARCH_ - PRIORITY_INCL CF_SEARCH_ - PRIORITY_INCL	SRCH_WIN_ - NGHBR_INCL CF_SRCH_ - WIN_NGHBR_INCL
00	0	0
01	1	0
10	0	1
11	1	1

6. *Candidate Frequency Search Control Message*: The mobile station shall process the message as follows:

If SEARCH_MODE_s is equal to '0000':

- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001010' (search set not specified), if SEARCH_TYPE_r is not equal to '00' and the Candidate Frequency Search Set is empty.
- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001011' (invalid search request), if SEARCH_TYPE_r is not equal to '00' and the Candidate Frequency is the same as the Serving Frequency (CF_CDMABAND_s is equal to CDMABAND_s and CF_CDMACH_s is equal to CDMACH_s).
- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001101' (search period too short), if SEARCH_TYPE_r is equal to '11' and *search_period* is less than $(\max(fwd_time, rev_time) + T_{71m})$ seconds, where

search_period = time period corresponding to SEARCH_PERIOD_r shown in Table 2.6.6.2.8.3.2-1,

fwd_time = the mobile station's estimate of the total length of time, in seconds, for which the mobile station will need to suspend its current Forward Traffic Channel processing in order to tune to the Candidate Frequency, to search the Candidate Frequency Search Set and to re-tune to the Serving Frequency; if the mobile station searches the Candidate Frequency Search Set in multiple visits, *fwd_time* is the total time for all visits to the Candidate Frequency in a search period (see 2.6.6.2.8.3.2),

and

rev_time = the mobile station's estimate of the total length of time, in seconds, for which the mobile station will need to suspend its current Reverse Traffic Channel processing in order to tune to

1 the Candidate Frequency, to search the Candidate Frequency
 2 Search Set and to re-tune to the Serving Frequency; if the
 3 mobile station searches the Candidate Frequency Search Set in
 4 multiple visits, *rev_time* is the total time for all visits to the
 5 Candidate Frequency in a search period.

- 6 • If the mobile station does not reject the *Candidate Frequency Search Control*
 7 *Message*, it shall perform the following actions when the message takes effect:
 - 8 – If any periodic search is in progress, the mobile station shall abort it (see
 9 2.6.6.2.8.3.4 and 2.6.6.2.10.4).
 - 10 – If ALIGN_TIMING_T is equal to '1' and the mobile station will align its search
 11 as requested by the base station, the mobile station shall set
 12 ALIGN_TIMING_USED_S to '1'; otherwise, the mobile station shall set
 13 ALIGN_TIMING_USED_S to '0' and SEARCH_OFFSET_S to '000000'.
 - 14 – If SEARCH_TYPE_T is equal to '00', the mobile station shall set
 15 PERIODIC_SEARCH_S to '0'.
 - 16 – If SEARCH_TYPE_T is equal to '01':
 - 17 + The mobile station shall set PERIODIC_SEARCH_S to '0'.
 - 18 + The mobile station shall perform a single search of the Candidate
 19 Frequency Search Set, as described in 2.6.6.2.8.3.1.
 - 20 – If SEARCH_TYPE_T is equal to '11':
 - 21 + The mobile station shall set PERIODIC_SEARCH_S to '1'.
 - 22 + The mobile station shall perform the periodic search procedures for the
 23 Candidate Frequency Search Set, as described in 2.6.6.2.8.3.2.

24 7. *Extended Neighbor List Update Message*: The mobile station shall update its
 25 neighbor set as specified in 2.6.6.2.6.3 and perform the following:

- 26 • If NGHBR_SRCH_MODE_T is equal to '01' or '11', the mobile station shall store
 27 the search priority (SEARCH_PRIORITY_S = SEARCH_PRIORITY_T) associated with
 28 each of the neighboring base stations contained in the *Extended Neighbor List*
 29 *Update Message* which are in the mobile's neighbor set.
- 30 • If NGHBR_SRCH_MODE_T is equal to '01' or '00', the mobile station shall set the
 31 SRCH_OFFSET_INCL_S field '0'.
- 32 • If NGHBR_SRCH_MODE_T is equal to '10' or '11', the mobile station shall perform
 33 the following:
 - 34 – Store the neighbor pilot channel search window size
 35 (SRCH_WIN_NGHBR_S = SRCH_WIN_NGHBR_T) associated with each of the
 36 neighboring base stations contained in the *Extended Neighbor List Updated*
 37 *Message* which are in the mobile's neighbor set,
 - 38 – If SRCH_OFFSET_INCL_T equals '1', set the SRCH_OFFSET_NGHBR field of
 39 NGHBR_REC[i] to the ith occurrence of SRCH_OFFSET_NGHBR_T,

- 1 – Set $SRCH_OFFSET_INCL_S$ to $SRCH_OFFSET_INCL_T$.
- 2 • The mobile station shall update the default search window size for its Neighbor
3 Set ($SRCH_WIN_N_S = SRCH_WIN_N_T$).
- 4 • The mobile station shall set $SEARCH_PRIORITY_INCL_S$ and
5 $SRCH_WIN_NGHBR_INCL_S$ to the value specified in Table 2.6.6.2.5.1-1
6 corresponding to $NGHBR_SRCH_MODE_T$.
- 7 • If USE_TIMING is equal to '1', the mobile station shall store the timing included
8 flag ($TIMING_INCL$) associated with each of the neighboring base stations
9 contained in the *Extended Neighbor List Update Message* which are in the mobile
10 station neighbor set; otherwise the mobile station shall set the timing included
11 flag ($TIMING_INCL$) associated with each of the neighboring base stations to '0'.
- 12 • If USE_TIMING is equal to '1' and $TIMING_INCL_T$ is equal to '1', the mobile
13 station shall store the neighbor transmit time offset ($NGHBR_TX_OFFSET =$
14 $NGHBR_TX_OFFSET_T$) associated with each of the neighboring base stations
15 contained in the *Extended Neighbor List Update Message* which are in the mobile
16 station neighbor set.
- 17 • If USE_TIMING is equal to '1' and the $TIMING_INCL$ is equal to '1', then the
18 mobile station shall perform the following:
- 19 – If the $GLOBAL_TIMING_INCL$ field is equal to '1', then the mobile station
20 shall store the neighbor transmit time duration ($NGHBR_TX_DURATION =$
21 $GLOBAL_TX_DURATION_T$) and the neighbor transmit time duration
22 ($NGHBR_TX_PERIOD = GLOBAL_TX_PERIOD_T$) contained in the *Extended*
23 *Neighbor List Update Message*.
- 24 – If the $GLOBAL_TIMING_INCL$ field is equal to '0', then the mobile station
25 shall store the neighbor transmit time duration ($NGHBR_TX_DURATION =$
26 $NGHBR_TX_DURATION_T$) and the neighbor transmit time duration
27 ($NGHBR_TX_PERIOD = NGHBR_TX_PERIOD_T$) associated with each of the
28 neighboring base stations contained in the *Extended Neighbor List Update*
29 *Message* which are in the mobile station neighbor set.
- 30 • The mobile station shall set $RESQ_ENABLED_S = RESQ_ENABLED_T$. If
31 $RESQ_ENABLED_S$ is equal to '1', then the mobile station shall store:
- 32 – Call rescue delay timer value ($RESQ_DELAY_TIME_S = RESQ_DELAY_TIME_T$)
- 33 – Call rescue allowed timer value ($RESQ_ALLOWED_TIME_S =$
34 $RESQ_ALLOWED_TIME_T$)
- 35 – Call rescue attempt timer value ($RESQ_ATTEMPT_TIME_S =$
36 $RESQ_ATTEMPT_TIME_T$)
- 37 – Code channel index for call rescue ($RESQ_CODE_CHAN_S =$
38 $RESQ_CODE_CHAN_T$)
- 39 – Quasi-Orthogonal Function mask identifier for call rescue ($RESQ_QOF_S =$
40 $RESQ_QOF_T$)

- 1 – Minimum time between consecutive rescues ($RESQ_MIN_PERIOD_s =$
2 $RESQ_MIN_PERIOD_r + 1$) if $RESQ_MIN_PERIOD_INCL_r$ is equal to '1';
3 otherwise, $RESQ_MIN_PERIOD_s = '00000'$.
- 4 – The required number of transmissions of a regular PDU before declaring L2
5 Acknowledgment Failure when Call Rescue is enabled
6 ($RESQ_NUM_TOT_TRANS_20MS_s = RESQ_NUM_TOT_TRANS_20MS_r$) if
7 included.
- 8 – The required number of transmissions of a mini PDU before declaring L2
9 Acknowledgment Failure when Call Rescue is enabled
10 ($RESQ_NUM_TOT_TRANS_5MS_s = RESQ_NUM_TOT_TRANS_5MS_r$) if
11 included.
- 12 – The mobile station shall set the Traffic Channel preamble length for Call
13 Rescue Soft Handoff as follows:
- 14 + If the mobile station is operating in Radio Configuration 1 or 2, set
15 $RESQ_NUM_PREAMBLE_RC1_RC2_s = RESQ_NUM_PREAMBLE_r$;
- 16 + If the mobile station is operating in Radio Configuration greater 2, set
17 $RESQ_NUM_PREAMBLE_s = RESQ_NUM_PREAMBLE_r$.
- 18 – The power level adjustment to be applied to the last closed-loop power level
19 when re-enabling the transmitter for call rescue soft handoff
20 ($RESQ_POWER_DELTA_s = RESQ_POWER_DELTA_r$).
- 21 – Set the $NGHBR_RESQ_CONFIGURED$ field of $NGHBR_REC[i]$ to the i^{th}
22 occurrence of $NGHBR_RESQ_CONFIGURED_r$.
- 23 • For each of the neighboring base stations contained in the *General Neighbor List*
24 *Message*, the mobile station shall set $ADD_PILOT_REC_INCL$ field of
25 $NGHBR_REC[i]$ to the i^{th} occurrence of $ADD_PILOT_REC_INCL_r$. If
26 $ADD_PILOT_REC_INCL_r$ equals '1', for each pilot, the mobile station shall also
27 perform the following:
- 28 – Set the $NGHBR_PILOT_REC_TYPE$ field of $NGHBR_PILOT_REC$ to
29 $NGHBR_PILOT_REC_TYPE_r$.
- 30 – If $NGHBR_PILOT_REC_TYPE_r$ is equal to '000'. The mobile station shall set
31 the TD_POWER_LEVEL field of $NGHBR_PILOT_REC$ to $TD_POWER_LEVEL_r$
32 and set the TD_MODE field of $NGHBR_PILOT_REC$ to TD_MODE_r .
- 33 – If $NGHBR_PILOT_REC_TYPE_r$ is equal to '001', the mobile station shall:
34 + Set the AUX_PILOT_QOF field of $NGHBR_PILOT_REC$ to QOF_r
- 35 + Set the $AUX_PILOT_WALSH_CODE$ field of $NGHBR_PILOT_REC$ to
36 $AUX_PILOT_WALSH_r$ with the Walsh Code length specified by
37 $WALSH_LENGTH_r$
- 38 – If $NGHBR_PILOT_REC_TYPE_r$ is equal to '010', the mobile station shall:
39 + Set the $AUX_PILOT_TD_QOF$ field of $NGHBR_PILOT_REC$ to QOF_r .

- 1 + Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
 2 AUX_WALSH_r with the Walsh Code length specified by
 3 WALSH_LENGTH_r.
- 4 + Set the AUX_TD_POWER_LEVEL field of NGHBR_PILOT_REC to
 5 AUX_TD_POWER_LEVEL_r.
- 6 + Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
- 7 – If NGHBR_PILOT_REC_TYPE_r is equal to ‘011’, the mobile station shall:
- 8 + Set the SR3_PRIMARY_PILOT field of NGHBR_PILOT_REC to
 9 SR3_PRIMARY_PILOT_r.
- 10 + Set the SR3_PILOT_POWER1 field of NGHBR_PILOT_REC to
 11 SR3_PILOT_POWER1_r.
- 12 + Set the SR3_PILOT_POWER2 field of NGHBR_PILOT_REC to
 13 SR3_PILOT_POWER2_r.
- 14 – If NGHBR_PILOT_REC_TYPE_r is equal to ‘100’, the mobile station shall:
- 15 + Set the SR3_PRIMARY_PILOT field of NGHBR_PILOT_REC to
 16 SR3_PRIMARY_PILOT_r.
- 17 + Set the SR3_PILOT_POWER1 field of NGHBR_PILOT_REC to
 18 SR3_PILOT_POWER1_r.
- 19 + Set the SR3_PILOT_POWER2 field of NGHBR_PILOT_REC to
 20 SR3_PILOT_POWER2_r.
- 21 + Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.
- 22 + Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
 23 AUX_PILOT_WALSH_r with the Walsh Code length specified by
 24 WALSH_LENGTH_r.
- 25 + If ADD_INFO_INCL1_r is equal to ‘1’, set the AUX_PILOT_QOF1 field of
 26 NGHBR_PILOT_REC to QOF1_r and set the AUX_PILOT_WALSH_CODE1
 27 field of NGHBR_PILOT_REC to AUX_PILOT_WALSH1_r with the Walsh
 28 Code length specified by WALSH_LENGTH1_r; otherwise, set the
 29 AUX_PILOT_QOF1 field of NGHBR_PILOT_REC to QOF_r and set the
 30 AUX_PILOT_WALSH_CODE1 field of NGHBR_PILOT_REC to
 31 AUX_PILOT_WALSH_r with the Walsh Code length specified by
 32 WALSH_LENGTH_r.
- 33 + If ADD_INFO_INCL2_r is equal to ‘1’, set the AUX_PILOT_QOF2 field of
 34 NGHBR_PILOT_REC to QOF2_r and set the AUX_PILOT_WALSH_CODE2
 35 field of NGHBR_PILOT_REC to AUX_PILOT_WALSH2_r with the Walsh
 36 Code length specified by WALSH_LENGTH2_r; otherwise, set the
 37 AUX_PILOT_QOF2 field of NGHBR_PILOT_REC to QOF_r and set the
 38 AUX_PILOT_WALSH_CODE2 field of NGHBR_PILOT_REC to
 39 AUX_PILOT_WALSH_r with the Walsh Code length specified by
 40 WALSH_LENGTH_r.

1 8. *Supplemental Channel Assignment Message*: The mobile station shall process this
2 message as follows:

3 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set
4 to the specified value if any of the following conditions is true, and shall not perform
5 any other action described in this section for processing the *Supplemental Channel*
6 *Assignment Message*:

- 7 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
8 set to '00000110' (capability not supported), if the number of forward or reverse
9 Supplemental Code Channels specified in the *Supplemental Channel Assignment*
10 *Message* is greater than the maximum number of Supplemental Code Channels
11 supported by the mobile station.
- 12 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
13 set to '00000011' (message structure not acceptable), if both
14 USE_REV_HDM_SEQ and EXPL_REV_START_TIME or both
15 USE_FOR_HDM_SEQ and EXPL_FOR_START_TIME specified in the
16 *Supplemental Channel Assignment Message* are set to '1'.
- 17 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
18 set to '00000100' (message field not in valid range), if PILOT_PN specified in the
19 *Supplemental Channel Assignment Message* is not in the Active Set and this
20 message is not linked with a *General Handoff Direction Message*.

21 If none of the above conditions is true, the mobile station shall perform the
22 following.

- 23 • The mobile station shall store the following parameters from the *Supplemental*
24 *Channel Assignment Message*:
 - 25 – Use *General Handoff Direction Message* forward sequence number indicator
26 (USE_FOR_HDM_SEQ_s = USE_FOR_HDM_SEQ_r)
 - 27 – If USE_FOR_HDM_SEQ_r is equal to '1', then the mobile station shall store
28 the following:
 - 29 + The sequence number of the *General Handoff Direction Message* to which
30 this message is linked for the Forward Supplemental Code Channel
31 assignment (FOR_LINKED_HDM_SEQ_s = FOR_LINKED_HDM_SEQ_r)
 - 32 + The forward Supplemental Code Channel assignment order
33 (SCAM_FOR_ORDER_s = least significant bit of FOR_SUP_CONFIG_r)
 - 34 + The forward duration assignment indicator
35 (SCAM_FOR_DURATION_MODE_s = USE_FOR_DURATION_r).
 - 36 – Use *General Handoff Direction Message* reverse sequence number indicator
37 (USE_REV_HDM_SEQ_s = USE_REV_HDM_SEQ_r)
 - 38 – If USE_REV_HDM_SEQ_r is equal to '1', then the mobile station shall store
39 the following:

- 1 + The sequence number of the *General Handoff Direction Message* to which
2 this message is linked for the Reverse Supplemental Code Channel
3 assignment ($REV_LINKED_HDM_SEQ_S = REV_LINKED_HDM_SEQ_R$)
- 4 + The reverse duration assignment indicator
5 ($SCAM_REV_DURATION_MODE_S = USE_REV_DURATION_R$).
- 6 • If $USE_RETRY_DELAY_R$ is '0', then the mobile station shall store 0 as
7 $RETRY_DELAY_S$. The mobile station may send subsequent *Supplemental*
8 *Channel Request Messages* whenever $RETRY_DELAY_S$ is set to 0.
 - 9 • If $USE_RETRY_DELAY_R$ is set to '1', the mobile station shall interpret the
10 *Supplemental Channel Assignment Message* as an indication that the base
11 station has specified a *Supplemental Channel Request Message* retry delay in
12 $RETRY_DELAY_R$ as follows:
 - 13 – The mobile station shall store the next system time 80 ms boundary +
14 $RETRY_DELAY_R \times 320$ ms as $RETRY_DELAY_S$. The mobile station shall not
15 send any subsequent *Supplemental Channel Request Message* until after the
16 system time stored in $RETRY_DELAY_S$. At the system time stored in
17 $RETRY_DELAY_S$, the mobile station shall reset $RETRY_DELAY_S$ to 0.
 - 18 – If $RETRY_DELAY_R$ is '00000000', then the mobile station shall store 0 as
19 $RETRY_DELAY_S$. The mobile station may send subsequent *Supplemental*
20 *Channel Request Messages* whenever $RETRY_DELAY_S$ is set to 0.
 - 21 – If $RETRY_DELAY_R$ is '11111111', then the mobile station shall store *infinity*
22 as $RETRY_DELAY_S$, and the mobile station shall not send any further
23 *Supplemental Channel Request Messages* until the mobile station receives a
24 new *Supplemental Channel Assignment Message* with no retry delay or a non-
25 infinite retry delay specified, or until the mobile station receives a *General*
26 *Handoff Direction Message* with a $CLEAR_RETRY_DELAY$ indication set.
 - 27 • If $REV_INCLUDED_R$ is equal to '1', then the mobile station shall process Reverse
28 Supplemental Code Channel assignment information for the *Supplemental*
29 *Channel Assignment Message*. This information shall be processed as follows:
 - 30 – The mobile station shall store $USE_T_ADD_ABORT_R$, the Reverse
31 Supplemental Code Channel assignment T_ADD abort indicator, as
32 $USE_T_ADD_ABORT_S$.
 - 33 – The mobile station shall store $REV_DTX_DURATION_R$, Reverse Supplemental
34 Channel Discontinuous Transmission Duration, as $REV_DTX_DURATION_S$.
 - 35 – If $REV_PARMS_INCLUDED_R$ is equal to '1', the mobile station shall store the
36 following:
 - 37 + $T_MULCHAN_S = T_MULCHAN_R$
 - 38 + $BEGIN_PREAMBLE_S = BEGIN_PREAMBLE_R$
 - 39 + $RESUME_PREAMBLE_S = RESUME_PREAMBLE_R$

- 1 – If IGNORE_SCAM_S is equal to ‘1’ and SCRM_SEQ_NUM_T is not present or is
2 present and is not equal to SCRM_SEQ_NUM_S, then the mobile station shall
3 not process the remaining Reverse Supplemental Code Channel assignment
4 information in this message.
- 5 – If IGNORE_SCAM_S is equal to ‘1’ and SCRM_SEQ_NUM_T is present and is
6 equal to SCRM_SEQ_NUM_S, then the mobile station shall set
7 IGNORE_SCAM_S to ‘0’.
- 8 – The mobile station shall set REV_START_TIME_S as follows:
9 + If EXPL_REV_START_TIME_T is equal to ‘1’, the mobile station shall set
10 the REV_START_TIME_S to REV_START_TIME_T.
- 11 + If USE_REV_HDM_SEQ_T is equal to ‘1’ and REV_LINKED_HDM_SEQ_T is
12 not equal to HDM_SEQ_S, the mobile station shall set the
13 REV_START_TIME_S to NULL.
- 14 + If USE_REV_HDM_SEQ_T is equal to ‘1’ and REV_LINKED_HDM_SEQ_T is
15 equal to HDM_SEQ_S, then the mobile station shall set the
16 REV_START_TIME_S to the action time of the *General Handoff Direction*
17 *Message* that is linked to the *Supplemental Channel Assignment Message*.
- 18 + If EXPL_REV_START_TIME_T is equal to ‘0’ and USE_REV_HDM_SEQ_T is
19 equal to ‘0’, the mobile station shall set the REV_START_TIME_S to the
20 next 80 ms boundary following the action time of the *Supplemental*
21 *Channel Assignment Message*.
- 22 – The mobile station shall set NUM_REV_CODES_S to NUM_REV_CODES_T. If
23 REV_START_TIME_S is not equal to NULL, the mobile station shall perform the
24 following actions:
25 + If NUM_REV_CODES_T is equal to ‘000’, the mobile station shall stop
26 transmitting the Reverse Supplemental Code Channels at the start time
27 specified by REV_START_TIME_S.
- 28 + If NUM_REV_CODES_T is not equal to ‘000’, the mobile station shall set
29 PILOT_GATING_USE_RATE to ‘0’ at the action time of the message and
30 the mobile station may start transmitting on NUM_REV_CODES_S Reverse
31 Supplemental Code Channels at the start time specified by
32 REV_START_TIME_S for a duration of time specified by the following rules:
33 o If USE_REV_DURATION_T is equal to ‘1’, the mobile station shall set
34 REV_DURATION_S to REV_DURATION_T. The mobile station may
35 continue transmitting on the Reverse Supplemental Code Channels
36 for a period of (REV_DURATION_S × 80) ms, or until it receives the
37 action time of a subsequent *General Handoff Direction Message* or a
38 *Supplemental Channel Assignment Message* that specifies a different
39 Reverse Supplemental assignment duration or start time.

- 1 o If USE_REV_DURATION_r is equal to '0', the mobile station may
2 continue to transmit indefinitely on the Reverse Supplemental Code
3 Channels, or until it receives the action time of a subsequent *General*
4 *Handoff Direction Message* or a *Supplemental Channel Assignment*
5 *Message* that specifies a different Reverse Supplemental assignment
6 duration or start time.
- 7 • If FOR_INCLUDED is equal to '1', then the mobile station shall process Forward
8 Supplemental Code Channel assignment information as follows:
- 9 – The mobile station shall assign a value to FOR_START_TIME_s according to
10 the following rules:
- 11 + If EXPL_FOR_START_TIME is equal to '1', the mobile station shall set the
12 FOR_START_TIME_s to FOR_START_TIME_r.
- 13 + If USE_FOR_HDM_SEQ_r is equal to '1' and FOR_LINKED_HDM_SEQ_r is
14 not equal to HDM_SEQ_s, the mobile station shall set the
15 FOR_START_TIME_s to NULL.
- 16 + If USE_FOR_HDM_SEQ_r is equal to '1' and FOR_LINKED_HDM_SEQ_r is
17 equal to HDM_SEQ_s, then the mobile station shall set the
18 FOR_START_TIME_s to the action time of the *General Handoff Direction*
19 *Message* that is linked to the *Supplemental Channel Assignment Message*.
- 20 + If EXPL_FOR_START_TIME_r is equal to '0' and USE_FOR_HDM_SEQ_r
21 equals '0', the mobile station shall set the FOR_START_TIME_s to the
22 action time of the *Supplemental Channel Assignment Message*.
- 23 – If FOR_SUP_CONFIG_r is equal to '00' and FOR_START_TIME_s is not equal to
24 NULL, the mobile station should stop processing the Forward Supplemental
25 Code Channels at the time specified by FOR_START_TIME_s.
- 26 – If FOR_SUP_CONFIG_r is equal to '01' and FOR_START_TIME_s is not equal to
27 NULL, the mobile station shall set PILOT_GATING_USE_RATE to '0' at the
28 action time of the message and start processing the Forward Supplemental
29 Code Channels in the CODE_CHAN_LIST_s at FOR_START_TIME_s for a period
30 of time specified by the following rules:
- 31 + If USE_FOR_DURATION is equal to '1', the mobile station shall set
32 FOR_DURATION_s to FOR_DURATION_r. The mobile station shall
33 continue processing the Forward Supplemental Code Channels for a
34 period of (FOR_DURATION_s × 80) ms, or until it receives the action time
35 of a subsequent *Supplemental Channel Assignment Message* or a *General*
36 *Handoff Direction Message* that specifies a different Forward
37 Supplemental assignment duration or start time.

- 1 + If USE_FOR_DURATION_r is equal to '0', the mobile station shall continue
2 processing the Forward Supplemental Code Channels until it receives
3 the action time of a subsequent *Supplemental Channel Assignment*
4 *Message* or a *General Handoff Direction Message* that specifies a different
5 Forward Supplemental assignment duration or start time.
- 6 – If FOR_SUP_CONFIG_r is equal to '10', the mobile station shall perform the
7 following:
8 + The mobile station shall update the CODE_CHAN_LIST_s as specified in
9 2.6.8.
10 + If FOR_START_TIME_s is not equal to NULL the mobile station should
11 stop processing Forward Supplemental Code Channels at the time
12 specified by FOR_START_TIME_s.
- 13 – If FOR_SUP_CONFIG_r is equal to '11', the mobile station shall perform the
14 following:
15 + The mobile station shall update the CODE_CHAN_LIST_s as specified in
16 2.6.8.
17 + If FOR_START_TIME_s is not equal to NULL, then the mobile station shall
18 set PILOT_GATING_USE_RATE to '0' at the action time of the message
19 and start processing the Forward Supplemental Code Channels in the
20 CODE_CHAN_LIST_s at the time specified by FOR_START_TIME_s for a
21 period of time specified by the following rules:
- 22 o If USE_FOR_DURATION_r is equal to '1', the mobile station shall set
23 FOR_DURATION_s to FOR_DURATION_r. The mobile station shall
24 continue processing the Forward Supplemental Code Channels for
25 (FOR_DURATION_s × 80) ms, until it receives a subsequent
26 *Supplemental Channel Assignment Message* or a *General Handoff*
27 *Direction Message* that specifies a different Forward Supplemental
28 assignment duration or start time.
- 29 o If USE_FOR_DURATION_r is equal to '0', the mobile station shall
30 continue processing the Forward Supplemental Code Channels until
31 it receives a subsequent *Supplemental Channel Assignment Message*
32 or a *General Handoff Direction Message* that specifies a different
33 Forward Supplemental assignment duration or start time.

34 9. *General Handoff Direction Message*: The mobile station shall process the message
35 as follows:

36 In addition to the requirements in this section, if the SCR_INCLUDED field is
37 included in this message and is set to '1' the mobile station shall also process this
38 message in accordance with the requirements for the active service subfunction (see
39 2.6.4.1.2.2).

40 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set
41 to the specified value if any of the following conditions is true, and shall not perform

1 any other action described in this section for processing the *General Handoff*
 2 *Direction Message*:

- 3 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
 4 set to '00000110' (capability not supported), if the mobile station does not
 5 support the band class specified in the *General Handoff Direction Message*.
- 6 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
 7 set to '00000110' (capability not supported), if the number of forward or reverse
 8 Supplemental Code Channels specified in the *General Handoff Direction Message*
 9 is greater than the maximum number of Supplemental Code Channels
 10 supported by the mobile station.
- 11 • If the SCR_INCLUDED field is included in this message and is set to '1', the
 12 mobile station shall perform the following:
 - 13 - The mobile station shall send a *Mobile Station Reject Order* with the ORDQ
 14 field set to '00000111' (message cannot be handled by the current mobile
 15 station configuration), if the mobile station does not support the service
 16 configuration specified in the *General Handoff Direction Message*.
 - 17 - The mobile station shall send a *Mobile Station Reject Order* (ORDQ =
 18 '00000111') within T_{56m} seconds, if the mobile station supports the service
 19 configuration specified but does not accept the service configuration
 20 specified in the *General Handoff Direction Message*.
- 21 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
 22 set to '00000111' (message cannot be handled by the current mobile station
 23 configuration), if the NNSCR_INCLUDED field is included and set to '1' and the
 24 SCR_INCLUDED field is either not included or included but set to '0', and the
 25 mobile station does not support the configuration specified in the non-
 26 negotiable service configuration information record in the *General Handoff*
 27 *Direction Message*.
- 28 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
 29 set to '00001010' (search set not specified), if the PERIODIC_SEARCH field is
 30 included in the *General Handoff Direction Message* and is set to '1', and the
 31 Candidate Frequency Search Set is empty.
- 32 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
 33 set to '00001101' (search period too short), if the PERIODIC_SEARCH field is
 34 included in the *General Handoff Direction Message* and is set to '1', and
 35 *search_period* is less than $(\max(fwd_time, rev_time) + T_{71m})$ seconds, where
 36 *search_period* = time period corresponding to SEARCH_PERIOD_s shown in
 37 Table 2.6.6.2.8.3.2-1,
 38 *fwd_time* = the mobile station's estimate of the total length of time, in seconds,
 39 for which the mobile station will need to suspend its current
 40 Forward Traffic Channel processing in order to tune to the CDMA
 41 Candidate Frequency, to search the Candidate Frequency Search

1 Set, and to re-tune to the Serving Frequency; if the mobile station
 2 searches the Candidate Frequency Search Set in multiple visits,
 3 *fwd_time* is the total time for all visits to the CDMA Candidate
 4 Frequency in a search period (see 2.6.6.2.8.3.2),

5 and

6 *rev_time* = the mobile station's estimate of the total length of time, in seconds,
 7 for which the mobile station will need to suspend its current Reverse
 8 Traffic Channel processing in order to tune to the CDMA Candidate
 9 Frequency, to search the Candidate Frequency Search Set, and to
 10 re-tune to the Serving Frequency; if the mobile station searches the
 11 Candidate Frequency Search Set in multiple visits, *rev_time* is the
 12 total time for all visits to the CDMA Candidate Frequency in a
 13 search period.

14 If none of the above conditions is true, the mobile station shall perform the actions
 15 described in the remainder of this section to process the *General Handoff Direction*
 16 *Message* at the action time of the message.

17 If EXTRA_PARMS is equal to '1', the mobile station shall store the return on failure
 18 indicator from the *General Handoff Direction Message* (RETURN_IF_HANDOFF_FAIL_S
 19 = RETURN_IF_HANDOFF_FAIL_T); otherwise the mobile station shall set
 20 RETURN_IF_HANDOFF_FAIL_S to '0'.

21 The mobile station shall set RETURN_IF_HANDOFF_FAIL_S to '0' (disable return on
 22 failure) if any of the following conditions is true:

- 23 • If P_REV_IN_USE_S is less than or equal to four and the mobile station does not
 24 support hard handoff with return on failure, or
- 25 • At least one of the pilots specified by the message is also included in the Active
 26 Set prior to the action time of the message, and one of the following conditions is
 27 true:
 - 28 – EXTRA_PARMS is equal to '0', or
 - 29 – EXTRA_PARMS is equal to '1', the message specifies the same Frequency
 30 Assignment as the Serving Frequency (BAND_CLASS_T is equal to
 31 CDMABAND_S and CDMA_FREQ_T is equal to CDMACH_S), and
 32 FRAME_OFFSET_T is equal to FRAME_OFFSET_S.

33 The mobile station shall store the following parameters from its current
 34 configuration:

- 35 • CDMA band class (SF_CDMABAND_S = CDMABAND_S)
- 36 • Frequency assignment (SF_CDMACH_S = CDMACH_S)
- 37 • Frame Offset (SF_FRAME_OFFSET_S = FRAME_OFFSET_S)

38 If RETURN_IF_HANDOFF_FAIL_S is equal to '1', the mobile station shall also store
 39 the following parameters from its current configuration:

- 1 • Protocol revision level
2 (SF_P_REV_s = P_REV_s)
- 3 • Protocol revision level in use on the Serving Frequency
4 (SF_P_REV_IN_USE_s = P_REV_IN_USE_s)
- 5 • Search window size for the Active Set and Candidate Set
6 (SF_SRCH_WIN_A_s = SRCH_WIN_A_s)
- 7 • Search window size for the Neighbor Set
8 (SF_SRCH_WIN_N_s = SRCH_WIN_N_s)
- 9 • Search window size for the Remainder Set
10 (SF_SRCH_WIN_R_s = SRCH_WIN_R_s)
- 11 • Pilot detection threshold
12 (SF_T_ADD_s = T_ADD_s)
- 13 • Pilot drop threshold
14 (SF_T_DROP_s = T_DROP_s)
- 15 • Active Set versus Candidate Set comparison threshold
16 (SF_T_COMP_s = T_COMP_s)
- 17 • Drop timer value
18 (SF_T_TDROP_s = T_TDROP_s)
- 19 • Drop timer range value (SF_T_TDROP_RANGE_s = T_TDROP_RANGE_s)
- 20 • Soft slope for the dynamic add and drop thresholds
21 (SF_SOFT_SLOPE_s = SOFT_SLOPE_s)
- 22 • Intercept for the dynamic add threshold
23 (SF_ADD_INTERCEPT_s = ADD_INTERCEPT_s)
- 24 • Intercept for the dynamic drop threshold
25 (SF_DROP_INTERCEPT_s = DROP_INTERCEPT_s)
- 26 • Private long code mask indicator: If the mobile station is using the private long
27 code mask on the Serving Frequency, it shall set SF_PRIVATE_LCM_s to '1';
28 otherwise, it shall set SF_PRIVATE_LCM_s to '0'.
- 29 • Private long code mask: If the mobile station is using the private long code mask
30 on the Serving Frequency, it shall set SF_PVTLCM_42_s to the PVTLCM_42.
- 31 • Public long code mask type: The mobile station shall set SF_PLCM_TYPE_s to
32 PLCM_TYPE_s. If PLCM_TYPE_s equals '0001', the mobile station shall set
33 SF_PLCM_39_s to PLCM_39_s.
- 34 • Service negotiation type
35 (SF_SERV_NEG_s = SERV_NEG_s)
- 36 • Service configuration:
37 Store the current service configuration (service configuration record and non-
38 negotiable service configuration record) in SF_SERVICE_CONFIG_s

- 1 • Call Information:
- 2 Store the list of current calls (Call Control instances, etc.) in SF_CALLS_s
- 3 • Message encryption mode: If message encryption is on, the mobile station shall
- 4 set SF_ENCRYPT_MODE_s to '1'; otherwise, the mobile station shall set
- 5 SF_ENCRYPT_MODE_s to '0'.
- 6 • Extended nominal power setting of the current cell
- 7 (SF_NOM_PWR_EXT_s = NOM_PWR_EXT_s)
- 8 • Nominal power setting of the current cell
- 9 (SF_NOM_PWR_s = NOM_PWR_s)
- 10 • Power control step
- 11 (SF_PWR_CNTL_STEP_s = PWR_CNTL_STEP_s)
- 12 • Serving Frequency Active Set (SF Active Set = (For each pilot in the current
- 13 Active Set: (PILOT_PN, PWR_COMB_IND)))
- 14 • Serving Frequency Code Channel List
- 15 (SF_CODE_CHAN_LIST_s = CODE_CHAN_LIST_s)

16 When the message takes effect, the mobile station shall perform the following actions:

- 17 • The mobile station shall send a *Handoff Completion Message* or an *Extended*
- 18 *Handoff Completion Message* as specified in 2.6.6.2.5.2. If the RC assigned on the
- 19 reverse fundamental channel or supplemental channel is less than RC08 the mobile
- 20 station shall set RC_BITMAP_CAPABILITY_EXT_ALLOWED_s to '0'.
- 21 • Update the Active Set, Candidate Set, and Neighbor Set in accordance with the
- 22 *General Handoff Direction Message* processing (see 2.6.6.2.6.1, 2.6.6.2.6.2, and
- 23 2.6.6.2.6.3).
- 24 • The mobile station shall delete all pilots that are not listed in the Active Set from
- 25 the Active Set of the Supplemental Channel for the Forward Supplemental
- 26 Channel Assignment (if any). If these deleted pilots include all pilots in the
- 27 Active Set of the Supplemental Channel, the mobile station shall cancel the
- 28 Forward Supplemental Channel Assignment.
- 29 • Discontinue use of all Forward Traffic Channels associated with pilots not listed
- 30 in the *General Handoff Direction Message*.
- 31 • If EXTRA_PARMS is equal to '1', perform the following actions:
 - 32 – If FRAME_OFFSET_r is not equal to FRAME_OFFSET_s, change the frame
 - 33 offset on all of the code channels of the Forward Traffic Channel and of the
 - 34 Reverse Traffic Channel.
 - 35 – If RESET_L2_r is equal to '1', and RETURN_IF_HANDOFF_FAIL_s is equal to
 - 36 '0', Layer 3 shall send a L2-Supervision.Request primitive to Layer 2 to reset
 - 37 the acknowledgment procedures, as specified in [4]. The mobile station shall
 - 38 reset the acknowledgment procedures immediately after the action time of
 - 39 the *General Handoff Direction Message*.

- 1 – If RESET_FPC_r is equal to ‘1’ and RETURN_IF_HANDOFF_FAIL_s is equal to
2 ‘0’, initialize the Forward Traffic Channel power control counters, as
3 specified in 2.6.4.1.1.1.
- 4 – If SERV_NEG_TYPE_r is equal to ‘1’, set SERV_NEG_s to enabled; otherwise set
5 SERV_NEG_s to disabled.
- 6 – Use the long code mask as follows:
- 7 + If PRIVATE_LCM_r equals ‘1’, the mobile station shall use the Private Long
8 Code Mask as specified in 2.3.6.
- 9 + If PRIVATE_LCM_r equals ‘0’, the mobile station shall use the Public Long
10 Code Mask derived from PLCM_TYPE_s as specified in 2.3.6
- 11 + The mobile station shall indicate to the user the voice privacy mode
12 status.
- 13 – Process the ENCRYPT_MODE field, as specified in 2.3.12.2.
- 14 – Perform the procedures as specified in 2.6.11.3.
- 15 • If EXTRA_PARMS is equal to ‘0’, set the following variables to the values
16 indicated:
- 17 – Hard handoff traffic channel preamble count required before transmitting a
18 *Handoff Completion Message* or an *Extended Handoff Completion Message*
19 (NUM_PREAMBLE_s = ‘000’)
- 20 – Complete search flag (COMPLETE_SEARCH_s = ‘1’)
- 21 – CDMA band class for the Target Frequency
22 (TF_CDMABAND_s = SF_CDMABAND_s)
- 23 – Frequency assignment for the Target Frequency
24 (TF_CDMACH_s = SF_CDMACH_s)
- 25 • Store the following parameters from the *General Handoff Direction Message*:
- 26 – *General Handoff Direction Message* sequence number
27 (HDM_SEQ_s = HDM_SEQ_r)
- 28 – Forward power control subchannel relative gain (FPC_SUBCHAN_GAIN_s =
29 FPC_SUBCHAN_GAIN_r).
- 30 – If the mobile station uses FPC_SUBCHAN_GAIN_s, the mobile station shall
31 perform the following:
- 32 + If PC_ACTION_TIME_r is received, the mobile station shall apply its usage
33 of the FPC_SUBCHAN_GAIN_s at the time specified by PC_ACTION_TIME_r.
- 34 + If PC_ACTION_TIME is not received and the explicit action time is
35 received, the mobile station shall apply its usage of the
36 FPC_SUBCHAN_GAIN_s at the action time.

- 1 + If neither PC_ACTION_TIME_T nor explicit action time is received, the
2 mobile station shall apply its usage of the FPC_SUBCHAN_GAIN_S at the
3 first 80ms boundary occurring at least 80ms after the end of the frame
4 containing the last bit of the *General Handoff Direction Message* sent to
5 the mobile station.
- 6 - Reverse Eighth Gating Mode (REV_FCH_GATING_MODE_S =
7 REV_FCH_GATING_MODE_T).
- 8 - Reverse Power Control Delay if REV_PWR_CNTL_DELAY_INCL_T is equal to '1'
9 (REV_PWR_CNTL_DELAY_S = REV_PWR_CNTL_DELAY_T).
- 10 - Concurrent services supported indicator (CS_SUPPORTED_S =
11 CS_SUPPORTED_T).
- 12 - Forward Packet Data Channel supported indicator
13 (FOR_PDCH_SUPPORTED_S = FOR_PDCH_SUPPORTED_T).
- 14 - Pilot information request supported indicator
15 (PILOT_INFO_REQ_SUPPORTED_S = PILOT_INFO_REQ_SUPPORTED_T).
- 16 - If SEARCH_INCLUDED is equal to '1', store the following:
- 17 + Search window size for the Active Set and Candidate Set
18 (SRCH_WIN_A_S = SRCH_WIN_A_T)
- 19 + Pilot detection threshold
20 (T_ADD_S = T_ADD_T)
- 21 + Pilot drop threshold
22 (T_DROP_S = T_DROP_T)
- 23 + Active Set versus Candidate Set comparison threshold
24 (T_COMP_S = T_COMP_T)
- 25 + Drop timer value
26 (T_TDROPS = T_TDROPT)
- 27 + Drop timer range value (T_TDROPS_RANGE_S = T_TDROPS_RANGE_T) if
28 T_TDROPS_RANGE_INCL_T is equal to '1'; otherwise, (T_TDROPS_RANGE_S =
29 '0000')
- 30 + Soft slope for the dynamic add and drop thresholds
31 (SOFT_SLOPE_S = SOFT_SLOPE_T)
- 32 + Intercept for the dynamic add threshold
33 (ADD_INTERCEPT_S = ADD_INTERCEPT_T)
- 34 + Intercept for the dynamic drop threshold
35 (DROP_INTERCEPT_S = DROP_INTERCEPT_T)
- 36 - If EXTRA_PARAMS is equal to '1', store the following:
- 37 + Protocol revision level (P_REV_S = P_REV_T), and protocol revision level
38 currently in use (P_REV_IN_USE_S = min (P_REV_S, MOB_P_REV_P of the
39 current band class))

- 1 + If the mobile station supports packet data service options, the packet
2 data services zone identifier ($PACKET_ZONE_ID_S = PACKET_ZONE_ID_T$)
- 3 + Frame offset ($FRAME_OFFSET_S = FRAME_OFFSET_T$)
- 4 + Acknowledgment procedures reset indicator
5 (If $RETURN_IF_HANDOFF_FAIL_S$ is equal to '1', set $TF_RESET_L2_S$ to
6 $RESET_L2_T$)
- 7 + Indicator to initialize the Forward Traffic Channel power control counters
8 (If $RETURN_IF_HANDOFF_FAIL_S$ is equal to '1', set $TF_RESET_FPC_S$ to
9 $RESET_FPC_T$)
- 10 + Nominal power setting of the target cell ($NOM_PWR_S = NOM_PWR_T$)
- 11 + Extended nominal power setting of the target cell (If $CDMABAND_S =$
12 $'00000'$ or $CDMABAND_S = '00011'$, then $NOM_PWR_EXT_S = '0'$;
13 otherwise, $NOM_PWR_EXT_S = NOM_PWR_EXT_T$)
- 14 + Hard handoff traffic channel preamble count required before
15 transmitting a *Handoff Completion Message* or an *Extended Handoff*
16 *Completion Message* ($NUM_PREAMBLE_S = NUM_PREAMBLE_T$)
- 17 + CDMA band class for the Target Frequency
18 ($TF_CDMABAND_S = BAND_CLASS_T$ and $CDMABAND_S = BAND_CLASS_T$)
- 19 + Frequency assignment for the Target Frequency
20 ($TF_CDMACH_S = CDMA_FREQ_T$ and $CDMACH_S = CDMA_FREQ_T$)
- 21 + Complete search flag ($COMPLETE_SEARCH_S = COMPLETE_SEARCH_T$)
- 22 + Periodic search flag ($PERIODIC_SEARCH_S = PERIODIC_SEARCH_T$)
- 23 + Nominal code channel output power offset relative to the Reverse Pilot
24 Channel power ($RLGAIN_TRAFFIC_PILOT_S = RLGAIN_TRAFFIC_PILOT_T$)
- 25 – If $EXTRA_PARMS$ is equal to '1' and $DEFAULT_RLAG$ is equal to '1', the
26 mobile station shall set each entry of the Reverse Link Attribute Adjustment
27 Gain Table and Reverse Channel Adjustment Gain Table (see [2]) to 0.
- 28 – If $REV_PARMS_INCLUDED$ is included and is equal to '1', the mobile station
29 shall store the following:
- 30 + Neighbor pilot strength measurement threshold offset ($T_MULCHAN_S =$
31 $T_MULCHAN_T$)
- 32 + Reverse Supplemental Code Channel beginning of transmission
33 preamble length ($BEGIN_PREAMBLE_S = BEGIN_PREAMBLE_T$)
- 34 + Reverse Supplemental Code Channel resumption of transmission
35 preamble length ($RESUME_PREAMBLE_S = RESUME_PREAMBLE_T$)
- 36 – For each pilot included in the message, the mobile station shall store the
37 following:
- 38 + $PILOT_PN$, the pilot PN sequence offset index

- 1 + PWR_COMB_IND, the power control symbol combining indicator
- 2 – If USE_PWR_CNTL_STEP is equal to ‘1’ and PWR_CNTL_STEP_T corresponds
- 3 to a power control step size supported by the mobile station (see [2]), then
- 4 the mobile station shall set PWR_CNTL_STEP_S to PWR_CNTL_STEP_T.
- 5 • Set the pilot detection threshold for the Target Frequency and the Candidate
- 6 Frequency:
- 7 – Set TF_T_ADD_S to T_ADD_S.
- 8 – If the Target Frequency is the same as the Candidate Frequency
- 9 (TF_CDMABAND_S is equal to CF_CDMABAND_S and TF_CDMACH_S is equal to
- 10 CF_CDMACH_S), set CF_T_ADD_S to T_ADD_S.
- 11 • If FOR_INCLUDED is included and is equal to ‘0’, the mobile station shall
- 12 perform the following:
- 13 – The mobile station shall update the Code Channel List, CODE_CHAN_LIST_S,
- 14 as specified in 2.6.8.
- 15 – If USE_FOR_HDM_SEQ_S is equal to ‘1’ and FOR_LINKED_HDM_SEQ_S is
- 16 equal to HDM_SEQ_T (this indicates that there is pending Forward
- 17 Supplemental Code Channel assignment information, received in a
- 18 *Supplemental Channel Assignment Message*, linked to this *General Handoff*
- 19 *Direction Message*), then the mobile station shall perform the following
- 20 actions:
- 21 + The mobile station shall set USE_FOR_HDM_SEQ_S to ‘0’.
- 22 + If SCAM_FOR_ORDER_S is equal to ‘0’, the mobile station shall stop
- 23 processing all Forward Supplemental Code Channels at the action time
- 24 of the *General Handoff Direction Message*.
- 25 + If SCAM_FOR_ORDER_S is equal to ‘1’, the mobile station shall start
- 26 processing the Forward Supplemental Code Channels specified in
- 27 CODE_CHAN_LIST_S at the action time of the *General Handoff Direction*
- 28 *Message*, for a period of time determined by the following rules:
- 29 o If SCAM_FOR_DURATION_MODE_S is equal to ‘1’, the mobile station
- 30 shall continue processing the Forward Supplemental Code Channels
- 31 for a period of (FOR_DURATION_S × 80) ms, until it receives a
- 32 subsequent *General Handoff Direction Message* or a *Supplemental*
- 33 *Channel Assignment Message* that specifies a different Forward
- 34 Supplemental Code Channel assignment.
- 35 o If SCAM_FOR_DURATION_MODE_S is equal to ‘0’, the mobile station
- 36 shall continue processing the Forward Supplemental Code Channels
- 37 until it receives a subsequent *Supplemental Channel Assignment*
- 38 *Message* or a *General Handoff Direction Message* that specifies a
- 39 different Forward Supplemental Code Channel assignment.

- 1 – If USE_FOR_HDM_SEQ_S is equal to '0' or FOR_LINKED_HDM_SEQ_S is not
2 equal to HDM_SEQ_R, and if the mobile station is currently processing
3 Forward Supplemental Code Channels, it shall continue processing the
4 Forward Supplemental Code Channels using the updated Code Channel
5 List, CODE_CHAN_LIST_S.
- 6 • If NNSCR_INCLUDED field is included and set to '1' and SCR_INCLUDED field is
7 either not included or included but set to '0', the mobile station shall process
8 the received Non-negotiable Service Configuration Record as specified in
9 2.6.4.1.13 at the action time of this message. If SYNC_ID_INCL_T is set to '1', the
10 mobile station shall perform the following:
- 11 – The mobile station shall store the synchronization identifier received from
12 the base station (SYNC_ID_S = SYNC_ID_T).
- 13 – The mobile station shall store the current service configuration as specified
14 in 2.6.4.1.2.2.5.1 at the action time of this message.
- 15 Otherwise, the mobile station shall set SYNC_ID_S to NULL.
- 16 • If FOR_INCLUDED is included and is equal to '1', then the mobile station shall
17 process the Forward Supplemental Code Channel assignment information as
18 follows:
- 19 – The mobile station shall set USE_FOR_HDM_SEQ_S to '0'.
- 20 – If FOR_START_TIME_S specifies a time which is after the action time of the
21 *General Handoff Direction Message*, the mobile station shall cancel any
22 pending Forward Supplemental Code Channel assignment and shall set
23 FOR_START_TIME_S to NULL.
- 24 – The □m obile station shall update the C
25 CODE_CHAN_LIST_S, in accordance with the value of FOR_SUP_CONFIG, as
26 specified in 2.6.8.
- 27 – If FOR_SUP_CONFIG is equal to '00' or '10', the mobile station should stop
28 processing Forward Supplemental Code Channels, if any, when the message
29 takes effect.
- 30 – If FOR_SUP_CONFIG is equal to '01' or '11', the mobile station shall set
31 PILOT_GATING_USE_RATE to '0' at the action time of the message and start
32 processing the Forward Supplemental Code Channels in the updated Code
33 Channel List, CODE_CHAN_LIST_S, at the action time of the message, for a
34 period of time determined by the following rules:
- 35 + If USE_FOR_DURATION is equal to '1', the mobile station shall set
36 FOR_DURATION_S to FOR_DURATION_T. The mobile station shall
37 continue processing the Forward Supplemental Code Channels for a
38 period of (FOR_DURATION_S × 80) ms, until it receives a subsequent
39 *Supplemental Channel Assignment Message* or a *General Handoff*
40 *Direction Message* that specifies a different Forward Supplemental Code
41 Channel assignment.

- 1 + If USE_FOR_DURATION is equal to '0', the mobile station shall continue
2 processing the Forward Supplemental Code Channels until it receives a
3 subsequent *Supplemental Channel Assignment Message* or a *General*
4 *Handoff Direction Message* that specifies a different Forward
5 Supplemental Code Channel assignment.
- 6 • If REV_INCLUDED is included and is equal to '0', the mobile station shall
7 perform the following:
- 8 – If USE_REV_HDM_SEQ_s is equal to '1' and REV_LINKED_HDM_SEQ_s is
9 equal to HDM_SEQ_r (this indicates that there is pending Reverse
10 Supplemental Code Channel assignment information, received in a
11 *Supplemental Channel Assignment Message*, linked to this *General Handoff*
12 *Direction Message*), the mobile station shall perform the following actions:
- 13 + If NUM_REV_CODES_s is equal to '000', the mobile station shall stop
14 transmitting on all Reverse Supplemental Code Channels at the action
15 time of the message.
- 16 + If NUM_REV_CODES_s is not equal to '000', the mobile station may start
17 transmitting on NUM_REV_CODES_s Reverse Supplemental Code
18 Channels at the action time of the message, for a duration of time
19 determined by the following rules:
- 20 o If SCAM_REV_DURATION_MODE_s is equal to '1', the mobile station
21 may continue transmitting on the Reverse Supplemental Code
22 Channels for a period of (REV_DURATION_s × 80) ms, until it receives
23 a subsequent *General Handoff Direction Message* or a *Supplemental*
24 *Channel Assignment Message* that specifies a different Reverse
25 Supplemental Code Channel assignment.
- 26 o If SCAM_REV_DURATION_MODE_s is equal to '0', the mobile station
27 may continue transmitting on the Reverse Supplemental Code
28 Channels until it receives a subsequent *General Handoff Direction*
29 *Message* or a *Supplemental Channel Assignment Message* that
30 specifies a different Reverse Supplemental Code Channel
31 assignment.
- 32 + The mobile station shall set USE_REV_HDM_SEQ_s to '0'.
- 33 – If USE_REV_HDM_SEQ_s is equal to '0' or REV_LINKED_HDM_SEQ_s is not
34 equal to HDM_SEQ_r, and if the previous Reverse Supplemental Code
35 Channel assignment is still valid, the mobile station may continue to
36 transmit on the Reverse Supplemental Code Channels according to the
37 previously specified Reverse Supplemental Code Channel assignment.
- 38 • If REV_INCLUDED is included and is equal to '1', then the mobile station shall
39 process the Reverse Supplemental Code Channel assignment information as
40 follows:
- 41 – The mobile station shall set REV_DTX_DURATION_s to
42 REV_DTX_DURATION_r.

- 1 – The mobile station shall set USE_REV_HDM_SEQ_s to ‘0’.
- 2 – If REV_START_TIME_s specifies a time which is after the action time of the
- 3 *General Handoff Direction Message*, the mobile station shall cancel any
- 4 pending Reverse Supplemental Code Channel assignment and shall set
- 5 REV_START_TIME_s to NULL.
- 6 – If CLEAR_RETRY_DELAY is equal to ‘1’, the mobile station shall cancel any
- 7 previously indicated retry delay and shall set RETRY_DELAY_s⁷⁰ to 0;
- 8 otherwise, the mobile station shall continue to honor any previously active
- 9 retry delay stored in RETRY_DELAY_s.
- 10 – The mobile station shall set NUM_REV_CODES_s to NUM_REV_CODES_r, and
- 11 shall perform the following actions:
- 12 + If NUM_REV_CODES_s is equal to ‘000’, the mobile station shall stop
- 13 transmitting on all Reverse Supplemental Code Channels at the action
- 14 time of the message.
- 15 + If NUM_REV_CODES_s is not equal to ‘000’, the mobile station shall set
- 16 PILOT_GATING_USE_RATE to ‘0’ at the action time of the message and
- 17 may start transmitting on NUM_REV_CODES_s Reverse Supplemental
- 18 Code Channels at the action time of the message, for a duration of time
- 19 determined by the following rules:
- 20 o If USE_REV_DURATION_r is equal to ‘1’, the mobile station shall set
- 21 REV_DURATION_s to REV_DURATION_r. The mobile station may
- 22 continue transmitting on the Reverse Supplemental Code Channels
- 23 for a period of (REV_DURATION_s × 80) ms, until it receives a
- 24 subsequent *General Handoff Direction Message* or a *Supplemental*
- 25 *Channel Assignment Message* that specifies a different Reverse
- 26 Supplemental Code Channel assignment.
- 27 o If USE_REV_DURATION is equal to ‘0’, the mobile station may
- 28 continue to transmit on the Reverse Supplemental Code Channels
- 29 until it receives a subsequent *General Handoff Direction Message* or a
- 30 *Supplemental Channel Assignment Message* that specifies a different
- 31 Reverse Supplemental Code Channel assignment.
- 32 – The mobile station shall store USE_T_ADD_ABORT_r, the Reverse
- 33 Supplemental Code Channel assignment T_ADD abort indicator, as
- 34 USE_T_ADD_ABORT_s.
- 35 • The mobile station shall set IGNORE_SCAM_s and IGNORE_ESCAM_s to ‘0’.

⁷⁰ The CLEAR_RETRY_DELAY field received in *General Handoff Direction Message* does not affect the RETRY_DELAY_s[RETRY_TYPE] values.

- 1 • If PERIODIC_SEARCH_S is equal to '0' and a periodic search is in progress, the
2 mobile station shall abort the periodic search (see 2.6.6.2.8.3.4 and
3 2.6.6.2.10.4).
- 4 • Perform a soft or hard handoff depending on the following conditions:
- 5 – If any of the following conditions is true, the mobile station shall perform a
6 hard handoff:
- 7 + EXTRA_PARMS is set to '1' and either BAND_CLASS_T is not equal to
8 SF_CDMABAND_S, CDMA_FREQ_R is not equal to SF_CDMACH_S, or
9 FRAME_OFFSET_T is not equal to SF_FRAME_OFFSET_S, or
- 10 + The set of pilots specified by the message is disjoint from the Active
11 Set prior to the action time of the message.
- 12 – If the mobile station performs a hard handoff, it shall perform the following:
- 13 + If a Periodic Serving Frequency Pilot Report Procedure is in progress, the
14 mobile station shall abort the procedure (see 2.6.6.2.12).
- 15 + If a Candidate Frequency periodic search is in progress, the mobile station
16 shall abort the periodic search (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4).
- 17 + The mobile station shall cancel the Forward Supplemental Channel
18 assignment or the Reverse Supplemental Channel assignment (if any).
- 19 + If RETURN_IF_HANDOFF_FAIL_S is equal to '0', the mobile station shall
20 perform actions specified in 2.6.6.2.8.1. If the message specifies more than
21 one pilot, the mobile station shall also perform actions specified in
22 2.6.6.2.7.1 and 2.6.6.2.7.2.
- 23 + If RETURN_IF_HANDOFF_FAIL_S is equal to '1', the mobile station shall
24 perform actions specified in 2.6.6.2.8.2. If the message specifies more than
25 one pilot, the mobile station shall also perform actions specified in
26 2.6.6.2.7.1 and 2.6.6.2.7.2.
- 27 – Otherwise, the mobile station shall perform a soft handoff as specified in
28 2.6.6.2.7.
- 29 10. *Periodic Pilot Measurement Request Order*: The mobile station shall perform the
30 following:
- 31 • If the PPSMM timer is enabled, disable it.
- 32 • If ORDQ is equal to '11111111', the mobile station shall send a *Periodic Pilot*
33 *Strength Measurement Message* to the base station within T_{56m} seconds.
- 34 • If ORDQ is not equal to '11111111', the mobile station shall perform the
35 following:
- 36 – Set the MIN_PILOT_PWR_THRESH_S to MIN_PILOT_PWR_THRESH_T received
37 from the *Periodic Pilot Strength Measurement Request Order*.
- 38 – Set the MIN_PILOT_EC_IO_THRESH_S to MIN_PILOT_EC_IO_THRESH_T
39 received from the *Periodic Pilot Strength Measurement Request Order*.

- 1 – Set PPSMM_PERIOD_s equal to the larger value of ORDQ and the total length
- 2 of time, in units of 80 ms, required by the mobile station to update the pilot
- 3 strength measurement of each pilot in the Active Set and the Candidate Set.
- 4 – Perform the Periodic Serving Frequency Pilot Report Procedure as specified
- 5 in 2.6.6.2.12.
- 6 • If the mobile station sends the *Periodic Pilot Strength Measurement Message* and
- 7 if INCL_SETPT_r is equal to ‘1’, the mobile station shall include outer loop E_b/N_t
- 8 setpoint information corresponding to the physical channel specified by
- 9 FPC_PRI_CHAN_s, and Supplemental Channel outer loop E_b/N_t setpoint
- 10 information if one or more Supplemental Channels are assigned, in the *Periodic*
- 11 *Pilot Strength Measurement Message*.

12 11. *Universal Handoff Direction Message*: The mobile station shall process the message
13 as follows:

14 In addition to the requirements in this section, if the SCR_INCLUDED field is
15 included in this message and is set to ‘1’, the mobile station shall also process this
16 message in accordance with the requirements for the active service subfunction (see
17 2.6.4.1.2.2).

18 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set
19 to the specified value if any of the following conditions is true, and shall not perform
20 any other action described in this section for processing the *Universal Handoff*
21 *Direction Message*:

- 22 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
- 23 set to ‘0000110’ (capability not supported), if the mobile station does not
- 24 support the band class specified in the *Universal Handoff Direction Message*.
- 25 • If the SCR_INCLUDED field is included in this message and is set to ‘1’, the
- 26 mobile station shall perform the following:
 - 27 - The mobile station shall send a *Mobile Station Reject Order* with the ORDQ
 - 28 field set to ‘0000111’ (message cannot be handled by the current mobile
 - 29 station configuration), if the mobile station does not support the service
 - 30 configuration specified in the *Universal Handoff Direction Message*.
 - 31 - The mobile station shall send a *Mobile Station Reject Order* (ORDQ =
 - 32 ‘0000111’) within T_{56m} seconds, if the mobile station supports the service
 - 33 configuration specified but does not accept the service configuration
 - 34 specified in the *Universal Handoff Direction Message*.
- 35 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
- 36 set to ‘0000111’ (message cannot be handled by the current mobile station
- 37 configuration), if the NNSCR_INCLUDED field is included and set to ‘1’ and the
- 38 SCR_INCLUDED field is either not included or included but set to ‘0’, and the
- 39 mobile station does not support the configuration specified in the non-
- 40 negotiable service configuration information record in the *Universal Handoff*
41 *Direction Message*.

- 1 • If the CC_INFO_INCL field is included in this message and is set to '1', the
2 mobile station shall perform the following for each of the NUM_CALLS_ASSIGN
3 call assignments included in this message:
- 4 – If there already exists or currently pending instantiation a Call Control
5 instance identified by CON_REF_r, the mobile station shall send a *Mobile*
6 *Station Reject Order* with ORDQ field set to '00010010' (a call control
7 instance is already present with the specified identifier), with the CON_REF
8 field of the order set to CON_REF_r.
- 9 – If RESPONSE_IND_r equals '1' and TAG_r does not match any of the TAG
10 values contained in the list TAG_OUTSTANDING_LIST, the mobile station
11 shall send a *Mobile Station Reject Order* with ORDQ field set to '00010011'
12 (TAG received does not match TAG stored), with the TAG field of the order
13 set to TAG_r, and the CON_REF field of the order set to CON_REF_r.
- 14 – If the mobile station does not accept this call assignment, the mobile station
15 shall send a *Mobile Station Reject Order* with ORDQ field set to '00010000'
16 (call assignment not accepted), with the CON_REF field of the order set to
17 CON_REF_r.
- 18 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
19 set to '00001010' (search set not specified), if the PERIODIC_SEARCH field is
20 included in the *Universal Handoff Direction Message* and is set to '1' and the
21 Candidate Frequency Search Set is empty.
- 22 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
23 set to '00000011' (message structure not acceptable), if the message specifies
24 the Forward/Reverse Supplemental Channel assignment, the most significant
25 bit of CH_IND_r is equal to '0', and CH_IND_r is not equal to '000'.
- 26 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
27 set to '00000111' (message can not be handled by the current mobile station
28 configuration), if the message includes a reverse Supplemental Channel
29 assignment, and any of the following conditions are true:
- 30 – any of the mobile station's reverse supplemental channel configuration
31 parameter for the corresponding Supplemental Channel is NULL, or
32 – the message includes a Reverse Packet Data Channel assignment.
- 33 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
34 set to '00000111' (message can not be handled by the current mobile station
35 configuration), if the message includes a forward Supplemental Channel
36 assignment and any of the mobile station's forward supplemental channel
37 configuration parameters for the corresponding Supplemental Channel is NULL.
- 38 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set
39 to '00001101' (search period too short), if the PERIODIC_SEARCH field is included
40 in the *Universal Handoff Direction Message* and is set to '1', and *search_period* is
41 less than $(\max(fwd_time, rev_time) + T_{71m})$ seconds, where

search_period = time period corresponding to SEARCH_PERIOD_S shown in Table 2.6.6.2.8.3.2-1,

fwd_time = the mobile station's estimate of the total length of time, in seconds, for which the mobile station will need to suspend its current Forward Traffic Channel processing in order to tune to the CDMA Candidate Frequency, to search the Candidate Frequency Search Set, and to re-tune to the Serving Frequency; if the mobile station searches the Candidate Frequency Search Set in multiple visits, *fwd_time* is the total time for all visits to the CDMA Candidate Frequency in a search period (see 2.6.6.2.8.3.2),

and

rev_time = the mobile station's estimate of the total length of time, in seconds, for which the mobile station will need to suspend its current Reverse Traffic Channel processing in order to tune to the CDMA Candidate Frequency, to search the Candidate Frequency Search Set, and to re-tune to the Serving Frequency; if the mobile station searches the Candidate Frequency Search Set in multiple visits, *rev_time* is the total time for all visits to the CDMA Candidate Frequency in a search period.

- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '0000111' (message can not be handled by the current mobile station configuration), if CH_IND_T is equal to '000', and EXT_CH_IND_T is not defined in Table 3.7.2.3.2.4-11.
- The mobile shall send a *Mobile Station Reject Order* with the ORDQ field set to '00011100' (PLCM_TYPE mismatch) if PLCM_TYPE_T equals '0010' and IMSI_O is derived from IMSI_T or if PLCM_TYPE_T equals '0011' and IMSI_O is derived from IMSI_M.

If none of the above conditions is true, the mobile station shall perform the actions described in the remainder of this section to process the *Universal Handoff Direction Message* at the action time of the message.

If EXTRA_PARDS is equal to '1', the mobile station shall store the return on failure indicator from the *Universal Handoff Direction Message* (RETURN_IF_HANDOFF_FAIL_S = RETURN_IF_HANDOFF_FAIL_T); otherwise the mobile station shall set RETURN_IF_HANDOFF_FAIL_S to '0'.

The mobile station shall set RETURN_IF_HANDOFF_FAIL_S to '0' (disable return on failure) if any of the following conditions is true:

- If P_REV_IN_USE_S is less than or equal to four and the mobile station does not support hard handoff with return on failure, or
- At least one of the pilots specified by the message is also included in the Active Set prior to the action time of the message, and one of the following conditions is true:

- 1 – EXTRA_PARMS is equal to '0', or
 2 – EXTRA_PARMS is equal to '1', the message specifies the same Frequency
 3 Assignment as the Serving Frequency (BAND_CLASS_r is equal to
 4 CDMABAND_s and CDMA_FREQ_r is equal to CDMACH_s), and
 5 FRAME_OFFSET_r is equal to FRAME_OFFSET_s.

6 The mobile station shall store the following parameters from its current
 7 configuration:

- 8 • CDMA band class (SF_CDMABAND_s = CDMABAND_s)
- 9 • Frequency assignment (SF_CDMACH_s = CDMACH_s)
- 10 • Frame Offset (SF_FRAME_OFFSET_s = FRAME_OFFSET_s)

11 If RETURN_IF_HANDOFF_FAIL_s is equal to '1', the mobile station shall also store
 12 the following parameters from its current configuration:

- 13 • Protocol revision level (SF_P_REV_s = P_REV_s)
- 14 • Protocol revision level in use on the Serving Frequency (SF_P_REV_IN_USE_s =
 15 P_REV_IN_USE_s)
- 16 • Search window size for the Active Set and Candidate Set (SF_SRCH_WIN_A_s =
 17 SRCH_WIN_A_s)
- 18 • Search window size for the Neighbor Set
 19 (SF_SRCH_WIN_N_s = SRCH_WIN_N_s),
- 20 • Search window size for the Remainder Set
 21 (SF_SRCH_WIN_R_s = SRCH_WIN_R_s)
- 22 • Pilot detection threshold (SF_T_ADD_s = T_ADD_s)
- 23 • Pilot drop threshold (SF_T_DROP_s = T_DROP_s)
- 24 • Active Set versus Candidate Set comparison threshold
 25 (SF_T_COMP_s = T_COMP_s)
- 26 • Drop timer value (SF_T_TDROPS = T_TDROPS)
- 27 • Drop timer range value (SF_T_TDROPS_RANGE_s = T_TDROPS_RANGE_s)
- 28 • Soft slope for the dynamic add and drop thresholds
 29 (SF_SOFT_SLOPE_s = SOFT_SLOPE_s)
- 30 • Intercept for the dynamic add threshold
 31 (SF_ADD_INTERCEPT_s = ADD_INTERCEPT_s)
- 32 • Intercept for the dynamic drop threshold
 33 (SF_DROP_INTERCEPT_s = DROP_INTERCEPT_s)
- 34 • Private long code mask indicator: If the mobile station is using the private long
 35 code mask on the Serving Frequency, it shall set SF_PRIVATE_LCM_s to '1';
 36 otherwise, it shall set SF_PRIVATE_LCM_s to '0'.

- 1 • Private long code mask: If the mobile station is using the private long code mask
2 on the Serving Frequency, it shall set SF_PVTLCM_42_s to the PVTLCM_42.
- 3 • Public long code mask type: The mobile station shall set SF_PLCM_TYPE_s to
4 PLCM_TYPE_s. If PLCM_TYPE_s equals '0001', the mobile station shall set
5 SF_PLCM_39_s to PLCM_39_s.
- 6 • Service negotiation type (SF_SERV_NEG_s = SERV_NEG_s)
- 7 • Service configuration: Store the current service configuration (service
8 configuration record and non-negotiable service configuration record) in
9 SF_SERVICE_CONFIG_s
- 10 • Call Information:
11 Store the list of current calls (Call Control instances, etc.) in SF_CALLS_s
- 12 • Message encryption mode: If message encryption is on, the mobile station shall
13 set SF_ENCRYPT_MODE_s to '1'; otherwise, the mobile station shall set
14 SF_ENCRYPT_MODE_s to '0'.
- 15 • Extended nominal power setting of the current cell
16 (SF_NOM_PWR_EXT_s = NOM_PWR_EXT_s)
- 17 • Nominal power setting of the current cell (SF_NOM_PWR_s = NOM_PWR_s)
- 18 • Power control step (SF_PWR_CNTL_STEP_s = PWR_CNTL_STEP_s)
- 19 • Serving Frequency Active Set (SF Active Set = (For each pilot in the current
20 Active Set: (PILOT_PN, PWR_COMB_IND)))
- 21 • Serving Frequency Code Channel List
22 (SF_CODE_CHAN_LIST_s = CODE_CHAN_LIST_s)

23 If NNSCR_INCLUDED field is included and set to '1' and SCR_INCLUDED field is
24 either not included or included but set to '0', the mobile station shall process the
25 received Non-negotiable Service Configuration Record as specified in 2.6.4.1.13 at
26 the action time of this message. If SYNC_ID_INCL_T is set to '1', the mobile station
27 shall perform the following:

- 28 • The mobile station shall store (if included) the synchronization identifier
29 received from the base station corresponding to this service configuration
30 (SYNC_ID_s = SYNC_ID_T).
- 31 • The mobile station shall store the current service configuration as specified in
32 2.6.4.1.2.2.5.1 at the action time of this message.

33 Otherwise, the mobile station shall set SYNC_ID_s to NULL.

34 If SYNC_ID_INCL_T is set to '1', NNSCR_INCLUDED field is not included or is
35 included and set to '0', and SCR_INCLUDED is not included or is included and set
36 to '0', the mobile station shall perform the following:

- 37 • The mobile station shall store the synchronization identifier received from the
38 base station (SYNC_ID_s = SYNC_ID_T).

- 1 • If the currently used service configuration has a corresponding SYNC_ID, the
2 mobile station shall perform one of the following:
- 3 - If the current SID (if SID_r is included in the message then the current SID is
4 SID_r; otherwise, the current SID is SID_s) or current NID (if NID_r is included
5 in the message then the current NID is NID_r; otherwise, the current NID is
6 NID_s) is not equal to the stored SID or NID corresponding to the currently
7 used service configuration, the mobile station shall store the current service
8 configuration as specified in 2.6.4.1.2.2.5.1 at the action time of this
9 message.
- 10 - Otherwise, the mobile station shall update the stored SYNC_ID value
11 corresponding to the currently used service configuration with SYNC_ID_r.
- 12 • If the currently used service configuration does not have a corresponding
13 SYNC_ID, the mobile station shall store the current service configuration as
14 specified in 2.6.4.1.2.2.5.1 at the action time of this message.

15 When the message takes effect, the mobile station shall perform the following
16 actions:

- 17 • The mobile station shall send a *Handoff Completion Message* or an *Extended*
18 *Handoff Completion Message* as specified in 2.6.6.2.5.2. . If the RC assigned on the
19 reverse fundamental channel or supplemental channel is less than RC08 the mobile
20 station shall set RC_BITMAP_CAPABILITY_EXT_ALLOWED_s to '0'.
- 21 • Update the Active Set, Candidate Set, and Neighbor Set in accordance with the
22 *Universal Handoff Direction Message* processing (see 2.6.6.2.6.1, 2.6.6.2.6.2, and
23 2.6.6.2.6.3).
- 24 • Discontinue use of all Forward Traffic Channels associated with pilots not in the
25 updated Active Set.
- 26 • The mobile station shall perform the following to determine the long code mask
27 to use after the handoff:
- 28 - If the PRIVATE_LCM field is not included and PLCM_TYPE_INCL_r equals '0',
29 the mobile station shall continue to use the long code mask currently in use.
- 30 - If the PRIVATE_LCM field is not included and PLCM_TYPE_INCL_r equals '1',
31 the mobile station shall perform the following:
- 32 + The mobile station shall set PLCM_TYPE_s to PLCM_TYPE_r; if
33 PLCM_TYPE_r equals '0001', the mobile station shall set PLCM_39_s to
34 PLCM_39_r.
- 35 + The mobile station shall use the public long code mask derived from
36 PLCM_TYPE_s as specified in 2.3.6.
- 37 - If PRIVATE_LCM_r equals '1' and PLCM_TYPE_INCL_r equals '0', the mobile
38 station shall perform the following:
- 39 + The mobile station shall use the private long code mask.

- 1 – If PRIVATE_LCM_T equals ‘1’ and PLCM_TYPE_INCL_T equals ‘1’, the mobile
2 station shall perform the following:
- 3 + The mobile station shall use the private long code mask.
- 4 + The mobile station shall set PLCM_TYPE_S to PLCM_TYPE_T; if
5 PLCM_TYPE_T equals ‘0001’, the mobile station shall set PLCM_39_S to
6 PLCM_39_T.
- 7 – If PRIVATE_LCM_T equals ‘0’ and PLCM_TYPE_INCL_T equals ‘0’, the mobile
8 station shall perform the following:
- 9 + The mobile station shall use the public long code mask derived from
10 PLCM_TYPE_S as specified in 2.3.6.
- 11 – If PRIVATE_LCM_T equals ‘0’ and PLCM_TYPE_INCL_T equals ‘1’, the mobile
12 station shall perform the following:
- 13 + The mobile station shall set PLCM_TYPE_S to PLCM_TYPE_T; if
14 PLCM_TYPE_T equals ‘0001’, the mobile station shall set PLCM_39_S to
15 PLCM_39_T.
- 16 + The mobile station shall use the public long code mask derived from
17 PLCM_TYPE_S as specified in 2.3.6.
- 18 – The mobile station shall indicate to the user the voice privacy mode status.
- 19 • If PARMS_INCL is equal to ‘1’, perform the following actions:
- 20 – Set protocol revision level (P_REV_S = P_REV_T), and protocol revision level
21 currently in use (P_REV_IN_USE_S = min (P_REV_S, MOB_P_REV_P of the
22 current band class)).
- 23 – If SERV_NEG_TYPE_T is equal to ‘1’, set SERV_NEG_S to enabled; otherwise set
24 SERV_NEG_S to disabled.
- 25 • If EXTRA_PARMS is equal to ‘1’, perform the following actions:
- 26 – If FRAME_OFFSET_T is not equal to FRAME_OFFSET_S, change the frame
27 offset on all of the code channels of the Forward Traffic Channel and of the
28 Reverse Traffic Channel.
- 29 – If RESET_L2_T is equal to ‘1’, and RETURN_IF_HANDOFF_FAIL_S is equal to
30 ‘0’, Layer 3 shall send a L2-Supervision.Request primitive to Layer 2 to reset
31 the acknowledgment procedures, as specified in [4]. The mobile station shall
32 reset the acknowledgment procedures immediately after the action time of
33 the *Universal Handoff Direction Message*.
- 34 – If RESET_FPC_T is equal to ‘1’ and RETURN_IF_HANDOFF_FAIL_S is equal to
35 ‘0’, initialize the Forward Traffic Channel power control counters, as
36 specified in 2.6.4.1.1.1.
- 37 – Process the ENCRYPT_MODE field, as specified in 2.3.12.2.
- 38 – Perform the procedures as specified in 2.6.11.3.

- 1 • If EXTRA_PARMS is equal to '0', set the following variables to the values
2 indicated:
- 3 – Hard handoff traffic channel preamble count required before transmitting a
4 *Handoff Completion Message* or an *Extended Handoff Completion Message*
5 (NUM_PREAMBLE_S = '000')
- 6 – Complete search flag (COMPLETE_SEARCH_S = '1')
- 7 – CDMA band class for the Target Frequency
8 (TF_CDMABAND_S = SF_CDMABAND_S)
- 9 – Frequency assignment for the Target Frequency
10 (TF_CDMACH_S = SF_CDMACH_S)
- 11 • Store the following parameters from the *Universal Handoff Direction Message*:
- 12 – *Universal Handoff Direction Message* sequence number
13 (HDM_SEQ_S = HDM_SEQ_T)
- 14 – Forward power control subchannel relative gain (FPC_SUBCHAN_GAIN_S =
15 FPC_SUBCHAN_GAIN_T).
- 16 – If the mobile station uses FPC_SUBCHAN_GAIN_S, the mobile station shall
17 perform the following:
- 18 + If PC_ACTION_TIME_T is received, the mobile station shall apply its usage
19 of the FPC_SUBCHAN_GAIN_S at the time specified by PC_ACTION_TIME_T.
- 20 + If PC_ACTION_TIME is not received and the explicit action time is
21 received, the mobile station shall apply its usage of the
22 FPC_SUBCHAN_GAIN_S at the action time.
- 23 + If neither PC_ACTION_TIME_T nor explicit action time is received, the
24 mobile station shall apply its usage of the FPC_SUBCHAN_GAIN_S at the
25 first 80ms boundary occurring at least 80ms after the end of the frame
26 containing the last bit of the *Universal Handoff Direction Message* sent to
27 the mobile station.
- 28 – Reverse Eighth Gating Mode (REV_FCH_GATING_MODE_S =
29 REV_FCH_GATING_MODE_T).
- 30 – Reverse Power Control Delay if REV_PWR_CNTL_DELAY_INCL_T is equal to '1'
31 (REV_PWR_CNTL_DELAY_S = REV_PWR_CNTL_DELAY_T).
- 32 – Concurrent services supported indicator (CS_SUPPORTED_S =
33 CS_SUPPORTED_T).
- 34 – Maximum number of additional service reference identifiers allowed in
35 origination (MAX_ADD_SERV_INSTANCE_S = MAX_ADD_SERV_INSTANCE_T),
36 if included; otherwise, the mobile station shall set
37 MAX_ADD_SERV_INSTANCE_S to 0.

- 1 – Control Hold Mode supported indicator ($CHM_SUPPORTED_S =$
2 $CHM_SUPPORTED_T$) if included; otherwise, the mobile station shall perform
3 the following:
- 4 + If $P_REV_IN_USE_S$ is less than 6, set $CHM_SUPPORTED_S$ to '0'.
5 + Otherwise, set $CHM_SUPPORTED_S$ to '1'
- 6 – CDMA off time report supported indicator
7 ($CDMA_OFF_TIME_REP_SUP_IND_S = CDMA_OFF_TIME_REP_SUP_IND_T$).
- 8 – If $CDMA_OFF_TIME_REP_SUP_IND_T$ is equal to '1', the mobile station shall
9 store CDMA off time report threshold ($CDMA_OFF_TIME_REP_THRESHOLD_S =$
10 $CDMA_OFF_TIME_REP_THRESHOLD_T$ in units specified by
11 $CDMA_OFF_TIME_REP_UNIT_T$).
- 12 – Forward Packet Data Channel supported indicator
13 ($FOR_PDCH_SUPPORTED_S = FOR_PDCH_SUPPORTED_T$).
- 14 – PDCH Control Hold Mode supported indicator ($PDCH_CHM_SUPPORTED_S =$
15 $PDCH_CHM_SUPPORTED_T$) if included; otherwise, set
16 $PDCH_CHM_SUPPORTED_S$ to '0'.
- 17 – Reverse Packet Data Channel supported indicator
18 ($REV_PDCH_SUPPORTED_S = REV_PDCH_SUPPORTED_T$) if included;
19 otherwise, set $REV_PDCH_SUPPORTED_S$ to '0'.
- 20 – Short Data Burst supported indicator ($SDB_SUPPORTED_S =$
21 $SDB_SUPPORTED_T$).
- 22 – Pilot information request supported indicator
23 ($PILOT_INFO_REQ_SUPPORTED_S = PILOT_INFO_REQ_SUPPORTED_T$).
- 24 – Release to Idle State allowed indicator ($RELEASE_TO_IDLE_IND_S =$
25 $RELEASE_TO_IDLE_IND_T$).
- 26 – If $SEARCH_INCLUDED$ is equal to '1', store the following:
- 27 + Search window size for the Active Set and Candidate Set
28 ($SRCH_WIN_A_S = SRCH_WIN_A_T$)
- 29 + Pilot detection threshold ($T_ADD_S = T_ADD_T$)
- 30 + Pilot drop threshold ($T_DROP_S = T_DROP_T$)
- 31 + Active Set versus Candidate Set comparison threshold
32 ($T_COMP_S = T_COMP_T$)
- 33 + Drop timer value ($T_TDROP_S = T_TDROP_T$)
- 34 + Drop timer range value ($T_TDROP_RANGE_S = T_TDROP_RANGE_T$) if
35 $T_TDROP_RANGE_INCL_T$ is equal to '1'; otherwise, ($T_TDROP_RANGE_S =$
36 '0000')
- 37 + Soft slope for the dynamic add and drop thresholds
38 ($SOFT_SLOPE_S = SOFT_SLOPE_T$)

- 1 + Intercept for the dynamic add threshold
2 (ADD_INTERCEPT_s = ADD_INTERCEPT_r)
- 3 + Intercept for the dynamic drop threshold
4 (DROP_INTERCEPT_s = DROP_INTERCEPT_r)
- 5 – If EXTRA_PARMS is equal to '1', store the following:
- 6 + If the mobile station supports packet data service options, the packet
7 data services zone identifier (PACKET_ZONE_ID_s = PACKET_ZONE_ID_r).
- 8 + If the mobile station supports packet data service options and the
9 PZ_HYST_ENABLED field is included, the mobile station shall store the
10 packet zone hysteresis enabled indicator (PZ_HYST_ENABLED_s =
11 PZ_HYST_ENABLED_r); otherwise, the mobile station shall set
12 PZ_HYST_ENABLED_s to '1'.
- 13 + If the PZ_HYST_LIST_LEN field is included, the mobile station shall store
14 the packet zone hysteresis list length (PZ_HYST_LIST_LEN_s =
15 PZ_HYST_LIST_LEN_r); otherwise, the mobile station shall set
16 PZ_HYST_LIST_LEN_s to 4.
- 17 + If the PZ_HYST_ACT_TIMER field is included, the mobile station shall
18 store the packet zone hysteresis activation timer (PZ_HYST_ACT_TIMER_s
19 = PZ_HYST_ACT_TIMER_r); otherwise, the mobile station shall set
20 PZ_HYST_ACT_TIMER_s to 30 seconds.
- 21 + If the PZ_HYST_TIMER_MUL field and the PZ_HYST_TIMER_EXP field are
22 included, the mobile station shall store the packet zone hysteresis timer
23 (PZ_HYST_TIMER_s = PZ_HYST_TIMER_MUL_r × 8 ^
24 PZ_HYST_TIMER_EXP_r); otherwise, the mobile station shall set
25 PZ_HYST_TIMER_s to 60 seconds.
- 26 + Frame offset (FRAME_OFFSET_s = FRAME_OFFSET_r)
- 27 + Acknowledgment procedures reset indicator
28 (If RETURN_IF_HANDOFF_FAIL_s is equal to '1', set TF_RESET_L2_s to
29 RESET_L2_r)
- 30 + Indicator to initialize the Forward Traffic Channel power control counters
31 (If RETURN_IF_HANDOFF_FAIL_s is equal to '1', set TF_RESET_FPC_s to
32 RESET_FPC_r)
- 33 + Nominal power setting of the target cell (NOM_PWR_s = NOM_PWR_r)
- 34 + Extended nominal power setting of the target cell (If CDMABAND_s =
35 '00000' or CDMABAND_s = '00011', then NOM_PWR_EXT_s = '0';
36 otherwise, NOM_PWR_EXT_s = NOM_PWR_EXT_r)
- 37 + Hard handoff traffic channel preamble count required before
38 transmitting a *Handoff Completion Message* or an *Extended Handoff*
39 *Completion Message* (NUM_PREAMBLE_s = NUM_PREAMBLE_r)

- 1 + CDMA band class for the Target Frequency
2 (TF_CDMABAND_s = BAND_CLASS_r and CDMABAND_s = BAND_CLASS_r)
- 3 + Frequency assignment for the Target Frequency
4 (TF_CDMACH_s = CDMA_FREQ_r and CDMACH_s = CDMA_FREQ_r)
- 5 + Complete search flag (COMPLETE_SEARCH_s = COMPLETE_SEARCH_r)
- 6 + Periodic search flag (PERIODIC_SEARCH_s = PERIODIC_SEARCH_r)
- 7 + Nominal code channel output power offset relative to the Reverse Pilot
8 Channel power (RLGAIN_TRAFFIC_PILOT_s = RLGAIN_TRAFFIC_PILOT_r)
- 9 – If EXTRA_PARMS is equal to ‘1’ and DEFAULT_RLAG is equal to ‘1’, the
10 mobile station shall set each entry of the Reverse Link Attribute Adjustment
11 Gain Table and Reverse Channel Adjustment Gain Table (see [2]) to 0.
- 12 – If USE_PWR_CNTL_STEP is equal to ‘1’ and PWR_CNTL_STEP_r corresponds
13 to a power control step size supported by the mobile station (see [2]), then
14 the mobile station shall set PWR_CNTL_STEP_s to PWR_CNTL_STEP_r.
- 15 – If CLEAR_RETRY_DELAY_r is equal to ‘1’, the mobile station shall cancel any
16 previously indicated retry delay and shall set RETRY_DELAY_s[RETRY_TYPE]
17 to 0, where RETRY_TYPE is equal to ‘001’, ‘010’, ‘011’, ‘100’, or ‘101’;
18 otherwise, the mobile station shall continue to honor any previously active
19 retry delay stored in RETRY_DELAY_s.
- 20 – If 3XFL_1XRL_INCL_r is equal to ‘1’, the mobile station shall set
21 1XRL_FREQ_OFFSET_s to 1XRL_FREQ_OFFSET_r.
- 22 – If SCH_INCL_r is equal to ‘1’ and NUM_FOR_ASSIGN_r is not equal to ‘00’, the
23 mobile station shall store the following information for each occurrence of
24 the record and process the Forward Supplemental Burst as specified in
25 2.6.6.2.5.1.1:
- 26 + FOR_SCH_START_TIME_INCL_s[FOR_SCH_ID_r] =
27 FOR_SCH_START_TIME_INCL_r
- 28 + If FOR_SCH_START_TIME_INCL_s[FOR_SCH_ID_r] is equal to ‘1’, set
29 FOR_SCH_START_TIME_s[FOR_SCH_ID_r] = FOR_SCH_START_TIME_r
- 30 + FOR_SCH_DURATION_s[FOR_SCH_ID_r] = FOR_SCH_DURATION_r
- 31 + SCCL_INDEX_s[FOR_SCH_ID_r] = SCCL_INDEX_r
- 32 + If SCH_BCMC_IND field is included the mobile station shall perform the
33 following:
- 34 o If SCH_BCMC_IND_r equals ‘1’ and USE_ADD_PLCM_FOR_SCH_r
35 equals ‘1’, set corresponding SCH_BCMC_IND[FOR_SCH_ID_r] to ‘1’;
36 otherwise, set SCH_BCMC_IND[FOR_SCH_ID_r] = ‘0’
- 37 + If SCH_BCMC_IND_r is included and equals ‘1’ and
38 ADD_PLCM_FOR_SCH_INCL_r is included and is set to ‘1’, the mobile
39 station shall store following fields:

- 1 o Set ADD_PLCM_FOR_SCH_TYPE_s to ADD_PLCM_FOR_SCH_TYPE_r.
- 2 o Set ADD_PLCM_FOR_SCH_35_s to ADD_PLCM_FOR_SCH_35_r if
- 3 ADD_PLCM_FOR_SCH_TYPE_r is equal to '1'.
- 4 + If SCH_BCMC_IND_r is included and equals '1', the mobile station shall
- 5 store following fields:
- 6 o USE_ADD_PLCM_FOR_SCH_s[FOR_SCH_ID_r] =
- 7 USE_ADD_PLCM_FOR_SCH_r
- 8 o FSCH_OUTERCODE_INCL_s[FOR_SCH_ID_r] =
- 9 FSCH_OUTERCODE_INCL_r
- 10 o If FSCH_OUTERCODE_INCL_r equals '1', the mobile station shall store
- 11 following fields:
- 12 ◇ FSCH_OUTERCODE_RATE_s[FOR_SCH_ID_r] =
- 13 FSCH_OUTERCODE_RATE_r
- 14 ◇ FSCH_OUTERCODE_OFFSET_s[FOR_SCH_ID_r] =
- 15 FSCH_OUTERCODE_OFFSET_r
- 16 - If SCH_INCL_r is equal to '1' and NUM_REV_ASSIGN_r is not equal to '00', the
- 17 mobile station shall store the following information for each occurrence of
- 18 the record and process the Reverse Supplemental Burst as specified in
- 19 2.6.6.2.5.1.2:
- 20 + REV_SCH_START_TIME_INCL_s[REV_SCH_ID_r] =
- 21 REV_SCH_START_TIME_INCL_r
- 22 + If REV_SCH_START_TIME_INCL_s[REV_SCH_ID_r] is equal to '1', set
- 23 REV_SCH_START_TIME_s[REV_SCH_ID_r] = REV_SCH_START_TIME_r
- 24 + REV_SCH_DURATION_s[REV_SCH_ID_r] = REV_SCH_DURATION_r
- 25 + REV_SCH_NUM_BITS_IDX_s[REV_SCH_ID_r] = REV_SCH_NUM_BITS_IDX_r
- 26 - The mobile station shall set BCMC_ON_TRAFFIC_SUP_s to
- 27 BCMC_ON_TRAFFIC_SUP_r. If BCMC_ON_TRAFFIC_SUP_r is set to '1', the
- 28 mobile station shall store AUTO_REQ_TRAF_ALLOWED_IND_s =
- 29 AUTO_REQ_TRAF_ALLOWED_IND_r
- 30 - If SID_INCL_r is equal to '1', the mobile station shall store the following:
- 31 + System identification (SID_s = SID_r)
- 32 - If NID_INCL_r is equal to '1', the mobile station shall store the following:
- 33 + Network identification (NID_s = NID_r)
- 34 - If ENC_SUPPORTED_r is equal to '1', the mobile station shall store:
- 35 + Signaling encryption supported indicator (SIG_ENCRYPT_SUP_s =
- 36 SIG_ENCRYPT_SUP_r)
- 37 + User information encryption supported indicator (UI_ENCRYPT_SUP_s =
- 38 UI_ENCRYPT_SUP_r)

- 1 – Sync ID supported indicator ($USE_SYNC_ID_S = USE_SYNC_ID_T$) if included.
- 2 – Channel configuration request allowed indicator ($USE_CH_CFG_RRM_S =$
3 $USE_CH_CFG_RRM_T$) if included; otherwise, set $USE_CH_CFG_RRM_S$ to '0'.
- 4 – If $TX_PWR_LIMIT_DEFAULT_T$ is included and set to '0', the mobile station
5 shall perform the following:
- 6 + If the mobile station is being assigned to operate in the 1915MHz –
7 1920MHz block of the PCS band, the mobile station shall store the
8 transmit power limit $TX_PWR_LIMIT_S = (TX_PWR_LIMIT_T - 30dB)$;
- 9 + Otherwise, the mobile station shall set $TX_PWR_LIMIT_S$ to the limit
10 defined in [11] for the target base station.
- 11 – If $TX_PWR_LIMIT_DEFAULT_T$ is included and set to '1', the mobile station
12 shall store $TX_PWR_LIMIT_S$ to the limit defined in [11] for the target base
13 station.
- 14 – Permission for the mobile station to request QoS settings in the *Origination*
15 *Message*, *Origination Continuation Message*, or *Enhanced Origination Message*
16 ($MOB_QOS_S = MOB_QOS_T$) if included.
- 17 – The mobile station initiated position location determination supported
18 indicator ($MS_INIT_POS_LOC_SUP_IND_S = MS_INIT_POS_LOC_SUP_IND_T$).
- 19 – If CH_IND_T is equal to '101', the mobile station shall perform the following:
- 20 + The mobile station shall set $CH_IND_S = '01'$.
- 21 + If SCH_INCL_T is equal to '1' and NUM_FOR_SCH is not equal to '00000',
22 for all the NUM_FOR_SCH occurrences, the mobile station shall perform
23 the following:
- 24 o The mobile station shall determine,
25 $N_FSCH_BITS_SET_S[FOR_SCH_ID_T][SCCL_INDEX_T]$, the number of
26 information bits per Forward Supplemental Channel frame identified
27 by FOR_SCH_ID and corresponding to the index $SCCL_INDEX$
28 according to the following rules:
- 29 If $FSCH_VAR_TABLE_ID_S[FOR_SCH_ID_T]$ is equal to '000', then:
- 30 – If $USE_FLEX_NUM_BITS_S$ is equal to '0' or if
31 $USE_FLEX_NUM_BITS_S$ is equal to '1' and
32 $FSCH_NBIT_TABLE_ID_S[FOR_SCH_ID_T]$ is equal to '0000',
33 then the mobile station shall set the number of information
34 bits per frame,
35 $N_FSCH_BITS_SET_S[FOR_SCH_ID_T][SCCL_INDEX_T]$ and
36 number of CRC bits per frame,
37 $FSCH_CRC_LEN_SET_S[FOR_SCH_ID_T][SCCL_INDEX_T]$,
38 according to Table 3.7.3.3.2.37-2 using
39 $FOR_SCH_NUM_BITS_IDX_T$ as the index to the table.

- 1 – If USE_FLEX_NUM_BITS_s is equal to '1' and
2 FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r] is not equal to '0000',
3 then the mobile station shall set the number of CRC bits per
4 frame, FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r],
5 using Table 3.7.5.20-1 and
6 CRC_LEN_IDX_s[FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r]][FOR_
7 SCH_NUM_BITS_IDX_r] as the index to the table.
8 The mobile station shall also set the number of information
9 bits per frame corresponding to SCCL_INDEX_r,
10 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], to
11 NUM_BITS_s[FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r]][FOR_SC
12 H_NUM_BITS_IDX_r].
- 13 If FSCH_VAR_TABLE_IDS[FOR_SCH_ID_r] is not equal to '000', then:
- 14 – The mobile station shall set
15 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r], the set of indices to
16 the number of information bits per frame as follows:
- 17 + If FOR_SCH_NUM_BITS_IDX_r is equal to '0000', then
18 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] = {
19 FOR_SCH_NUM_BITS_IDX_r },
- 20 + otherwise the mobile station shall set (initialize)
21 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] =
22 {FOR_SCH_NUM_BITS_IDX_r} and for i=1, ...,
23 FOR_SCH_NUM_BITS_IDX_r the mobile station shall add
24 FOR_SCH_NUM_BITS_IDX_r -
25 VAR_FSCH_RATE_OFFSET_s[FOR_SCH_ID_r][FOR_SCH_NUM
26 BITS_IDX_r][i] to the set specified by
27 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r]
- 28
- 29 – If USE_FLEX_NUM_BITS_s is equal to '0' or if
30 USE_FLEX_NUM_BITS_s is equal to '1' and
31 FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r] is equal to '0000',
32 then the mobile station shall set
33 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the set of
34 number of information bits per frame as follows.
35 The *i*th member of the set
36 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] is
37 obtained using Table 3.7.3.3.2.37-2 and the *i*th member of the
38 set N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] as the index to
39 the table.
- 40 – If USE_FLEX_NUM_BITS_s is equal to '1' and
41 FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r] is not equal to '0000',
42 then

- 1 + the mobile station shall set
2 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the
3 set of number of information bits per frame as follows.
4 The *i*th member of the set
5 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] is
6 equal to
7 NUM_BITS_s[FSCH_NBIT_TABLE_ID_s[FOR_SCH_ID_r]]
8 [N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*]], where
9 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*] denotes the *i*th
10 member of the set
11 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] and,
- 12 + the mobile station shall set
13 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the
14 set of number CRC bits per frame as follows.
15 The *i*th member of the set
16 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r]
17 using Table 3.7.5.20-1 and
18 CRC_LEN_IDX_s[FSCH_NBIT_TABLE_ID_s[FOR_SCH_ID_r]][*i*]
19 _FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*] as the index to
20 the table, where
21 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*] denotes the *i*th
22 member of the set
23 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r].
- 24 + If SCH_INCL_r is equal to '1' and NUM_REV_SCH is not equal to '00000',
25 for all the NUM_REV_SCH occurrences, the mobile station shall perform
26 the following:
- 27 o Set REV_SCH_NUM_BITS_IDX_s[REV_SCH_ID_r] to
28 REV_SCH_NUM_BITS_IDX_r.
 - 29 o Set REV_WALSH_ID_s [REV_SCH_ID_r][REV_SCH_NUM_BITS_IDX_s] to
30 REV_WALSH_ID_r.
- 31 + For each member of the Active Set included in the message, the mobile
32 station shall perform the following:
- 33 o Set PILOT_PN to PILOT_PN_r.
 - 34 o If SRCH_OFFSET_INCL_r equals '1', set the SRCH_OFFSET field of
35 PILOT_REC to SRCH_OFFSET_r; otherwise, set the SRCH_OFFSET
36 field of PILOT_REC to '000'.
 - 37 o Set ADD_PILOT_REC_INCL to ADD_PILOT_REC_INCL_r.
 - 38 o If ADD_PILOT_REC_INCL_r equals '1', the mobile station shall also
39 perform the following:
 - 40 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
41 PILOT_REC_TYPE_r.

- 1 ◇ If PILOT_REC_TYPE_r is equal to '000', the mobile station shall set
2 the TD_POWER_LEVEL field of PILOT_REC to
3 TD_POWER_LEVEL_r and set the TD_MODE field of
4 NGHBR_PILOT_REC to TD_MODE_r.
- 5 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
6 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
7 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
8 AUX_PILOT_WALSH_r with the Walsh Code length specified by
9 WALSH_LENGTH_r.
- 10 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
11 – Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
12 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
13 AUX_WALSH_r with the Walsh Code length specified by
14 WALSH_LENGTH_r.
15 – Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
16 AUX_TD_POWER_LEVEL_r.
17 – Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 18 If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
19 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
20 SR3_PRIMARY_PILOT_r.
21 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
22 SR3_PILOT_POWER1_r.
23 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
24 SR3_PILOT_POWER2_r.
- 25 If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
26 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
27 SR3_PRIMARY_PILOT_r.
28 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
29 SR3_PILOT_POWER1_r.
30 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
31 SR3_PILOT_POWER2_r.
32 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
33 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
34 AUX_PILOT_WALSH_r with the Walsh Code length specified by
35 WALSH_LENGTH_r.

- 1 – If ADD_INFO_INCL1_r is equal to ‘1’, set the AUX_PILOT_QOF1
2 field of PILOT_REC to QOF1_r and set the
3 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
4 AUX_PILOT_WALSH1_r with the Walsh Code length specified
5 by WALSH_LENGTH1_r; otherwise, set the AUX_PILOT_QOF1
6 field of PILOT_REC to QOF_r and set the
7 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
8 AUX_PILOT_WALSH_r with the Walsh Code length specified by
9 WALSH_LENGTH_r.
- 10 – If ADD_INFO_INCL2_r is equal to ‘1’, set the AUX_PILOT_QOF2
11 field of PILOT_REC to QOF2_r and set the
12 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
13 AUX_PILOT_WALSH2_r with the Walsh Code length specified
14 by WALSH_LENGTH2_r; otherwise, set the AUX_PILOT_QOF2
15 field of PILOT_REC to QOF_r and set the
16 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
17 AUX_PILOT_WALSH_r with the Walsh Code length specified by
18 WALSH_LENGTH_r.
- 19 o Store PWR_COMB_IND, CODE_CHAN_FCH and QOF_MASK_ID_FCH.
- 20 o If SCH_INCL_r is equal to ‘1’ and NUM_SCH is equal to ‘00000’, the
21 mobile station shall delete the corresponding pilot from the all entries
22 of the corresponding Supplemental Channel.
- 23 o If SCH_INCL_r is equal to ‘1’ and NUM_SCH is not equal to ‘00000’, for
24 each Supplemental Channel included in this record, the mobile
25 station shall:
- 26 ◇ If PILOT_INCL is equal to ‘0’, then the mobile station shall delete
27 the corresponding pilot from the Active Set of Supplemental
28 Channel for the corresponding SCCL_INDEX_r.
- 29 ◇ If PILOT_INCL is equal to ‘1’, then for each Supplemental Channel
30 included in this record, the mobile station shall set PILOT_PN_s
31 [FOR_SCH_ID_r][SCCL_INDEX_r][i] to PILOT_PN_r,
32 QOF_ID_s[FOR_SCH_ID_r][SCCL_INDEX_r][i] to
33 QOF_MASK_ID_SCH_r, and
34 FOR_SCH_CC_INDEX_s[FOR_SCH_ID_r][SCCL_INDEX_r][i] to
35 CODE_CHAN_SCH_r.
- 36 ◇ If PILOT_INCL is equal to ‘1’ and CESH_INCLUDED is set to ‘1’,
37 then for each Supplemental Channel included in this record, the
38 mobile station shall set
39 CESH_ENCODER_TYPE_s[FOR_SCH_ID_r][SCCL_INDEX_r][i] to
40 CESH_ENCODER_TYPE_r.

- 1 ◇ If PILOT_INCL is equal to '1' and CCSH_INCLUDED is set to '0',
2 then for each Supplemental Channel included in this record, the
3 mobile station shall set
4 CCSH_ENCODER_TYPE_S[FOR_SCH_ID_R][SCCL_INDEX_R][i] to '0'
5 (default Turbo Encoder type).
6 ◇ The mobile station shall delete all pilots that are not included in
7 the list specified by the NUM_PILOTS field from the Active Set of
8 Supplemental Channel for the corresponding SCCL_INDEX_R.
- 9 + If CCSH_INCLUDED is equal to '1', the mobile station shall perform the
10 following:
11 o If CCSH_ENCODER_ACTION_TIME_R is received, then the mobile
12 station shall set CCSH_ENCODER_ACTION_TIME_S to
13 CCSH_ENCODER_ACTION_TIME_R, and the mobile station shall apply
14 each CCSH_ENCODER_TYPE_S at the time specified by
15 CCSH_ENCODER_ACTION_TIME_R.
16 o If CCSH_ENCODER_ACTION_TIME_R is not received, the mobile
17 station shall apply each CCSH_ENCODER_TYPE_S at the action time
18 of the message.
- 19 + If 3X_FCH_INFO_INCL_R equals '1', for each included member of the
20 Active Set, the mobile station store the following:
21 o If 3X_FCH_LOW_INCL_R equals '1', set the QOF_MASK_ID_FCH_LOW
22 field to QOF_MASK_ID_FCH_LOW_R and the CODE_CHAN_FCH_LOW
23 field to CODE_CHAN_FCH_LOW_R. Otherwise, set the
24 QOF_MASK_ID_FCH_LOW field to QOF_MASK_ID_FCH_R and the
25 CODE_CHAN_FCH_LOW to CODE_CHAN_FCH_R.
26 o If 3X_FCH_HIGH_INCL_R equals '1', set the QOF_MASK_ID_FCH_HIGH
27 field to QOF_MASK_ID_FCH_HIGH_R and the
28 CODE_CHAN_FCH_HIGH field to CODE_CHAN_FCH_HIGH_R.
29 Otherwise, set the QOF_MASK_ID_FCH_HIGH field to
30 QOF_MASK_ID_FCH_R and the CODE_CHAN_FCH_HIGH to
31 CODE_CHAN_FCH_R.
32 o If 3X_SCH_INFO_INCL_R equals '1', for each Supplemental Channel
33 included, the mobile station store the following:
34 If 3X_SCH_LOW_INCL_R equals '1', set the QOF_ID_SCH_LOW_S
35 [FOR_SCH_ID_R][SCCL_INDEX_R][i] to QOF_MASK_ID_SCH_LOW_R
36 and the
37 FOR_SCH_CC_INDEX_LOW[FOR_SCH_ID_R][SCCL_INDEX_R][i] field
38 to CODE_CHAN_SCH_LOW_R. Otherwise, set
39 QOF_ID_SCH_LOW_S[FOR_SCH_ID_R][SCCL_INDEX_R][i] to
40 QOF_MASK_ID_SCH_R, and
41 FOR_SCH_CC_INDEX_LOW_S[FOR_SCH_ID_R][SCCL_INDEX_R][i] to
42 CODE_CHAN_SCH_R.

- 1 If $3X_SCH_HIGH_INCL_r$ equals '1', set the $QOF_ID_SCH_HIGH_s$
2 $[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to $QOF_MASK_ID_SCH_HIGH_r$
3 and the
4 $FOR_SCH_CC_INDEX_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$
5 field to $CODE_CHAN_SCH_HIGH_r$. Otherwise, set
6 $QOF_ID_SCH_HIGH_s[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
7 $QOF_MASK_ID_SCH_r$, and
8 $FOR_SCH_CC_INDEX_HIGH_s[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
9 $CODE_CHAN_SCH_r$.
- 10 + The mobile station shall delete all pilots that are not listed in the
11 NUM_PILOTS field from the Active Set.
 - 12 + The mobile station shall delete all pilots that are not listed in the Active
13 Set from the Active Set of the Supplemental Channel for the Forward
14 Supplemental Channel Assignment (if any). If these deleted pilots
15 include all pilots in the Active Set of the Supplemental Channel, the
16 mobile station shall cancel the Forward Supplemental Channel
17 Assignment.
 - 18 – If CH_IND_r is equal to '010' or '110', the mobile station shall perform the
19 following:
 - 20 + The mobile station shall set $CH_IND_s = '10'$.
 - 21 + If SCH_INCL_r is equal to '1' and NUM_FOR_SCH is not equal to '00000',
22 for all the NUM_FOR_SCH occurrences, the mobile station shall perform
23 the following:
 - 24 o The mobile station shall determine,
25 $N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r]$, the number of
26 information bits per Forward Supplemental Channel frame identified
27 by FOR_SCH_ID and corresponding to the index $SCCL_INDEX$
28 according to the following rules:
 - 29 If $FSCH_VAR_TABLE_ID_s[FOR_SCH_ID_r]$ is equal to '000', then:
 - 30 – If $USE_FLEX_NUM_BITS_s$ is equal to '0' or if
31 $USE_FLEX_NUM_BITS_s$ is equal to '1' and
32 $FSCH_NBIT_TABLE_ID_s[FOR_SCH_ID_r]$ is equal to '0000',
33 then the mobile station shall set the number of information
34 bits per frame,
35 $N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r]$ and
36 number of CRC bits per frame,
37 $FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r]$,
38 according to Table 3.7.3.3.2.37-2 using
39 $FOR_SCH_NUM_BITS_IDX_r$ as the index to the table.

- 1 – If USE_FLEX_NUM_BITS_s is equal to '1' and
2 FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r] is not equal to '0000',
3 then the mobile station shall set the number of CRC bits per
4 frame, FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r],
5 using Table 3.7.5.20-1 and
6 CRC_LEN_IDX_s[FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r]][FOR_
7 SCH_NUM_BITS_IDX_r] as the index to the table.
8 The mobile station shall also set the number of information
9 bits per frame corresponding to SCCL_INDEX_r,
10 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], to
11 NUM_BITS_s[FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r]][FOR_SC
12 H_NUM_BITS_IDX_r].
- 13 If FSCH_VAR_TABLE_IDS[FOR_SCH_ID_r] is not equal to '000', then:
- 14 – The mobile station shall set
15 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r], the set of indices to
16 the number of information bits per frame as follows:
- 17 + If FOR_SCH_NUM_BITS_IDX_r is equal to '0000', then
18 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] = {
19 FOR_SCH_NUM_BITS_IDX_r },
- 20 + otherwise the mobile station shall set (initialize)
21 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] =
22 {FOR_SCH_NUM_BITS_IDX_r} and for i=1, ...,
23 FOR_SCH_NUM_BITS_IDX_r the mobile station shall add
24 FOR_SCH_NUM_BITS_IDX_r -
25 VAR_FSCH_RATE_OFFSET_s[FOR_SCH_ID_r][FOR_SCH_NUM
26 BITS_IDX_r][i] to the set specified by
27 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r]
- 28 – If USE_FLEX_NUM_BITS_s is equal to '0' or if
29 USE_FLEX_NUM_BITS_s is equal to '1' and
30 FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r] is equal to '0000',
31 then the mobile station shall set
32 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the set of
33 number of information bits per frame as follows.
34 The *i*th member of the set
35 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] is
36 obtained using Table 3.7.3.3.2.37-2 and the *i*th member of the
37 set N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] as the index to
38 the table.
- 39 – If USE_FLEX_NUM_BITS_s is equal to '1' and
40 FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r] is not equal to '0000',
41 then

- 1 + the mobile station shall set
2 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the
3 set of number of information bits per frame as follows.
4 The *i*th member of the set
5 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] is
6 equal to
7 NUM_BITS_s[FSCH_NBIT_TABLE_ID_s[FOR_SCH_ID_r]]
8 [N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*]], where
9 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*] denotes the *i*th
10 member of the set
11 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] and,
- 12 + the mobile station shall set
13 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the
14 set of number CRC bits per frame as follows.
15 The *i*th member of the set
16 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r]
17 using Table 3.7.5.20-1 and
18 CRC_LEN_IDX_s[FSCH_NBIT_TABLE_ID_s[FOR_SCH_ID_r]][N
19 _FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*]] as the index to
20 the table, where
21 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*] denotes the *i*th
22 member of the set
23 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r].
- 24 + If SCH_INCL_r is equal to '1' and NUM_REV_SCH is not equal to '00000',
25 for all the NUM_REV_SCH occurrences, the mobile station shall perform
26 the following:
- 27 o Set REV_SCH_NUM_BITS_IDX_s[REV_SCH_ID_r] to
28 REV_SCH_NUM_BITS_IDX_r.
 - 29 o Set REV_WALSH_ID_s [REV_SCH_ID_r][REV_SCH_NUM_BITS_IDX_s] to
30 REV_WALSH_ID_r.
- 31 + For each member of the Active Set included in the message, the mobile
32 station shall perform the followings:
- 33 o Set PILOT_PN to PILOT_PN_r.
 - 34 o If SRCH_OFFSET_INCL_r equals '1', set the SRCH_OFFSET field of
35 PILOT_REC to SRCH_OFFSET_r; otherwise, set the SRCH_OFFSET
36 field of PILOT_REC to '000'.
 - 37 o Set ADD_PILOT_REC_INCL to ADD_PILOT_REC_INCL_r.
 - 38 o If ADD_PILOT_REC_INCL_r equals '1', the mobile station shall also
39 perform the following:
 - 40 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
41 PILOT_REC_TYPE_r.

- 1 ◇ If PILOT_REC_TYPE_r is equal to '000', the mobile station shall set
2 the TD_POWER_LEVEL field of PILOT_REC to
3 TD_POWER_LEVEL_r and set the TD_MODE field of PILOT_REC to
4 TD_MODE_r.
- 5 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
6 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
7 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
8 AUX_PILOT_WALSH_r with the Walsh Code length specified by
9 WALSH_LENGTH_r.
- 10 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
11 – Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
12 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
13 AUX_WALSH_r with the Walsh Code length specified by
14 WALSH_LENGTH_r.
15 – Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
16 AUX_TD_POWER_LEVEL_r.
17 – Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 18 ◇ If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
19 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
20 SR3_PRIMARY_PILOT_r.
21 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
22 SR3_PILOT_POWER1_r.
23 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
24 SR3_PILOT_POWER2_r.
- 25 ◇ If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
26 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
27 SR3_PRIMARY_PILOT_r.
28 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
29 SR3_PILOT_POWER1_r.
30 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
31 SR3_PILOT_POWER2_r.
32 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
33 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
34 AUX_PILOT_WALSH_r with the Walsh Code length specified by
35 WALSH_LENGTH_r.

- 1 – If ADD_INFO_INCL_{1r} is equal to ‘1’, set the AUX_PILOT_QOF1
2 field of PILOT_REC to QOF_{1r} and set the
3 AUX_PILOT_WALSH_CODE₁ field of PILOT_REC to
4 AUX_PILOT_WALSH_{1r} with the Walsh Code length specified
5 by WALSH_LENGTH_{1r}; otherwise, set the AUX_PILOT_QOF1
6 field of PILOT_REC to QOF_r and set the
7 AUX_PILOT_WALSH_CODE₁ field of PILOT_REC to
8 AUX_PILOT_WALSH_r with the Walsh Code length specified by
9 WALSH_LENGTH_r.
- 10 – If ADD_INFO_INCL_{2r} is equal to ‘1’, set the AUX_PILOT_QOF2
11 field of PILOT_REC to QOF_{2r} and set the
12 AUX_PILOT_WALSH_CODE₂ field of PILOT_REC to
13 AUX_PILOT_WALSH_{2r} with the Walsh Code length specified
14 by WALSH_LENGTH_{2r}; otherwise, set the AUX_PILOT_QOF2
15 field of PILOT_REC to QOF_r and set the
16 AUX_PILOT_WALSH_CODE₂ field of PILOT_REC to
17 AUX_PILOT_WALSH_r with the Walsh Code length specified by
18 WALSH_LENGTH_r.
- 19 o Store PWR_COMB_IND, CODE_CHAN_DCCH and
20 QOF_MASK_ID_DCCH.
- 21 o If SCH_INCL_r is equal to ‘1’ and NUM_SCH is equal to ‘00000’, the
22 mobile station shall delete the corresponding pilot from all entries of
23 the corresponding Supplemental Channel.
- 24 o If SCH_INCL_r is equal to ‘1’ and NUM_SCH is not equal to ‘00000’,
25 the mobile station shall:
- 26 ◇ If PILOT_INCL is equal to ‘0’, then the mobile station shall delete
27 the corresponding pilot from the Active Set of Supplemental
28 Channel for the corresponding SCCL_INDEX_r.
- 29 ◇ If PILOT_INCL is equal to ‘1’, then for each Supplemental Channel
30 included in this record, the mobile station shall set PILOT_PN_s
31 [FOR_SCH_ID_r][SCCL_INDEX_s][i] to PILOT_PN_r,
32 QOF_ID_s[FOR_SCH_ID_r][SCCL_INDEX_s][i] to
33 QOF_MASK_ID_SCH_r, and FOR_SCH_CC_INDEX_s
34 [FOR_SCH_ID_s][SCCL_INDEX_s][i] to CODE_CHAN_SCH_r.
- 35 ◇ If PILOT_INCL is equal to ‘1’ and CCSH_INCLUDED is set to ‘1’,
36 then for each Supplemental Channel included in this record, the
37 mobile station shall set
38 CCSH_ENCODER_TYPE_s[FOR_SCH_ID_r][SCCL_INDEX_r][i] to
39 CCSH_ENCODER_TYPE_r.

- 1 ◇ If PILOT_INCL is equal to '1' and CCSH_INCLUDED is set to '0',
2 then for each Supplemental Channel included in this record, the
3 mobile station shall set
4 CCSH_ENCODER_TYPE_S[FOR_SCH_ID_r][SCCL_INDEX_r][i] to '0'
5 (default Turbo Encoder type).
6 ◇ The mobile station shall delete all pilots that are not included in
7 the list specified by the NUM_PILOTS field from the Active Set of
8 Supplemental Channel for the corresponding SCCL_INDEX_r.
- 9 + If CCSH_INCLUDED is equal to '1', the mobile station shall perform the
10 following:
11 o If CCSH_ENCODER_ACTION_TIME_r is received, then the mobile
12 station shall set CCSH_ENCODER_ACTION_TIME_S to
13 CCSH_ENCODER_ACTION_TIME_r, and the mobile station shall apply
14 each CCSH_ENCODER_TYPE_S at the time specified by
15 CCSH_ENCODER_ACTION_TIME_r.
16 o If CCSH_ENCODER_ACTION_TIME_r is not received, the mobile
17 station shall apply each CCSH_ENCODER_TYPE_S at the action time
18 of the message.
- 19 + If 3X_DCCH_INFO_INCL_r equals '1', for each included member of the
20 Active Set, the mobile station store the following:
21 o If 3X_DCCH_LOW_INCL_r equals '1', set the
22 QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_DCCH_LOW_r
23 and the CODE_CHAN_DCCH_LOW field to
24 CODE_CHAN_DCCH_LOW_r. Otherwise, set the
25 QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_FCH_r and the
26 CODE_CHAN_DCCH_LOW to CODE_CHAN_FCH_r.
27 o If 3X_DCCH_HIGH_INCL_r equals '1', set the
28 QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_DCCH_HIGH_r
29 and the CODE_CHAN_DCCH_HIGH field to
30 CODE_CHAN_DCCH_HIGH_r. Otherwise, set the
31 QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_FCH_r and the
32 CODE_CHAN_DCCH_HIGH to CODE_CHAN_FCH_r.
33 o If 3X_SCH_INFO_INCL_r equals '1', for each Supplemental Channel
34 included, the mobile station store the following:

- 1 If $3X_SCH_LOW_INCL_r$ equals '1', set
2 $QOF_ID_SCH_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
3 $QOF_MASK_ID_SCH_LOW_r$ and
4 $FOR_SCH_CC_INDEX_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ field
5 to $CODE_CHAN_SCH_LOW_r$. Otherwise, set
6 $QOF_ID_SCH_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
7 $QOF_MASK_ID_SCH_r$, and
8 $FOR_SCH_CC_INDEX_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
9 $CODE_CHAN_SCH_r$.
- 10 If $3X_SCH_HIGH_INCL_r$ equals '1', set
11 $QOF_ID_SCH_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
12 $QOF_MASK_ID_SCH_HIGH_r$ and the
13 $FOR_SCH_CC_INDEX_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$
14 field to $CODE_CHAN_SCH_HIGH_r$. Otherwise, set
15 $QOF_ID_SCH_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
16 $QOF_MASK_ID_SCH_r$, and
17 $FOR_SCH_CC_INDEX_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
18 $CODE_CHAN_SCH_r$.
- 19 + The mobile station shall set $FUNDICATED_BCMC_IND_s$ to
20 $FUNDICATED_BCMC_IND_r$.
- 21 + If $FUNDICATED_BCMC_IND_r$ equals '1', for each included member of the
22 Active Set, the mobile station shall store the following:
- 23 o Set $FOR_CPCCH_WALSH_s$ to $FOR_CPCCH_WALSH_r$.
- 24 o Set FOR_CPCSCH_s to FOR_CPCSCH_r .
- 25 + The mobile station shall delete all pilots that are not listed in the
26 NUM_PILOTS field from the Active Set.
- 27 + The mobile station shall delete all pilots that are not listed in the Active
28 Set from the Active Set of the Supplemental Channel for the Forward
29 Supplemental Channel Assignment (if any). If these deleted pilots
30 include all pilots in the Active Set of the Supplemental Channel, the
31 mobile station shall cancel the Forward Supplemental Channel
32 Assignment.
- 33 – If CH_IND_r is equal to '111', the mobile station shall perform the following:
- 34 + The mobile station shall set $CH_IND_s = '11'$.
- 35 + If SCH_INCL_r is equal to '1' and NUM_FOR_SCH is not equal to '00000',
36 for all the NUM_FOR_SCH occurrences, the mobile station shall perform
37 the following:
- 38 o The mobile station shall determine,
39 $N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r]$, the number of
40 information bits per Forward Supplemental Channel frame identified
41 by FOR_SCH_ID and corresponding to the index $SCCL_INDEX$
42 according to the following rules:

- 1 If FSCH_VAR_TABLE_IDS_s[FOR_SCH_ID_r] is equal to '000', then:
- 2 - If USE_FLEX_NUM_BITS_s is equal to '0' or if
- 3 USE_FLEX_NUM_BITS_s is equal to '1' and
- 4 FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r] is equal to '0000',
- 5 then the mobile station shall set the number of information
- 6 bits per frame,
- 7 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] and
- 8 number of CRC bits per frame,
- 9 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r],
- 10 according to Table 3.7.3.3.2.37-2 using
- 11 FOR_SCH_NUM_BITS_IDX_r as the index to the table.
- 12 - If USE_FLEX_NUM_BITS_s is equal to '1' and
- 13 FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r] is not equal to '0000',
- 14 then the mobile station shall set the number of CRC bits per
- 15 frame, FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r],
- 16 using Table 3.7.5.20-1 and
- 17 CRC_LEN_IDX_s[FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r]][FOR_
- 18 SCH_NUM_BITS_IDX_r] as the index to the table.
- 19 The mobile station shall also set the number of information
- 20 bits per frame corresponding to SCCL_INDEX_r,
- 21 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], to
- 22 NUM_BITS_s[FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r]][FOR_SC
- 23 H_NUM_BITS_IDX_r].
- 24 If FSCH_VAR_TABLE_IDS_s[FOR_SCH_ID_r] is not equal to '000', then:
- 25 - The mobile station shall set
- 26 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r], the set of indices to
- 27 the number of information bits per frame as follows:
- 28 + If FOR_SCH_NUM_BITS_IDX_r is equal to '0000', then
- 29 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] = {
- 30 FOR_SCH_NUM_BITS_IDX_r },
- 31 + otherwise the mobile station shall set (initialize)
- 32 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] =
- 33 {FOR_SCH_NUM_BITS_IDX_r} and for i=1, ...,
- 34 FOR_SCH_NUM_BITS_IDX_r the mobile station shall add
- 35 FOR_SCH_NUM_BITS_IDX_r -
- 36 VAR_FSCH_RATE_OFFSET_s[FOR_SCH_ID_r][FOR_SCH_NUM
- 37 BITS_IDX_r][i] to the set specified by
- 38 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r]

- 1 – If $USE_FLEX_NUM_BITS_s$ is equal to '0' or if
2 $USE_FLEX_NUM_BITS_s$ is equal to '1' and
3 $FSCH_NBIT_TABLE_ID_s[FOR_SCH_ID_r]$ is equal to '0000',
4 then the mobile station shall set
5 $N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r]$, the set of
6 number of information bits per frame as follows.
7 The i^{th} member of the set
8 $N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r]$ is
9 obtained using Table 3.7.3.3.2.37-2 and the i^{th} member of the
10 set $N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r]$ as the index to
11 the table.
- 12 – If $USE_FLEX_NUM_BITS_s$ is equal to '1' and
13 $FSCH_NBIT_TABLE_ID_s[FOR_SCH_ID_r]$ is not equal to '0000',
14 then
- 15 + the mobile station shall set
16 $N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r]$, the
17 set of number of information bits per frame as follows.
18 The i^{th} member of the set
19 $N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r]$ is
20 equal to
21 $NUM_BITS_s[FSCH_NBIT_TABLE_ID_s[FOR_SCH_ID_r]]$
22 $[N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][i]]$, where
23 $N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][i]$ denotes the i^{th}
24 member of the set
25 $N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r]$ and,
- 26 + the mobile station shall set
27 $FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r]$, the
28 set of number CRC bits per frame as follows.
29 The i^{th} member of the set
30 $FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r]$
31 using Table 3.7.5.20-1 and
32 $CRC_LEN_IDX_s[FSCH_NBIT_TABLE_ID_s[FOR_SCH_ID_r]][N$
33 $_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][i]]$ as the index to
34 the table, where
35 $N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][i]$ denotes the i^{th}
36 member of the set
37 $N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r]$.
- 38 + If SCH_INCL_r is equal to '1' and NUM_REV_SCH is not equal to '00000',
39 for all the NUM_REV_SCH occurrences, the mobile station shall perform
40 the following:
- 41 o Set $REV_SCH_NUM_BITS_IDX_s[REV_SCH_ID_r]$ to
42 $REV_SCH_NUM_BITS_IDX_r$.

- 1 o Set REV_WALSH_IDS[REV_SCH_ID_r][REV_SCH_NUM_BITS_IDX_s] to
2 REV_WALSH_ID_r.
- 3 + For each member in the Active Set included in the message, the mobile
4 station shall perform the followings:
- 5 o Set PILOT_PN to PILOT_PN_r.
- 6 o If SRCH_OFFSET_INCL_r equals '1', set the SRCH_OFFSET field of
7 PILOT_REC to SRCH_OFFSET_r; otherwise, set the SRCH_OFFSET
8 field of PILOT_REC to '000'.
- 9 o Set ADD_PILOT_REC_INCL to ADD_PILOT_REC_INCL_r.
- 10 o If ADD_PILOT_REC_INCL_r equals '1', the mobile station shall also
11 perform the following:
- 12 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
13 PILOT_REC_TYPE_r.
- 14 ◇ If PILOT_REC_TYPE_r is equal to '000', the mobile station shall set
15 the TD_POWER_LEVEL field of PILOT_REC to
16 TD_POWER_LEVEL_r and set the TD_MODE field of PILOT_REC to
17 TD_MODE_r.
- 18 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
- 19 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 20 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
21 AUX_PILOT_WALSH_r with the Walsh Code length specified by
22 WALSH_LENGTH_r.
- 23 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
- 24 – Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
- 25 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
26 AUX_WALSH_r with the Walsh Code length specified by
27 WALSH_LENGTH_r.
- 28 – Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
29 AUX_TD_POWER_LEVEL_r.
- 30 – Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 31 ◇ If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
- 32 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
33 SR3_PRIMARY_PILOT_r.
- 34 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
35 SR3_PILOT_POWER1_r.
- 36 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
37 SR3_PILOT_POWER2_r.

- 1 ◇ If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
- 2 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
- 3 SR3_PRIMARY_PILOT_r.
- 4 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
- 5 SR3_PILOT_POWER1_r.
- 6 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
- 7 SR3_PILOT_POWER2_r.
- 8 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 9 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
- 10 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 11 WALSH_LENGTH_r.
- 12 – If ADD_INFO_INCL1_r is equal to '1', set the AUX_PILOT_QOF1
- 13 field of PILOT_REC to QOF1_r and set the
- 14 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
- 15 AUX_PILOT_WALSH1_r with the Walsh Code length specified
- 16 by WALSH_LENGTH1_r; otherwise, set the AUX_PILOT_QOF1
- 17 field of PILOT_REC to QOF_r and set the
- 18 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
- 19 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 20 WALSH_LENGTH_r.
- 21 – If ADD_INFO_INCL2_r is equal to '1', set the AUX_PILOT_QOF2
- 22 field of PILOT_REC to QOF2_r and set the
- 23 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
- 24 AUX_PILOT_WALSH2_r with the Walsh Code length specified
- 25 by WALSH_LENGTH2_r; otherwise, set the AUX_PILOT_QOF2
- 26 field of PILOT_REC to QOF_r and set the
- 27 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
- 28 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 29 WALSH_LENGTH_r.
- 30 ○ Store PWR_COMB_IND, CODE_CHAN_FCH, QOF_MASK_ID_FCH,
- 31 CODE_CHAN_DCCH and QOF_MASK_ID_DCCH.
- 32 ○ If SCH_INCL_r is equal to '1' and NUM_SCH is equal to '00000', the
- 33 mobile station shall delete the corresponding pilot from all entries of
- 34 the corresponding Supplemental Channel.
- 35 ○ If SCH_INCL_r is equal to '1' and NUM_SCH is not equal to '00000',
- 36 the mobile station shall:
- 37 ◇ If PILOT_INCL is equal to '0', then the mobile station shall delete
- 38 the corresponding pilot from the Active Set of Supplemental
- 39 Channel for the corresponding SCCL_INDEX_r.

- 1 ◇ If PILOT_INCL is equal to '1', then for each Supplemental Channel
2 included in this record, the mobile station shall set PILOT_PN_S
3 [FOR_SCH_ID_r][SCCL_INDEX_r][i] to PILOT_PN_r,
4 QOF_ID_S[FOR_SCH_ID_r][SCCL_INDEX_r][i] to
5 QOF_MASK_ID_SCH_r, and FOR_SCH_CC_INDEX_S
6 [FOR_SCH_ID_r][SCCL_INDEX_r][i] to CODE_CHAN_SCH_r.
- 7 ◇ If PILOT_INCL is equal to '1' and CCSH_INCLUDED is set to '1',
8 then for each Supplemental Channel included in this record, the
9 mobile station shall set
10 CCSH_ENCODER_TYPE_S[FOR_SCH_ID_r][SCCL_INDEX_r][i] to
11 CCSH_ENCODER_TYPE_r.
- 12 ◇ If PILOT_INCL is equal to '1' and CCSH_INCLUDED is set to '0',
13 then for each Supplemental Channel included in this record, the
14 mobile station shall set
15 CCSH_ENCODER_TYPE_S[FOR_SCH_ID_r][SCCL_INDEX_r][i] to '0'
16 (default Turbo Encoder type).
- 17 ◇ The mobile station shall delete all pilots that are not included in
18 the list specified by the NUM_PILOTS field from the Active Set of
19 Supplemental Channel for the corresponding SCCL_INDEX_r.
- 20 + If CCSH_INCLUDED is equal to '1', the mobile station shall perform the
21 following:
- 22 o If CCSH_ENCODER_ACTION_TIME_r is received, then the mobile
23 station shall set CCSH_ENCODER_ACTION_TIME_S to
24 CCSH_ENCODER_ACTION_TIME_r, and the mobile station shall apply
25 each CCSH_ENCODER_TYPE_S at the time specified by
26 CCSH_ENCODER_ACTION_TIME_r.
- 27 o If CCSH_ENCODER_ACTION_TIME_r is not received, the mobile
28 station shall apply each CCSH_ENCODER_TYPE_S at the action time
29 of the message.
- 30 + If 3X_FCH_INFO_INCL_r equals '1', for each included member of the
31 Active Set, the mobile station store the following:
- 32 o If 3X_FCH_LOW_INCL_r equals '1', set the QOF_MASK_ID_FCH_LOW
33 field to QOF_MASK_ID_FCH_LOW_r and the CODE_CHAN_FCH_LOW
34 field to CODE_CHAN_FCH_LOW_r. Otherwise, set the
35 QOF_MASK_ID_FCH_LOW field to QOF_MASK_ID_FCH_r and the
36 CODE_CHAN_FCH_LOW to CODE_CHAN_FCH_r.
- 37 o If 3X_FCH_HIGH_INCL_r equals '1', set the QOF_MASK_ID_FCH_HIGH
38 field to QOF_MASK_ID_FCH_HIGH_r and the
39 CODE_CHAN_FCH_HIGH field to CODE_CHAN_FCH_HIGH_r.
40 Otherwise, set the QOF_MASK_ID_FCH_HIGH field to
41 QOF_MASK_ID_FCH_r and the CODE_CHAN_FCH_HIGH to
42 CODE_CHAN_FCH_r.

- 1 + If $3X_DCCH_INFO_INCL_r$ equals '1', for each included member of the
2 Active Set, the mobile station store the following:
- 3 o If $3X_DCCH_LOW_INCL_r$ equals '1', set the
4 QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_DCCH_LOW_r
5 and the CODE_CHAN_DCCH_LOW field to
6 CODE_CHAN_DCCH_LOW_r. Otherwise, set the
7 QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_FCH_r and the
8 CODE_CHAN_DCCH_LOW to CODE_CHAN_FCH_r.
- 9 o If $3X_DCCH_HIGH_INCL_r$ equals '1', set the
10 QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_DCCH_HIGH_r
11 and the CODE_CHAN_DCCH_HIGH field to
12 CODE_CHAN_DCCH_HIGH_r. Otherwise, set the
13 QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_FCH_r and the
14 CODE_CHAN_DCCH_HIGH to CODE_CHAN_FCH_r.
- 15 + If $3X_FCH_INFO_INCL_r$ or $3X_DCCH_INFO_INCL_r$ equals '1', for each
16 included member of the Active Set, the mobile station store the following:
- 17 o If $3X_SCH_INFO_INCL_r$ equals '1', for each Supplemental Channel
18 included, the mobile station store the following:
- 19 If $3X_SCH_LOW_INCL_r$ equals '1', set
20 QOF_ID_SCH_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i] to
21 QOF_MASK_ID_SCH_LOW_r and the
22 FOR_SCH_CC_INDEX_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i] field
23 to CODE_CHAN_SCH_LOW_r. Otherwise, set
24 QOF_ID_SCH_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i] to
25 QOF_MASK_ID_SCH_r, and
26 FOR_SCH_CC_INDEX_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i] to
27 CODE_CHAN_SCH_r.
- 28 If $3X_SCH_HIGH_INCL_r$ equals '1', set
29 QOF_ID_SCH_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i] to
30 QOF_MASK_ID_SCH_HIGH_r and the
31 FOR_SCH_CC_INDEX_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]
32 field to CODE_CHAN_SCH_HIGH_r. Otherwise, set
33 QOF_ID_SCH_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i] to
34 QOF_MASK_ID_SCH_r, and
35 FOR_SCH_CC_INDEX_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i] to
36 CODE_CHAN_SCH_r.
- 37 + The mobile station shall set FUNDICATED_BCNC_IND_s to
38 FUNDICATED_BCNC_IND_r.
- 39 + If FUNDICATED_BCNC_IND_r equals '1', the mobile station shall store
40 the following:
- 41 o Set REV_FCH_ASSIGNED_s to REV_FCH_ASSIGNED_r.

- 1 + If FUNDICATED_BCMC_IND_r equals '1', the mobile station shall set
2 FCH_BCMC_IND to '1'; otherwise, the mobile station shall set
3 FCH_BCMC_IND to '0'.
- 4 + If FUNDICATED_BCMC_IND_r equals '1' and FOR_CPCCH_INFO_INCL_r is
5 included and is set to '1', for each included member of the Active Set, the
6 mobile station shall store the following:
- 7 o Set FOR_CPCCH_WALSH_s to FOR_CPCCH_WALSH_r.
- 8 o Set FOR_CPCSCH_s to FOR_CPCSCH_r.
- 9 + If FUNDICATED_BCMC_IND_r equals '1' and ADD_PLCM_FOR_FCH_INCL_r
10 is included and is set to '1', the mobile station shall store the following:
- 11 o Set ADD_PLCM_FOR_FCH_TYPE_s to ADD_PLCM_FOR_FCH_TYPE_r.
- 12 o Set ADD_PLCM_FOR_FCH_39_s to ADD_PLCM_FOR_FCH_39_r if
13 ADD_PLCM_FOR_FCH_TYPE_r is equal to '1'.
- 14 + The mobile station shall delete all pilots that are not listed in the
15 NUM_PILOTS field from the Active Set.
- 16 + The mobile station shall delete all pilots that are not listed in the Active
17 Set from the Active Set of the Supplemental Channel for the Forward
18 Supplemental Channel Assignment (if any). If these deleted pilots
19 include all pilots in the Active Set of the Supplemental Channel, the
20 mobile station shall cancel the Forward Supplemental Channel
21 Assignment.
- 22 - If CH_IND_r is equal to '000', the mobile station shall perform the following:
- 23 + If this message assigns a Forward Packet Data Channel or Reverse
24 Packet Data Channel which was not assigned prior to the action time of
25 this message, Layer 3 shall send SIG-HandoffPDCH.Indication
26 (handoff_type = HANDOFF) to the MAC layer; otherwise, Layer 3 shall
27 send SIG-HandoffPDCH.Indication (handoff_type = ASSIGN) to the MAC
28 layer.
- 29 + If the message includes a Reverse Packet Data Channel assignment, the
30 mobile station shall cancel the Reverse Supplemental Channel
31 assignment, if any, at the action time of the message.
- 32 + The mobile station shall set CH_IND_s to '000'.
- 33 + The mobile station shall set EXT_CH_IND_s to EXT_CH_IND_r.
- 34 + If PDCH_CONTROL_HOLD_r is equal to '0' and
35 PILOT_GATING_USE_RATE is equal to '1', the mobile station shall set
36 PILOT_GATING_USE_RATE to '0' and shall start the continuous reverse
37 pilot at the specified action time of the message and, if a F-PDCH is
38 assigned, the mobile station shall start the continuous R-CQICH as
39 defined in [3].

- 1 + If PDCH_CONTROL_HOLD_r is equal to '1', the mobile station may
2 perform the following:
- 3 o Set PILOT_GATING_USE_RATE equal to '1' and start the reverse pilot
4 gating and Reverse CQI Channel gating at PILOT_GATING_RATE_s at
5 the action time of the message.
- 6 o The mobile station shall cancel the forward and reverse supplemental
7 channel assignment, if any.
- 8 + The mobile station shall set FULL_CI_FEEDBACK_IND_s to
9 FULL_CI_FEEDBACK_IND_r.
- 10 + If EXT_CH_IND_r equals '01000', the mobile station shall set
11 FOR_CPCCH_RATE_s to FOR_CPCCH_RATE_r, and
12 FOR_CPCCH_UPDATE_RATE_s to FOR_CPCCH_UPDATE_RATE_r;
13 otherwise, the mobile station shall set FOR_CPCCH_RATE_s to '00', and
14 FOR_CPCCH_UPDATE_RATE_s to '00'.
- 15 + The mobile station shall set REV_CQICH_FRAME_OFFSET_s to
16 REV_CQICH_FRAME_OFFSET_r.
- 17 + The mobile station shall set REV_CQICH_REPS_s to REV_CQICH_REPS_r.
- 18 + The mobile station shall set REV_ACKCH_REPS_s to REV_ACKCH_REPS_r.
- 19 + If SCH_INCL_r is equal to '1', and EXT_CH_IND_r signals the allocation of a
20 F-FCH or a F-DCCH, and NUM_FOR_SCH is not equal to '00000', for all
21 the NUM_FOR_SCH occurrences, the mobile station shall perform the
22 following:
- 23 o The mobile station shall determine,
24 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the number of
25 information bits per Forward Supplemental Channel frame identified
26 by FOR_SCH_ID and corresponding to the index SCCL_INDEX
27 according to the following rules:
- 28 If FSCH_VAR_TABLE_IDS_s[FOR_SCH_ID_r] is equal to '000', then:
- 29 - If USE_FLEX_NUM_BITS_s is equal to '0' or if
30 USE_FLEX_NUM_BITS_s is equal to '1' and
31 FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r] is equal to '0000',
32 then the mobile station shall set the number of information
33 bits per frame,
34 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] and
35 number of CRC bits per frame,
36 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r],
37 according to Table 3.7.3.3.2.37-2 using
38 FOR_SCH_NUM_BITS_IDX_r as the index to the table.

- 1 – If USE_FLEX_NUM_BITS_s is equal to '1' and
2 FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r] is not equal to '0000',
3 then the mobile station shall set the number of CRC bits per
4 frame, FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r],
5 using Table 3.7.5.20-1 and
6 CRC_LEN_IDX_s[FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r]][FOR_
7 SCH_NUM_BITS_IDX_r] as the index to the table.
8 The mobile station shall also set the number of information
9 bits per frame corresponding to SCCL_INDEX_r,
10 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], to
11 NUM_BITS_s[FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r]][FOR_SC
12 H_NUM_BITS_IDX_r].
- 13 If FSCH_VAR_TABLE_IDS[FOR_SCH_ID_r] is not equal to '000', then:
- 14 – The mobile station shall set
15 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r], the set of indices to
16 the number of information bits per frame as follows:
- 17 + If FOR_SCH_NUM_BITS_IDX_r is equal to '0000', then
18 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] = {
19 FOR_SCH_NUM_BITS_IDX_r },
- 20 + otherwise, the mobile station shall set (initialize)
21 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] =
22 {FOR_SCH_NUM_BITS_IDX_r} and for i=1, ...,
23 FOR_SCH_NUM_BITS_IDX_r the mobile station shall add
24 FOR_SCH_NUM_BITS_IDX_r -
25 VAR_FSCH_RATE_OFFSET_s[FOR_SCH_ID_r][FOR_SCH_NUM
26 BITS_IDX_r][i] to the set specified by
27 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r]
- 28 – If USE_FLEX_NUM_BITS_s is equal to '0' or if
29 USE_FLEX_NUM_BITS_s is equal to '1' and
30 FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r] is equal to '0000',
31 then the mobile station shall set
32 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the set of
33 number of information bits per frame as follows.
34 The *i*th member of the set
35 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] is
36 obtained using Table 3.7.3.3.2.37-2 and the *i*th member of the
37 set N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] as the index to
38 the table.
- 39 – If USE_FLEX_NUM_BITS_s is equal to '1' and
40 FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r] is not equal to '0000',
41 then

- 1 + the mobile station shall set
2 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the
3 set of number of information bits per frame as follows.
4 The *i*th member of the set
5 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] is
6 equal to
7 NUM_BITS_s[FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r]]
8 [N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*]], where
9 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*] denotes the *i*th
10 member of the set
11 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] and,
- 12 + the mobile station shall set
13 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the
14 set of number CRC bits per frame as follows.
15 The *i*th member of the set
16 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r]
17 using Table 3.7.5.20-1 and
18 CRC_LEN_IDX_s[FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r]]
19 [N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*]] as the index to
20 the table, where
21 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*] denotes the *i*th
22 member of the set
23 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r].
- 24 + If SCH_INCL_r is equal to '1' and NUM_REV_SCH is not equal to '00000',
25 for all the NUM_REV_SCH occurrences, the mobile station shall perform
26 the following:
- 27 o Set REV_SCH_NUM_BITS_IDX_s[REV_SCH_ID_r] to
28 REV_SCH_NUM_BITS_IDX_r.
 - 29 o Set REV_WALSH_IDS [REV_SCH_ID_r][REV_SCH_NUM_BITS_IDX_s] to
30 REV_WALSH_ID_r.
- 31 + If FOR_PDCH_RLGAIN_INCL_r is included and equal to '1', the mobile
32 station shall set RLGAIN_ACKCH_PILOT_s to RLGAIN_ACKCH_PILOT_r,
33 and RLGAIN_CQICH_PILOT_s to RLGAIN_CQICH_PILOT_r.
- 34 + If FOR_PDCH_PARMS_INCL_r is equal to '1', the mobile station shall set
35 NUM_SOFT_SWITCHING_FRAMES_s to
36 NUM_SOFT_SWITCHING_FRAMES_r + 1, and
37 NUM_SOFTER_SWITCHING_FRAMES_s to
38 NUM_SOFTER_SWITCHING_FRAMES_r + 1.
- 39 + If CHM_SWITCHING_PARMS_INCL_r is included and equal to '1', the
40 mobile station shall set NUM_SOFT_SWITCHING_FRAMES_CHM_s to
41 NUM_SOFT_SWITCHING_FRAMES_CHM_r + 1, and
42 NUM_SOFTER_SWITCHING_FRAMES_CHM_s to
43 NUM_SOFTER_SWITCHING_FRAMES_CHM_r + 1.

- 1 + If CHM_SWITCHING_PARAMS_INCL_T is included and equal to '0', the
2 mobile station shall set NUM_SOFT_SWITCHING_FRAMES_CHM_S to
3 NUM_SOFT_SWITCHING_FRAMES_T + 1, and
4 NUM_SOFT_SWITCING_FRAMES_CHM_S to
5 NUM_SOFT_SWITCING_FRAMES_T + 1.
- 6 + If FOR_PDCH_PARAMS_INCL_T is equal to '1', the mobile station shall
7 set NUM_SOFT_SWITCHING_SLOTS_S according to Table 3.7.2.3.2.21-9
8 based on the value of NUM_SOFT_SWITCHING_SLOTS_T.
- 9 + If FOR_PDCH_PARAMS_INCL_T is equal to '1', the mobile station shall
10 set NUM_SOFT_SWITCING_SLOTS_S according to Table 3.7.2.3.2.21-
11 9 based on the value of NUM_SOFT_SWITCING_SLOTS_T.
- 12 + If CHM_SWITCHING_PARAMS_INCL_T is included and equal to '1', the
13 mobile station shall:
- 14 o Set NUM_SOFT_SWITCHING_SLOTS_CHM_S according to Table
15 3.7.2.3.2.21-9 based on the value of
16 NUM_SOFT_SWITCHING_SLOTS_CHM_T.
- 17 o Set NUM_SOFT_SWITCING_SLOTS_CHM_S according to Table
18 3.7.2.3.2.21-9 based on the value of
19 NUM_SOFT_SWITCING_SLOTS_CHM_T.
- 20 + If CHM_SWITCHING_PARAMS_INCL_T is included and equal to '0', the
21 mobile station shall:
- 22 o Set NUM_SOFT_SWITCHING_SLOTS_CHM_S according to Table
23 3.7.2.3.2.21-9 based on the value of
24 NUM_SOFT_SWITCHING_SLOTS_T.
- 25 o Set NUM_SOFT_SWITCING_SLOTS_CHM_S according to Table
26 3.7.2.3.2.21-9 based on the value of
27 NUM_SOFT_SWITCING_SLOTS_T.
- 28 + If FOR_PDCH_PARAMS_INCL_T is equal to '1', the mobile station shall set
29 PDCH_SOFT_SWITCHING_DELAY_S to PDCH_SOFT_SWITCHING_DELAY_T
30 + 1, and PDCH_SOFT_SWITCING_DELAY_S to
31 PDCH_SOFT_SWITCING_DELAY_T + 1.
- 32 + If FOR_PDCH_PARAMS_INCL_T is equal to '1', and
33 FOR_PDCH_COMMON_PARAMS_T is equal to '1', the mobile station shall
34 store the following parameters that are common to all pilots in the Active
35 Set:
- 36 o The mobile station shall set FOR_PDCH_COMMON_PARAMS_S to '1'.
37 o The mobile station shall set WALSH_TABLE_ID_S to
38 WALSH_TABLE_ID_T.
- 39 o The mobile station shall set NUM_PDCCH_S to NUM_PDCCH_T.

- 1 o The mobile station shall set FOR_PDCCH_WALSH_S[i] to the ith
2 occurrence of FOR_PDCCH_WALSH_r.
- 3 o The mobile station shall set TX_DISABLED_TIMER_S to
4 TX_DISABLED_TIMER_r.
- 5 + If FOR_PDCH_PARAMS_INCL_r is equal to '0', and
6 FOR_PDCH_COMMON_PARAMS_S is equal to '0', the mobile station shall
7 send a *Mobile Station Reject Order* with ORDQ equal to '00000011'
8 (message structure not acceptable) and remain in the current state.
- 9 + If EXT_CH_IND_r signals the allocation of a R-PDCH, the mobile station
10 shall:
- 11 o Set FOR_GCH_ASSIGNED_S to FOR_GCH_ASSIGNED_r.
- 12 o Set FOR_RCCH_ASSIGNED_S to FOR_RCCH_ASSIGNED_r.
- 13 o If FOR_RCCH_ASSIGNED_S is equal to '1', the mobile station shall:
- 14 ◇ Set FOR_RCCH_DRC_MODE_S to FOR_RCCH_DRC_MODE_r.
- 15 ◇ Set FOR_RCCH_REPETITION_S to FOR_RCCH_REPETITION_r.
- 16 ◇ Set FOR_RCCH_UPDATE_RATE_S to FOR_RCCH_UPDATE_RATE_r.
- 17 o If FOR_ACKCH_ASSIGNED_r is equal to '1', the mobile station shall
18 set FOR_ACKCH_MODE_S to FOR_ACKCH_MODE_r.
- 19 o If FOR_ACKCH_COMB_SEL_r is included, the mobile station shall set
20 FOR_ACKCH_COMB_SEL_S to FOR_ACKCH_COMB_SEL_r; otherwise,
21 the mobile station shall set FOR_ACKCH_COMB_SEL_S to '0'.
- 22 o If REV_PDCH_RLGAIN_INCL_r is included and equal to '1', the mobile
23 station shall perform the following:
- 24 ◇ The mobile station shall set RLGAIN_SPICH_PILOT_S to
25 RLGAIN_SPICH_PILOT_r.
- 26 ◇ The mobile station shall set RLGAIN_REQCH_PILOT_S to
27 RLGAIN_REQCH_PILOT_r.
- 28 ◇ The mobile station shall set RLGAIN_PDCCH_PILOT_S to
29 RLGAIN_PDCCH_PILOT_r.
- 30 o If REV_PDCH_PARAMS_1_INCL_r is included and equal to '1', the
31 mobile station shall perform the following:
- 32 ◇ The mobile station shall set REV_PDCH_TABLE_SEL_S to
33 REV_PDCH_TABLE_SEL_r.
- 34 ◇ The mobile station shall set REV_PDCH_MAX_AUTO_TPR_S to
35 REV_PDCH_MAX_AUTO_TPR_r.
- 36 + Otherwise, the mobile station shall:
- 37 o Set FOR_GCH_ASSIGNED_S to NULL.

- 1 o Set FOR_RCCH_ASSIGNED_s to NULL.
- 2 + For each member of the Active Set included in the message, the mobile
3 station shall perform the following:
- 4 o Set PILOT_PN to PILOT_PN_r.
- 5 o If SRCH_OFFSET_INCL_r equals '1', set the SRCH_OFFSET field of
6 PILOT_REC to SRCH_OFFSET_r; otherwise, set the SRCH_OFFSET
7 field of PILOT_REC to '000'.
- 8 o Set ADD_PILOT_REC_INCL to ADD_PILOT_REC_INCL_r.
- 9 o If ADD_PILOT_REC_INCL_r equals '1', the mobile station shall also
10 perform the following:
- 11 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
12 PILOT_REC_TYPE_r.
- 13 ◇ If PILOT_REC_TYPE_r is equal to '000', the mobile station shall set
14 the TD_POWER_LEVEL field of PILOT_REC to
15 TD_POWER_LEVEL_r and set the TD_MODE field of
16 NGHBR_PILOT_REC to TD_MODE_r.
- 17 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
- 18 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 19 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
20 AUX_PILOT_WALSH_r with the Walsh Code length specified by
21 WALSH_LENGTH_r.
- 22 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
- 23 – Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
- 24 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
25 AUX_WALSH_r with the Walsh Code length specified by
26 WALSH_LENGTH_r.
- 27 – Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
28 AUX_TD_POWER_LEVEL_r.
- 29 – Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 30 o Set FOR_PDCH_INCL_s to FOR_PDCH_INCL_r.
- 31 o If FOR_PDCH_INCL_r is equal to '1', the mobile station shall perform
32 the following:
- 33 ◇ If FOR_PDCH_PARAMS_INCL_r is equal to '1', and
34 FOR_PDCH_COMMON_PARAMS_r is equal to '0', the mobile station
35 shall store the following parameters:
- 36 – The mobile station shall set FOR_PDCH_COMMON_PARAMS_s
37 to '0'.

- 1 – The mobile station shall set WALSH_TABLE_ID_S to
2 WALSH_TABLE_ID_R.
- 3 – The mobile station shall set NUM_PDCCH_S to NUM_PDCCH_R.
- 4 – The mobile station shall set FOR_PDCCH_WALSH_S[i] to the ith
5 occurrence of FOR_PDCCH_WALSH_R.
- 6 ◇ The mobile station shall set MAC_ID_S to MAC_ID_R.
- 7 ◇ The mobile station shall set REV_CQICH_COVER_S to
8 REV_CQICH_COVER_R.
- 9 ◇ If EXT_CH_IND_R signals the allocation of a F-CPCCH, the mobile
10 station shall set FOR_CPCCH_WALSH_S to FOR_CPCCH_WALSH_R,
11 and FOR_CPCSCH_S to FOR_CPCSCH_R.
- 12 ◇ The mobile station shall store FOR_PDCCH_WALSH_S[i] to the ith
13 occurrence of FOR_PDCCH_WALSH_R.
- 14 o The mobile station shall set PWR_COMB_IND_S to PWR_COMB_IND_R.
- 15 o If PDCH_GROUP_IND_INCL_R is equal to '1', the mobile station shall
16 set PDCH_GROUP_IDENTIFIERS as follows:
- 17 ◇ If this is the first pilot in the list that has a F-PDCH assignment,
18 the mobile station shall perform the following:
- 19 – The mobile station shall set PDCH_GROUP_IDENTIFIERS to
20 '000';
- 21 ◇ Otherwise, the mobile station shall perform the following:
- 22 – If PDCH_GROUP_IND_R is set to '1', the mobile station shall set
23 PDCH_GROUP_IDENTIFIERS to the same value as that of the
24 previous pilot in the list that has a F-PDCH assigned;
25 otherwise, the mobile station shall set
26 PDCH_GROUP_IDENTIFIERS to the value one greater than
27 that of the previous pilot in the list that has a F-PDCH
28 assigned.
- 29 o Otherwise, the mobile station shall perform the following:
- 30 ◇ If this is the first pilot in the list that has a F-PDCH assignment,
31 the mobile station shall perform the following:
- 32 – The mobile station shall set PDCH_GROUP_IDENTIFIERS to
33 '000';
- 34 ◇ Otherwise, the mobile station shall perform the following:
- 35 – If F-PDCH is assigned for this pilot, the mobile station shall
36 perform the following:

- 1 + If PWR_COMB_IND_r is set to '1', and there are no pilots
2 between this pilot and the previous pilot in the list that
3 has a F-PDCH assigned, the mobile station shall set
4 PDCH_GROUP_IDENTIFIER_s to the same value as that of
5 the previous pilot in the list that has a F-PDCH assigned.
- 6 + If PWR_COMB_IND_r is set to '1', and all pilots between
7 this pilot and the previous pilot in the list that has a F-
8 PDCH assigned have PWR_COMB_IND set to '1', the
9 mobile station shall set PDCH_GROUP_IDENTIFIER_s to
10 the same value as that of the previous pilot in the list that
11 has a F-PDCH assigned.
- 12 + Otherwise, the mobile station shall set
13 PDCH_GROUP_IDENTIFIER_s to the value one greater than
14 that of the previous pilot in the list.
- 15 - Otherwise, the mobile station shall set
16 PDCH_GROUP_IDENTIFIER_s to NULL.
- 17 o If EXT_CH_IND_r signals the allocation of a F-FCH, the mobile station
18 shall set CODE_CHAN_FCH_s to CODE_CHAN_FCH_r, and
19 QOF_MASK_ID_FCH_s to QOF_MASK_ID_FCH_r.
- 20 o If EXT_CH_IND_r signals the allocation of a F-DCCH, the mobile
21 station shall set CODE_CHAN_DCCH_s to CODE_CHAN_DCCH_r, and
22 QOF_MASK_ID_DCCH_s to QOF_MASK_ID_DCCH_r.
- 23 o
- 24 o If FOR_PDCH_INCL_r is equal to '1', EXT_CH_IND_r signals the
25 allocation of a R-PDCH, and if FOR_ACKCH_ASSIGNED_r is equal to
26 '1', the mobile station shall set FOR_ACKCH_WALSH_INDEX_s to
27 FOR_ACKCH_WALSH_INDEX_r, and FOR_ACKSCH_INDEX_s to
28 FOR_ACKSCH_INDEX_r.
- 29 o If FOR_RCCH_INCL_r is included and set to '1', the mobile station
30 shall do the following:
- 31 ◇ set FOR_RCCH_WALSH_INDEX_s to FOR_RCCH_WALSH_INDEX_s.
- 32 ◇ set FOR_RCSCH_INDEX_s to FOR_RCSCH_INDEX_r.
- 33 o If FOR_PDCH_INCL_r is equal to '1', and if FOR_GCH_ASSIGNED_r is
34 included and set to '1', the mobile station shall perform the following;
- 35 ◇ set NUM_FOR_GCH_s to NUM_FOR_GCH_r, and
- 36 ◇ for each of the NUM_FOR_GCH_s occurrences of
37 FOR_GCH_WALSH_INDEX_r, the mobile station shall set
38 FOR_GCH_WALSH_INDEX_s[j] to FOR_GCH_WALSH_INDEX_r[j].
- 39 o Otherwise, the mobile station shall perform the following:

- 1 ◇ set NUM_FOR_GCH_S to 0, and
- 2 ◇ set FOR_GCH_WALSH_INDEX_S to NULL.
- 3 o If SCH_INCL_T is equal to '1' and NUM_SCH is equal to '00000', the
- 4 mobile station shall delete the corresponding pilot from the all entries
- 5 of the corresponding Supplemental Channel.
- 6 o If SCH_INCL_T is equal to '1' and NUM_SCH is not equal to '00000', for
- 7 each Supplemental Channel included in this record, the mobile
- 8 station shall:
- 9 ◇ If PILOT_INCL is equal to '0', then the mobile station shall delete
- 10 the corresponding pilot from the Active Set of Supplemental
- 11 Channel for the corresponding SCCL_INDEX_T.
- 12 ◇ If PILOT_INCL is equal to '1', then for each Supplemental Channel
- 13 included in this record, the mobile station shall set PILOT_PN_S
- 14 [FOR_SCH_ID_T][SCCL_INDEX_T][i] to PILOT_PN_T,
- 15 QOF_ID_S[FOR_SCH_ID_T][SCCL_INDEX_T][i] to
- 16 QOF_MASK_ID_SCH_T, and
- 17 FOR_SCH_CC_INDEX_S[FOR_SCH_ID_T][SCCL_INDEX_T][i] to
- 18 CODE_CHAN_SCH_T.
- 19 ◇ If PILOT_INCL is equal to '1' and CCSH_INCLUDED is set to '1',
- 20 then for each Supplemental Channel included in this record, the
- 21 mobile station shall set
- 22 CCSH_ENCODER_TYPE_S[FOR_SCH_ID_T][SCCL_INDEX_T][i] to
- 23 CCSH_ENCODER_TYPE_T.
- 24 ◇ If PILOT_INCL is equal to '1' and CCSH_INCLUDED is set to '0',
- 25 then for each Supplemental Channel included in this record, the
- 26 mobile station shall set
- 27 CCSH_ENCODER_TYPE_S[FOR_SCH_ID_T][SCCL_INDEX_T][i] to '0'
- 28 (default Turbo Encoder type).
- 29 ◇ The mobile station shall delete all pilots that are not included in
- 30 the list specified by the NUM_PILOTS field from the Active Set of
- 31 Supplemental Channel for the corresponding SCCL_INDEX_T.
- 32 + If CCSH_INCLUDED is equal to '1', the mobile station shall perform the
- 33 following:
- 34 o If CCSH_ENCODER_ACTION_TIME_T is received, then the mobile
- 35 station shall set CCSH_ENCODER_ACTION_TIME_S to
- 36 CCSH_ENCODER_ACTION_TIME_T, and the mobile station shall apply
- 37 each CCSH_ENCODER_TYPE_S at the time specified by
- 38 CCSH_ENCODER_ACTION_TIME_T.
- 39 o If CCSH_ENCODER_ACTION_TIME_T is not received, the mobile
- 40 station shall apply each CCSH_ENCODER_TYPE_S at the action time
- 41 of the message.

- 1 + The mobile station shall set FUNDICATED_BCNC_IND_S to
2 FUNDICATED_BCNC_IND_R. If FUNDICATED_BCNC_IND_R equals '1' and
3 the EXT_CH_IND_R signals the allocation of a F-FCH, the mobile station
4 shall set FCH_BCNC_IND to '1'; otherwise, the mobile station shall set
5 FCH_BCNC_IND to '0'.
- 6 + If FUNDICATED_BCNC_IND_R equals '1' and ADD_PLCM_FOR_FCH_INCL_R
7 is included and is set to '1', the mobile station shall store the following:
- 8 o Set ADD_PLCM_FOR_FCH_TYPE_S to ADD_PLCM_FOR_FCH_TYPE_R.
- 9 o Set ADD_PLCM_FOR_FCH_39_S to ADD_PLCM_FOR_FCH_39_R if
10 ADD_PLCM_FOR_FCH_TYPE_R is equal to '1'.
- 11 + The mobile station shall delete all pilots that are not listed in the
12 NUM_PILOTS field from the Active Set.
- 13 + The mobile station shall delete all pilots that are not listed in the Active
14 Set from the Active Set of the Supplemental Channel for the Forward
15 Supplemental Channel Assignment (if any). If these deleted pilots
16 include all pilots in the Active Set of the Supplemental Channel, the
17 mobile station shall cancel the Forward Supplemental Channel
18 Assignment.
- 19 • If the CH_IND_R is set to '111' and FUNDICATED_BCNC_IND_R equals '1', the
20 mobile station shall change the R-FCH assignment as specified in
21 REV_FCH_ASSIGNED_R, at the specified action time.
- 22 • If the most significant bit of CH_IND_R is set to '1' and
23 PILOT_GATING_USE_RATE is equal to '1', the mobile station shall set
24 PILOT_GATING_USE_RATE to '0' and shall start the continuous reverse pilot at
25 the specified action time. If the most significant bit of CH_IND_R is set to '0',
26 CH_IND_R is not equal to '000', and PILOT_GATING_USE_RATE is equal to '0', the
27 mobile station shall perform the following:
- 28 – The mobile station shall set PILOT_GATING_USE_RATE to '1' and shall start
29 the reverse pilot gating at the specified action time.
- 30 – If the Fundamental Channel is also being released, the mobile station shall
31 store the configuration used for the Fundamental Channel.
- 32 – The mobile station shall cancel the forward and reverse supplemental
33 channel assignment, if any.
- 34 • The mobile station shall set IGNORE_ESCAM_S and IGNORE_SCAM_S to '0'.
- 35 • Set the pilot detection threshold for the Target Frequency and the Candidate
36 Frequency:
- 37 – Set TF_T_ADD_S to T_ADD_S.
- 38 – If the Target Frequency is the same as the Candidate Frequency
39 (TF_CDMABAND_S is equal to CF_CDMABAND_S and TF_CDMACH_S is equal
40 to CF_CDMACH_S), set CF_T_ADD_S to T_ADD_S.

- 1 • If PERIODIC_SEARCH_S is equal to '0' and a periodic search is in progress, the
2 mobile station shall abort the periodic search (see 2.6.6.2.8.3.4 and
3 2.6.6.2.10.4).
- 4 • The mobile station shall determine its roaming status (see 2.6.5.3). The mobile
5 station should indicate to the user whether the mobile station is roaming.
- 6 • Perform a soft or hard handoff depending on the following conditions:
- 7 – If any of the following conditions is true, the mobile station shall perform a hard
8 handoff:
- 9 + EXTRA_PARMS is set to '1' and either BAND_CLASS_T is not equal to
10 SF_CDMABAND_S, CDMA_FREQ_T is not equal to SF_CDMACH_S, or
11 FRAME_OFFSET_T is not equal to SF_FRAME_OFFSET_S, or
- 12 + The set of pilots specified by the message is disjoint from the Active Set prior
13 to the action time of the message.
- 14 – If the mobile station performs a hard handoff, it shall perform the following:
- 15 + If a Periodic Serving Frequency Pilot Report Procedure is in progress, the
16 mobile station shall abort the procedure (see 2.6.6.2.12).
- 17 + If a Candidate Frequency periodic search is in progress, the mobile station
18 shall abort the periodic search (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4).
- 19 + If a Forward Supplemental Channel assignment or a Reverse Supplemental
20 Channel assignment is in progress, the mobile station shall abort it.
- 21 + The mobile station shall cancel any outstanding Forward Supplemental
22 Channel assignment or Reverse Supplemental Channel assignment that
23 is not specified by this message.
- 24 + The mobile station shall cancel the current Forward Supplemental Channel
25 assignment or the Reverse Supplemental Channel assignment, if it is in
26 progress. If the message does not specify another Forward Supplemental
27 Channel assignment or Reverse Supplemental Channel assignment, the
28 mobile station shall cancel the outstanding Forward Supplemental Channel
29 assignment or Reverse Supplemental Channel assignment, if any.
- 30 + If RETURN_IF_HANDOFF_FAIL_S is equal to '0', the mobile station shall
31 perform actions specified in 2.6.6.2.8.1. If the message specifies more than
32 one pilot, the mobile station shall also perform actions specified in
33 2.6.6.2.7.1 and 2.6.6.2.7.2.
- 34 + If RETURN_IF_HANDOFF_FAIL_S is equal to '1', the mobile station shall
35 perform actions specified in 2.6.6.2.8.2. If the message specifies more than
36 one pilot, the mobile station shall also perform actions specified in
37 2.6.6.2.7.1 and 2.6.6.2.7.2.
- 38 – Otherwise, the mobile station shall perform a soft handoff as specified in
39 2.6.6.2.7.

1 12. *Mobile Assisted Burst Operation Parameters Message*: The mobile station shall
2 process this message as follows:

- 3 • The mobile station shall set ORDER_FLAG_s to ORDER_FLAG_r.
- 4 • If ORDER_FLAG_r is equal to '1', the mobile station shall perform the
5 following:
 - 6 – The mobile station shall set PS_MIN_DELTA_s to PS_MIN_DELTA_r + 1.
 - 7 – The mobile station shall set ORDER_INTERVAL_s to ORDER_INTERVAL_r.
- 8 • If ORDER_FLAG_r is equal to '0', the mobile station shall perform the
9 following:
 - 10 – The mobile station shall set PS_MIN_DELTA_s to 0.
 - 11 – The mobile station shall set ORDER_INTERVAL_s to 0.
- 12 • The mobile station shall set PERIODIC_FLAG_s to PERIODIC_FLAG_r.
- 13 • If PERIODIC_FLAG_r is equal to '1', the mobile station shall perform the
14 following:
 - 15 – The mobile station shall set NUM_PILOTS_s to NUM_PILOTS_r.
 - 16 – The mobile station shall set PERIODIC_INTERVAL_s to
17 PERIODIC_INTERVAL_r.
- 18 • If PERIODIC_FLAG_r is equal to '0', the mobile station shall perform the
19 following:
 - 20 – The mobile station shall set NUM_PILOTS_s to 0.
 - 21 – The mobile station shall set PERIODIC_INTERVAL_s to 0.
- 22 • The mobile station shall set THRESHOLD_FLAG_s to THRESHOLD_FLAG_r.
- 23 • If THRESHOLD_FLAG_r is equal to '1', the mobile station shall perform the
24 following:
 - 25 – The mobile station shall set PS_FLOOR_LOW_s to PS_FLOOR_LOW_r.
 - 26 – The mobile station shall set PS_FLOOR_HIGH_s to PS_FLOOR_HIGH_r.
 - 27 – The mobile station shall set PS_CEILING_LOW_s to PS_CEILING_LOW_r.
 - 28 – The mobile station shall set PS_CEILING_HIGH_s to PS_CEILING_HIGH_r.
- 29 • If THRESHOLD_FLAG_r is equal to '0', the mobile station shall perform the
30 following:
 - 31 – The mobile station shall set PS_FLOOR_LOW_s to '0'.
 - 32 – The mobile station shall set PS_FLOOR_HIGH_s to '0'.
 - 33 – The mobile station shall set PS_CEILING_LOW_s to '0'.
 - 34 – The mobile station shall set PS_CEILING_HIGH_s to '0'.

1 13. *Extended Supplemental Channel Assignment Message*: The mobile station shall
2 process this message as follows:

3 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
4 set to the specified value if any of the following conditions is true, and shall not
5 perform any other action described in this section for processing the *Extended*
6 *Supplemental Channel Assignment Message*:

- 7 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ
8 field set to '00000110' (capability not supported), if the number of forward or
9 reverse Supplemental Channels specified in the *Extended Supplemental*
10 *Channel Assignment Message* is greater than the maximum number of
11 Supplemental Channels supported by the mobile station.
- 12 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ
13 field set to '00000100' (message field not in valid range), if PILOT_PN
14 specified in the *Extended Supplemental Channel Assignment Message* is not
15 in the Active Set.
- 16 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ
17 field set to '00000111' (message can not be handled by the current mobile
18 station configuration), if the message includes a reverse Supplemental
19 Channel assignment, and any of the following conditions is true:
 - 20 – any of the mobile station's reverse supplemental channel configuration
21 parameter for the corresponding Supplemental Channel is NULL, or,
 - 22 – the Reverse Packet Data Channel is assigned.
- 23 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ
24 field set to '00000111' (message can not be handled by the current mobile
25 station configuration), if the message includes a forward Supplemental
26 Channel assignment and any of the mobile station's forward supplemental
27 channel configuration parameter for the corresponding Supplemental
28 Channel is NULL.

29 If none of the above conditions is true, the mobile station shall perform the
30 following:

- 31 • The mobile station shall store $REV_SCH_DTX_DURATION_r$, Reverse
32 Supplemental Channel Discontinuous Transmission Duration, as
33 $REV_SCH_DTX_DURATION_s$ at the action time of the message.
- 34 • The mobile station shall store the unit for $START_TIME_UNIT_s =$
35 $START_TIME_UNIT_r$.
- 36 • The mobile station shall store $USE_T_ADD_ABORT_r$, Reverse Supplemental
37 Channel assignment T_ADD abort indicator, as $USE_T_ADD_ABORT_s$.
- 38 • If $IGNORE_ESCAM_s$ is equal to '1' and $SCRM_SEQ_NUM_r$ is not present or is
39 present and is not equal to $SCRM_SEQ_NUM_s$, then the mobile station shall
40 not process the remaining Reverse Supplemental Channel assignment
41 information in this message.

- 1 • If IGNORE_ESCAM_s is equal to '1' and SCRM_SEQ_NUM_r is present and is
2 equal to SCRM_SEQ_NUM_s, then the mobile station shall set
3 IGNORE_ESCAM_s to '0'.
- 4 • If ADD_INFO_INCL_r is equal to '1', the message includes a Supplemental
5 Channel assignment (that is, NUM_FOR_SCH_r is not equal to '00' and/or
6 NUM_REV_SCH_r is not equal to '00'), and PILOT_GATING_USE_RATE is
7 equal to '1', the mobile station shall process the following information of the
8 *Extended Supplemental Channel Assignment Message* as follows:
9 – The mobile station shall set FPC_PRI_CHAN_s = FPC_PRI_CHAN_r at the
10 action time of the message.
- 11 • If REV_CFG_INCLUDED is equal to '1', for all the (NUM_REV_CFG_RECS +
12 1) occurrences of the reverse configuration record, the mobile station shall
13 store the REV_WALSH_ID matrix as follows:
14 – REV_WALSH_ID_s[REV_SCH_ID_r][REV_SCH_NUM_BITS_IDX_r] =
15 REV_WALSH_ID_r
- 16 • If NUM_REV_SCH_r is not equal to '00', then the mobile station shall store
17 the following information for each occurrence of the record and process the
18 Reverse Supplemental Burst as specified in 2.6.6.2.5.1.2:
19 – REV_SCH_START_TIME_INCL_s[REV_SCH_ID_r] =
20 REV_SCH_START_TIME_INCL_r
21 – If REV_SCH_START_TIME_INCL_s[REV_SCH_ID_r] is set to '1', set
22 REV_SCH_START_TIME_s[REV_SCH_ID_r] = REV_SCH_START_TIME_r
23 – REV_SCH_DURATION_s[REV_SCH_ID_r] = REV_SCH_DURATION_r
24 – REV_SCH_NUM_BITS_IDX_s[REV_SCH_ID_r] = REV_SCH_NUM_BITS_IDX_r
- 25 • If NUM_FOR_SCH_r is not equal to '00', then the mobile station shall store
26 the following information for each occurrence of the record and process the
27 Forward Supplemental Burst as specified in 2.6.6.2.5.1.1:
28 – FOR_SCH_START_TIME_INCL_s[FOR_SCH_ID_r] =
29 FOR_SCH_START_TIME_INCL_r
30 – If FOR_SCH_START_TIME_INCL_s[FOR_SCH_ID_r] is set to '1', set
31 FOR_SCH_START_TIME_s[FOR_SCH_ID_r] = FOR_SCH_START_TIME_r
32 – FOR_SCH_DURATION_s[FOR_SCH_ID_r] = FOR_SCH_DURATION_r
33 – FOR_SCH_FER_REP_s[FOR_SCH_ID_r] = FOR_SCH_FER_REP_r
34 – SCCL_INDEX_s[FOR_SCH_ID_r] = SCCL_INDEX_r
35 – If SCH_BCMC_IND field is included the mobile station shall perform the
36 following:
37 + If SCH_BCMC_IND_r equals '1' and USE_ADD_PLCM_FOR_SCH_r
38 equals '1', set corresponding SCH_BCMC_IND[FOR_SCH_ID_r] to '1';
39 otherwise, set SCH_BCMC_IND[FOR_SCH_ID_r] = '0'.

- 1 – If SCH_BCMC_IND_r is included and equals ‘1’ and
2 ADD_PLCM_FOR_SCH_INCL_r is included and is set to ‘1’, the mobile
3 station shall store following fields:
4 + Set ADD_PLCM_FOR_SCH_TYPE_s to ADD_PLCM_FOR_SCH_TYPE_r.
5 + Set ADD_PLCM_FOR_SCH_35_s to ADD_PLCM_FOR_SCH_35_r if
6 ADD_PLCM_FOR_SCH_TYPE_r is equal to ‘1’.
- 7 – If SCH_BCMC_IND_r is included and equals ‘1’, the mobile station shall
8 store following fields:
9 + USE_ADD_PLCM_FOR_SCH_s[FOR_SCH_ID_r] =
10 USE_ADD_PLCM_FOR_SCH_r
11 + FSCH_OUTERCODE_INCL_s[FOR_SCH_ID_r] =
12 FSCH_OUTERCODE_INCL_r
13 + If FSCH_OUTERCODE_INCL_r equals ‘1’, the mobile station shall store
14 following fields:
15 o FSCH_OUTERCODE_RATE_s[FOR_SCH_ID_r] =
16 FSCH_OUTERCODE_RATE_r
17 o FSCH_OUTERCODE_OFFSET_s[FOR_SCH_ID_r] =
18 FSCH_OUTERCODE_OFFSET_r
- 19 • If FOR_CFG_INCLUDED is equal to ‘1’, the mobile station shall perform the
20 following:
21 – Set FOR_SCH_FER_REP_s to FOR_SCH_FER_REP_r.
22 – If FOR_SCH_FER_REP_r is equal to ‘0’, set SCH_TOT_FRAMES_s and
23 SCH_BAD_FRAMES_s to 0.
24 – Store NUM_FOR_CFG_RECS occurrences of Forward Supplemental
25 Channel Configuration associated with the identification of Forward
26 Supplemental Channel.
- 27 • For each record of the Forward Supplemental Channel Code list the mobile
28 station shall store the Forward Supplemental Channel Code list associated
29 with the FOR_SCH_ID_r as follows:
30 – NUM_SUP_SHO_s[FOR_SCH_ID_r][SCCL_INDEX_r] = NUM_SUP_SHO_r.
31 – The mobile station shall determine,
32 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the number of
33 information bits per Forward Supplemental Channel frame identified by
34 FOR_SCH_ID and corresponding to the index SCCL_INDEX according to
35 the following rules:
36 + If FSCH_VAR_TABLE_ID_s[FOR_SCH_ID_r] is equal to ‘000’, then:

- 1 o If USE_FLEX_NUM_BITS_s is equal to '0' or if
2 USE_FLEX_NUM_BITS_s is equal to '1' and
3 FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r] is equal to '0000', then
4 the mobile station shall set the number of information bits per
5 frame, N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] and
6 number of CRC bits per frame,
7 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], according
8 to Table 3.7.3.3.2.37-2 using FOR_SCH_NUM_BITS_IDX_r as the
9 index to the table.
- 10 o If USE_FLEX_NUM_BITS_s is equal to '1' and
11 FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r] is not equal to '0000',
12 then the mobile station shall set the number of CRC bits per
13 frame, FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r],
14 using Table 3.7.5.20-1 and
15 CRC_LEN_IDX_s[FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r]][FOR_SC
16 H_NUM_BITS_IDX_r] as the index to the table.
17 The mobile station shall also set the number of information bits
18 per frame corresponding to SCCL_INDEX_r,
19 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], to
20 NUM_BITS_s[FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r]][FOR_SCH_N
21 UM_BITS_IDX_r].
- 22 + If FSCH_VAR_TABLE_IDS[FOR_SCH_ID_r] is not equal to '000', then:
- 23 o The mobile station shall set
24 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r], the set of indices to the
25 number of information bits per frame as follows:
- 26 ◇ If FOR_SCH_NUM_BITS_IDX_r is equal to '0000', then
27 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] = {
28 FOR_SCH_NUM_BITS_IDX_r },
- 29 ◇ otherwise the mobile station shall set (initialize)
30 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] =
31 {FOR_SCH_NUM_BITS_IDX_r} and for i=1, ...,
32 FOR_SCH_NUM_BITS_IDX_r the mobile station shall add
33 FOR_SCH_NUM_BITS_IDX_r -
34 VAR_FSCH_RATE_OFFSET_s[FOR_SCH_ID_r][FOR_SCH_NUM_
35 BITS_IDX_r][i] to the set specified by
36 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r]

- 1 o If USE_FLEX_NUM_BITS_s is equal to '0' or if
2 USE_FLEX_NUM_BITS_s is equal to '1' and
3 FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r] is equal to '0000', then
4 the mobile station shall set
5 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the set of
6 number of information bits per frame as follows.
7 The *i*th member of the set
8 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] is obtained
9 using Table 3.7.3.3.2.37-2 and the *i*th member of the set
10 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] as the index to the table.
- 11 o If USE_FLEX_NUM_BITS_s is equal to '1' and
12 FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r] is not equal to '0000',
13 then
- 14 ◇ the mobile station shall set
15 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the set of
16 number of information bits per frame as follows.
17 The *i*th member of the set
18 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] is equal to
19 NUM_BITS_s[FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r]]
20 [N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*]], where
21 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*] denotes the *i*th
22 member of the set N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r]
23 and,
- 24 ◇ the mobile station shall set
25 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the set
26 of number CRC bits per frame as follows.
27 The *i*th member of the set
28 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] using
29 Table 3.7.5.20-1 and
30 CRC_LEN_IDX_s[FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r]][N_FS
31 CH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*]] as the index to the
32 table, where N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*]
33 denotes the *i*th member of the set
34 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r].
- 35 – For the *i*th record of the Forward Supplemental Channel Active Set (for all
36 values of *i* between 1 and NUM_SUP_SHO+1) specified in this message,
37 the mobile station shall store the following entries corresponding to the
38 SCCL_INDEX_r as follows:
- 39 + PILOT_PN_s[FOR_SCH_ID_r][SCCL_INDEX_r][*i*] = PILOT_PN_r,
- 40 + Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC_INCL_r. If
41 ADD_PILOT_REC_INCL_r equals '1', the mobile station shall store the
42 following:

- 1 o Set the PILOT_REC_TYPE field of PILOT_REC to
2 PILOT_REC_TYPE_r.
- 3 o If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
4 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r
5 and set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 6 o If PILOT_REC_TYPE_r is equal to '001', the mobile station shall.
- 7 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 8 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
9 AUX_PILOT_WALSH_r with the Walsh Code length specified by
10 WALSH_LENGTH_r.
- 11 o If NGHBR_PILOT_REC_TYPE_r is equal to '010', the mobile station
12 shall:
- 13 – Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
- 14 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
15 AUX_WALSH_r with the Walsh Code length specified by
16 WALSH_LENGTH_r.
- 17 – Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
18 AUX_TD_POWER_LEVEL_r.
- 19 – Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
- 20 o If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
- 21 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
22 SR3_PRIMARY_PILOT_r.
- 23 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
24 SR3_PILOT_POWER1_r.
- 25 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
26 SR3_PILOT_POWER2_r.
- 27 o If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
- 28 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
29 SR3_PRIMARY_PILOT_r.
- 30 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
31 SR3_PILOT_POWER1_r.
- 32 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
33 SR3_PILOT_POWER2_r.
- 34 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 35 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
36 AUX_PILOT_WALSH_r with the Walsh Code length specified by
37 WALSH_LENGTH_r.

- 1 – If ADD_INFO_INCL1_r is equal to ‘1’, set the AUX_PILOT_QOF1
2 field of PILOT_REC to QOF1_r and set the
3 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
4 AUX_PILOT_WALSH1_r with the Walsh Code length specified
5 by WALSH_LENGTH1_r.
- 6 – Otherwise, set the AUX_PILOT_QOF1 field of PILOT_REC to
7 QOF_r and set the AUX_PILOT_WALSH_CODE1 field of
8 PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code
9 length specified by WALSH_LENGTH_r.
- 10 – If ADD_INFO_INCL2_r is equal to ‘1’, set the AUX_PILOT_QOF2
11 field of PILOT_REC to QOF2_r and set the
12 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
13 AUX_PILOT_WALSH2_r with the Walsh Code length specified
14 by WALSH_LENGTH2_r.
- 15 – Otherwise, set the AUX_PILOT_QOF2 field of PILOT_REC to
16 QOF_r and set the AUX_PILOT_WALSH_CODE2 field of
17 PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code
18 length specified by WALSH_LENGTH_r.
- 19 + QOF_MASK_ID_SCH_s[FOR_SCH_ID_r][SCCL_INDEX_r][i] =
20 QOF_MASK_ID_SCH_r,
- 21 + FOR_SCH_CC_INDEX_s[FOR_SCH_ID_r][SCCL_INDEX_r][i]=
22 CODE_CHAN_SCH_r.
- 23 + If the mobile station supports Code Combining Soft Handoff, and
24 CCSH_INCLUDED is set to ‘1’, set
25 CCSH_ENCODER_TYPE_s[FOR_SCH_ID_r][SCCL_INDEX_r][i]=
26 CCSH_ENCODER_TYPE_r.
- 27 + If the mobile station supports Code Combining Soft Handoff, and
28 CCSH_INCLUDED is set to ‘0’, set
29 CCSH_ENCODER_TYPE_s[FOR_SCH_ID_r][SCCL_INDEX_r][i]= 0 (default
30 Turbo Encoder type)
- 31 • The mobile station may soft-combine the Forward Supplemental Channel
32 frames received on the Forward Supplemental Channels in the same
33 Forward Supplemental Channel Active Set.
- 34 • If the mobile station supports any Radio Configuration greater than 2, the
35 mobile station shall perform the following:
- 36 – If FPC_INCL_r is equal to ‘1’, the mobile station shall:
- 37 + Set FPC_MODE_SCH_s to FPC_MODE_SCH_r.
- 38 – If FPC_INCL is equal to ‘1’ and FPC_MODE_SCH is equal to '001', '010',
39 ‘101’, or ‘110’, the mobile station shall:
- 40 + Set FPC_SEC_CHAN_s to FPC_SEC_CHAN_r.

- 1 + Set FPC_BCMC_CHAN_s to FPC_BCMC_CHAN_r.
- 2 – If NUM_SUP_r is included and not equal to ‘00’, for each Supplemental
- 3 Channel included in the message, the mobile station shall:
- 4 + Set SCH_ID_s to SCH_ID_r.
- 5 + Set FPC_SCH_FER_s to FPC_SCH_FER_r.
- 6 + Set FPC_SCH_INIT_SETPT_s as follows:
- 7 o If FPC_SCH_INIT_SETPT_OP_r is set to ‘0’, set
- 8 FPC_SCH_INIT_SETPT_s to FPC_SCH_INIT_SETPT_r.
- 9 o If FPC_SCH_INIT_SETPT_OP_r is set to ‘1’:
- 10 ◇ If FPC_PRI_CHAN_r is equal to ‘0’, set FPC_SCH_INIT_SETPT_s
- 11 to (FPC_FCH_CURR_SETPT_s + FPC_SCH_INIT_SETPT_r).
- 12 ◇ Otherwise, set FPC_SCH_INIT_SETPT_s to
- 13 (FPC_DCCH_CURR_SETPT_s + FPC_SCH_INIT_SETPT_r).
- 14 + Set FPC_SCH_MIN_SETPT_s to FPC_SCH_MIN_SETPT_r.
- 15 + Set FPC_SCH_MAX_SETPT_s to FPC_SCH_MAX_SETPT_r.
- 16 – If FPC_THRESH_SCH_INCL is included and equal to ‘1’, the mobile
- 17 station shall set FPC_SETPT_THRESH_SCH_s to SETPT_THRESH_SCH_r.
- 18 • If RPC_INCL is equal to ‘1’, the mobile station shall set RLGAIN_SCH_PILOT_s
- 19 to RLGAIN_SCH_PILOT_r.
- 20 • If NUM_3X_CFG_r is not equal to ‘00’, the mobile station shall store the
- 21 Forward 3X Supplemental Channel Configuration associated with the
- 22 identification of Forward Supplemental Channel (NUM_3X_CFG_s =
- 23 NUM_3X_CFG_r).
- 24 • For each 3X SCH record included in this message, the mobile station shall
- 25 update the Forward Supplemental Channel Code list associated with the
- 26 FOR_SCH_ID_r as follows:
- 27 – For the ith record of the Forward Supplemental Channel Active Set (for all
- 28 values of i between 1 and NUM_SUP_SHO+1) specified in this message,
- 29 the mobile station shall store the following three entries corresponding to
- 30 the SCCL_INDEX_r as follows:
- 31 + If 3X_SCH_LOW_INCL_r equals ‘1’, set
- 32 QOF_MASK_ID_SCH_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i] to
- 33 QOF_MASK_ID_SCH_LOW_r and
- 34 FOR_SCH_CC_INDEX_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i] to
- 35 CODE_CHAN_SCH_LOW_r. Otherwise, set
- 36 QOF_MASK_ID_SCH_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i] to
- 37 QOF_MASK_ID_SCH[FOR_SCH_ID_r][SCCL_INDEX_r][i] and
- 38 FOR_SCH_CC_INDEX_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i] to
- 39 CODE_CHAN_SCH[FOR_SCH_ID_r][SCCL_INDEX_r][i].

- 1 + If $3X_SCH_HIGH_INCL_r$ equals '1', set
2 $QOF_MASK_ID_SCH_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
3 $QOF_MASK_ID_SCH_HIGH_r$ and
4 $FOR_SCH_CC_INDEX_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
5 $CODE_CHAN_SCH_HIGH_r$. Otherwise, set
6 $QOF_MASK_ID_SCH_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
7 $QOF_MASK_ID_SCH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ and
8 $FOR_SCH_CC_INDEX_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
9 $CODE_CHAN_SCH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$.
- 10 • If $PILOT_GATING_USE_RATE$ is set to '1' and if $NUM_REV_SCH_r$ or
11 $NUM_FOR_SCH_r$ is not equal to '00', the mobile station shall perform the
12 following:
- 13 – The mobile station shall set $PILOT_GATING_USE_RATE$ to '0' and shall
14 start the continuous reverse pilot at the specified action time and, if a F-
15 PDCH is assigned, the mobile station shall start the continuous R-
16 CQICH as defined in [3].
- 17 – If a F-PDCH is not assigned and the Fundamental Channel was
18 previously established prior to transitioning to the *Control Hold Mode*, the
19 mobile station shall start processing F-FCH and start transmitting on R-
20 FCH at the action time of the message. The mobile station shall establish
21 the Fundamental Channel with the same configuration as previously
22 used.
- 23 • If $FOR_SCH_CC_INCL_r$ equals '1', the mobile station shall store the
24 $NUM_FOR_SCH_r$ occurrences of the Forward Supplemental Channel channel
25 configuration records as follows:
- 26 – The mobile station shall store the Forward Supplemental Channel
27 Identification ($FOR_SCH_ID[FOR_SCH_ID_r]_s = FOR_SCH_ID_r$).
- 28 – The mobile station shall store the Forward Supplemental Channel
29 Multiplex Option ($FOR_SCH_MUX[FOR_SCH_ID_r]_s = FOR_SCH_MUX_r$).
- 30 – The mobile station shall store the Forward Supplemental Channel Radio
31 Configuration ($FOR_SCH_RC[FOR_SCH_ID_r]_s = SCH_RC_r$).
- 32 – The mobile station shall store the Forward Supplemental Channel
33 Coding Type ($FOR_SCH_CODING[FOR_SCH_ID_r]_s = CODING_r$).
- 34 – If $FRAME_40_USED_r$ and $FRAME_80_USED_r$ are both equal to '0', the
35 mobile station shall set $FOR_SCH_FRAME_LENGTH_s[FOR_SCH_ID_r]$ to
36 '00' (i.e., 20 ms frame length).
- 37 – If $FRAME_40_USED_r$ is equal to '1', the mobile station shall set
38 $FOR_SCH_FRAME_LENGTH_s[FOR_SCH_ID_r]$ to '01' (i.e., 40 ms frame
39 length).

- 1 - If FRAME_80_USED_r is equal to '1', the mobile station shall set
- 2 FOR_SCH_FRAME_LENGTH_s[FOR_SCH_ID_r] to '10' (i.e., 80 ms frame
- 3 length).
- 4 - F_MAX_RATE_IDX_s[FOR_SCH_ID_r] = MAX_RATE_r.
- 5 • If REV_SCH_CC_INCL_r equals '1', the mobile station shall store the
- 6 NUM_REV_SCH_r occurrences of the Reverse Supplemental Channel channel
- 7 configuration records as follows:
- 8 - The mobile station shall store the Reverse Supplemental Channel
- 9 Identification (REV_SCH_ID[REV_SCH_ID_r]_s = REV_SCH_ID_r).
- 10 - The mobile station shall store the Reverse Supplemental Channel
- 11 Multiplex Option (REV_SCH_MUX[REV_SCH_ID_r]_s = REV_SCH_MUX_r).
- 12 - The mobile station shall store the Reverse Supplemental Channel Radio
- 13 Configuration (REV_SCH_RC[REV_SCH_ID_r]_s = SCH_RC_r).
- 14 - The mobile station shall store the Reverse Supplemental Channel Coding
- 15 Type (REV_SCH_CODING[REV_SCH_ID_r]_s = CODING_r).
- 16 - If FRAME_40_USED_r and FRAME_80_USED_r are both equal to '0', the
- 17 mobile station shall set REV_SCH_FRAME_LENGTH_s[REV_SCH_ID_r] to
- 18 '00' (i.e., 20 ms frame length).
- 19 - If FRAME_40_USED_r is equal to '1', the mobile station shall set
- 20 REV_SCH_FRAME_LENGTH_s[REV_SCH_ID_r] to '01' (i.e., 40 ms frame
- 21 length).
- 22 - If FRAME_80_USED_r is equal to '1', the mobile station shall set
- 23 REV_SCH_FRAME_LENGTH_s[REV_SCH_ID_r] to '10' (i.e., 80 ms frame
- 24 length).
- 25 - R_MAX_RATE_IDX_s[REV_SCH_ID_r] = MAX_RATE_r.

26 14. *Forward Supplemental Channel Assignment Mini Message:* The mobile station shall
27 process this message as follows:

28 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
29 set to '00000111' (message can not be handled by the current mobile station
30 configuration), if any of the mobile station's forward supplemental channel
31 configuration parameters for the corresponding Supplemental Channel is NULL.

32 Otherwise, the mobile station shall store the following information and process
33 the Forward Supplemental Burst as specified in 2.6.6.2.5.1.1:

- 34 • Set FOR_SCH_START_TIME_INCL_s[FOR_SCH_ID_r] to '1'
- 35 • FOR_SCH_START_TIME_s[FOR_SCH_ID_r] = FOR_SCH_START_TIME_r
- 36 • FOR_SCH_DURATION_s[FOR_SCH_ID_r] = FOR_SCH_DURATION_r
- 37 • SCCL_INDEX_s[FOR_SCH_ID_r] = SCCL_INDEX_r
- 38 • If PILOT_GATING_USE_RATE is set to '1', the mobile station shall perform
- 39 the following:

- 1 – The mobile station shall set PILOT_GATING_USE_RATE to ‘0’ and shall
2 start the continuous reverse pilot at the specified action time and, if a F-
3 PDCH is assigned, the mobile station shall start the continuous R-
4 CQICH as defined in [3].
- 5 – If a F-PDCH is not assigned and the Fundamental Channel was
6 previously established prior to transitioning to the *Control Hold Mode*, the
7 mobile station shall start processing F-FCH and start transmitting on R-
8 FCH at the action time of the message. The mobile station shall establish
9 the Fundamental Channel with the same configuration as previously
10 used.

11 15. *Reverse Supplemental Channel Assignment Mini Message*: The mobile station shall
12 process this message as follows:

13 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
14 set to ‘00000111’ (message can not be handled by the current mobile station
15 configuration), if any of the mobile station’s reverse supplemental channel
16 configuration parameters for the corresponding Supplemental Channel is NULL,
17 or if the Reverse Packet Data Channel is assigned.

18 If IGNORE_ESCAM_s is equal to ‘1’, the mobile station shall not process the
19 Reverse Supplemental Channel assignment information in this message.

20 Otherwise, the mobile station shall store the following information and process
21 the Reverse Supplemental Burst as specified in 2.6.6.2.5.1.2:

- 22 • Set REV_SCH_START_TIME_INCL_s[REV_SCH_ID_r] to ‘1’
- 23 • REV_SCH_START_TIME_s[REV_SCH_ID_r] = REV_SCH_START_TIME_r
- 24 • REV_SCH_DURATION_s[REV_SCH_ID_r] = REV_SCH_DURATION_r
- 25 • REV_SCH_NUM_BITS_IDX_s[REV_SCH_ID_r] = REV_SCH_NUM_BITS_IDX_r
- 26 • If PILOT_GATING_USE_RATE is set to ‘1’, the mobile station shall perform
27 the following:

- 28 – The mobile station shall set PILOT_GATING_USE_RATE to ‘0’ and shall
29 start the continuous reverse pilot at the specified action time and, if a F-
30 PDCH is assigned, the mobile station shall start the continuous R-
31 CQICH as defined in [3].
- 32 – If a F-PDCH is not assigned and the Fundamental Channel was
33 previously established prior to transitioning to the *Control Hold Mode*, the
34 mobile station shall start processing F-FCH and start transmitting on R-
35 FCH at the action time of the message. The mobile station shall establish
36 the Fundamental Channel with the same configuration as previously
37 used.

38 2.6.6.2.5.1.1 Processing of the Forward Supplemental Burst Assignment

39 A Forward Supplemental Assignment specifies the explicit start time identified by
40 FOR_SCH_START_TIME or the implicit start time (if FOR_SCH_START_TIME_INCL is set to

1 '0'), FOR_SCH_DURATION, and SCCL_INDEX of a forward burst assignment. The time
 2 interval of duration is specified by FOR_SCH_DURATION (see Table 3.7.3.3.2.37-3) and
 3 starts at the time specified by the explicit start time FOR_SCH_START_TIME or the implicit
 4 start time (if FOR_SCH_START_TIME_INCL is set to '0'). This time interval for a Forward
 5 Supplemental Assignment is called the Forward Supplemental Assignment Interval. A
 6 value of FOR_SCH_DURATION equal to '1111' indicates infinite duration. The variable
 7 SCCL_INDEX_s[FOR_SCH_ID] specifies the rate, QOF index and the Active Set for the
 8 Forward Supplemental Channel identified by FOR_SCH_ID for a given Forward
 9 Supplemental Assignment. A value of FOR_SCH_DURATION equal to '0000' indicates that
 10 the mobile station should stop processing the forward Supplemental Channels at the
 11 explicit start time specified by FOR_SCH_START_TIME or the implicit start time (if
 12 FOR_SCH_START_TIME_INCL is set to '0'). The implicit start time is the time occurring no
 13 later than the first 80 ms boundary (relative to System Time) which occurs at least 80 ms
 14 after the end of the frame containing the last bit of the *Extended Supplemental Channel*
 15 *Assignment Message* or the action time of the *Universal Handoff Direction Message*.

16 If the mobile station receives an *Extended Supplemental Channel Assignment Message* with
 17 FOR_SCH_CC_INCL set to '1', the mobile station shall begin to use the Forward
 18 Supplemental Channel configuration specified by this message at the start time of this
 19 Forward Supplemental Assignment.

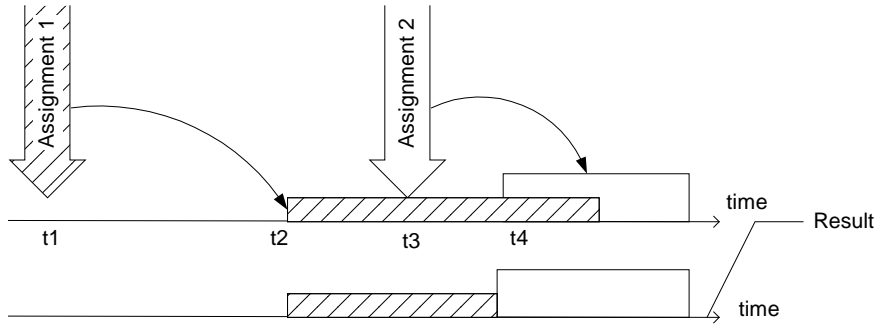

20 For each Forward Supplemental Assignment the mobile station shall determine the start
 21 time for processing forward supplemental channel as the time for which the following
 22 equation holds:

$$\lfloor t / (\text{START_TIME_UNIT}_s + 1) \rfloor - \text{FOR_SCH_START_TIME}_r \bmod 32 = 0,$$

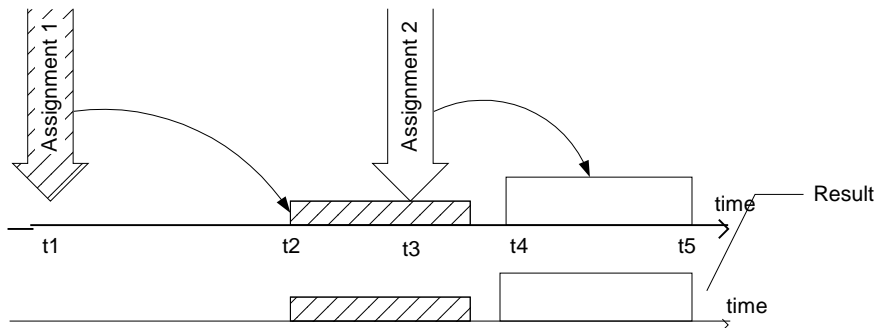

24 where t is the System Time in units of 20 ms.

25 Figure 2.6.6.2.5.1.1-1 illustrates the scenario in which a second Forward Supplemental
 26 Assignment is received while the mobile station is processing the forward supplemental
 27 channel according to a previously received assignment. Two cases are displayed in Figure
 28 2.6.6.2.5.1.1-1: Case a) where the first assignment extends beyond the start time of the
 29 second assignment and Case b) where the first assignment ends before the second one
 30 starts.

31

a) "Assignment 1" extends beyond the start time for "Assignment 2"

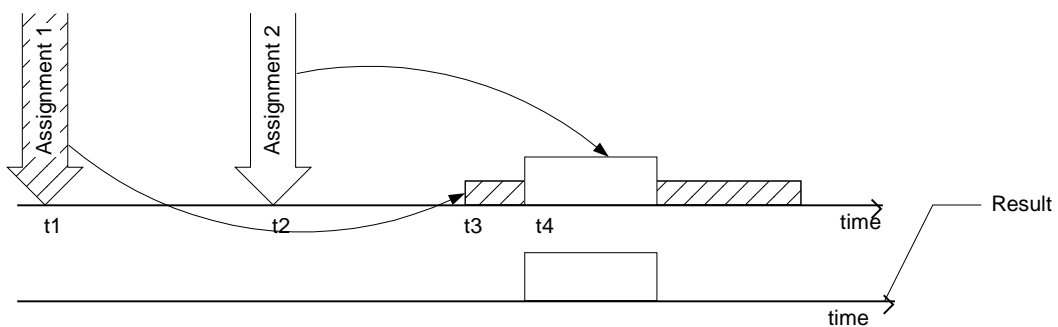

b) "Assignment 1" ends prior to the start time of "Assignment 2"

Figure 2.6.6.2.5.1.1-1. New Supplemental Channel Assignment Received while a Previous Supplemental Channel Assignment is in Progress

Figure 2.6.6.2.5.1.1-2 shows an example scenario in which the mobile station receives a second Forward Supplemental Assignment before it starts processing the supplemental channel according to the first assignment. In this case, the second assignment simply replaces the first assignment.

9
10
11

Figure 2.6.6.2.5.1.1-2. New Supplemental Channel Assignment Received before a Previous Supplemental Channel Assignment starts

The mobile station shall set FPC_MODE_S to $FPC_MODE_SCH_S$ at the $FOR_SCH_START_TIME_S$ of the forward Supplemental Channel assignment. The mobile station shall set FPC_MODE_S to $FPC_MODE_NO_SCH_S$ at the end of the forward Supplemental Channel assignment.

1 For each Forward Supplemental Channel assignment corresponding to each Forward
 2 Supplemental Channel (identified by FOR_SCH_ID), the mobile station should perform the
 3 following:

- 4 • If FOR_SCH_DURATION_s[FOR_SCH_ID] is not equal to '0000', then
 - 5 - If the mobile station is currently processing the Forward Supplemental Channel
 6 identified by FOR_SCH_ID, then the mobile station should continue processing
 7 the Forward Supplemental Channel identified by FOR_SCH_ID according to the
 8 Forward Supplemental Assignment previously received for the Forward
 9 Supplemental Channel identified by FOR_SCH_ID up to the time specified by
 10 the FOR_SCH_START_TIME_s[FOR_SCH_ID] (i.e., the mobile station should stop
 11 processing the forward supplemental channel identified by FOR_SCH_ID at
 12 either the time specified by the start time of the new assignment, or at the time
 13 the previously received assignment ends, whichever time is earlier).

14 At the time specified by FOR_SCH_START_TIME_s[FOR_SCH_ID], the mobile
 15 station should start processing the Forward Supplemental Channel identified by
 16 FOR_SCH_ID for a duration of time specified by
 17 FOR_SCH_DURATION[FOR_SCH_ID]_s with FOR_SCH_MUX_s[FOR_SCH_ID_r],
 18 FOR_SCH_RC_s[FOR_SCH_ID_r], FOR_SCH_CODING_s[FOR_SCH_ID_r],
 19 FOR_SCH_FRAME_LENGTH_s[FOR_SCH_ID_r], the QOF index, the Supplemental
 20 Channel Active Set indexed by SCCL_INDEX_s[FOR_SCH_ID], and number of
 21 information bits per frame (or set of number of bits per frame if
 22 FSCH_VAR_TABLE_ID_s[FOR_SCH_ID_r] is not equal to '000') specified by
 23 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r].

24 If the set of number of bits per frame,
 25 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], has more than one member
 26 and F_INC_RATE_ALLOWED_s is equal to '0', then the following rule applies for
 27 the duration of this assignment:

- 28 + Once the mobile station determines the forward Supplemental Channel
 29 number of bits per frame, the number of bits per frame in the subsequent
 30 Forward Supplemental Channel frames may be any member of the set
 31 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] which is smaller or equal
 32 to the number of bits in the current frame.
- 33 - Otherwise, if the mobile station is not currently processing the Forward
 34 Supplemental Channel identified by FOR_SCH_ID, then at the time specified by
 35 FOR_SCH_START_TIME_s[FOR_SCH_ID], the mobile station should start
 36 processing the Forward Supplemental Channel identified by FOR_SCH_ID for a
 37 duration of time specified by FOR_SCH_DURATION_s[FOR_SCH_ID] with the
 38 QOF index, the Supplemental Channel Active Set indexed by
 39 SCCL_INDEX_s[FOR_SCH_ID], and number of bits per frame (or set of number of
 40 information bits per frame if FSCH_VAR_TABLE_ID_s[FOR_SCH_ID_r] is not equal
 41 to '000') specified by N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r].

42 If the set of number of bits per frame,
 43 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] and

1 F_INC_RATE_ALLOWED_s is equal to '0', has more than one member, then the
2 following rule applies for the duration of this assignment:

3 + Once the mobile station determines the forward Supplemental Channel
4 number of bits per frame, the number of bits per frame in the subsequent
5 Forward Supplemental Channel frames may be any member of the set
6 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] which is smaller or equal
7 to the number of bits in the current frame.

8 • If FOR_SCH_DURATION_s[FOR_SCH_ID] is equal to '0000', the mobile station should
9 perform the following:

10 - If the mobile station is currently processing the Forward Supplemental Channel
11 identified by FOR_SCH_ID, then the mobile station should continue processing
12 the Forward Supplemental Channel identified by FOR_SCH_ID according to the
13 Forward Supplemental Assignment previously received for the Forward
14 Supplemental Channel identified by FOR_SCH_ID up to the time specified by
15 the implicit start time (FOR_SCH_START_TIME_INCL_s is set to '0') or the explicit
16 start time (FOR_SCH_START_TIME_INCL_s is set to '1') (i.e., the mobile station
17 should stop processing the forward supplemental channel identified by
18 FOR_SCH_ID at the time specified by the implicit start time or the explicit start
19 time, or at the time the previously received assignment ends, whichever time is
20 earlier). The mobile station should cancel the pending Forward Supplemental
21 Channel assignment if any.

22 + If FOR_SCH_START_TIME_INCL_s is equal to '1', the mobile station should
23 stop processing the Forward Supplemental Channel identified by
24 FOR_SCH_ID at the time specified by
25 FOR_SCH_START_TIME_s[FOR_SCH_ID].

26 + If FOR_SCH_START_TIME_INCL_s is equal to '0', the mobile station should
27 stop processing the Forward Supplemental Channel identified by
28 FOR_SCH_ID no later than the first 80 ms boundary (relative to System
29 Time) occurring at least 80 ms after the end of the frame containing the last
30 bit of the *Extended Supplemental Channel Assignment Message* or the action
31 time of the *Universal Handoff Direction Message*.

32 - Otherwise, if the mobile station is not currently processing the Forward
33 Supplemental Channel identified by FOR_SCH_ID, the mobile station should
34 cancel the pending Forward Supplemental Channel assignment if any.

35 2.6.6.2.5.1.2 Processing of the Reverse Supplemental Burst Assignment

36 A Reverse Supplemental Assignment specifies the explicit start time identified by
37 REV_SCH_START_TIME or the implicit start time (if REV_SCH_START_TIME_INCL is set to
38 '0'), REV_SCH_DURATION, and REV_SCH_NUM_BITS_IDX of a reverse burst assignment.
39 The time interval of duration is specified by REV_SCH_DURATION (see Table 3.7.3.3.2.37-
40 3) and starts at the time specified by the explicit start time REV_SCH_START_TIME or the
41 implicit start time (if REV_SCH_START_TIME_INCL is set to '0'). This time interval for a
42 Reverse Supplemental Assignment is called the reverse supplemental assignment interval.

1 A value of REV_SCH_DURATION equal to '1111' indicates infinite duration. A value of
 2 REV_SCH_DURATION equal to '0000' indicates that the mobile station should stop
 3 transmitting the reverse Supplemental Channels at the explicit start time specified by
 4 REV_SCH_START_TIME or the implicit start time (if REV_SCH_START_TIME_INCL is set to
 5 '0'). The implicit start time is the time occurring no later than the first 80 ms boundary
 6 (relative to System Time) which occurs at least 80 ms after the end of the frame containing
 7 the last bit of the *Extended Supplemental Channel Assignment Message* or the action time of
 8 the *Universal Handoff Direction Message*.

9 If the mobile station receives an *Extended Supplemental Channel Assignment Message* with
 10 REV_SCH_CC_INCL set to '1', the mobile station shall begin to use the Reverse
 11 Supplemental Channel configuration specified by this message at the start time of this
 12 Reverse Supplemental Assignment.

13 For each Reverse Supplemental Assignment the mobile station shall determine the start
 14 time for processing reverse supplemental channel as the time for which the following
 15 equation holds:

$$\lfloor t / (\text{START_TIME_UNIT}_s + 1) \rfloor - \text{REV_SCH_START_TIME}_r \bmod 32 = 0,$$

17 where t is the System Time in units of 20 ms.

18 Figure 2.6.6.2.5.1.1-1 illustrates the scenario in which a second Reverse Supplemental
 19 Assignment is received while the mobile station is transmitting on the reverse
 20 supplemental channel according to a previously received assignment. Two cases are
 21 displayed in Figure 2.6.6.2.5.1.1-1: Case a) where the first assignment extends beyond the
 22 start time of the second assignment and Case b) where the first assignment ends before the
 23 second one starts.

24 Figure 2.6.6.2.5.1.1-2 shows an example scenario in which the mobile station receives a
 25 second Reverse Supplemental Assignment before it starts transmitting on the supplemental
 26 channel according to the first assignment. In this case, the second assignment simply
 27 replaces the first assignment.

28 For each Reverse Supplemental Channel assignment corresponding to each Reverse
 29 Supplemental Channel (identified by REV_SCH_ID), the mobile station shall perform the
 30 following:

- 31 • The mobile station shall determine, $N_{\text{RSCH_BITS}}_s[\text{REV_SCH_ID}_r]$, the number of
 32 information bits per Reverse Supplemental Channel frame identified by
 33 REV_SCH_ID according to the following rules:
 - 34 - If $\text{RSCH_VAR_TABLE_ID}_s[\text{REV_SCH_ID}_r]$ is equal to '000', then:
 - 35 + If $\text{USE_FLEX_NUM_BITS}_s$ is equal to '0' or if $\text{USE_FLEX_NUM_BITS}_s$ is equal
 36 to '1' and $\text{RSCH_NBIT_TABLE_ID}_s[\text{REV_SCH_ID}_r]$ is equal to '0000', then the
 37 mobile station shall set the number of information bits per frame,
 38 $N_{\text{RSCH_BITS_SET}}_s[\text{REV_SCH_ID}_r]$ and number of CRC bits per frame,
 39 $\text{RSCH_CRC_LEN_SET}_s[\text{REV_SCH_ID}_r]$, according to Table 3.7.3.3.2.37-2
 40 using REV_SCH_NUM_BITS_IDX_r as the index to the table.

- 1 + If USE_FLEX_NUM_BITS_s is equal to '1' and
2 RSCH_NBIT_TABLE_IDS[REV_SCH_ID_r] is not equal to '0000', then the
3 mobile station shall set the number of CRC bits per frame,
4 RSCH_CRC_LEN_SET_s[REV_SCH_ID_r], according to Table 3.7.5.20-1 using
5 CRC_LEN_IDX_s[RSCH_NBIT_TABLE_IDS[REV_SCH_ID_r]][REV_SCH_NUM_BI
6 TS_IDX_r] as the index to the table. The mobile station shall also set the
7 number of information bits per frame, N_SCH_BITS_SET_s[REV_SCH_ID_r], to
8 NUM_BITS_s[RSCH_NBIT_TABLE_IDS[REV_SCH_ID_r]]
9 [REV_SCH_NUM_BITS_IDX_r].
- 10 - If RSCH_VAR_TABLE_IDS[REV_SCH_ID_r] is not equal to '000', then:
- 11 + The mobile station shall set N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r], the set
12 of indices to the number of information bits per frame as follows:
- 13 ○ If REV_SCH_NUM_BITS_IDX_r is equal to '0000', then
14 N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r] = {REV_SCH_NUM_BITS_IDX_r},
- 15 ○ otherwise, the mobile station shall set (initialize)
16 N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r] = { REV_SCH_NUM_BITS_IDX_r
17 }, and for i=1, ..., REV_SCH_NUM_BITS_IDX_r the mobile station shall
18 add REV_SCH_NUM_BITS_IDX_r -
19 VAR_RSCH_RATE_OFFSET_s[REV_SCH_ID_r][REV_SCH_NUM_BITS_IDX_r][i
20] to the set specified by N_RSCH_BITS_IDX_SET_s[FOR_SCH_ID_r]
- 21 + If USE_FLEX_NUM_BITS_s is equal to '0' or if USE_FLEX_NUM_BITS_s is equal
22 to '1' and RSCH_NBIT_TABLE_IDS[REV_SCH_ID_r] is equal to '0000', then the
23 mobile station shall determine N_RSCH_BITS_SET_s[REV_SCH_ID_r], the set
24 of number of information bits per frame as follows. The *i*th member of the set
25 N_RSCH_BITS_SET_s[REV_SCH_ID_r] is obtained using Table 3.7.3.3.2.37-1
26 and the *i*th member of the set N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r] as the
27 index to the table.
- 28 + If USE_FLEX_NUM_BITS_s is equal to '1' and
29 RSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r] is not equal to '0000', then
- 30 ○ the mobile station shall set N_RSCH_BITS_SET_s[REV_SCH_ID_r], the set
31 of number of information bits per frame as follows.
32 The *i*th member of the set N_RSCH_BITS_SET_s[REV_SCH_ID_r] is equal to
33 NUM_BITS_s[SCH_NBIT_TABLE_IDS[REV_SCH_ID_r]]
34 [N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r][i]], where
35 N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r][i] denotes the *i*th member of the
36 set N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r].

- 1 ○ the mobile station shall set $RSCH_CRC_LEN_SET_s[REV_SCH_ID_r]$, the
2 set of number of information bits per frame as follows.
3 The i^{th} member of the set $RSCH_CRC_LEN_IDX_SET_s[REV_SCH_ID_r]$ is
4 equal to
5 $CRC_LEN_IDX_s[RSCH_NBIT_TABLE_ID_s[REV_SCH_ID_r]][N_RSCH_BITS_I$
6 $DX_SET_s[REV_SCH_ID_r][i]]$, where
7 $N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r][i]$ denotes the i^{th} member of the
8 set $N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r]$.
- 9 • If $REV_SCH_DURATION_s[REV_SCH_ID]$ is not equal to '0000', then
- 10 - If the mobile station is currently transmitting on the Reverse Supplemental
11 Channel identified by REV_SCH_ID , then the mobile station may continue
12 transmitting on the Reverse Supplemental Channel identified by REV_SCH_ID
13 with the Walsh cover specified by
14 $REV_WALSH_ID_s[REV_SCH_ID][REV_SCH_NUM_BITS_IDX[REV_SCH_ID_r]]$
15 according to the current Reverse Supplemental Assignment for the Reverse
16 Supplemental Channel identified by REV_SCH_ID up to the time specified by
17 the $REV_SCH_START_TIME_s[REV_SCH_ID_r]$ (i.e., the mobile station shall stop
18 transmitting on the reverse supplemental channel identified by REV_SCH_ID at
19 either the time specified by the start time of the new assignment, or at the time
20 the previously received assignment ends, whichever time is earlier).
- 21 At the time specified by $REV_SCH_START_TIME_s[REV_SCH_ID_r]$, the mobile
22 station may start transmitting on the Reverse Supplemental Channel identified
23 by REV_SCH_ID with $REV_SCH_MUX_s[REV_SCH_ID_r]$,
24 $REV_SCH_RC_s[REV_SCH_ID_r]$, $REV_SCH_CODING_s[REV_SCH_ID_r]$,
25 $REV_SCH_FRAME_LENGTH_s[REV_SCH_ID_r]$, the Walsh cover specified by
26 $REV_WALSH_ID_s[REV_SCH_ID][REV_SCH_NUM_BITS_IDX_s[REV_SCH_ID_r]]$ and
27 number of bits per frame (or set of number of information bits per frame if
28 $RSCH_VAR_TABLE_ID_s[REV_SCH_ID_r]$ is not equal to '000') specified by
29 $N_RSCH_BITS_SET_s[REV_SCH_ID_r]$.
- 30 If the set of number of bits per frame, $N_RSCH_BITS_SET_s[REV_SCH_ID_r]$, has
31 more than one member and $R_INC_RATE_ALLOWED_s$ is equal to '0', then the
32 following rule applies for the duration of this assignment:
- 33 + Once the mobile station transmits n number of bits per Reverse
34 Supplemental Channel specified by REV_SCH_ID , where n is a member of
35 the set $N_RSCH_BITS_SET_s[REV_SCH_ID_r]$, the mobile station shall not
36 transmit at a rate higher than the one specifies by n information bits per
37 frame for the duration of the assignment.
- 38 - If the mobile station is not currently transmitting on the Reverse Supplemental
39 Channel identified by $REV_SCH_ID_r$, then at the time specified by
40 $REV_SCH_START_TIME_s[REV_SCH_ID_r]$, the mobile station may start
41 transmitting on the Reverse Supplemental Channel identified by REV_SCH_ID
42 with the Walsh cover specified by
43 $REV_WALSH_ID_s[REV_SCH_ID][REV_SCH_NUM_BITS_IDX_s[REV_SCH_ID_r]]$ and

1 number of bits per frame (or set of number of information bits per frame if
 2 RSCH_VAR_TABLE_IDS_s[REV_SCH_ID_r] is not equal to '000') specified by
 3 N_RSCH_BITS_SET_s[REV_SCH_ID_r]. If the set of number of bits per frame,
 4 N_RSCH_BITS_SET_s[REV_SCH_ID_r], has more than one member and
 5 R_INC_RATE_ALLOWED_s is equal to '0', then the following rule applies for the
 6 duration of this assignment:

7 + Once the mobile station transmits n number of bits per Reverse
 8 Supplemental Channel specifies by REV_SCH_ID, where n is a member of
 9 the set N_RSCH_BITS_SET_s[REV_SCH_ID_r], the mobile station shall not
 10 transmit at a rate higher than the one specifies by n information bits per
 11 frame for the duration of the assignment.

12 • If REV_SCH_DURATION_s[REV_SCH_ID_r] is equal to '0000', the mobile station shall
 13 perform the followings:

14 - If the mobile station is currently transmitting on the Reverse Supplemental
 15 Channel identified by REV_SCH_ID, then the mobile station may continue
 16 transmitting on the Reverse Supplemental Channel identified by REV_SCH_ID
 17 with the Walsh cover specified by
 18 REV_WALSH_ID_s[REV_SCH_ID][REV_SCH_NUM_BITS_IDX[REV_SCH_ID_r]]
 19 according to the current Reverse Supplemental Assignment for the Reverse
 20 Supplemental Channel identified by REV_SCH_ID up to the time specified by
 21 the implicit start time (if REV_SCH_START_TIME_INCL_s is equal to '1') or the
 22 explicit start time (if REV_SCH_START_TIME_INCL_s is equal to '1') (i.e., the
 23 mobile station shall stop transmitting on the reverse supplemental channel
 24 identified by REV_SCH_ID at the implicit start time or the explicit start time, or
 25 at the time the previously received assignment ends, whichever time is earlier).
 26 The mobile station shall cancel the pending Reverse Supplemental Channel
 27 assignment if any.

28 + If REV_SCH_START_TIME_INCL_s is equal to '1', the mobile station shall stop
 29 transmitting on the Reverse Supplemental Channel identified by
 30 REV_SCH_ID_r at the time specified by
 31 REV_SCH_START_TIME_s[REV_SCH_ID_r].

32 + If REV_SCH_START_TIME_INCL_s is equal to '0', the mobile station shall stop
 33 transmitting on the Reverse Supplemental Channel identified by
 34 REV_SCH_ID_r no later than the first 80 ms boundary (relative to System
 35 Time) occurring at least 80 ms after the end of the frame containing the last
 36 bit of the *Extended Supplemental Channel Assignment Message* or the action
 37 time of the *Universal Handoff Direction Message*.

38 - Otherwise, if the mobile is not currently transmitting on the Reverse
 39 Supplemental Channel identified by REV_SCH_ID, the mobile station shall
 40 cancel the pending Forward Supplemental Channel assignment if any.

41 • If REV_SCH_DTX_DURATION_s is not equal to '1111', the mobile station shall
 42 perform the following:

- 1 - The mobile station shall maintain a
2 REV_SCH_DTX_TRANSMISSION_COUNTER[REV_SCH_ID_r] counter counting
3 discontinuous transmission time in units of 20 ms as follows:
- 4 + The mobile station shall reset the
5 REV_SCH_DTX_TRANSMISSION_COUNTER[REV_SCH_ID_r] counter to 0:
- 6 ○ For each Reverse Supplemental Channel assignment corresponding to
7 REV_SCH_ID_r, at action time specified by the REV_SCH_START_TIME_r
8 field for that assignment, if included; otherwise at the action time of the
9 message.
- 10 ○ Each time the mobile station resumes transmission on Reverse
11 Supplemental Channelc after discontinued operation on the Reverse
12 Supplemental Channel.
- 13 + The mobile station shall increment the
14 REV_SCH_DTX_TRANSMISSION_COUNTER[REV_SCH_ID_r] counter by one
15 at each 20ms interval for which the mobile station is not transmitting on the
16 Reverse Supplemental Channel during the Reverse Supplemental Channel
17 duration.
- 18 - If the REV_SCH_DTX_TRANSMISSION_COUNTER[REV_SCH_ID_r] counter value
19 exceeds REV_SCH_DTX_DURATION_s (i.e., the mobile station discontinues
20 transmission on the Reverse Supplemental Channel for more than the duration
21 specified by REV_SCH_DTX_DURATION_s), the mobile station shall perform the
22 following:
- 23 + The mobile station shall not resume transmission on the Reverse
24 Supplemental Channel corresponding to REV_SCH_ID_r.
- 25 + The mobile station shall send an indication to each affected service instance
26 indicating that the mobile station has terminated transmission on the
27 supplemental channel corresponding to REV_SCH_ID_r due to expiration of
28 the discontinued transmission period.

29 2.6.6.2.5.2 Processing of Reverse Traffic Channel Handoff Messages

30 The mobile station sends the following messages on the Reverse Traffic Channel in support
31 of handoff when its transmitter is enabled, following the receipt of a *forward dedicated*
32 *channel acquired* indication from Layer 2 (see [4]):

- 33 1. *Pilot Strength Measurement Message* or *Extended Pilot Strength Measurement*
34 *Message*: The mobile station shall send an autonomous *Pilot Strength Measurement*
35 *Message* if P_REV_IN_USE_s is less than seven or *Extended Pilot Strength*
36 *Measurement Message* if P_REV_IN_USE_s is equal to or greater than seven in
37 assured mode. The mobile station shall send either *Pilot Strength Measurement*
38 *Message* or *Extended Pilot Strength Measurement Message* containing measurements
39 consistent with the event whenever any of the following events occur:
- 40 • P_REV_IN_USE_s is less than or equal to three or SOFT_SLOPE_s is equal to
41 '000000' and the strength of a Neighbor Set or Remaining Set pilot is found to
42 be above T_ADD_s.

- P_REV_IN_USE_s is greater than three, SOFT_SLOPE_s is not equal to '000000', and the strength PS, as specified in 2.6.6.2.2, of any Candidate Set pilot is found to satisfy the following inequality:

$$10 \times \log_{10} PS > \frac{\text{SOFT_SLOPE}_s}{8} \times 10 \times \log_{10} \sum_{i \in A} PS_i + \frac{\text{ADD_INTERCEPT}_s}{2}$$

where the summation is performed over all pilots currently in the Active Set and a *Pilot Strength Measurement Message* or an *Extended Pilot Strength Measurement Message* carrying this information has not been sent since the last *Extended Handoff Direction Message*, *General Handoff Direction Message* or *Universal Handoff Direction Message* was received.

- P_REV_IN_USE_s is greater than three, SOFT_SLOPE_s is not equal to '000000', and the strength PS, as specified in 2.6.6.2.2, of any Neighbor Set or Remaining Set pilot is found to satisfy the following inequality:

$$10 \times \log_{10} PS > \max\left(\frac{\text{SOFT_SLOPE}_s}{8} \times 10 \times \log_{10} \sum_{i \in A} PS_i + \frac{\text{ADD_INTERCEPT}_s}{2}, -\frac{\text{T_ADD}_s}{2}\right)$$

where the summation is performed over all pilots currently in the Active Set.

- P_REV_IN_USE_s is less than or equal to three or SOFT_SLOPE_s is equal to '000000', the strength of a Candidate Set pilot exceeds the strength of an Active Set pilot by T_COMP_s × 0.5 dB, and a *Pilot Strength Measurement Message* carrying this information has not been sent since the last *Extended Handoff Direction Message*, *General Handoff Direction Message* or *Universal Handoff Direction Message* was received.
- P_REV_IN_USE_s is greater than three, SOFT_SLOPE_s is not equal to '000000', and the strength of a Candidate Set pilot exceeds the strength of an Active Set pilot by T_COMP_s × 0.5 dB and satisfies the following inequality:

$$10 \times \log_{10} PS > \frac{\text{SOFT_SLOPE}_s}{8} \times 10 \times \log_{10} \sum_{i \in A} PS_i + \frac{\text{ADD_INTERCEPT}_s}{2}$$

where the summation is performed over all pilots currently in the Active Set and a *Pilot Strength Measurement Message* or an *Extended Pilot Strength Measurement Message* carrying this information has not been sent since the last *Extended Handoff Direction Message*, *General Handoff Direction Message* or *Universal Handoff Direction Message* was received.

- The handoff drop timer of an Active Set pilot has expired and a *Pilot Strength Measurement Message* or an *Extended Pilot Strength Measurement Message* carrying this information has not been sent since the last *Extended Handoff Direction Message*, *General Handoff Direction Message*, or *Universal handoff Direction Message* was received.
- A Candidate Set pilot has been autonomously promoted to the Active Set (see 2.6.6.2.6.1), and an *Extended Pilot Strength Measurement Message* carrying this information has not been sent since the last *Extended Handoff Direction*

1 *Message, General Handoff Direction Message, or Universal Handoff Direction*
2 *Message* was received.

3 2. *Handoff Completion Message or Extended Handoff Completion Message*: The mobile
4 station shall send a *Handoff Completion Message* if $P_REV_IN_USE_s$ is less than
5 seven or an *Extended Handoff Completion Message* if $P_REV_IN_USE_s$ is equal to or
6 greater than seven in assured mode as follows:

- 7 • If the handoff message (*Extended Handoff Direction Message, General Handoff*
8 *Direction Message or Universal Handoff Direction Message*) specifies a soft
9 handoff, the mobile station shall send the *Handoff Completion Message* if
10 $P_REV_IN_USE_s$ is less than seven or an *Extended Handoff Completion Message*
11 if $P_REV_IN_USE_s$ is equal to or greater than seven within T_{56m} seconds after
12 the action time of the received handoff message.
- 13 • If the handoff message (*Extended Handoff Direction Message, General Handoff*
14 *Direction Message or Universal Handoff Direction Message*) specifies a hard
15 handoff without return on failure (see 2.6.6.2.8.1), the mobile station shall send
16 the *Handoff Completion Message* if $P_REV_IN_USE_s$ is less than seven or an
17 *Extended Handoff Completion Message* if $P_REV_IN_USE_s$ is equal to or greater
18 than seven within T_{73m} seconds after the action time of the received handoff
19 message.
- 20 • If the handoff message (*General Handoff Direction Message or Universal Handoff*
21 *Direction Message*) specifies a hard handoff with return on failure (see
22 2.6.6.2.8.2), the mobile station shall send the *Handoff Completion Message* if
23 $P_REV_IN_USE_s$ is less than seven or an *Extended Handoff Completion Message*
24 if $P_REV_IN_USE_s$ is equal to or greater than seven within T_{56m} seconds after
25 mobile station declares the handoff to be successful (see 2.6.6.2.8.2).

26 3. *Candidate Frequency Search Report Message*: The mobile station shall send a
27 *Candidate Frequency Search Report Message* in assured mode, whenever any of the
28 following events occur:

- 29 • $RETURN_IF_HANDOFF_FAIL_s$ is equal to '1', and a handoff attempt is
30 unsuccessful (see 2.6.6.2.8.2). In this case, the mobile station shall send a
31 *Candidate Frequency Search Report Message* within T_{56m} seconds after
32 completing a search of all pilots in the Candidate Frequency Search Set and
33 resuming the use of the Serving Frequency Active Set (see 2.6.6.2.8.2.1).
- 34 • $RETURN_IF_HANDOFF_FAIL_s$ is equal to '1', an inter-frequency handoff attempt
35 is unsuccessful (see 2.6.6.2.8.2), and $PERIODIC_SEARCH_s$ is equal to '1'. In
36 this case, the mobile station shall send a *Candidate Frequency Search Report*
37 *Message* in a search period if the conditions specified in 2.6.6.2.8.3.2 are met.
- 38 • The mobile station receives a *Candidate Frequency Search Request Message* or a
39 *Candidate Frequency Search Control Message* with $SEARCH_TYPE$ set to '01'. If
40 none of the conditions requiring the mobile station to send a *Mobile Station*
41 *Reject Order* is true (see 2.6.6.2.5.1), the mobile station shall send a *Candidate*
42 *Frequency Search Report Message*, as described in 2.6.6.2.8.3.1 and
43 2.6.6.2.10.1.

- 1 • The mobile station receives a *Candidate Frequency Search Request Message* or
2 *Candidate Frequency Search Control Message* with SEARCH_TYPE set to '11',
3 SEARCH_MODE_s is equal to '0000' and the Candidate Frequency Search Set is
4 not empty. If none of the conditions requiring the mobile station to send a
5 *Mobile Station Reject Order* is true (see 2.6.6.2.5.1), the mobile station shall send
6 a *Candidate Frequency Search Report Message* in a search period if the
7 conditions specified in 2.6.6.2.8.3.2 are met.
- 8 4. *Periodic Pilot Strength Measurement Message*: The mobile station shall send a
9 *Periodic Pilot Strength Measurement Message* in unassured mode, as specified in
10 2.6.6.2.5.1 and 2.6.6.2.12.
- 11 5. *Pilot Strength Measurement Mini Message*: If the mobile station supports the Mobile
12 Assisted Burst operation capability, the mobile station shall send this message
13 while processing any Supplemental Channel, according to the following:
- 14 • The mobile station shall transmit a *Pilot Strength Measurement Mini Message* for
15 a pilot *p* in the Active Set on the r-dsch logical channel whenever all of the
16 following conditions are true:
- 17 – ORDER_FLAG_s is equal to '1'.
- 18 – The pilot *p* in the Active Set has a received signal strength that is greater
19 than the signal strength of another pilot in the Active Set by
20 PS_MIN_DELTA_s, in units of 0.5 dB, at the current time and has been for
21 ORDER_INTERVAL_s most recent successive 20 ms frame intervals since this
22 pilot was last reported in a rank order based *Pilot Strength Measurement Mini*
23 *Message*.
- 24 – The rank order of pilot *p* has changed.
- 25 • If PERIODIC_FLAG_s is equal to '1', the mobile station shall transmit a *Pilot*
26 *Strength Measurement Mini Message* within PERIODIC_INTERVAL_s 20 ms frame
27 intervals on the r-dsch for each of the *n* pilots in the Active Set with the largest
28 signal strengths, where *n* = (min (NUM_PILOTS, the number of pilots in the
29 Active Set)), whenever the following condition is true:
- 30 – The mobile station has not transmitted another *Pilot Strength*
31 *Measurement Mini Message* for the corresponding pilot during the last
32 PERIODIC_INTERVAL_s 20 ms frame intervals.
- 33 • If THRESHOLD_FLAG_s is equal to '1', the mobile station shall transmit a *Pilot*
34 *Strength Measurement Mini Message* for pilot *p* on the r-dsch logical channel
35 whenever all of the following conditions are true:
- 36 – The mobile station has not transmitted a previous *Pilot Strength*
37 *Measurement Mini Message* for pilot *p* within the most recent
38 THRESHOLD_INTERVAL_s 20 ms frames intervals.
- 39 – Pilot *p* is in the Active Set.

- 1 – The signal strength of pilot p is greater than $PS_CEILING_HIGH_s$ and the
2 signal strength of pilot p was less than or equal to $PS_CEILING_LOW_s$ at any
3 time since the mobile station last sent a *Pilot Strength Measurement Mini*
4 *Message* for pilot p ; or the signal strength of pilot p is less than
5 $PS_FLOOR_LOW_s$ and the signal strength for pilot p was greater than or
6 equal to $PS_FLOOR_HIGH_s$ at any time since the last time that the mobile
7 station sent a *Pilot Strength Measurement Mini Message* for pilot p .

8 2.6.6.2.6 Set Maintenance

9 2.6.6.2.6.1 Maintenance of the Active Set

10 The mobile station shall support a maximum Active Set size of N_{6m} pilots. The mobile
11 station shall track the pilot strengths of all pilots in the Active Set.

12 When the mobile station is first assigned Forward Traffic Channels, the mobile station shall
13 initialize the Active Set to contain the pilots associated with the assigned Forward Traffic
14 Channels. When the mobile station processes an *Extended Handoff Direction Message*, a
15 *General Handoff Direction Message* or *Universal Handoff Direction Message*, then at the
16 action time of the message the mobile station shall replace the pilots in the Active Set with
17 the pilots listed in the message.

18 If the call rescue allowed timer is enabled, then the mobile station shall autonomously add
19 one or more Candidate Set pilots whose strength exceeds T_ADD_s to the Active Set,
20 beginning with the strongest, provided that:

- 21 • the $NGHBR_RESQ_CONFIGURED$ field of the $NGHBR_REC$ for the corresponding
22 pilot is equal to '1', and
- 23 • the resulting Active Set size does not exceed N_{6m} pilots.

24 When autonomously adding Rescue Channel pilots to the Active Set, the mobile station
25 may autonomously drop one or more of the existing pilots in the Active Set, beginning with
26 the weakest, to allow for adding pilots when the Active Set is full.

27 2.6.6.2.6.2 Maintenance of the Candidate Set

28 The mobile station shall support a maximum Candidate Set size of N_{7m} pilots.

29 When the mobile station is first assigned a Forward Traffic Channel, the mobile station
30 shall initialize the Candidate Set to contain no pilots. The mobile station shall adjust the
31 Candidate Set whenever any of the following events occur:

- 32 • If the mobile station detects that the strength of a Neighbor Set pilot or a Remaining
33 Set pilot exceeds T_ADD_s , the mobile station shall add the pilot to the Candidate
34 Set.
- 35 • If the mobile station processes an *Extended Handoff Direction Message*, a *General*
36 *Handoff Direction Message* or a *Universal Handoff Direction Message* which does not
37 list a pilot in the current Active Set, and the handoff drop timer corresponding to
38 that pilot has not expired at the action time of the message, the mobile station shall
39 add the pilot to the Candidate Set at the action time of the message.

- 1 • If the mobile station autonomously drops an existing pilot in the Active Set (see
2 2.6.6.2.6.1), and the handoff drop timer corresponding to that pilot has not expired,
3 the mobile station shall add the pilot to the Candidate Set.
- 4 • If $P_REV_IN_USE_s$ is greater than three, and $SOFT_SLOPE_s$ is not equal to '000000',
5 the mobile station shall perform the following:
 - 6 - If the mobile station processes a *General Handoff Direction Message* or a
7 *Universal Handoff Direction Message* which does not list a pilot in the current
8 Active Set, the handoff drop timer corresponding to that pilot has expired at the
9 action time of the message, and that pilot is found to be above T_DROP_s , the
10 mobile station shall add the pilot to the Candidate Set at the action time of the
11 message.
 - 12 - If the mobile station autonomously drops an existing pilot in the Active Set (see
13 2.6.6.2.6.1), the handoff drop timer corresponding to that pilot has expired, and
14 that pilot is found to be above T_DROP_s , the mobile station shall add the pilot to
15 the Candidate Set.
- 16 • If the mobile station processes an *Extended Handoff Direction Message*, a *General*
17 *Handoff Direction Message* or *Universal Handoff Direction Message*, which lists a
18 pilot in the current Candidate Set, the mobile station shall delete the pilot from the
19 Candidate Set at the action time of the message.
- 20 • If the handoff drop timer corresponding to a Candidate Set pilot expires, the mobile
21 station shall delete the pilot from the Candidate Set.
- 22 • If the mobile station autonomously adds a Candidate Set pilot to the Active Set (see
23 2.6.6.2.6.1), the mobile station shall delete the pilot from the Candidate Set.
- 24 • If the mobile station adds a pilot to the Candidate Set, and the resulting Candidate
25 Set size exceeds N_{7m} , the mobile station shall delete from the Candidate Set the
26 pilot whose handoff drop timer is closest to expiration. If more than one such pilot
27 exists, the mobile station shall delete one such pilot that has the lowest strength. If
28 no pilot in the Candidate Set has an enabled handoff drop timer, the mobile station
29 shall delete from the Candidate Set the pilot that has the lowest strength.

30 2.6.6.2.6.3 Maintenance of the Neighbor Set

31 The mobile station shall support a Neighbor Set size of at least N_{8m} pilots.

32 When the mobile station is first assigned a Forward Traffic Channel, the mobile station
33 shall initialize the Neighbor Set to contain all the pilots specified in the most recently
34 received *Neighbor List Message*, *Extended Neighbor List Message* or *General Neighbor List*
35 *Message*.

36 The mobile station shall maintain a counter, AGE_s , for each pilot in the Neighbor Set. The
37 mobile station shall initialize this counter to zero when it moves the pilot from the Active
38 Set or the Candidate Set to the Neighbor Set. The mobile station shall initialize this
39 counter to $NGHBR_MAX_AGE_s$ when it moves the pilot from the Remaining Set to the
40 Neighbor Set. The mobile station shall increment AGE_s for each pilot in the Neighbor Set
41 upon receipt of a *Neighbor List Update Message* or an *Extended Neighbor List Update*

1 *Message*. When the mobile station is first assigned to a Forward Traffic Channel, the
2 mobile station shall set AGE_S for each pilot in the Neighbor Set to $NGHBR_MAX_AGE_S$.

3 The mobile station shall adjust the Neighbor Set whenever any of the following events
4 occur:

- 5 • If the mobile station receives a *Neighbor List Update Message* or an *Extended*
6 *Neighbor List Update Message*, it shall perform the following:
 - 7 - Increment AGE_S for each pilot in the Neighbor Set.
 - 8 - Delete from the Neighbor Set all pilots whose AGE_S exceeds $NGHBR_MAX_AGE_S$.
 - 9 - Add to the Neighbor Set each pilot named in the message, if it is not already a
10 pilot of the Active Set, Candidate Set, or Neighbor Set. If the mobile station can
11 store in the Neighbor Set only k additional pilots, and more than k new pilots
12 were sent in the *Neighbor List Update Message* or the *Extended Neighbor List*
13 *Update Message*, the mobile station shall store the first k new pilots listed in the
14 message.
- 15 • If the handoff drop timer of a pilot in the Candidate Set expires, the mobile station
16 shall add the pilot to the Neighbor Set.
- 17 • If $P_REV_IN_USE_S$ is less than or equal to three or $SOFT_SLOPE_S$ is equal to
18 '000000', the mobile station shall perform the following:
 - 19 - If the mobile station processes an *Extended Handoff Direction Message*, a
20 *General Handoff Direction Message*, or a *Universal Handoff Direction Message* in
21 which a pilot in the Active Set is not listed, and the handoff drop timer
22 corresponding to the pilot has expired, the mobile station shall add the pilot to
23 the Neighbor Set.
 - 24 - If the mobile station autonomously drops an existing pilot in the Active Set (see
25 2.6.6.2.6.1) and the handoff drop timer corresponding to the pilot has expired,
26 the mobile station shall add the pilot to the Neighbor Set.
- 27 • If $P_REV_IN_USE_S$ is greater than three, and $SOFT_SLOPE_S$ is not equal to '000000',
28 the mobile station shall perform the following:
 - 29 - If the mobile station processes an *Extended Handoff Direction Message*, a
30 *General Handoff Direction Message*, or a *Universal Handoff Direction Message*
31 which does not list a pilot in the current Active Set, the handoff drop timer
32 corresponding to that pilot has expired, and that pilot is found to be below
33 T_DROP_S , the mobile station shall add the pilot to the Neighbor Set.
 - 34 - If the mobile station autonomously drops an existing pilot in the Active Set (see
35 2.6.6.2.6.1), the handoff drop timer corresponding to that pilot has expired, and
36 that pilot is found to be below T_DROP_S , the mobile station shall add the pilot to
37 the Neighbor Set.
- 38 • If the mobile station adds a pilot to the Candidate Set, and the resulting Candidate
39 Set size exceeds the size supported by the mobile station, the mobile station shall
40 add the deleted Candidate Set pilot to the Neighbor Set (see 2.6.6.2.6.2).

- 1 • If the mobile station detects that the strength of a Neighbor Set pilot exceeds
2 T_ADD_S , the mobile station shall delete the pilot from the Neighbor Set.
- 3 • If the mobile station processes an *Extended Handoff Direction Message*, a *General*
4 *Handoff Direction Message* or a *Universal Handoff Direction Message* which lists a
5 pilot in the current Neighbor Set, the mobile station shall delete the pilot from the
6 Neighbor Set.
- 7 • If the mobile station adds a pilot to the Neighbor Set, and the resulting Neighbor Set
8 size exceeds the size supported by the mobile station, the mobile station shall delete
9 from the Neighbor Set the pilot whose AGE_S is the largest. If more than one such
10 pilot exists, the mobile station shall delete one such pilot that has the lowest
11 strength.

12 2.6.6.2.7 Soft Handoff

13 2.6.6.2.7.1 Forward Traffic Channel Processing

14 All Forward Traffic Channels associated with pilots in the Active Set of the mobile station
15 carry identical modulation symbols with the exception of the power control subchannel (see
16 [2]).

17 When the Active Set contains more than one pilot, the mobile station should provide
18 diversity combining of the associated Forward Traffic Channels. The mobile station shall
19 provide for differential propagation delays from zero to at least 150 μ s.

20 2.6.6.2.7.2 Reverse Traffic Channel Power Control During Soft Handoff

21 The *Extended Handoff Direction Message*, a *General Handoff Direction Message* or a
22 *Universal Handoff Direction Message* identifies sets of Forward Fundamental Channels or
23 Forward Dedicated Control Channels that carry identical closed loop power control
24 subchannels. A set consists of one or more Forward Fundamental Channels or Forward
25 Dedicated Control Channels with identical power control information.

26 The *Universal Handoff Direction Message* identifies sets of Forward Common Power Control
27 Channels that carry identical closed loop power control subchannels. A set consists of one
28 or more Forward Common Power Control Channels with identical power control
29 information.

30 Each Rescue Channel that has been autonomously promoted to the Active Set as part of
31 Call Rescue Soft Handoff (see 2.6.6.2.13) shall form its own set. The mobile station shall
32 not diversity combine the closed loop power control subchannel of any Rescue Channel
33 with any other Forward Fundamental Channel until directed otherwise by an *Extended*
34 *Handoff Direction Message*, *General Handoff Direction Message*, or *Universal Handoff*
35 *Direction Message*.

36 In each power control group containing valid power control bits (see [2]), the mobile station
37 should provide diversity combining of the identical closed loop power control subchannels
38 and shall obtain at most one power control bit from each set of identical closed loop power
39 control subchannels. The mobile station should only combine reliable power control bits
40 (see [11]) as follows:

- 1 • If the reliable power control bits obtained from all sets are equal to '0', the mobile
2 station shall increase its power as specified in [2].
- 3 • If the reliable power control bit obtained from any set is equal to '1', the mobile
4 station shall decrease its power as specified in [2].

5 2.6.6.2.7.3 Starting Periodic Search following Soft Handoff

6 If the PERIODIC_SEARCH_s is equal to '1', a periodic search is not already in progress, and
7 the Frequency Assignment after handoff is different from the Candidate Frequency
8 (CDMABAND_s is not equal to CF_CDMABAND_s or CDMACH_s is not equal to
9 CF_CDMACH_s), the mobile station shall perform the following:

- 10 • The mobile station shall set ALIGN_TIMING_USED_s to '0' and SEARCH_OFFSET_s to
11 '000000'.
- 12 • The mobile station shall start a periodic search as described in 2.6.6.2.8.3.2.

13 2.6.6.2.8 CDMA-to-CDMA Hard Handoff

14 The base station directs the mobile station to perform a CDMA-to-CDMA hard handoff by
15 sending an *Extended Handoff Direction Message*, a *General Handoff Direction Message* or a
16 *Universal Handoff Direction Message* in which the mobile station is transitioned between
17 disjoint sets of base stations, different Frequency Assignments, or different frame offsets.
18 When the base station uses a *Extended Handoff Direction Message*, a *General Handoff*
19 *Direction Message*, *MEID Universal Handoff Direction Message* or a *Universal Handoff*
20 *Direction Message* to direct the mobile to a channel with flexible channel spacing between
21 the forward and reverse channels, the base station extends these message using the
22 *General Extension Message* and include channel records that specify the forward and
23 reverse frequencies to be used by the mobile station for handoff. The mobile station shall
24 process this message as specified in section 2.6.18. If RETURN_IF_HANDOFF_FAIL_s is
25 equal to '0', the mobile station performs the actions described in 2.6.6.2.8.1. If
26 RETURN_IF_HANDOFF_FAIL_s is equal to '1', the mobile station performs the actions
27 described in 2.6.6.2.8.2.

28 2.6.6.2.8.1 Hard Handoff without Return on Failure

29 At the action time specified in the *Extended Handoff Direction Message*, the *General*
30 *Handoff Direction Message* or *Universal Handoff Direction Message* the mobile station shall
31 disable its transmitter, reset the fade timer specified in 2.6.4.1.8, suspend incrementing
32 TOT_FRAMES_s, BAD_FRAMES_s, DCCH_TOT_FRAMES_s, and DCCH_BAD_FRAMES_s if
33 applicable as specified in 2.6.4.1.1, and tune to the assigned Forward Traffic Channel. The
34 mobile station shall perform acquisition of the pilots in the new Active Set.

35 If a periodic Serving Frequency pilot report procedure is in progress, the mobile station
36 shall abort it (see 2.6.6.2.12).

37 The mobile station shall begin monitoring the assigned Forward Traffic Channel within the
38 time specified below:

- 1 • If the *Extended Handoff Direction Message*, *General Handoff Direction Message* or
2 *Universal Handoff Direction Message* specifies a CDMA Frequency Assignment
3 different from the Serving Frequency and an Active Set containing pilots with pilot
4 PN sequence offsets identical to those of the pilots in the Serving Frequency Active
5 Set, the mobile station shall begin monitoring the assigned Forward Traffic Channel
6 within T_{60m} seconds after the action time.
- 7 • If the *Extended Handoff Direction Message*, *General Handoff Direction Message* or
8 *Universal Handoff Direction Message* specifies a CDMA Frequency Assignment
9 different from the Serving Frequency and an Active Set containing a pilot with pilot
10 PN sequence offset not equal to that of any pilot in the Serving Frequency Active
11 Set, the mobile station shall begin monitoring the assigned Forward Traffic Channel
12 within T_{61m} seconds after the action time.
- 13 • If the *Extended Handoff Direction Message*, *General Handoff Direction Message* or
14 *Universal Handoff Direction Message* specifies a CDMA-to-CDMA hard handoff
15 without changing the CDMA Frequency Assignment, the mobile station shall begin
16 monitoring the assigned Forward Traffic Channel within T_{62m} seconds after the
17 action time.

18 If the Target Frequency is the same as the Candidate Frequency ($TF_CDMABAND_S$ is equal
19 to $CF_CDMABAND_S$, and TF_CDMACH_S is equal to CF_CDMACH_S) and is different from the
20 Serving Frequency ($TF_CDMABAND_S$ is not equal to $SF_CDMABAND_S$, or TF_CDMACH_S is
21 not equal to SF_CDMACH_S), the mobile station shall perform the following:

- 22 • If applicable, the mobile station shall replace its Neighbor Set with its Candidate
23 Frequency Neighbor Set, excluding the pilots in its Active Set. When the mobile
24 station adds a pilot from its Candidate Frequency Neighbor Set to its Active Set, it
25 shall maintain $SEARCH_PRIORITY_S$, $SRCH_WIN_NGHBR_S$, and
26 $SRCH_OFFSET_NGHBR_S$ associated with the pilot.
- 27 • The mobile station shall set $PILOT_INC_S$ to $CF_PILOT_INC_S$, $SRCH_WIN_N_S$ to
28 $CF_SRCH_WIN_N_S$, and $SRCH_WIN_R_S$ to $CF_SRCH_WIN_R_S$.
- 29 • The mobile station shall set $SEARCH_PRIORITY_INCL_S$ to
30 $CF_SEARCH_PRIORITY_INCL_S$, $SRCH_OFFSET_INCL_S$ to $CF_SRCH_OFFSET_INCL_S$,
31 and $SRCH_WIN_NGHBR_INCL_S$ to $CF_SRCH_WIN_NGHBR_INCL_S$.

32 If a F-CPCCH is not assigned, the mobile station shall perform the following:

- 33 • After the action time, upon receiving a period of $(N_{11m} \times 20)$ ms with sufficient
34 signal quality on the physical channel corresponding to $FPC_PRI_CHAN_S$ on the
35 assigned Forward Traffic Channel, the mobile station shall re-enable its transmitter.
36 The mobile station shall transmit the Traffic Channel Preamble, as described in [2],
37 followed by a Handoff Completion Message or Extended Handoff Completion
38 Message.
- 39 • After the action time, upon receiving a period of $(N_{3m} \times 20)$ ms with sufficient
40 signal quality on the physical channel corresponding to $FPC_PRI_CHAN_S$, the
41 mobile station shall resume incrementing TOT_FRAMES_S , BAD_FRAMES_S ,

1 DCCH_TOT_FRAMES_s, and DCCH_BAD_FRAMES_s if applicable as specified in
2 2.6.4.1.1.

3 If a F-CPCCH is assigned, the mobile station shall perform the following:

- 4 • After the action time, upon receiving a period of ($N_{19m} \times 1.25$) ms with sufficient
5 signal quality on the Forward Common Power Control Subchannels assigned to this
6 mobile station, the mobile station shall re-enable its transmitter. The mobile station
7 shall transmit the Traffic Channel Preamble, as described in [2], followed by an
8 *Extended Handoff Completion Message*. The mobile station shall also transmit the
9 Reverse Channel Quality Indicator Channel as described in [2] and [3].

10 If the PERIODIC_SEARCH_s is equal to '1', a periodic search is not already in progress, and
11 the Frequency Assignment after handoff is different from the Candidate Frequency
12 (CDMABAND_s is not equal to CF_CDMABAND_s or CDMACH_s is not equal to
13 CF_CDMACH_s), the mobile station shall perform the following:

- 14 • The mobile station shall set ALIGN_TIMING_USED_s to '0' and SEARCH_OFFSET_s to
15 '000000'.
- 16 • The mobile station shall start a periodic search as described in 2.6.6.2.8.3.2.

17 2.6.6.2.8.2 Hard Handoff with Return on Failure

18 At the action time specified in the *General Handoff Direction Message* or *Universal Handoff*
19 *Direction Message*, the mobile station shall perform the following:

- 20 • The mobile station shall stop processing the Forward Fundamental Channel, the
21 Forward Dedicated Control Channel, the Forward Supplemental Code Channels (if
22 any), and the Forward Supplemental Channels (if any).
- 23 • The mobile station shall stop transmitting on the Reverse Fundamental Channel, on
24 the Reverse Dedicated Control Channel, and on the Reverse Supplemental Code
25 Channels (if any), and on the Reverse Supplemental Channels (if any).
- 26 • The mobile station shall disable the fade timer (see 2.6.4.1.8) and the handoff drop
27 timers corresponding to the Serving Frequency Active Set and Candidate Set (see
28 2.6.6.2.3), and shall suspend incrementing TOT_FRAMES_s, BAD_FRAMES_s,
29 DCCH_TOT_FRAMES_s, and DCCH_BAD_FRAMES_s if applicable (see 2.6.4.1.1).
- 30 • The mobile station shall lock the accumulation of valid level changes in the closed
31 loop mean output power and shall ignore received power control bits related to the
32 period that the transmitter is disabled (see [2]).
- 33 • If the Serving Frequency is different from the Target Frequency (SF_CDMACH_s is
34 not equal to TF_CDMACH_s or SF_CDMABAND_s is not equal to TF_CDMABAND_s),
35 the mobile station shall set CDMACH_s to TF_CDMACH_s and CDMABAND_s to
36 TF_CDMABAND_s, and shall tune to the Target Frequency.

37 The mobile station shall not change its time reference (see [2]) until the handoff is
38 successfully completed (as described later in this section) or the mobile station resumes
39 using the Serving Frequency Active Set (as described in 2.6.6.2.8.2.1).

1 The mobile station shall maintain a *handoff* timer. The mobile station shall set the
 2 expiration time for the handoff timer to $(0.08 \times TF_WAIT_TIME_S)$ seconds and enable the
 3 timer at the action time of the *General Handoff Direction Message* or *Universal Handoff*
 4 *Direction Message*.

5 The mobile station shall perform the following actions:

- 6 • If the Target Frequency is different from the Serving Frequency ($TF_CDMABAND_S$ is
 7 not equal to $SF_CDMABAND_S$, or TF_CDMACH_S is not equal to SF_CDMACH_S), the
 8 mobile station shall measure the mean input power on the Target Frequency
 9 (*target_freq_pwr*, in dBm/1.23 MHz) and may use *target_freq_pwr* along with the
 10 measurement of the average input power on the Serving Frequency
 11 (*avg_serving_freq_pwr*, in dBm/1.23 MHz) in the handoff procedure. The mobile
 12 station may declare the handoff attempt to be unsuccessful if all of the following
 13 conditions are true:
 - 14 – $DIFF_RX_PWR_THRESH_S$ is not equal to '00000',
 - 15 – the mobile station has been measuring the received power on the Serving
 16 Frequency for at least the last N_{12m} frames, and
 - 17 – $(target_freq_pwr - avg_serving_freq_pwr)$ is less than $(-30 + 2 \times$
 18 $DIFF_RX_PWR_THRESH_S)$ dB.

19 If the mobile station declares the handoff attempt to be unsuccessful, it shall
 20 restore the configuration to what it was before the handoff attempt (see 2.6.6.2.5.1)
 21 and send a *Candidate Frequency Search Report Message* as described in
 22 2.6.6.2.8.2.1.

- 23 • The mobile station shall measure E_C/I_0 for each pilot in the Active Set using the
 24 procedures specified in 2.6.6.2.2, if any of the following conditions is true:
 - 25 – the Target Frequency is the same as the Serving Frequency ($TF_CDMABAND_S$ is
 26 equal to $SF_CDMABAND_S$, and TF_CDMACH_S is equal to SF_CDMACH_S),
 - 27 – the mobile station does not use the power measurements in the handoff
 28 procedure,
 - 29 – $DIFF_RX_PWR_THRESH_S$ is equal to '00000',
 - 30 – the mobile station has not been measuring the received power on the Serving
 31 Frequency for at least the last N_{12m} frames, or
 - 32 – $(target_freq_pwr - avg_serving_freq_pwr)$ is not less than $(-30 + 2 \times$
 33 $DIFF_RX_PWR_THRESH_S)$ dB.

34 If the mobile station measures E_C/I_0 for pilots in the Active Set, it shall compare the
 35 sum of the measured E_C/I_0 for all pilots with the minimum total pilot E_C/I_0
 36 threshold ($MIN_TOTAL_PILOT_EC_IO_S$).

- 37 – If $MIN_TOTAL_PILOT_EC_IO_S$ is not equal to '00000', and $(-20 \times \log_{10}$
 38 $(E_C/I_0)_{total})$ is greater than $MIN_TOTAL_PILOT_EC_IO_S$, where $(E_C/I_0)_{total}$ is the
 39 sum of the measured E_C/I_0 for the pilots in the Active Set, the mobile station

1 shall declare the handoff attempt to be unsuccessful, and shall perform the
2 following:

3 + If COMPLETE_SEARCH_s is equal to '1', and the Target Frequency is the
4 same as the Candidate Frequency (TF_CDMABAND_s is equal to
5 CF_CDMABAND_s, and TF_CDMACH_s is equal to CF_CDMACH_s) and is
6 different from the Serving Frequency (TF_CDMABAND_s is not equal to
7 SF_CDMABAND_s, or TF_CDMACH_s is not equal to SF_CDMACH_s), the
8 mobile station shall measure the strength of each pilot in its Candidate
9 Frequency Search Set using the procedures specified in 2.6.6.2.2; otherwise,
10 the mobile station shall end the search.

11 + The mobile station shall then restore its configuration to what it was before
12 the handoff attempt (see 2.6.6.2.5.1) and send a *Candidate Frequency Search*
13 *Report Message* as described in 2.6.6.2.8.2.1.

14 - If MIN_TOTAL_PILOT_EC_IO_s is equal to '00000', or $(-20 \times \log_{10} (E_c/I_o)_{total})$ is
15 not less than MIN_TOTAL_PILOT_EC_IO_s, where $(E_c/I_o)_{total}$ is the sum of the
16 measured E_c/I_o for the pilots in the Active Set, the mobile station shall attempt
17 to demodulate the Forward Traffic Channel(s). If the Active Set contains more
18 than one pilot, the mobile station shall perform the actions specified in
19 2.6.6.2.7. If the Target Frequency is the same as the Candidate Frequency
20 (TF_CDMABAND_s is equal to CF_CDMABAND_s, and TF_CDMACH_s is equal to
21 CF_CDMACH_s), and is different from the Serving Frequency (TF_CDMABAND_s is
22 not equal to SF_CDMABAND_s, or TF_CDMACH_s is not equal to SF_CDMACH_s),
23 the mobile station shall measure the strength of each pilot in its Candidate
24 Frequency Search Set using the procedures specified in 2.6.6.2.2, and the
25 mobile station shall wait for the first of the following events to occur:

26 + If the handoff timer expires, the mobile station shall declare the handoff
27 attempt to be unsuccessful, and perform the following:

28 o If COMPLETE_SEARCH_s is equal to '1', and if the Target Frequency is the
29 same as the Candidate Frequency (TF_CDMABAND_s is equal to
30 CF_CDMABAND_s, and TF_CDMACH_s is equal to CF_CDMACH_s) and is
31 different from the Serving Frequency (TF_CDMABAND_s is not equal to
32 SF_CDMABAND_s, or TF_CDMACH_s is not equal to SF_CDMACH_s), and
33 the mobile station has not completed the search of all pilots in its
34 Candidate Frequency Search Set, then it shall complete the search, i.e.,
35 it shall obtain at least one measurement of the strength of each pilot in
36 its Candidate Frequency Search Set, using the search procedures
37 specified in 2.6.6.2.8.3.

38 o Otherwise, the mobile station shall end the search.

39 The mobile station shall then restore its configuration to what it was before
40 the handoff attempt (see 2.6.6.2.5.1) and send a *Candidate Frequency Search*
41 *Report Message* as described in 2.6.6.2.8.2.1.

- 1 + If a F-CPCCH is not assigned, and the mobile station receives a period of
2 ($N_{11m} \times 20$) ms with sufficient signal quality on the physical channel
3 corresponding to FPC_PRI_CHAN_s, or if a F-CPCCH is assigned, and the
4 mobile station receives a period of ($N_{19m} \times 1.25$) ms with sufficient signal
5 quality on the Forward Common Power Control Subchannels assigned to
6 this mobile station, then, the mobile station shall declare the handoff
7 attempt to be successful, and perform the following:
- 8 o The mobile station shall disable the handoff timer.
 - 9 o If TF_RESET_L2_s is equal to '1', Layer 3 shall send a L2-
10 Supervision.Request primitive to Layer 2 to reset the acknowledgment
11 procedures as specified in [4].
 - 12 o If TF_RESET_FPC_s is equal to '1', the mobile station shall initialize the
13 Forward Traffic Channel power control counters as specified in
14 2.6.4.1.1.1.
 - 15 o If the Target Frequency is the same as the Candidate Frequency
16 (TF_CDMABAND_s is equal to CF_CDMABAND_s, and TF_CDMACH_s is
17 equal to CF_CDMACH_s) and is different from the Serving Frequency
18 (TF_CDMABAND_s is not equal to SF_CDMABAND_s, or TF_CDMACH_s is
19 not equal to SF_CDMACH_s), the mobile station shall perform the
20 following:
 - 21 ◇ If applicable, the mobile station shall replace its Neighbor Set with its
22 Candidate Frequency Neighbor Set, excluding the pilots in its Active
23 Set. When the mobile station adds a pilot from its Candidate
24 Frequency Neighbor Set to its Active Set, it shall maintain
25 SEARCH_PRIORITY_s, SRCH_WIN_NGHBR_s, and
26 SRCH_OFFSET_NGHBR_s associated with the pilot.
 - 27 ◇ The mobile station shall set PILOT_INC_s to CF_PILOT_INC_s,
28 SRCH_WIN_N_s to CF_SRCH_WIN_N_s, and SRCH_WIN_R_s to
29 CF_SRCH_WIN_R_s.
 - 30 ◇ The mobile station shall set SEARCH_PRIORITY_INCL_s to
31 CF_SEARCH_PRIORITY_INCL_s, SRCH_OFFSET_INCL_s to
32 CF_SRCH_OFFSET_INCL_s, and SRCH_WIN_NGHBR_INCL_s to
33 CF_SRCH_WIN_NGHBR_INCL_s.
 - 34 o The mobile station shall re-enable its transmitter and shall re-enable the
35 fade timer (see 2.6.4.1.8) and reset it for T_{5m} seconds. Then, the mobile
36 station shall transmit the Traffic Channel Preamble, as described in [2],
37 followed by a *Handoff Completion Message* if P_REV_IN_USE_s is less than
38 seven or an *Extended Handoff Completion Message* if P_REV_IN_USE_s is
39 equal to or greater than seven.

- 1 o If a F-CPCCH is not assigned, after starting the handoff timer, upon
2 receiving the first period of ($N_{3m} \times 20$) ms with sufficient signal quality
3 on the physical channel corresponding to FPC_PRI_CHAN_s, the mobile
4 station shall resume incrementing TOT_FRAMES_s, BAD_FRAMES_s,
5 DCCH_TOT_FRAMES_s, and DCCH_BAD_FRAMES_s if applicable as
6 specified in 2.6.4.1.1.
7 o If the Target Frequency is same as the Candidate Frequency
8 (TF_CDMABAND_s is equal to CF_CDMABAND_s and TF_CDMACH_s is
9 equal to CF_CDMACH_s), then the mobile station shall set
10 PERIODIC_SEARCH_s to '0'.
11 o If PERIODIC_SEARCH_s is equal to '1', the mobile station shall perform
12 the following:
13 ◇ The mobile station shall set ALIGN_TIMING_USED_s to '0' and
14 SEARCH_OFFSET_s to '000000'.
15 ◇ The mobile station shall start a periodic search as described in
16 2.6.6.2.8.3.2.
17 o The mobile station shall maintain its pilot sets using the procedures
18 described in 2.6.6.2.6.

19 2.6.6.2.8.2.1 Restoring the Configuration

20 If the mobile station declares a handoff attempt to be unsuccessful (see 2.6.6.2.8.2), it shall
21 perform the following actions:

- 22 • If the handoff timer is enabled, the mobile station shall disable it.
23 • The mobile station shall restore the following parameters:
24 – Message encryption mode: If SF_ENCRYPT_MODE_s is equal to '0', the mobile
25 station shall turn off message encryption; otherwise, it shall turn on message
26 encryption.
27 – Service configuration: The mobile station shall use the service configuration
28 stored in SF_SERVICE_CONFIG_s to process Forward and Reverse Traffic
29 Channel frames.
30 – The mobile station shall restore the list of calls stored in SF_CALLS_s.
31 – Protocol revision level ($P_REV_s = SF_P_REV_s$)
32 – Protocol revision level in use on the serving frequency ($P_REV_IN_USE_s =$
33 $SF_P_REV_IN_USE_s$)
34 – Service negotiation type ($SERV_NEG_s = SF_SERV_NEG_s$)
35 – Private long code mask: If SF_PRIVATE_LCM_s is set to '1' then the mobile
36 station shall set PVTLCM_42 to SF_PVTLCM_42_s.
37 – Long code mask: If SF_PRIVATE_LCM_s is equal to '1', the mobile station shall
38 use the private long code mask; otherwise, it shall use the public long code
39 mask derived from SF_PLCM_TYPE_s and SF_PLCM_39_s (if any).

- 1 – Search window size for the Active Set and Candidate Set
- 2 (SRCH_WIN_A_s = SF_SRCH_WIN_A_s)
- 3 – Search window size for the Neighbor Set
- 4 (SRCH_WIN_N_s = SF_SRCH_WIN_N_s)
- 5 – Search window size for the Remaining Set
- 6 (SRCH_WIN_R_s = SF_SRCH_WIN_R_s)
- 7 – Pilot detection threshold (T_ADD_s = SF_T_ADD_s)
- 8 – Pilot drop threshold (T_DROP_s = SF_T_DROP_s)
- 9 – Soft slope for the dynamic add and drop threshold (SOFT_SLOPE_s =
- 10 SF_SOFT_SLOPE_s)
- 11 – Intercept for the dynamic add threshold (ADD_INTERCEPT_s =
- 12 SF_ADD_INTERCEPT_s)
- 13 – Intercept for the dynamic drop threshold (DROP_INTERCEPT_s =
- 14 SF_DROP_INTERCEPT_s)
- 15 – Active Set versus Candidate Set comparison threshold (T_COMP_s =
- 16 SF_T_COMP_s)
- 17 – Drop timer value (T_TDROPS_s = SF_T_TDROPS_s)
- 18 – Drop timer range value (T_TDROPS_RANGE_s = SF_T_TDROPS_RANGE_s)
- 19 – Frame offset (FRAME_OFFSET_s = SF_FRAME_OFFSET_s)
- 20 – Nominal power setting (NOM_PWR_s = SF_NOM_PWR_s)
- 21 – Extended nominal power setting (NOM_PWR_EXT_s = SF_NOM_PWR_EXT_s)
- 22 – Power control step (PWR_CNTL_STEP_s = SF_PWR_CNTL_STEP_s)
- 23 – CDMA band class (CDMABAND_s = SF_CDMABAND_s)
- 24 – Frequency assignment (CDMACH_s = SF_CDMACH_s)
- 25 – Active Set (For each pilot in the Serving Frequency Active Set: (PILOT_REC,
- 26 PWR_COMB_IND))
- 27 – Code channel list (CODE_CHAN_LIST_s = SF_CODE_CHAN_LIST_s)
- 28 • The mobile station shall tune to the Serving Frequency and resume using the
- 29 Serving Frequency Active Set as follows:
- 30 – If the mobile station was processing the Forward Fundamental Channel prior to
- 31 tuning to the Candidate Frequency, the mobile station shall resume processing
- 32 the Forward Fundamental Channel. If the mobile station was transmitting on
- 33 the Reverse Fundamental Channel prior to tuning to the Candidate Frequency,
- 34 the mobile station shall resume transmitting on the Reverse Fundamental
- 35 Channel.

- 1 – If the mobile station was processing the Forward Dedicated Control Channel
2 prior to tuning to the Candidate Frequency, the mobile station shall resume
3 processing the Forward Dedicated Control Channel. If the mobile station was
4 transmitting on the Reverse Dedicated Control Channel prior to tuning to the
5 Candidate Frequency, the mobile station shall resume transmitting on the
6 Reverse Dedicated Control Channel.
- 7 – The mobile station shall not resume transmitting on the Reverse Supplemental
8 Code Channels and Reverse Supplemental Channels (if any). The mobile station
9 shall not process on the Forward Supplemental Code Channels and Forward
10 Supplemental Channels (if any).
- 11 – When the mobile station resumes transmission on the Reverse Traffic Channel,
12 it shall use the following rules to re-enable its transmitter:
- 13 + If the interval between the time that the mobile station disables its
14 transmitter and the time that it resumes using the Serving Frequency Active
15 Set is equal to or greater than $(N_{2m} \times 20)$ ms, then:
- 16 o If a F-CPCCH is not assigned, the mobile station shall wait to receive a
17 period of $(N_{3m} \times 20)$ ms with sufficient signal quality on the physical
18 channel corresponding to $FPC_PRI_CHAN_S$ before it re-enables its
19 transmitter.
- 20 o If a F-CPCCH is assigned, the mobile station shall wait to receive a
21 period of $(N_{17m} \times 1.25)$ ms with sufficient signal quality on the Forward
22 Common Power Control Subchannels assigned to this mobile station
23 before it re-enables its transmitter.
- 24 + Otherwise, after the mobile station tunes to the Serving Frequency, the
25 mobile station shall re-enable its transmitter no later than $N_{3m} \times 20$ ms if a
26 F-CPCCH is not assigned, and no later than $(N_{17m} \times 1.25)$ ms if a F-CPCCH
27 is assigned. The mobile station should re-enable its transmitter earlier.
28 After the mobile station re-enables its transmitter, the mean output power
29 shall be as specified in [2] for a step change in input power. If the mobile
30 station re-enables its transmitter earlier than $(N_{3m} \times 20)$ ms if a F-CPCCH is
31 not assigned, or earlier than $(N_{17m} \times 1.25)$ ms if a F-CPCCH is assigned,
32 after it tunes to the Serving Frequency, the initial mean output power shall
33 be as specified in [2], where the initial mean input power estimate is either:
- 34 o within 6 dB of the actual mean input power, or
- 35 o equal to the mean input power before the mobile station tuned to the
36 Target Frequency.
- 37 • The mobile station shall enable the fade timer and the handoff drop timers
38 corresponding to the pilots in its Active Set and Candidate Set. The mobile station
39 shall resume incrementing TOT_FRAMES_S , BAD_FRAMES_S , $DCCH_TOT_FRAMES_S$,
40 and $DCCH_BAD_FRAMES_S$ if applicable as specified in 2.6.4.1.1.
- 41 • The mobile station shall send a *Candidate Frequency Search Report Message* within
42 T_{56m} seconds of declaring the handoff attempt to be unsuccessful. The mobile

1 station shall report the contents of the *Candidate Frequency Search Report Message*
2 as follows:

- 3 – The mobile station shall report the two components of the Target Frequency
4 in the CDMA_FREQ and BAND_CLASS fields.
- 5 – The mobile station shall report the received power on the Target Frequency and
6 on the Serving Frequency in the CF_TOTAL_RX_PWR and SF_TOTAL_RX_PWR
7 fields, respectively.
- 8 – For each pilot in the Target Frequency Active Set that measures above
9 TF_T_ADD_s, the mobile station shall report its phase and strength in the fields
10 PILOT_PN_PHASE and PILOT_STRENGTH, respectively.
- 11 – If the Target Frequency is the same as the Candidate Frequency
12 (TF_CDMABAND_s is equal to CF_CDMABAND_s, and TF_CDMACH_s is equal to
13 CF_CDMACH_s), and is different from the Serving Frequency (TF_CDMABAND_s is
14 not equal to SF_CDMABAND_s or TF_CDMACH_s is not equal to SF_CDMACH_s),
15 the mobile station shall also report the strength of each pilot in the Candidate
16 Frequency Search Set that measures above CF_T_ADD_s.
- 17 • If the Serving Frequency is the same as the Candidate Frequency (SF_CDMABAND_s
18 is equal to CF_CDMABAND_s and SF_CDMACH_s is equal to CF_CDMACH_s), then the
19 mobile station shall set PERIODIC_SEARCH_s to '0'.
- 20 • If PERIODIC_SEARCH_s is equal to '1' and the Candidate Frequency Search Set is
21 not empty, the mobile station shall perform the following:
 - 22 – The mobile station shall set ALIGN_TIMING_USED_s to '0' and
23 SEARCH_OFFSET_s to '000000'.
 - 24 – The mobile station shall carry out the periodic search procedures described in
25 2.6.6.2.8.3.2.

26 2.6.6.2.8.3 Search of Pilots on the CDMA Candidate Frequency

27 If SEARCH_MODE_s is equal to '0000', the mobile station shall perform the following: If
28 PERIODIC_SEARCH_s is equal to '0', the mobile station shall search the Candidate
29 Frequency Search Set once, as described in 2.6.6.2.8.3.1; otherwise, the mobile station
30 shall search the Candidate Frequency Search Set periodically, as described in
31 2.6.6.2.8.3.2.

32 2.6.6.2.8.3.1 CDMA Candidate Frequency Single Search

33 The mobile station does a single search of the Candidate Frequency Search Set by
34 performing the following actions at the action time of the *Candidate Frequency Search*
35 *Control Message* or the *Candidate Frequency Search Request Message* that started the
36 search:

- 37 • If ALIGN_TIMING_USED_s is set to '0', the mobile station shall measure the strength
38 of all pilots in the Candidate Frequency Search Set in one or more visits to the
39 Candidate Frequency, as described in 2.6.6.2.8.3.3.

- If $ALIGN_TIMING_USED_s$ is set to '1', the mobile station shall measure the strength of all pilots in the Candidate Frequency Search Set in one or more scheduled visits (see below) to the Candidate Frequency, as described in 2.6.6.2.8.3.3.

The mobile station shall schedule visits to the Candidate Frequency only at $((0.00125 \times SEARCH_OFFSET_s) + k \times (SEARCH_TIME_RESOLUTION_s \times inter_visit_time))$ seconds after the action time of the *Candidate Frequency Search Request Message* or the *Candidate Frequency Search Control Message* that started the search, where

k = an integer between 0 and max_num_visits , inclusive, where max_num_visits is the value of MAX_NUM_VISITS field of the last *Candidate Frequency Search Response Message* sent by the mobile station,

and

$inter_visit_time$ = the value of the INTER_VISIT_TIME field of the last *Candidate Frequency Search Response Message* sent by the mobile station.

- The mobile station shall complete the measurements and send a *Candidate Frequency Search Report Message* within $((0.00125 \times SEARCH_OFFSET_s) + freshness_interval)$ seconds after the action time of the *Candidate Frequency Search Control Message*, or the *Candidate Frequency Search Request Message*, where $freshness_interval$ is determined as follows:
 - If the value of the TOTAL_OFF_TIME_FWD field or of the TOTAL_OFF_TIME_REV field of the last *Candidate Frequency Search Response Message* sent by the mobile station to the base station is greater than or equal to $\lceil (T_{70m} - T_{71m}) / SEARCH_TIME_RESOLUTION_s \rceil$, then

$freshness_interval = (\max(fwd_time, rev_time) + T_{71m})$ seconds,

where

$fwd_time = SEARCH_TIME_RESOLUTION_s \times (\text{value of the TOTAL_OFF_TIME_FWD field of the last } \textit{Candidate Frequency Search Response Message} \text{ sent by the mobile station}),$

and

$rev_time = SEARCH_TIME_RESOLUTION_s \times (\text{value of the TOTAL_OFF_TIME_REV field of the last } \textit{Candidate Frequency Search Response Message} \text{ sent by the mobile station}).$

- Otherwise,

$freshness_interval = T_{70m}$ seconds.

The mobile station shall set the fields of the *Candidate Frequency Search Report Message* as follows:

- The mobile station shall report the two components of the Candidate Frequency in the CDMA_FREQ and BAND_CLASS fields.

- 1 – The mobile station shall report the received power on the Candidate Frequency
2 and on the Serving Frequency in the CF_TOTAL_RX_PWR and
3 SF_TOTAL_RX_PWR fields, respectively.
- 4 – For each pilot in the Candidate Frequency Search Set that measures above
5 CF_T_ADD_s, the mobile station shall report its phase and strength in the fields
6 PILOT_PN_PHASE and PILOT_STRENGTH, respectively.

7 2.6.6.2.8.3.2 Candidate Frequency Periodic Search

8 When the mobile station performs a periodic search, it periodically searches the Candidate
9 Frequency Search Set and reports the results to the base station in the *Candidate*
10 *Frequency Search Report Message*, as described in this section. The mobile station may
11 measure all pilots in the Candidate Frequency Search Set in one visit to the Candidate
12 Frequency, or it may visit the Candidate Frequency several times in a search period, each
13 time measuring all or some of the pilots in the Candidate Frequency Search Set, as
14 described in 2.6.6.2.8.3.3.

15 If SF_TOTAL_EC_THRESH_s is not equal to '11111', while tuned to the Serving Frequency
16 (specified by CDMACH_s and CDMABAND_s), the mobile station shall measure the total
17 received power spectral density, in mW/1.23 MHz, on the Serving Frequency at least once
18 every 20 ms frame. The mobile station shall maintain the average of the spectral density
19 (*spec_density*) over the last N_{12m} frames.

20 (In the following, (E_c/I_o)_{total} is the total E_c/I_o of the pilots in the Active Set, measured as
21 specified in 2.6.6.2.2, and *total_ec* is defined as (10 × log₁₀ ((E_c/I_o)_{total} × *spec_density*)).

22 The mobile station shall maintain a periodic search timer as follows:

- 23 • When the mobile station starts a periodic search, it shall set the periodic search
24 timer to the value in Table 2.6.6.2.8.3.2-1 corresponding to SEARCH_PERIOD_s and
25 shall enable the timer.
 - 26 – If the periodic search is started by a *Candidate Frequency Search Request*
27 *Message* or a *Candidate Frequency Search Control Message*, then the mobile
28 station shall start the periodic search (0.00125 × SEARCH_OFFSET_s) seconds
29 after the action time of the *Candidate Frequency Search Request Message* or the
30 *Candidate Frequency Search Control Message* that started the search.
 - 31 – If the periodic search is started following successful or unsuccessful handoff
32 attempt, the mobile station shall start the periodic search:
 - 33 + Upon sending the *Handoff Completion Message* or *Extended Handoff*
34 *Completion Message*, in the case that the handoff was successful.
 - 35 + Upon sending the *Candidate Frequency Search Report Message*, in the case
36 that the handoff was unsuccessful.
- 37 • When the periodic search timer expires, the mobile station shall reset the periodic
38 search timer to the value in Table 2.6.6.2.8.3.2-1 corresponding to
39 SEARCH_PERIOD_s and shall re-enable the timer.

- 1 • If ALIGN_TIMING_USED_s is set to '0', SF_TOTAL_EC_THRESH_s is not equal to
2 '11111' and SF_TOTAL_EC_IO_THRESH_s is equal to '11111', the mobile station
3 shall perform the following actions once per frame:
- 4 – Disable the periodic search timer if *total_ec* is not less than
5 (-120 + 2 × SF_TOTAL_EC_THRESH_s).
- 6 – Reset the expiration time of the periodic search timer to the value in
7 Table 2.6.6.2.8.3.2-1 corresponding to SEARCH_PERIOD_s, and re-enable the
8 timer if the following conditions are true:
9 + the periodic search timer is disabled, and
10 + *total_ec* is less than (-120 + 2 × SF_TOTAL_EC_THRESH_s).
- 11 • If ALIGN_TIMING_USED_s is set to '0', SF_TOTAL_EC_THRESH_s is equal to '11111'
12 and SF_TOTAL_EC_IO_THRESH_s is not equal to '11111', the mobile station shall
13 perform the following actions once per frame:
- 14 – Disable the periodic search timer if (-20 × log₁₀ (E_c/I_o)_{total}) is not greater than
15 SF_TOTAL_EC_IO_THRESH_s.
- 16 – Reset the expiration time of the periodic search timer to the value in
17 Table 2.6.6.2.8.3.2-1 corresponding to SEARCH_PERIOD_s, and re-enable the
18 timer if the following conditions are true:
19 + the periodic search timer is disabled, and
20 + (-20 × log₁₀ (E_c/I_o)_{total}) is greater than SF_TOTAL_EC_IO_THRESH_s.
- 21 • If ALIGN_TIMING_USED_s is set to '0', SF_TOTAL_EC_THRESH_s is not equal to
22 '11111' and SF_TOTAL_EC_IO_THRESH_s is not equal to '11111', the mobile station
23 shall perform the following actions once per frame:
- 24 – Disable the periodic search timer if the following conditions are true:
25 + *total_ec* is not less than (-120 + 2 × SF_TOTAL_EC_THRESH_s), and
26 + (-20 × log₁₀ (E_c/I_o)_{total}) is not greater than SF_TOTAL_EC_IO_THRESH_s.
- 27 – Reset the expiration time of the periodic search timer to the value in
28 Table 2.6.6.2.8.3.2-1 corresponding to SEARCH_PERIOD_s, and re-enable the
29 timer if the following conditions are true:
30 + the periodic search timer is disabled, and
31 + *total_ec* is less than (-120 + 2 × SF_TOTAL_EC_THRESH_s), or (-20 × log₁₀
32 (E_c/I_o)_{total}) is greater than SF_TOTAL_EC_IO_THRESH_s.
- 33 • The mobile station shall maintain the periodic search timer independent of the total
34 E_c and the total E_c/I_o of the pilots in the Serving Frequency Active Set, if any of the
35 following conditions is true:
- 36 – ALIGN_TIMING_USED_s is set to '1', or

- 1 – SF_TOTAL_EC_THRESH_s is equal to ‘11111’ and SF_TOTAL_EC_IO_THRESH_s is
2 equal to ‘11111’.

3
4 **Table 2.6.6.2.8.3.2-1. Search Period Values**

SEARCH_PERIOD _s	Search Period (seconds)	SEARCH_PERIOD _s	Search Period (seconds)
0	0.48	8	30
1	0.96	9	40
2	2	10	50
3	2.96	11	60
4	4	12	80
5	4.96	13	100
6	10	14	150
7	20	15	200

5
6 If the periodic search timer is enabled, the mobile station shall perform the following
7 actions before the timer expires:

- 8 • If ALIGN_TIMING_USED_s is set to ‘0’, the mobile station shall measure the strength
9 of all pilots in the Candidate Frequency Search Set at least once in one or more
10 visits to the Candidate Frequency, as described in 2.6.6.2.8.3.3.
11 • If ALIGN_TIMING_USED_s is set to ‘1’, the mobile station shall measure the strength
12 of all pilots in the Candidate Frequency Search Set in one or more scheduled visits
13 (see below) to the Candidate Frequency, as described in 2.6.6.2.8.3.3.

14 The mobile station shall schedule visits to the Candidate Frequency only at $((0.00125 \times$
15 $SEARCH_OFFSET_s) + k \times (SEARCH_TIME_RESOLUTION_s \times inter_visit_time))$ seconds after
16 the action time of the *Candidate Frequency Search Request Message* or the *Candidate*
17 *Frequency Search Control Message* that started the search, where

18 $k =$ an integer between 0 and *max_num_visits*, inclusive, where
19 *max_num_visits* is the value of MAX_NUM_VISITS field of the
20 last *Candidate Frequency Search Response Message* sent by the
21 mobile station,

22 and

23 *inter_visit_time* = the value of the INTER_VISIT_TIME field of the last *Candidate*
24 *Frequency Search Response Message* sent by the mobile station.

- 25 – The mobile station shall abort a scheduled visit to the Candidate Frequency
26 if at the scheduled time, one or both of the following conditions hold:

- 1 + SF_TOTAL_EC_THRESH_s is not equal to '11111' and *total_ec* is not less than
2 (-120 + 2 × SF_TOTAL_EC_THRESH_s), or
- 3 + SF_TOTAL_EC_IO_THRESH_s is not equal to '11111' and (-20 × log₁₀
4 (*E_c/I_o*)_{total}) is not greater than SF_TOTAL_EC_IO_THRESH_s.
- 5 – If the mobile station aborts a scheduled visit during a search period, it may
6 abort all remaining scheduled visits in that search period.
- 7 • The mobile station shall send a *Candidate Frequency Search Report Message* if
8 MIN_TOTAL_PILOT_EC_IO_s is equal to '00000' or if (- 20 × log₁₀ (*E_c/I_o*)_{total}) is less
9 than or equal to MIN_TOTAL_PILOT_EC_IO_s, where (*E_c/I_o*)_{total} is the sum of *E_c/I_o*
10 for all those pilots that measure above CF_T_ADD_s in the current search period.

11 The mobile station shall report the contents of the *Candidate Frequency Search*
12 *Report Message* as follows:

- 13 – The mobile station shall report the two components of the Candidate Frequency
14 in the CDMA_FREQ and BAND_CLASS fields.
- 15 – The mobile station shall report the received power on the Candidate Frequency
16 and on the Serving Frequency in the CF_TOTAL_RX_PWR and
17 SF_TOTAL_RX_PWR fields, respectively.
- 18 – For each pilot in the Candidate Frequency Search Set that measures above
19 CF_T_ADD_s, the mobile station shall report its phase and strength in the fields
20 PILOT_PN_PHASE and PILOT_STRENGTH, respectively.
- 21 • The mobile station shall ensure that the strength measurement for all pilots in the
22 Candidate Frequency Search Set were obtained within *freshness_interval* before the
23 *Candidate Frequency Search Report Message* is sent, where *freshness_interval* is
24 determined as follows:
- 25 – If the value of the TOTAL_OFF_TIME_FWD field or of the TOTAL_OFF_TIME_REV
26 field of the last *Candidate Frequency Search Response Message* sent by the
27 mobile station to the base station is greater than or equal to
28 $\lceil (T_{70m} - T_{71m}) / \text{SEARCH_TIME_RESOLUTION}_s \rceil$, then
- 29
$$\text{freshness_interval} = (\max(\text{fwd_time}, \text{rev_time}) + T_{71m}) \text{ seconds,}$$
- 30 where
- 31
$$\text{fwd_time} = \text{SEARCH_TIME_RESOLUTION}_s \times (\text{value of the}$$

32 TOTAL_OFF_TIME_FWD field of the last *Candidate Frequency*
33 *Search Response Message* sent by the mobile station),
- 34 and
- 35
$$\text{rev_time} = \text{SEARCH_TIME_RESOLUTION}_s \times (\text{value of the}$$

36 TOTAL_OFF_TIME_REV field of the last *Candidate Frequency*
37 *Search Response Message* sent by the mobile station).
- 38 – Otherwise,
- 39
$$\text{freshness_interval} = T_{70m} \text{ seconds.}$$

2.6.6.2.8.3.3 Candidate Frequency Pilot Measurements

The mobile station measures the strength of all pilots in the Candidate Frequency Search Set in one or more visits to the Candidate Frequency. The mobile station shall perform the following actions each time it visits the Candidate Frequency to measure pilot strengths:

- If the mobile station is processing the Forward Fundamental Channel, the mobile station shall stop processing the Forward Fundamental Channel. If the mobile station is transmitting on the Reverse Fundamental Channel, the mobile station shall stop transmitting on the Reverse Fundamental Channel.
- If the mobile station is processing the Forward Dedicated Control Channel, the mobile station shall stop processing the Forward Dedicated Control Channel. If the mobile station is transmitting on the Reverse Dedicated Control Channel, the mobile station shall stop transmitting on the Reverse Dedicated Control Channel.
- The mobile station shall stop processing the Forward Supplemental Code Channels and Forward Supplemental Channels (if any). The mobile station shall stop transmitting on the Reverse Supplemental Code Channels and Reverse Supplemental Channels (if any).
- The mobile station shall disable the fade timer (see 2.6.4.1.8) and the handoff drop timers corresponding to its current Active Set and Candidate Set (see 2.6.6.2.3), and shall suspend incrementing TOT_FRAMES_S , BAD_FRAMES_S , $DCCH_TOT_FRAMES_S$, $DCCH_BAD_FRAMES_S$, $SCH_TOT_FRAMES_S$, and $SCH_BAD_FRAMES_S$ if applicable (see 2.6.4.1.1).
- The mobile station shall lock the accumulation of valid level changes in the closed loop mean output power and shall ignore received power control bits related to the period that the transmitter is disabled (see [2]).
- The mobile station shall store the following parameters from its current configuration:
 - CDMA band class ($SF_CDMABAND_S = CDMABAND_S$)
 - Frequency Assignment ($SF_CDMACH_S = CDMACH_S$)
 - Pilot detection threshold ($SF_T_ADD_S = T_ADD_S$)
- The mobile station shall set the following parameters:
 - $CDMABAND_S = CF_CDMABAND_S$
 - $CDMACH_S = CF_CDMACH_S$
 - $T_ADD_S = CF_T_ADD_S$

The mobile station shall tune to the Candidate Frequency.

- The mobile station shall not change its time reference (see [2]) until it resumes using the Serving Frequency Active Set, as described below.
- The mobile station shall measure the mean input power on the Candidate Frequency ($cand_freq_pwr$, in dBm / 1.23 MHz), and may use $cand_freq_pwr$ along

1 with the measurement of the mean input power on the Serving Frequency
 2 (*avg_serving_freq_pwr*, in dBm / 1.23 MHz) in the search procedure as follows:

- 3 – If $\text{DIFF_RX_PWR_THRESH}_s$ is not equal to '00000', and (*cand_freq_pwr* -
 4 *avg_serving_freq_pwr*) is less than $(-30 + 2 \times \text{DIFF_RX_PWR_THRESH}_s)$ dB, the
 5 mobile station may terminate the search for pilots in the current visit to the
 6 Candidate Frequency.
- 7 – If $\text{DIFF_RX_PWR_THRESH}_s$ is equal to '00000', the mobile station does not use
 8 the power measurements in the search procedure, or (*cand_freq_pwr* -
 9 *avg_serving_freq_pwr*) is not less than $(-30 + 2 \times \text{DIFF_RX_PWR_THRESH}_s)$ dB,
 10 the mobile station shall measure E_c/I_o for all or some of the pilots in its
 11 Candidate Frequency Search Set, using the search procedures specified in
 12 2.6.6.2.2.

- 13 • The mobile station shall restore the following parameters:

- 14 – Pilot detection threshold ($T_ADD_s = SF_T_ADD_s$)
- 15 – CDMA band class ($CDMABAND_s = SF_CDMABAND_s$)
- 16 – Frequency assignment ($CDMACH_s = SF_CDMACH_s$)

- 17 • The mobile station shall tune to the Serving Frequency and shall resume using the
 18 Serving Frequency Active Set as follows:

- 19 – If the mobile station was processing the Forward Fundamental Channel prior to
 20 tuning to the Candidate Frequency, the mobile station shall resume processing
 21 the Forward Fundamental Channel. If the mobile station was transmitting on
 22 the Reverse Fundamental Channel prior to tuning to the Candidate Frequency,
 23 the mobile station shall resume transmitting on the Reverse Fundamental
 24 Channel.
- 25 – If the mobile station was processing the Forward Dedicated Control Channel
 26 prior to tuning to the Candidate Frequency, the mobile station shall resume
 27 processing the Forward Dedicated Control Channel. If the mobile station was
 28 transmitting on the Reverse Dedicated Control Channel prior to tuning to the
 29 Candidate Frequency, the mobile station shall resume transmitting on the
 30 Reverse Dedicated Control Channel.
- 31 – If the Forward Supplemental Code Channels and Forward Supplemental
 32 Channels assignment has not expired, the mobile station shall resume
 33 processing the Forward Supplemental Code Channels and Forward
 34 Supplemental Channels (if any). If the Reverse Supplemental Code Channel and
 35 Reverse Supplemental Channels assignment has not expired, the mobile station
 36 may resume transmitting on the Reverse Supplemental Code Channels and
 37 Reverse Supplemental Channels (if any).
- 38 – When the mobile station resumes transmission on the Reverse Traffic Channel,
 39 it shall use the following rules to re-enable its transmitter:

- 1 + If the interval between the time that the mobile station disables its
2 transmitter and the time that it resumes using the Serving Frequency Active
3 Set is equal to or greater than $(N_{2m} \times 20)$ ms, then the mobile station shall
4 wait to receive a period of $(N_{3m} \times 20)$ ms with sufficient signal quality on the
5 physical channel corresponding to $FPC_PRI_CHAN_S$ before it re-enables its
6 transmitter.
- 7 + Otherwise, the mobile station shall re-enable its transmitter no later than
8 $N_{3m} \times 20$ ms after the mobile station tunes to the Serving Frequency. The
9 mobile station should re-enable its transmitter earlier. After the mobile
10 station re-enables its transmitter, the mean output power shall be as
11 specified in [2] for a step change in input power. If the mobile station re-
12 enables its transmitter earlier than $N_{3m} \times 20$ ms after it tunes to the Serving
13 Frequency, the initial mean output power shall be as specified in [2], where
14 the initial mean input power estimate is either:
- 15 o within 6 dB of the actual mean input power, or
 - 16 o equal to the mean input power before the mobile station tuned to the
17 Target Frequency.
- 18 • The mobile station shall enable the fade timer and the handoff drop timers
19 corresponding to the pilots in its Active Set and Candidate Set. The mobile station
20 shall resume incrementing TOT_FRAMES_S , BAD_FRAMES_S , $DCCH_TOT_FRAMES_S$,
21 $DCCH_BAD_FRAMES_S$, $SCH_TOT_FRAMES_S$, and $SCH_BAD_FRAMES_S$ if applicable
22 as specified in 2.6.4.1.8.

23 2.6.6.2.8.3.4 Aborting CDMA Candidate Frequency Periodic Search

24 When the mobile station aborts a periodic search, it shall perform the following:

- 25 • The mobile station shall cancel any remaining visits to the Candidate Frequency in
26 the current search period, and shall not send a *Candidate Frequency Search Report*
27 *Message* for the current search period.
- 28 • The mobile station shall disable the periodic search timer.

29 2.6.6.2.9 Reserved

30 2.6.6.2.10 Reserved

31 2.6.6.2.11 Processing of Reverse Supplemental Code Channels and Reverse Supplemental 32 Channels

33 Reverse Supplemental Code Channels are not supported for $P_REV_IN_USE_S$ greater than
34 or equal to nine.

35 If $USE_T_ADD_ABORT_S$ is set to '1', and the strength of a Neighbor Set or Remaining Set
36 pilot is found to be above T_ADD_S , then the mobile station shall terminate any active
37 transmission on Reverse Supplemental Code Channels or Reverse Supplemental Channels
38 at the end of the current 20 ms frame. The mobile station shall perform the following:

- 39 • Any previously active Reverse Supplemental Code Channel or Reverse Supplemental
40 Channel assignment shall be considered implicitly terminated.

- 1 • If active transmission on Reverse Supplemental Code Channels is terminated, the
2 mobile station shall set NUM_REV_CODES_s to '000' and shall set IGNORE_SCAM_s
3 to '1'.
- 4 • If active transmission on Reverse Supplemental Channels is terminated, the mobile
5 station shall set IGNORE_ESCAM_s to '1'.
- 6 • The mobile station shall set SCRM_SEQ_NUM_s to (SCRM_SEQ_NUM_s + 1) mod 16.
- 7 • The mobile station shall transmit a *Supplemental Channel Request Message* with
8 USE_SCRM_SEQ_NUM set to '1', SCRM_SEQ_NUM set to SCRM_SEQ_NUM_s, and
9 SIZE_OF_REQ_BLOB set to '0000'.

10 2.6.6.2.12 Periodic Serving Frequency Pilot Report Procedure

11 While the mobile station is tuned to the Serving Frequency (specified by CDMACH_s and
12 CDMABAND_s), the mobile station shall measure the total received power spectral density,
13 in mW/1.23 MHz, on the Serving Frequency at least once every 20 ms frame. The mobile
14 station shall maintain the average value of the total received power spectral density,
15 *spec_density*, over the last N_{12m} frames. The mobile station shall maintain the PPSMM
16 timer as follows:

- 17 • When the mobile station starts a Periodic Serving Frequency Pilot Report Procedure,
18 it shall set the PPSMM timer to PPSMM_PERIOD_s × 0.08 seconds and shall enable
19 the timer.
- 20 • When the PPSMM timer expires, the mobile station shall send a *Periodic Pilot*
21 *Strength Measurement Message* (2.6.6.2.5.2) to the base station, reset the PPSMM
22 timer to PPSMM_PERIOD_s × 0.08 seconds and shall re-enable the timer.
- 23 • When the mobile station receives an *Extended Handoff Direction Message*, a *General*
24 *Handoff Direction Message* or a *Universal Handoff Direction Message* directing the
25 mobile station to perform a hard handoff (see 2.6.6.2.5.1), it shall abort the Periodic
26 Serving Frequency Pilot Report Procedure and disable the PPSMM timer if it is
27 enabled.
- 28 • If MIN_PILOT_PWR_THRESH_s is not equal to '11111' and
29 MIN_PILOT_EC_IO_THRESH_s is equal to '11111', the mobile station shall perform
30 the following actions once per frame:
 - 31 – Disable the PPSMM timer if the received total energy per PN chip, E_c, of the
32 pilots in the Active Set is not less than (-120 + 2 × MIN_PILOT_PWR_THRESH_s),
33 where the value of E_c is computed as 10 × log₁₀ (PS × *spec_density*) and PS is
34 the total E_c/I₀ of the pilots in the Active Set measured as specified in 2.6.6.2.2.
 - 35 – Reset the expiration time of the PPSMM timer to PPSMM_PERIOD_s × 0.08
36 seconds and re-enable the timer if the following conditions are true:
 - 37 o the PPSMM timer is disabled, and
 - 38 o the received total energy per PN chip, E_c, of the pilots in the Active Set is
39 less than (-120 + 2 × MIN_PILOT_PWR_THRESH_s).

- 1 • If $\text{MIN_PILOT_PWR_THRESH}_S$ is equal to '11111' and $\text{MIN_PILOT_EC_IO_THRESH}_S$
 2 is not equal to '11111', the mobile station shall perform the following actions once
 3 per frame:
- 4 – Disable the PPSMM timer if the total pilot strength of the pilots in the Active Set,
 5 PS, satisfies the condition that $(-20 \times \log_{10}(\text{PS}))$ is not greater than
 6 $\text{MIN_PILOT_EC_IO_THRESH}_S$.
- 7 – Reset the expiration time of the PPSMM timer to $\text{PPSMM_PERIOD}_S \times 0.08$
 8 seconds and re-enable the timer if the following conditions are true:
- 9 o the PPSMM timer is disabled, and
- 10 o the total pilot strength of the pilots in the Active Set, PS, satisfies the
 11 condition that $(-20 \times \log_{10}(\text{PS}))$ is greater than $\text{MIN_PILOT_EC_IO_THRESH}_S$.
- 12 • If $\text{MIN_PILOT_PWR_THRESH}_S$ is not equal to '11111' and
 13 $\text{MIN_PILOT_EC_IO_THRESH}_S$ is not equal to '11111', the mobile station shall
 14 perform the following actions once per frame:
- 15 – Disable the PPSMM timer if the following conditions are true:
- 16 o the received total energy per PN chip, E_C , of the pilots in the Active Set is not
 17 less than $(-120 + 2 \times \text{MIN_PILOT_PWR_THRESH}_S)$, and
- 18 o the total pilot strength of the pilots in the Active Set, PS, satisfies the
 19 condition that $(-20 \times \log_{10}(\text{PS}))$ is not greater than
 20 $\text{MIN_PILOT_EC_IO_THRESH}_S$.
- 21 – Reset the expiration time of the PPSMM timer to $\text{PPSMM_PERIOD}_S \times 0.08$
 22 seconds and re-enable the timer if the following conditions are true:
- 23 o the PPSMM timer is disabled, and
- 24 o the received total energy per PN chip, E_C , of the pilots in the Active Set is
 25 less than $(-120 + 2 \times \text{MIN_PILOT_PWR_THRESH}_S)$, or the total pilot strength
 26 of the pilots in the Active Set, PS, satisfies the condition that $(-20 \times$
 27 $\log_{10}(\text{PS}))$ is greater than $\text{MIN_PILOT_EC_IO_THRESH}_S$.
- 28 • If $\text{MIN_PILOT_PWR_THRESH}_S$ is equal to '11111' and $\text{MIN_PILOT_EC_IO_THRESH}_S$
 29 is equal to '11111', the mobile station shall maintain the PPSMM timer independent
 30 of the received power and the total E_C/I_0 of the pilots.

31 2.6.6.2.13 Call Rescue Soft Handoff

32 This section presents an overview and mobile station requirements for the support of call
 33 rescue soft handoff while the mobile station is in the *Mobile Station Control on the Traffic*
 34 *Channel State*.

35 2.6.6.2.13.1 Overview

36 Support for the call rescue feature is mandatory for the mobile station. The mobile station
 37 initiates call rescue soft handoff after disabling its transmitter due to:

- 38 • insufficient signal quality on the Forward Traffic Channel (see 2.6.4.1.8)

- an acknowledgment failure.

In order for a pilot to be autonomously added to the Active Set, it must be a valid soft handoff candidate on the mobile station's neighbor list, and must also support a Rescue Channel. A Rescue Channel is a Fundamental Channel that is used for call rescue soft handoff, and has a pre-allocated Walsh Code that is provided to the mobile station as part of the *General Neighbor List Message*, *Universal Neighbor List Message*, and *Extended Neighbor List Update Message*.

If the mobile station is eligible to attempt call rescue soft handoff, then it re-enables its transmitter and monitors the Rescue Channel (as well as the other Traffic Channels in the Active Set) for good frames. Once good frames are received, then the call continues normally.

Three timers are used as part of call rescue soft handoff: the rescue delay timer, the rescue allowed timer, and the rescue attempt timer.

2.6.6.2.13.2 Requirements

If the rescue delay timer expires and the interval specified by $RESQ_MIN_PERIOD_S$ has elapsed since the last successful call rescue, then the mobile station shall enable the rescue allowed timer with an initial value of $(RESQ_ALLOWED_TIME_S \times 80)$ ms.

While the rescue allowed timer is enabled, if the mobile station is able to promote any new pilots to the Active Set (see 2.6.6.2.6.1), then the mobile station shall perform the following:

- disable the rescue allowed timer,
- update the service configuration as specified in 2.6.6.2.13.3.
- cancel any current and pending Forward or Reverse Supplemental Channel assignments.
- re-enable its transmitter at the last closed-loop power level plus $RESQ_POWER_DELTA_S$,
- enable the rescue attempt timer with an initial value of $(RESQ_ATTEMPT_TIME_S \times 40)$ ms.
- transmit the Traffic Channel preamble followed by a *Extended Pilot Strength Measurement Message*, where the length of the Traffic Channel preamble is determined as follows:
 - If operating in Radio Configuration 1 or 2, the length of the Traffic Channel preamble is given by $RESQ_NUM_PREAMBLE_RC1_RC2_S \times 20$ ms.
 - If operating in Radio Configuration greater than 2, the length of the Traffic Channel preamble is given by the duration corresponding to $RESQ_NUM_PREAMBLE_S$ as specified by the Table 3.7.3.3.2.17-1.

If the rescue allowed timer expires, then the mobile station shall not autonomously promote any new pilots to the Active Set.

1 While the rescue attempt timer is enabled, the mobile station shall not perform the
 2 Forward or Reverse Traffic Channel power control procedures specified in 2.6.4.1.1 and
 3 2.6.6.2.7.2, respectively.

4 If the rescue attempt timer expires, then the mobile station shall disable its transmitter.

5 2.6.6.2.13.3 Service Configuration Update Due to Call Rescue

6 The mobile station shall set CH_IND_s to '01'.

7 The mobile station shall replace the current Logical-to-Physical Mapping with the default
 8 Logical-to-Physical Mapping as specified in Table 2.6.4.2-1, where:

- 9 • requirement 1 is as follows: The SR_ID field shall be set to the SR_ID corresponding
 10 to the services mapped to the Fundamental Channel, and
- 11 • requirements 2 and 3 are as follows: the PHYSICAL_RESOURCE field shall be set
 12 to '0000'.

13 The mobile station shall replace the current Service Configuration information record with
 14 a new Service Configuration information record created as follows:

- 15 • The mobile station shall delete all Service Option Connection Records corresponding
 16 to an SR_ID that is not listed in the Call Rescue Logical-to-Physical Mapping
 17 created above and the Layer 3 shall terminate the corresponding call control
 18 instance (currently existing or pending instantiation).
- 19 • The mobile station shall identify the Call Control instance corresponding to the first
 20 service option connection listed in this newly created Service Configuration
 21 information record by the NULL identifier.

22 The mobile station shall set SYNC_ID_s to NULL.

23 2.6.6.3 Typical Message Exchanges During Handoffs

24 The following examples illustrate typical message exchanges between the mobile station
 25 and the base station during handoff. Refer to Annex B for examples of call processing
 26 during handoff.

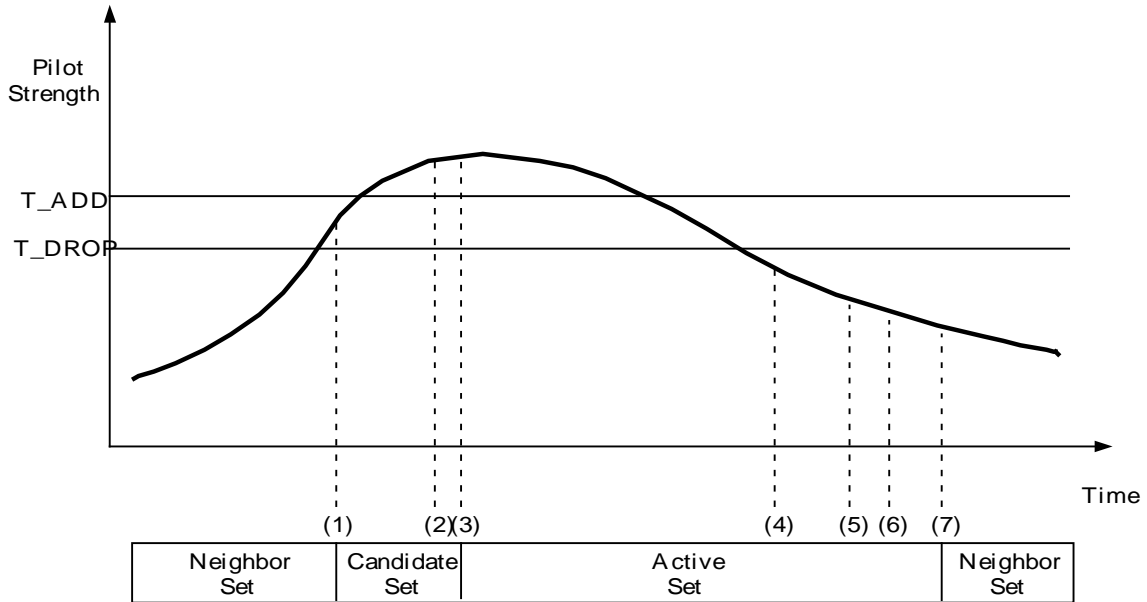

27 Figure 2.6.6.3-1 shows an example of the messages exchanged between the mobile station
 28 and the base station during a typical handoff process if P_REV_IN_USE_s is less than or
 29 equal to three or SOFT_SLOPE_s is equal to '000000'.

30 Figure 2.6.6.3-2 shows an example of the messages exchanged between the mobile station
 31 and the base station during a typical handoff process if P_REV_IN_USE_s is greater than
 32 three and SOFT_SLOPE_s is not equal to '000000'.

33 Figure 2.6.6.3-3 illustrates the messaging triggered by a pilot of the Candidate Set as its
 34 strength gradually rises above the strength of each pilot of the Active Set if P_REV_IN_USE_s
 35 is less than or equal to three, or SOFT_SLOPE_s is equal to '000000'. Note that the mobile
 36 station reports that a Candidate Set pilot is stronger than an Active Set pilot only if the
 37 difference between their respective strengths is at least $T_COMP \times 0.5$ dB.

1 Figure 2.6.6.3-4 illustrates the messaging triggered by a pilot of the Candidate Set as its
2 strength gradually rises above the strength of each pilot of the Active Set if $P_REV_IN_USE_s$
3 is greater than three and $SOFT_SLOPE_s$ is not equal to '000000'. Note that the mobile
4 station reports that a Candidate Set pilot is stronger than an Active Set pilot only if the
5 difference between their respective strengths is at least $T_COMP \times 0.5$ dB and Pilot P_0
6 strength exceeds $[(SOFT_SLOPE/8) \times 10 \times \log_{10}(PS_1 + PS_2) + ADD_INTERCEPT/2]$.

7

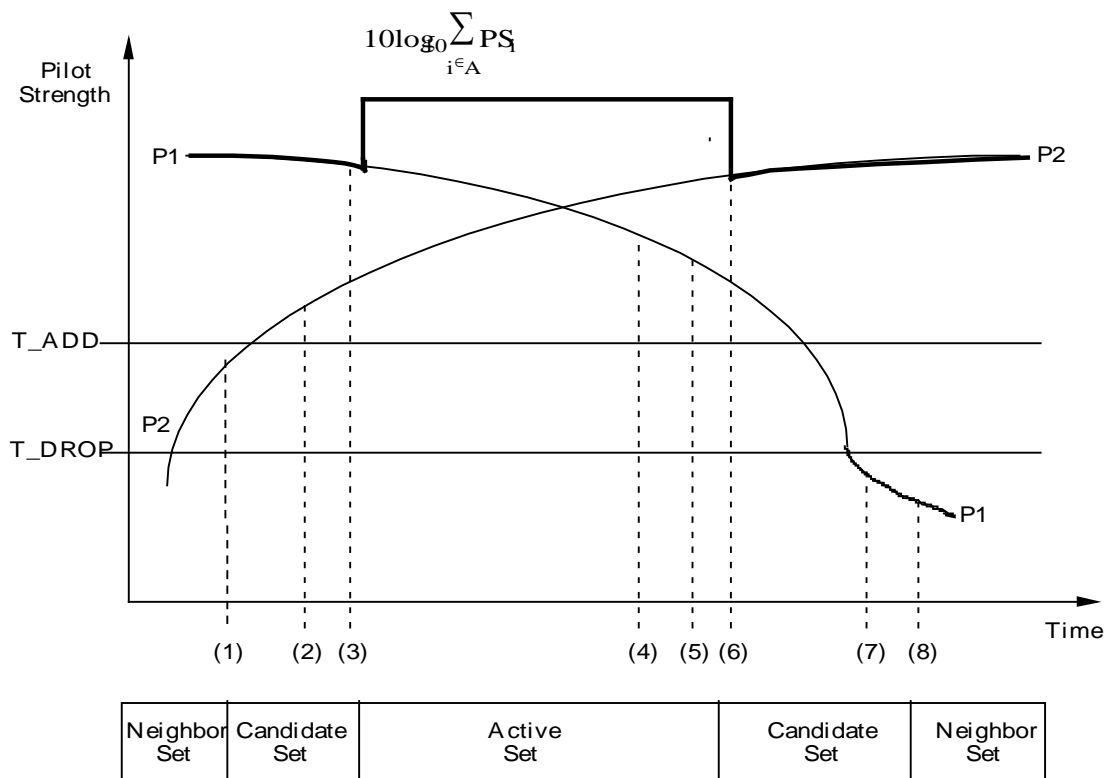

1
2

- 3 (1) Pilot strength exceeds T_ADD . Mobile station sends a *Pilot Strength Measurement*
4 *Message* and transfers pilot to the Candidate Set.
- 5 (2) Base station sends an *Extended Handoff Direction Message*, a *General Handoff*
6 *Direction Message* or a *Universal Handoff Direction Message*.
- 7 (3) Mobile station transfers pilot to the Active Set and sends a *Handoff Completion*
8 *Message*.
- 9 (4) Pilot strength drops below T_DROP . Mobile station starts the handoff drop timer.
- 10 (5) Handoff drop timer expires. Mobile station sends a *Pilot Strength Measurement*
11 *Message*.
- 12 (6) Base station sends an *Extended Handoff Direction Message*, a *General Handoff*
13 *Direction Message* or a *Universal Handoff Direction Message*.
- 14 (7) Mobile station moves pilot from the Active Set to the Neighbor Set and sends a
15 *Handoff Completion Message*.

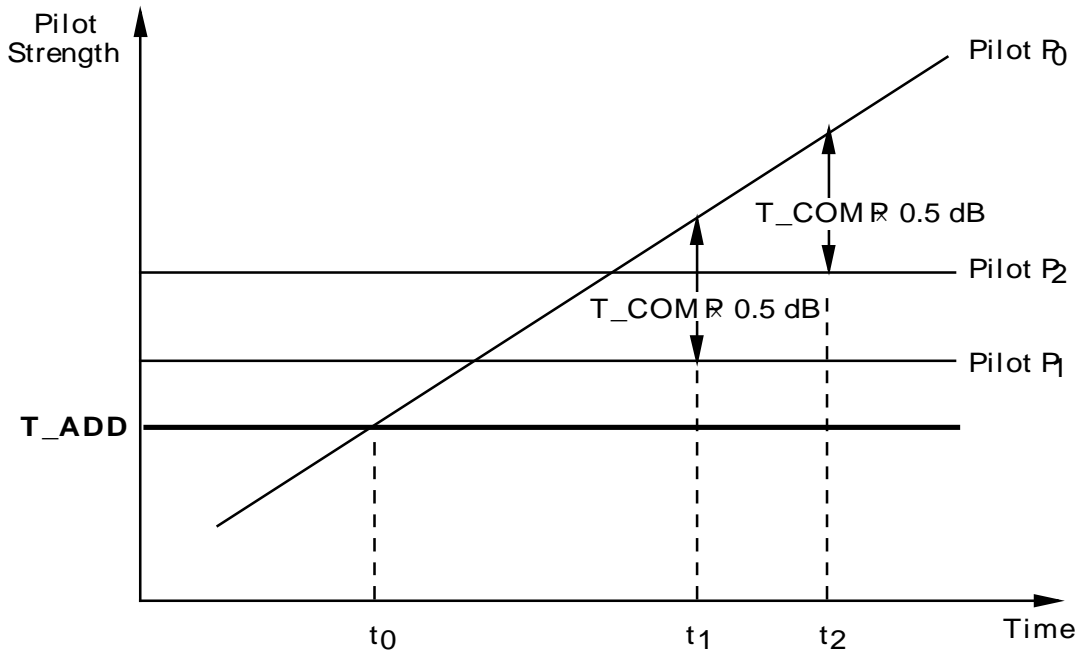

16 **Figure 2.6.6.3-1. Handoff Threshold Example if $P_REV_IN_USE_s$ is Less Than or Equal**
17 **to Three, or $SOFT_SLOPE_s$ is Equal to '000000'**

18

- 1
- 2 (1) Pilot P₂ strength exceeds T_ADD. Mobile station transfers the pilot to the Candidate Set.
- 3 (2) Pilot P₂ strength exceeds $[(\text{SOFT_SLOPE}/8) \times 10 \times \log_{10}(\text{PS}_1) + \text{ADD_INTERCEPT}/2]$.
- 4 Mobile station sends a *Pilot Strength Measurement Message*.
- 5 (3) Mobile station receives an *Extended Handoff Direction Message*, a *General Handoff*
- 6 *Direction Message* or a *Universal Handoff Direction Message*, transfers the pilot P₂ to the
- 7 Active Set, and sends a *Handoff Completion Message*.
- 8 (4) Pilot P₁ strength drops below $[(\text{SOFT_SLOPE}/8) \times 10 \times \log_{10}(\text{PS}_2) +$
- 9 $\text{DROP_INTERCEPT}/2]$. Mobile station starts the handoff drop timer.
- 10 (5) Handoff drop timer expires. Mobile station sends a *Pilot Strength Measurement*
- 11 *Message*.
- 12 (6) Mobile station receives an *Extended Handoff Direction Message*, a *General Handoff*
- 13 *Direction Message* or a *Universal Handoff Direction Message*, transfers the pilot P₁ to the
- 14 Candidate Set and sends a *Handoff Completion Message*.
- 15 (7) Pilot P₁ strength drops below T_DROP. Mobile station starts the handoff drop timer.
- 16 (8) Handoff drop timer expires. Mobile station moves the pilot P₁ from the Candidate Set
- 17 to the Neighbor Set.

16

2.6.7 Hash Functions and Randomization

2.6.7.1 Hash Function

Certain procedures require a uniform distribution of mobile stations among N resources. The following function returns an integer, using as arguments the mobile station's IMSI, the number of resources N, and a modifier DECORR. The modifier serves to decorrelate the values obtained for the various applications from the same mobile station.

HASH_KEY shall be equal to the 32 least significant bits of $(\text{IMSI_O_S1} + 2^{24} \times \text{IMSI_O_S2})$.

Define:

- Word L to be bits 0-15 of HASH_KEY
- Word H to be bits 16-31 of HASH_KEY

where bit 0 is the least significant bit of HASH_KEY.

For determining CDMA Band, CDMA Channel Number, Paging Channel Number, Forward Common Control Channel Number, Quick Paging Channel Number, and Paging Slot Number, the hash value is computed as follows:⁷¹

$$R = \lfloor N \times ((40503 \times (L \oplus H \oplus \text{DECORR})) \bmod 2^{16}) / 2^{16} \rfloor$$

For determining a mobile station's assigned paging indicator bit positions, the hash value is computed as follows:

$$R_1 = \lfloor N \times ((40503 \times (L \oplus H \oplus \text{DECORR}_1)) \bmod 2^{16}) / 2^{16} \rfloor$$

and

$$R_2 = \lfloor (1 - \lfloor (2 \times R_1) / (N+4) \rfloor) \times (N+4) / 2 + \lfloor (2 \times R_1) / (N+4) \rfloor \times ((N+4) / 2 - 4) \times ((40503 \times (L \oplus H \oplus \text{DECORR}_2)) \bmod 2^{16}) / 2^{16} \rfloor + N + 4 + \lfloor (2 \times R_1) / (N+4) \rfloor \times ((N+4) / 2) \text{ for Quick Paging Channel indicator rate of 4800 bps, or}$$

$$R_2 = \lfloor (1 - \lfloor (2 \times R_1) / (N+8) \rfloor) \times (N+8) / 2 + \lfloor (2 \times R_1) / (N+8) \rfloor \times ((N+8) / 2 - 8) \times ((40503 \times (L \oplus H \oplus \text{DECORR}_2)) \bmod 2^{16}) / 2^{16} \rfloor + N + 8 + \lfloor (2 \times R_1) / (N+8) \rfloor \times ((N+8) / 2) \text{ for Quick Paging Channel indicator rate of 9600 bps.}$$

The mobile station shall choose the range N and the modifiers DECORR, DECORR₁, and DECORR₂ according to the application as shown in Table 2.6.7.1-1. In the table, HASH_KEY [0...11] denotes the 12 least significant bits of HASH_KEY.

⁷¹ This formula is adapted from Knuth, Donald N., *The Art of Computer Programming*, 2 volumes, (Reading, MA, Addison-Wesley, 1998).

1

Table 2.6.7.1-1. Hash Function Modifier

Application	N	DECORR	Return Value
CDMA Band Number	Number of band entries	$2 \times \text{HASH_KEY} [0\dots11]$	R + 1
CDMA Channel Number	Number of channel entries	0	R + 1
Paging Channel Number	PAGE_CHAN _s from <i>System Parameters Message</i> (up to 7)	$2 \times \text{HASH_KEY} [0\dots11]$	R + 1
Quick Paging Channel Number	NUM_QPCH _s from <i>Extended System Parameters Message</i> or <i>MC-RR Parameters Message</i> (up to 3)	$2 \times \text{HASH_KEY} [0\dots11]$	R + 1
Paging Slot Number	2048	$6 \times \text{HASH_KEY}[0\dots11]$	R
Paging Indicator Positions	376 (for 9600 bps), 188 (for 4800 bps)	$\text{DECORR}_1 = \lfloor t / 64 \rfloor \bmod 2^{16}$, $\text{DECORR}_2 = \lfloor t / 64 + 1 \rfloor \bmod 2^{16}$, where t is the System Time in 20ms frames, relative to the beginning of the assigned Quick Paging Channel slot.	R ₁ and R ₂
Forward Common Control Channel Number	NUM_FCCCH _s from <i>MC-RR Parameters Message</i> (up to 7)	$2 \times \text{HASH_KEY} [0\dots11]$	R + 1

2

3 2.6.7.2 Pseudorandom Number Generator

4 Where pseudorandom numbers are needed, a linear congruential generator shall be used.
 5 The mobile station shall implement the linear congruential generator defined by:

$$6 \quad z_n = a \times z_{n-1} \bmod m$$

7 where $a = 7^5 = 16807$ and $m = 2^{31} - 1 = 2147483647$. z_n is the output of the generator.⁷²

⁷² This generator has full period, ranging over all integers from 1 to m-1; the values 0 and m are never produced. Several suitable implementations can be found in Park, Stephen K. and Miller, Keith W., "Random Number Generators: Good Ones are Hard to Find," *Communications of the ACM*, vol. 31, no. 10, October 1988, pp. 1192-1201.

1 During the *Mobile Station Initialization State*, the mobile station shall seed its generator with

$$2 \quad z_0 = (\text{ESN} \oplus \text{RANDOM_TIME}) \bmod m$$

3 where RANDOM_TIME shall be the least-significant 32-bits of SYS_TIME_s stored from the
4 *Sync Channel Message*. If the initial value so produced is found to be zero, it shall be
5 replaced with one. The mobile station shall compute a new z_n for each subsequent use.

6 The mobile station shall use the value u_n = z_n / m for those applications that require a
7 binary fraction u_n, 0 < u_n < 1.

8 The mobile station shall use the value k_n = ⌊N × z_n / m⌋ for those applications that require
9 a small integer k_n, 0 ≤ k_n ≤ N - 1.

10 2.6.8 CODE_CHAN_LIST_s Maintenance

11 The CODE_CHAN_LIST_s is a descriptive structure used to manage the Forward
12 Fundamental Channel and Forward Supplemental Code Channels, if any, associated with
13 the mobile station's Active Set. Associated with each member of the mobile station's Active
14 Set, there is an ordered array of code channels. The first entry of the ordered array
15 specifies the Forward Fundamental Channel associated with the pilot and the subsequent
16 entries, if any, specify the Forward Supplemental Code Channels associated with the pilot.
17 The CODE_CHAN_LIST_s is the collection of ordered arrays of code channels for each
18 member of the mobile station's Active Set. The ith entry in every array (of code channels
19 associated with a member of the Active Set) corresponds to the ith code channel.

20 The mobile station shall maintain the CODE_CHAN_LIST_s as follows:

- 21 • When the mobile station is first assigned a Forward Fundamental Channel, it shall
22 initialize the CODE_CHAN_LIST_s to contain the Forward Fundamental Channel for
23 each member of the Active Set.
- 24 • When the mobile station processes the *Extended Handoff Direction Message*, the
25 mobile station shall update the CODE_CHAN_LIST_s as follows:
 - 26 – For each pilot listed in the *Extended Handoff Direction Message* which does not
27 have a corresponding code channel in the CODE_CHAN_LIST_s, the mobile
28 station shall add the code channel, CODE_CHAN, of that pilot to the
29 CODE_CHAN_LIST_s, as the Forward Fundamental Channel for the pilot.
 - 30 – The mobile station shall delete all information in the CODE_CHAN_LIST_s
31 associated with a pilot that is not included in the *Extended Handoff Direction*
32 *Message*.
- 33 • When the mobile station processes the *General Handoff Direction Message*, the
34 mobile station shall update the CODE_CHAN_LIST_s to contain the Forward
35 Fundamental Channel associated with each pilot included in the *General Handoff*
36 *Direction Message*. The first code channel occurrence associated with each pilot
37 included in the *General Handoff Direction Message* corresponds to the Forward
38 Fundamental Channel. The mobile station shall perform the following:
 - 39 – If FOR_SUP_CONFIG_r is included and FOR_SUP_CONFIG_r is equal to '10' or
40 '11', the mobile station shall perform the following actions:

- 1 + For each pilot listed in the *General Handoff Direction Message*, the mobile
2 station shall set the Forward Supplemental Code Channels (associated with
3 the pilot) in the CODE_CHAN_LIST_s to the Forward Supplemental Code
4 Channels specified in the *General Handoff Direction Message*.
- 5 + The mobile station shall delete all information in the CODE_CHAN_LIST_s
6 associated with a pilot that is not included in the *General Handoff Direction*
7 *Message*.
- 8 – If FOR_SUP_CONFIG_r is equal to ‘00’ or ‘01’ or if FOR_SUP_CONFIG_r is not
9 included in the *General Handoff Direction Message*, the mobile station shall not
10 update Supplemental Code Channels associated with the pilots included in the
11 *General Handoff Direction Message*. The mobile station shall perform the
12 following actions:
- 13 + For each pilot listed in the *General Handoff Direction Message* which does
14 not have a corresponding code channel in the CODE_CHAN_LIST_s, the
15 mobile station shall add the code channel, CODE_CHAN, of that pilot to the
16 CODE_CHAN_LIST_s, as the Forward Fundamental Channel for the pilot.
- 17 + The mobile station shall delete all information in the CODE_CHAN_LIST_s
18 associated with a pilot that is not included in the *General Handoff Direction*
19 *Message*.
- 20 • When the mobile station processes the *Supplemental Channel Assignment Message*
21 it shall follow the following rules:
- 22 – If FOR_SUP_CONFIG_r is equal to ‘10’ or ‘11’, the mobile station shall update the
23 Forward Supplemental Code Channels for each pilot in the Active Set.
- 24 – If the pilot is not listed in the *Supplemental Channel Assignment Message*, the
25 mobile station shall delete all occurrences of Forward Supplemental Code
26 Channels associated with the pilot from the Code Channel List.
- 27 – If a pilot is listed in the *Supplemental Channel Assignment Message*, then the
28 mobile station shall set the Forward Supplemental Code Channels (associated
29 with the pilot) in the CODE_CHAN_LIST_s to the Forward Supplemental Code
30 Channels specified in the *Supplemental Channel Assignment Message*.
- 31 – If FOR_SUP_CONFIG_r is equal to ‘00’ or ‘01’, the mobile station shall not update
32 Supplemental Code Channels associated with the pilots included in the
33 *Supplemental Channel Assignment Message*.

34 2.6.9 CDMA Tiered Services

35 This section presents an overview and mobile station requirements for the support of
36 CDMA Tiered services while the mobile station is in the *Mobile Station Idle State* and in the
37 *Mobile Station Control on the Traffic Channel State*.

2.6.9.1 Overview

2.6.9.1.1 Definition

The mobile station may support Tiered Services based upon User Zones. Tiered Services provide the user custom services and special features based upon the mobile station location. Tiered Services also provides private network support. Important to the operation of CDMA Tiered Services is the concept of User Zones. It is via User Zones by which the base station offers custom services based upon the mobile station location.

User Zones are associated with a set of features and services, plus a geographic area in which the User Zone features/services are made available to the customers that have subscribed to that User Zone. The boundary of the User Zone Geographic area may be established based on the coverage area of a public or private base station or it may be established independent of RF topology.

User Zones may be supported by the public system on the same frequency as the serving base station, or they may be supported on a private system operating on a different frequency.

2.6.9.1.2 Types of User Zones

User Zones may be of two basic types:

- *Broadcast User Zones*: Broadcast User Zones are identified to the mobile station using the Paging Channel or the Primary Broadcast Control Channel. In this case, the base station broadcasts on the Paging Channel or the Primary Broadcast Control Channel messages identifying the User Zones that fall within the coverage area of the particular cell/sector. Mobile stations, as part of their monitoring of the Paging Channel or the Primary Broadcast Control Channel, will identify the presence of a particular User Zone.
- *Mobile Specific User Zones*: Mobile Specific User Zones are not broadcast by the base station. The mobile station may use other overhead message parameters and compare them with internally stored User Zone parameters to identify the presence of a particular User Zone. These parameters may include: SID, NID, BASE_ID, BASE_LAT, and BASE_LONG.

Broadcast User Zones allow for permanent as well as temporary subscription. Temporary subscription provides User Zone features and capabilities to users who are not subscribed to the User Zone. In this case, a mobile station, upon entering a new coverage area, may detect the presence of a User Zone that it presently does not subscribe to, but one that supports temporary subscription. The mobile station then queries the network to obtain the User Zone parameters. Once these parameters are received, the mobile station offers to the user via the mobile station user interface, the option of subscribing to the particular User Zone.

Some User Zones may require active registration (Active User Zones) upon the mobile station's entry to immediately trigger a change in a feature(s). For others, the implicit registration at call setup is sufficient (Passive User Zones). Active User Zones are used where inbound features change as a result of being in the User Zone. During the *Mobile*

1 *Station Idle State*, a mobile stations needs to register to update the User Zone ID whenever
2 the User Zone that the mobile station is entering and/or leaving is of the Active type.

3 A mobile station that supports User Zone services may store a list of User Zones, where
4 each User Zone is identified by a User Zone ID (UZID). Associated with each stored User
5 Zone, the mobile station may also store a number of determinant parameters used for
6 identifying User Zones.

7 2.6.9.2 Requirements

8 If the mobile station supports User Zone services, it shall maintain and update UZID_S
9 according the following rule:

10 If the mobile station selects a User Zone supported by the base station, the mobile station
11 shall set UZID_S to the User Zone Identifier associated with the User Zone; otherwise, the
12 mobile station shall set UZID_S to '0000000000000000'. The precise process for
13 determining how to select a User Zone that is supported by the base station is left to the
14 mobile station manufacturer.

15 If the mobile station does not support User Zone services, the mobile station shall set
16 UZID_S to '0000000000000000'.

17 The mobile station may search pilots of private neighbor base stations on other frequencies
18 and band classes as identified in the *Private Neighbor List Message*. Search performance
19 criteria are defined [11].

20 2.6.9.2.1 User Zone Operation in the Mobile Station Idle State:

21 When a mobile station performs an idle handoff, it selects User Zones based on internally
22 stored parameters and information broadcast on the Paging Channel or on the Primary
23 Broadcast Control Channel as described in 2.6.9.1.

24 After the mobile station performs idle handoff, if the mobile station determines that a
25 change from one Broadcast User Zone to another Broadcast User Zone is required, the
26 mobile station shall not update UZID_S, UZ_EXIT_IN_USE_S and shall not perform User Zone
27 registration until the pilot strength of the currently serving base station exceeds that of the
28 base station corresponding to the old User Zone by the value of UZ_EXIT_IN_USE_S.

29 If the mobile station determines that it needs to change User Zone, and if the difference
30 between the pilot strengths exceeds UZ_EXIT_IN_USE_S, then the mobile station shall
31 perform the following:

- 32 • Perform User Zone registration.
- 33 • Update UZID_S.
- 34 • Set UZ_EXIT_IN_USE_S to UZ_EXIT_RCVD_S.

35 The mobile station may also implement other means to avoid the premature exiting of a
36 User Zone due to rapid changes in signal strength. The exact implementation of such
37 techniques is left to mobile station implementation.

38 If the mobile station is in the *Mobile Station Idle State* and it receives a *User Zone Reject*
39 *Message* the mobile station shall perform the following:

- 1 • Set REJECT_ACTION_INDI_S to REJECT_ACTION_INDI_R.
- 2 • If UZID_ASSIGN_INCL_R = '0', the mobile station shall set UZID_S to
- 3 '0000000000000000', otherwise; the mobile station shall set UZID_S to
- 4 ASSIGN_UZID_R.

5 If the mobile station is in the *Mobile Station Idle State* and it selects an active User Zone,
6 then the mobile station shall perform User Zone registration (see 2.6.5.1.10) by entering
7 the *System Access State* with a registration indication.

8 The mobile station should provide the user with a User Zone indication corresponding to
9 the User Zone in service each time UZID_S is updated.

10 2.6.9.2.2 User Zone Operation in the Mobile Station Control on the Traffic Channel State

11 If the mobile station is in the *Traffic Channel Substate* of the *Mobile Station Control on the*
12 *Traffic Channel State* and if it determines that the User Zone has changed, it shall update
13 UZID_S and send a *User Zone Update Request Message* to the base station.

14 If the mobile station is in the *Traffic Channel Substate or Release Substate* of the *Mobile*
15 *Station Control on the Traffic Channel State* and it receives a *User Zone Update Message*,
16 then the mobile station shall update UZID_S and set it equal to UZID_R.

17 If the mobile station is in the *Traffic Channel Substate or Release Substate* of the *Mobile*
18 *Station Control on the Traffic Channel State* and it receives a *User Zone Reject Message*, then
19 the mobile station shall perform the following:

- 20 • Set REJECT_ACTION_INDI_S to REJECT_ACTION_INDI_R.
- 21 • If UZID_ASSIGN_INCL_R = 0, the mobile station shall set UZID_S to '0', otherwise; the
- 22 mobile station shall set UZID_S to ASSIGN_UZID_R.

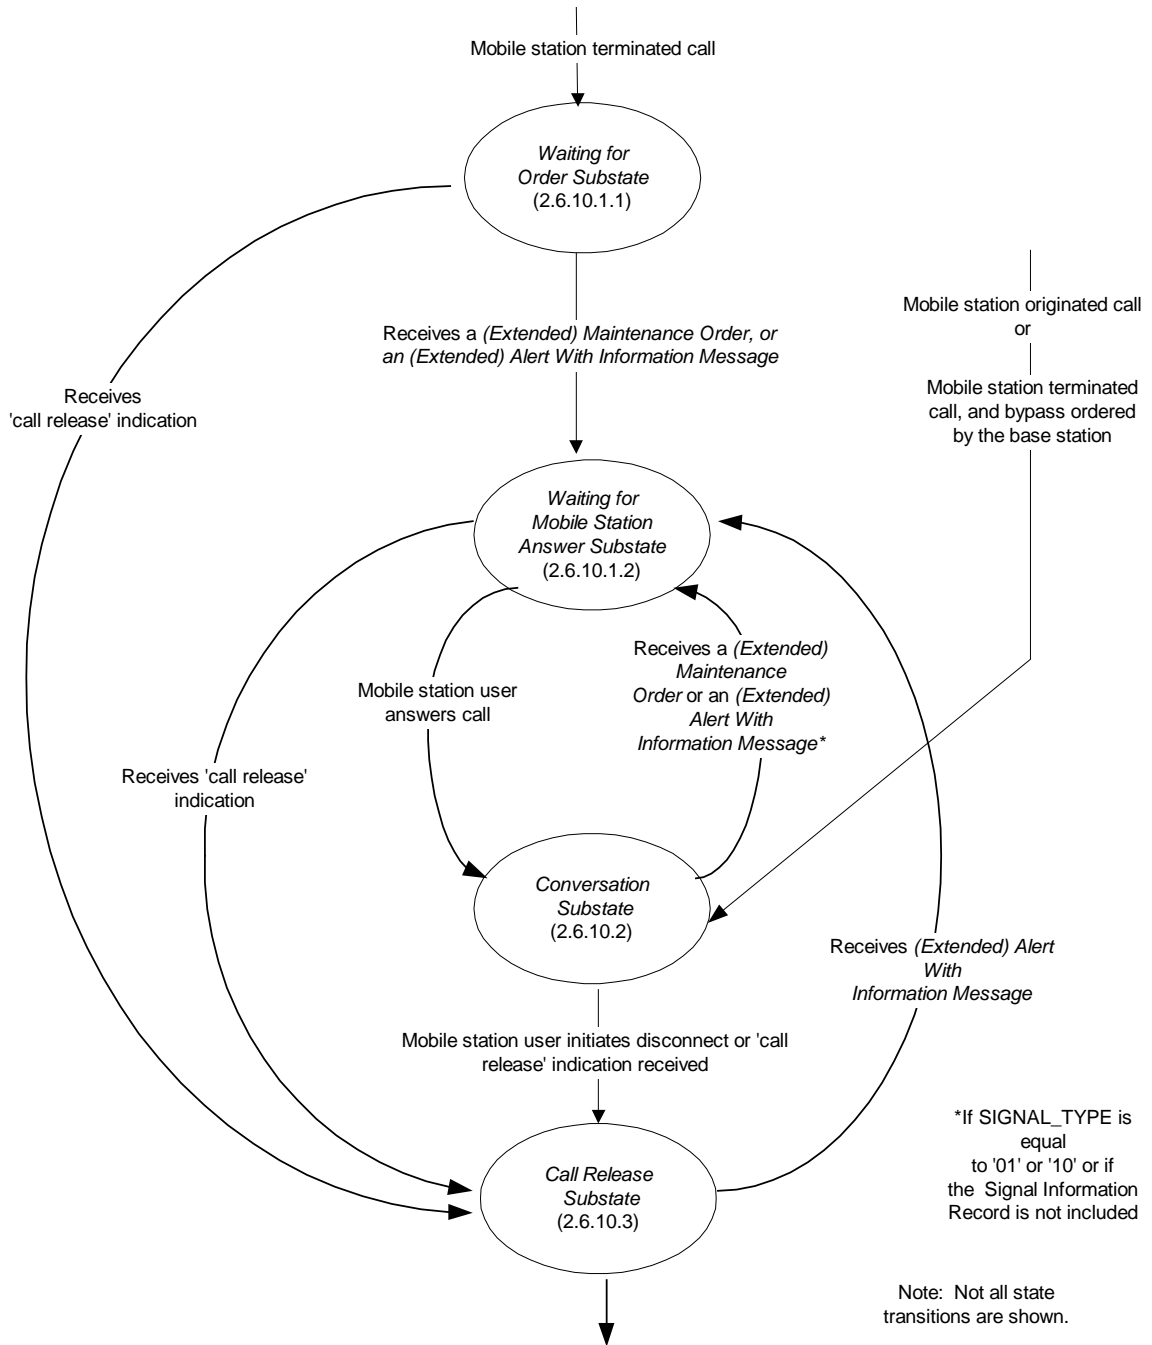

23 The mobile station should provide the user with a User Zone indication corresponding to
24 the User Zone in service each time UZID_S is updated.

25 2.6.10 Call Control Processing

26 As illustrated in Figure 2.6.10-1, the Call Control consists of the following states:

- 27 • *Waiting for Order Substate* - In this substate, the Call Control instance waits for an
- 28 *Alert With Information Message* or an *Extended Alert With Information Message*.
- 29 • *Waiting for Mobile Station Answer Substate* - In this substate, the Call Control
- 30 instance waits for the user to answer the call.
- 31 • *Conversation Substate* - In this substate, the parties involved in this call
- 32 communicate.
- 33 • *Call Release Substate* - In this substate, the Call Control instance waits for the call
- 34 to be disconnected.

35

2
3
4

Figure 2.6.10-1. Call Control

1 The following messages are processed by the Call Control:

- 2 • *Alert With Information Message*
- 3 • *Extended Alert with Information Message:*
- 4 • *Flash With Information Message*
- 5 • *Extended Flash With Information Message*
- 6 • *Send Burst DTMF Message*
- 7 • *Origination Continuation Message*

8 The following orders are processed by the Call Control:

- 9 • *Continuous DTMF Tone Order*
- 10 • *Maintenance Order*
- 11 • *Connect Order*

12 Upon instantiation, the Call Control instance shall perform the following:

- 13 • If this Call Control instance is instantiated with a 'restore indication', the Call
14 Control instance shall enter the *Conversation Substate*.
- 15 • If the call is mobile station terminated, and BYPASS_ALERT_ANSWER_s is '1', the
16 Call Control instance shall perform the following:
 - 17 - The Call Control instance shall enter the *Conversation Substate*.
 - 18 - The mobile station shall not connect the audio input, e.g., the microphone of the
19 mobile station, to the reverse link without the knowledge of the user.
- 20 • If the call is mobile station terminated and BYPASS_ALERT_ANSWER_s is '0', the
21 Call Control instance shall enter the *Waiting for Order Substate*.
- 22 • If the call is mobile station originated, the Call Control instance shall enter the
23 *Conversation Substate*.

24 2.6.10.1 Alerting

25 2.6.10.1.1 Waiting for Order Substate

26 In this substate, the Call Control instance waits for an *Alert With Information Message* or an
27 *Extended Alert With Information Message*.

28 Upon entering the *Waiting for Order Substate*, the Call Control instance shall set the
29 substate timer for T_{52m} seconds.

30 While in the *Waiting for Order Substate*, the Call Control instance shall perform the
31 following:

- 1 • If the substate timer expires, the Call Control instance shall send a “substate timer
2 expired indication” to the Layer 3 and shall enter the *Call Release Substate*.
- 3 • If the Call Control instance receives a “reset waiting for order substate timer
4 indication” from the Layer 3, the Call Control instance shall reset the substate timer
5 for T_{52m} seconds.
- 6 • If the Call Control instance receives a “release indication” from the Layer 3, the Call
7 Control instance shall enter the *Call Release Substate*.
- 8 • If the Call Control instance receives an indication that the user has originated an
9 emergency call (see 2.6.4.3), the mobile station shall send a *Flash With Information*
10 *Message* or an *Extended Flash With Information Message* in assured mode with a
11 Global Emergency Call Information Record (see 2.7.4.31), as follows:
- 12 - If this Call Control instance is identified by NULL, the mobile station shall send
13 either a *Flash With Information Message* or an *Extended Flash With Information*
14 *Message* (with either the CON_REF_INCL field of the message set to ‘0’ or the
15 CON_REF_INCL field set to ‘1’ and the CON_REF field set to the connection
16 reference of the service option connection corresponding to this call); otherwise,
17 the mobile station shall send an *Extended Flash With Information Message*, with
18 the CON_REF_INCL field of the message set to ‘1’ and the CON_REF field of the
19 message set to the connection reference of the service option connection
20 corresponding to this call.
- 21 • If the Call Control instance receives a message from the Layer 3 which is included
22 in the following list and every message field value is within its permissible range,
23 the Call Control instance shall process the message as described below and in
24 accordance with the message’s action time (see 2.6.4.1.5).
- 25 1. *Alert With Information Message*: If the message contains a Signal information
26 record, the mobile station should alert the user in accordance with the Signal
27 information record; otherwise, the mobile station should use standard alert as
28 defined in 3.7.5.5. The Call Control instance shall enter the *Waiting for Mobile*
29 *Station Answer Substate* (see 2.6.10.1.2).
- 30 2. *Extended Alert with Information Message*: If the message contains a Signal
31 information record, the mobile station should alert the user in accordance with
32 the Signal information record; otherwise, the mobile station should use
33 standard alert as defined in 3.7.5.5. The Call Control instance shall enter the
34 *Waiting for Mobile Station Answer Substate* (see 2.6.10.1.2).
- 35 3. *Maintenance Order*: The Call Control instance shall enter the *Waiting for Mobile*
36 *Station Answer Substate*.
- 37 • If the Call Control instance receives a message that is not included in the above list,
38 cannot be processed, or requires a capability which is not supported, the Call
39 Control instance shall discard the message and send a ‘message rejected indication’

1 to the Layer 3, with the reject reason indicated except when the following condition
2 applies.

- 3 - If the Call Control instance fails to meet the criteria solely due to receipt of the
4 Extended Record Type – International information record, the information record
5 shall be discarded and the message shall be processed in accordance with the
6 above procedures specified for the applicable message.

7 2.6.10.1.2 Waiting for Mobile Station Answer Substate

8 In this substate, the Call Control instance waits for the user to answer the mobile station
9 terminated call or to invoke special treatment.

10 Upon entering the *Waiting for Mobile Station Answer Substate*, the Call Control instance
11 shall set the substate timer for T_{53m} seconds.

12 While in the *Waiting for Mobile Station Answer Substate*, the Call Control instance shall
13 perform the following:

- 14 • If the substate timer expires, the Call Control instance shall send a “substate timer
15 expired indication” to the Layer 3 and shall enter the *Call Release Substate*.
- 16 • If the Call Control instance receives a “release indication” from the Layer 3, the Call
17 Control instance shall enter the *Call Release Substate*.
- 18 • If the Call Control instance is directed by the user to answer the call, the mobile
19 station shall send a *Connect Order* in assured mode:
 - 20 - If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall
21 perform the following: If this Call Control instance is identified by NULL, the
22 mobile station shall either set the CON_REF_INCL field of the message to ‘0’ or
23 set the CON_REF_INCL field to ‘1’ and set the CON_REF field to the connection
24 reference of the service option connection corresponding to this call; otherwise,
25 the mobile station shall set the CON_REF_INCL field of the message to ‘1’ and
26 the CON_REF field of the message to the connection reference of the service
27 option connection corresponding to this call.

28 The Call Control instance shall enter the *Conversation Substate*.

- 29 • If the Call Control instance is directed by the user to forward the incoming call, the
30 mobile station shall send a *Flash With Information Message* or an *Extended Flash
31 With Information Message* in assured mode with a *Keypad Facility* information record
32 (see 2.7.4.2) or the *Extended Keypad Facility* information record (see 2.7.4.35) with
33 the CHARi field set to a pre-programmed feature code which indicates User
34 Selective Call Forwarding with a pre-registered number, as follows:
 - 35 - If P_REV_IN_USE_s is less than seven, the mobile station shall send a *Flash With
36 Information Message*.

1 - If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall
 2 perform the following: if this Call Control instance is identified by NULL, the
 3 mobile station shall send either a *Flash With Information Message* or an
 4 *Extended Flash With Information Message* (with either the CON_REF_INCL field
 5 of the message set to '0' or the CON_REF_INCL field set to '1' and the CON_REF
 6 field set to the connection reference of the service option connection
 7 corresponding to this call); otherwise, the mobile station shall send an *Extended*
 8 *Flash With Information Message*, with the CON_REF_INCL field of the message
 9 set to '1' and the CON_REF field of the message set to the connection reference
 10 of the service option connection corresponding to this call.

11 • If the Call Control instance is directed by user to forward the incoming call to a
 12 number stored in the mobile station, the mobile station shall send a *Flash With*
 13 *Information Message* or an *Extended Flash With Information Message* in assured
 14 mode with a *Keypad Facility* information record (see 2.7.4.2) or the *Extended*
 15 *Keypad Facility* information record (see 2.7.4.35) with the CHARi field set to the
 16 following:

- 17 - a pre-programmed feature code which indicates User Selective Call Forwarding
- 18 to a number stored in the mobile station as the first digits in the field and
- 19 - the forwarding to number immediately following the pre-programmed feature
- 20 code.

21 The mobile station shall send the message as follows:

22 - If P_REV_IN_USE_s is less than seven, the mobile station shall send a *Flash With*
 23 *Information Message*.

24 - If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall
 25 perform the following: if this Call Control instance is identified by NULL, the
 26 mobile station shall send either a *Flash With Information Message* or an
 27 *Extended Flash With Information Message* (with either the CON_REF_INCL field
 28 of the message set to '0' or the CON_REF_INCL field set to '1' and the CON_REF
 29 field set to the connection reference of the service option connection
 30 corresponding to this call); otherwise, the mobile station shall send an *Extended*
 31 *Flash With Information Message*, with the CON_REF_INCL field of the message
 32 set to '1' and the CON_REF field of the message set to the connection reference
 33 of the service option connection corresponding to this call.

34 • If the Call Control instance is directed by the user to forward the incoming call to
 35 network-based voice mail, the mobile station shall send a *Flash With Information*
 36 *Message* or an *Extended Flash With Information Message* in assured mode with a
 37 *Keypad Facility* information record (see 2.7.4.2) or the *Extended Keypad Facility*
 38 information record (see 2.7.4.35) with the CHARi field set to a pre-programmed
 39 feature code which indicates User Selective Call Forwarding to voice mail, as
 40 follows:

- 1 - If P_REV_IN_USE_s is less than seven, the mobile station shall send a *Flash With*
2 *Information Message*.
- 3 - If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall
4 perform the following: if this Call Control instance is identified by NULL, the
5 mobile station shall send either a *Flash With Information Message* or an
6 *Extended Flash With Information Message* (with either the CON_REF_INCL field
7 of the message set to '0' or the CON_REF_INCL field set to '1' and the CON_REF
8 field set to the connection reference of the service option connection
9 corresponding to this call); otherwise, the mobile station shall send an *Extended*
10 *Flash With Information Message*, with the CON_REF_INCL field of the message
11 set to '1' and the CON_REF field of the message set to the connection reference
12 of the service option connection corresponding to this call.
- 13 • If the Call Control instance is directed by the user to activate answer holding, the
14 mobile station shall send a *Flash With Information Message* or an *Extended Flash*
15 *With Information Message* in assured mode requiring confirmation of delivery with a
16 *Keypad Facility* information record (see 2.7.4.2) or the *Extended Keypad Facility*
17 information record (see 2.7.4.35) with the CHARi field set to a pre-programmed
18 feature code which indicates Answer Holding:
- 19 - If P_REV_IN_USE_s is less than seven, the mobile station shall send a *Flash With*
20 *Information Message*.
- 21 - If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall
22 perform the following: if this Call Control instance is identified by NULL, the
23 mobile station shall send either a *Flash With Information Message* or an
24 *Extended Flash With Information Message* (with either the CON_REF_INCL field
25 of the message set to '0' or the CON_REF_INCL field set to '1' and the CON_REF
26 field set to the connection reference of the service option connection
27 corresponding to this call); otherwise, the mobile station shall send an *Extended*
28 *Flash With Information Message*, with the CON_REF_INCL field of the message
29 set to '1' and the CON_REF field of the message set to the connection reference
30 of the service option connection corresponding to this call.
- 31 After receiving confirmation of delivery of the *Flash With Information Message* or the
32 *Extended Flash With Information Message*, the mobile station shall send a *Connect*
33 *Order* in assured mode:
- 34 - If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall
35 perform the following: If this Call Control instance is identified by NULL, the
36 mobile station shall either set the CON_REF_INCL field of the message to '0' or
37 set the CON_REF_INCL field to '1' and set the CON_REF field to the connection
38 reference of the service option connection corresponding to this call; otherwise,
39 the mobile station shall set the CON_REF_INCL field of the message to '1' and
40 the CON_REF field of the message to the connection reference of the service
41 option connection corresponding to this call.

1 The Call Control instance shall enter the *Conversation Substate*.

- 2 • If the Call Control instance receives an indication that the user has originated an
3 emergency call (see 2.6.4.3), the mobile station shall send a *Flash With Information*
4 *Message* or an *Extended Flash With Information Message* in assured mode with a
5 Global Emergency Call Information Record (see 2.7.4.31), as follows:
 - 6 - If this Call Control instance is identified by NULL, the mobile station shall send
7 either a *Flash With Information Message* or an *Extended Flash With Information*
8 *Message* (with either the CON_REF_INCL field of the message set to '0' or the
9 CON_REF_INCL field set to '1' and the CON_REF field set to the connection
10 reference of the service option connection corresponding to this call); otherwise,
11 the mobile station shall send an *Extended Flash With Information Message*, with
12 the CON_REF_INCL field of the message set to '1' and the CON_REF field of the
13 message set to the connection reference of the service option connection
14 corresponding to this call.
- 15 • If the Call Control instance receives a message from Layer 3 which is included in
16 the following list and every message field value is within its permissible range, the
17 Call Control instance shall process the message as described below and in
18 accordance with the message's action time (see 2.6.4.1.5).
 - 19 1. *Alert With Information Message*: The Call Control instance shall reset the
20 substate timer for T_{53m} seconds. If this message does not contain a Signal
21 information record, the mobile station should use standard alert as defined in
22 3.7.5.5.
 - 23 2. *Extended Alert With Information Message*: The Call Control instance shall reset
24 the substate timer for T_{53m} seconds. If this message does not contain a Signal
25 information record, the mobile station should use standard alert as defined in
26 3.7.5.5.
 - 27 3. *Maintenance Order*: The mobile station shall reset the substate timer for T_{53m}
28 seconds.
- 29 • If the Call Control instance receives a message that is not included in the above list,
30 cannot be processed, or requires a capability which is not supported, the Call
31 Control instance shall discard the message and send a 'message rejected indication'
32 to the Layer 3, with the reject reason indicated except when the following condition
33 applies.
 - 34 - If the Call Control instance fails to meet the criteria solely due to receipt of
35 the Extended Record Type – International information record, the information
36 record shall be discarded and the message shall be processed in accordance
37 with the above procedures specified for the applicable message.

38 2.6.10.2 Conversation Substate

39 While in the *Conversation Substate*, the Call Control instance shall perform the following:

- 1 • If the Call Control instance receives a “release indication” from the Layer 3, the Call
2 Control instance shall enter the *Call Release Substate*.
- 3 • The mobile station shall send an *Origination Continuation Message* in assured mode,
4 within T_{54m} seconds after the Call Control instance entering *the Conversation*
5 *Substate* if any of the following conditions occur:
 - 6 - The mobile station originated the call, and did not send all the dialed digits in
7 the *Origination Message*.
 - 8 - There is more than one calling party number associated with the mobile station.
 - 9 - A calling party subaddress is used in the call.
 - 10 - A called party subaddress is used in the call.

11 If more than one calling party number is associated with the mobile station, the mobile
12 station shall include the calling party number being used in the calling party number
13 information record in the *Origination Continuation Message*. If only one calling party
14 number is associated with the mobile station, the mobile station shall not include the
15 calling party number information record in the *Origination Continuation Message*. If a
16 calling party subaddress is used, the mobile station shall include the calling party
17 subaddress information record in the *Origination Continuation Message*; otherwise, the
18 mobile station shall omit the calling party subaddress information record. If a called party
19 subaddress is used, the mobile station shall include the called party subaddress
20 information record in the *Origination Continuation Message*; otherwise, the mobile station
21 shall omit the called party subaddress information record.

- 22 • If the Call Control instance is directed by the user to issue a flash, the mobile
23 station shall build a *Flash With Information Message* or an *Extended Flash With*
24 *Information Message* with the collected digits or characters contained in a *Keypad*
25 *Facility* information record, if needed, and shall send the message in assured mode,
26 as follows:
 - 27 - If $P_REV_IN_USE_s$ is less than seven, the mobile station shall send a *Flash With*
28 *Information Message*.
 - 29 - If $P_REV_IN_USE_s$ is equal to or greater than seven, the mobile station shall
30 perform the following: if this Call Control instance is identified by NULL, the
31 mobile station shall send either a *Flash With Information Message* or an
32 *Extended Flash With Information Message* (with either the CON_REF_INCL field
33 of the message set to ‘0’ or the CON_REF_INCL field set to ‘1’ and the CON_REF
34 field set to the connection reference of the service option connection
35 corresponding to this call); otherwise, the mobile station shall send an *Extended*
36 *Flash With Information Message*, with the CON_REF_INCL field of the message
37 set to ‘1’ and the CON_REF field of the message set to the connection reference
38 of the service option connection corresponding to this call.
- 39 • If the Call Control instance is directed by the user to forward the incoming call, the
40 mobile station shall send a *Flash With Information Message* or an *Extended Flash*
41 *With Information Message* in assured mode with a *Keypad Facility* information record

(see 2.7.4.2) or the *Extended Keypad Facility* information record (see 2.7.4.35) with the CHARi field set to a pre-programmed feature code which indicates User Selective Call Forwarding with a pre-registered number, as follows:

- If P_REV_IN_USE_s is less than seven, the mobile station shall send a *Flash With Information Message*.
- If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall perform the following: if this Call Control instance is identified by NULL, the mobile station shall send either a *Flash With Information Message* or an *Extended Flash With Information Message* (with either the CON_REF_INCL field of the message set to '0' or the CON_REF_INCL field set to '1' and the CON_REF field set to the connection reference of the service option connection corresponding to this call); otherwise, the mobile station shall send an *Extended Flash With Information Message*, with the CON_REF_INCL field of the message set to '1' and the CON_REF field of the message set to the connection reference of the service option connection corresponding to this call.
- If the Call Control instance is directed by the user to forward the incoming call to a number stored in the mobile station, the mobile station shall send a *Flash With Information Message* or an *Extended Flash With Information Message* in assured mode with a *Keypad Facility* information record (see 2.7.4.2) or the *Extended Keypad Facility* information record (see 2.7.4.35) with the CHARi field set to the following:
 - a pre-programmed feature code which indicates User Selective Call Forwarding to a number stored in the mobile station as the first digits in the field and
 - the forwarding to number immediately following the pre-programmed feature code.

The mobile station shall send the message as follows:

- If P_REV_IN_USE_s is less than seven, the mobile station shall send a *Flash With Information Message*.
- If P_REV_IN_USE_s is equal to or greater than seven and if this Call Control instance is identified by NULL, the mobile station shall send either a *Flash With Information Message* or an *Extended Flash With Information Message* (with either the CON_REF_INCL field of the message set to '0' or the CON_REF_INCL field set to '1' and the CON_REF field set to the connection reference of the service option connection corresponding to this call). Otherwise, the mobile station shall send an *Extended Flash With Information Message*, with the CON_REF_INCL field of the message set to '1' and the CON_REF field of the message set to the connection reference of the service option connection corresponding to this call.
- If the Call Control instance is directed by the user to forward the incoming call to network-based voice mail, the mobile station shall send a *Flash With Information Message* or an *Extended Flash With Information Message* in assured mode with a

1 *Keypad Facility* information record (see 2.7.4.2) or the *Extended Keypad Facility*
2 information record (see 2.7.4.35) with the CHARi field set to a pre-programmed
3 feature code which indicates User Selective Call Forwarding to voice mail, as
4 follows:

- 5 - If P_REV_IN_USE_s is less than seven, the mobile station shall send a *Flash With*
6 *Information Message*.
- 7 - If P_REV_IN_USE_s is equal to or greater than seven and if this Call Control
8 instance is identified by NULL, the mobile station shall send either a *Flash With*
9 *Information Message* or an *Extended Flash With Information Message* (with either
10 the CON_REF_INCL field of the message set to '0' or the CON_REF_INCL field set
11 to '1' and the CON_REF field set to the connection reference of the service option
12 connection corresponding to this call). Otherwise, the mobile station shall send
13 an *Extended Flash With Information Message*, with the CON_REF_INCL field of
14 the message set to '1' and the CON_REF field of the message set to the
15 connection reference of the service option connection corresponding to this call.
- 16 • If the Call Control instance is directed by the user to activate answer holding, the
17 mobile station shall send a *Flash With Information Message* or an *Extended Flash*
18 *With Information Message* in assured mode requiring confirmation of delivery with a
19 *Keypad Facility* information record (see 2.7.4.2) or the *Extended Keypad Facility*
20 information record (see 2.7.4.35) with the CHARi field set to a pre-programmed
21 feature code which indicates Answer Holding, as follows:
 - 22 - If P_REV_IN_USE_s is less than seven, the mobile station shall send a *Flash With*
23 *Information Message*.
 - 24 - If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall
25 perform the following: if this Call Control instance is identified by NULL, the
26 mobile station shall send either a *Flash With Information Message* or an
27 *Extended Flash With Information Message* (with either the CON_REF_INCL field
28 of the message set to '0' or the CON_REF_INCL field set to '1' and the CON_REF
29 field set to the connection reference of the service option connection
30 corresponding to this call); otherwise, the mobile station shall send an *Extended*
31 *Flash With Information Message*, with the CON_REF_INCL field of the message
32 set to '1' and the CON_REF field of the message set to the connection reference
33 of the service option connection corresponding to this call.

- 1 • If answer holding is activated and the Call Control instance is directed by the user
2 to deactivate answer holding, the mobile station shall send a *Flash With Information*
3 *Message* or an *Extended Flash With Information Message* in assured mode with a
4 *Keypad Facility* information record (see 2.7.4.2) or the *Extended Keypad Facility*
5 information record (see 2.7.4.35) with the CHARi field set to a pre-programmed
6 feature code which indicates Answer Holding, as follows:
- 7 - If P_REV_IN_USE_S is less than seven, the mobile station shall send a *Flash With*
8 *Information Message*.
- 9 - If P_REV_IN_USE_S is equal to or greater than seven, the mobile station shall
10 perform the following: if this Call Control instance is identified by NULL, the
11 mobile station shall send either a *Flash With Information Message* or an
12 *Extended Flash With Information Message* (with either the CON_REF_INCL field
13 of the message set to '0' or the CON_REF_INCL field set to '1' and the CON_REF
14 field set to the connection reference of the service option connection
15 corresponding to this call); otherwise, the mobile station shall send an *Extended*
16 *Flash With Information Message*, with the CON_REF_INCL field of the message
17 set to '1' and the CON_REF field of the message set to the connection reference
18 of the service option connection corresponding to this call.
- 19 • If the Call Control instance is directed by the user to send burst DTMF digits, the
20 mobile station shall build the *Send Burst DTMF Message* with the dialed digits and
21 shall send the message in assured mode requiring confirmation of delivery.
- 22 - If P_REV_IN_USE_S is equal to or greater than seven, the mobile station shall
23 perform the following: If this Call Control instance is identified by NULL, the
24 mobile station shall set the CON_REF_INCL field of the message to '0';
25 otherwise, the mobile station shall set the CON_REF_INCL field of the message
26 to '1' and the CON_REF field of the message to the connection reference of the
27 service option connection corresponding to this call.

28 The mobile station sending multiple *Send Burst DTMF Messages* shall preserve relative
29 ordering of these messages (see [4]). The mobile station should attempt to preserve the
30 user timing as much as possible, using recommended values of DTMF_ON_LENGTH (see
31 Table 2.7.2.3.2.7-1) and DTMF_OFF_LENGTH (see Table 2.7.2.3.2.7-2).

- 32 • If the Call Control instance is directed by the user to send a continuous DTMF digit,
33 the mobile station shall build the *Continuous DTMF Tone Order* with the dialed digit
34 and shall send the order in assured mode requiring confirmation of delivery, as
35 follows:

- 1 - If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall
 2 perform the following: If this Call Control instance is identified by NULL, the
 3 mobile station shall either set the CON_REF_INCL field of the message to '0' or
 4 set the CON_REF_INCL field to '1' and set the CON_REF field to the connection
 5 reference of the service option connection corresponding to this call; otherwise,
 6 the mobile station shall set the CON_REF_INCL field of the message to '1' and
 7 the CON_REF field of the message to the connection reference of the service
 8 option connection corresponding to this call.

9 When the Call Control instance is directed by the user to cease sending the
 10 continuous DTMF digit, the mobile station shall send the *Continuous DTMF Tone*
 11 *Order* (ORDQ = '11111111') in assured mode requiring confirmation of delivery, as
 12 follows:

- 13 - If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall
 14 perform the following: If this Call Control instance is identified by NULL, the
 15 mobile station shall either set the CON_REF_INCL field of the message to '0' or
 16 set the CON_REF_INCL field to '1' and set the CON_REF field to the connection
 17 reference of the service option connection corresponding to this call; otherwise,
 18 the mobile station shall set the CON_REF_INCL field of the message to '1' and
 19 the CON_REF field of the message to the connection reference of the service
 20 option connection corresponding to this call.

21 The mobile station sending multiple *Continuous DTMF Tone Orders* shall preserve relative
 22 ordering of these messages (see [2]). The mobile station shall send the *Continuous DTMF*
 23 *Tone Order* with the ORDQ set to '11111111' indicating the completion of the current
 24 continuous DTMF digit before sending the *Continuous DTMF Tone Order* for another digit or
 25 the *Send Burst DTMF Message*.

- 26 • If the Call Control instance is directed by the user to disconnect the call, the Call
 27 Control instance shall send a 'call release request' to the Layer 3 and shall enter the
 28 *Call Release Substate*.
- 29 • If the Call Control instance receives an indication that this packet data service
 30 instance has been inactivated, the Call Control instance shall send a "call inactive
 31 indication" to the Layer 3 and shall enter the *Call Release Substate*.
- 32 • If the Call Control instance receives an indication that the user has originated an
 33 emergency call (see 2.6.4.3), the mobile station shall send a *Flash With Information*
 34 *Message* or an *Extended Flash With Information Message* in assured mode with a
 35 Global Emergency Call Information Record (see 2.7.4.31), as follows:
 - 36 - If this Call Control instance is identified by NULL, the mobile station shall
 37 send either a *Flash With Information Message* or an *Extended Flash With*
 38 *Information Message* (with either the CON_REF_INCL field of the message set to
 39 '0' or the CON_REF_INCL field set to '1' and the CON_REF field set to the
 40 connection reference of the service option connection corresponding to this call);
 41 otherwise, the mobile station shall send an *Extended Flash With Information*
 42 *Message*, with the CON_REF_INCL field of the message set to '1' and the

1 CON_REF field of the message set to the connection reference of the service
2 option connection corresponding to this call.

- 3 • If the Call Control instance receives a message from the Layer 3 which is included
4 in the following list and every message field value is within its permissible range,
5 the Call Control instance shall process the message as described below and in
6 accordance with the message's action time (see 2.6.4.1.5).
 - 7 1. *Alert With Information Message*: If the message contains a Signal information
8 record with the SIGNAL_TYPE field set to '01' or '10', or if the message does not
9 contain a Signal information record, the Call Control instance shall enter the
10 *Waiting For Mobile Station Answer Substate*. The mobile station should alert the
11 user in accordance with the Signal information record. If this message does not
12 contain a Signal information record, the mobile station should use standard
13 alert as defined in 3.7.5.5.
 - 14 2. *Continuous DTMF Tone Order*
 - 15 3. *Extended Alert With Information Message*: If the message contains a Signal
16 information record with the SIGNAL_TYPE field set to '01' or '10', or if the
17 message does not contain a Signal information record, the Call Control instance
18 shall enter the *Waiting For Mobile Station Answer Substate*. The mobile station
19 should alert the user in accordance with the Signal information record. If this
20 message does not contain a Signal information record, the mobile station should
21 use standard alert as defined in 3.7.5.5.
 - 22 4. *Flash With Information Message*
 - 23 5. *Extended Flash With Information Message*
 - 24 6. *Maintenance Order*: The Call Control instance shall enter the *Waiting for Mobile*
25 *Station Answer Substate*.
 - 26 7. *Send Burst DTMF Message*:
 - 27 • If the Call Control instance receives a message that is not included in the above list,
28 cannot be processed, or requires a capability which is not supported, the Call
29 Control instance shall discard the message and send a 'message rejected indication'
30 to the Layer 3, with the reject reason indicated except when the following condition
31 applies.
 - 32 - If the Call Control instance fails to meet the criteria solely due to receipt of
33 the Extended Record Type – International information record, the information
34 record shall be discarded and the message shall be processed in accordance
35 with the above procedures specified for the applicable message.

36 2.6.10.3 Call Release Substate

37 In this substate, the Call Control instance waits for the call to be released.

1 While in the *Call Release Substate*, the Call Control instance shall perform the following:

- 2 • If the Call Control instance receives a message from the Layer 3 which is included
3 in the following list and every message field value is within its permissible range,
4 the Call Control instance shall process the message as described below and in
5 accordance with the message's action time (see 2.6.4.1.5).
 - 6 1. *Alert With Information Message*: The Call Control instance shall send an "enter
7 traffic channel substate indication" to the Layer 3 and shall enter the *Waiting for*
8 *Mobile Station Answer Substate*. If this message does not contain a Signal
9 information record, the mobile station should use standard alert as defined in
10 3.7.5.5.
 - 11 2. *Extended Alert With Information Message*: The Call Control instance shall send a
12 "enter traffic channel substate indication" to Layer 3 and shall enter the *Waiting*
13 *for Mobile Station Answer Substate*. If this message does not contain a Signal
14 information record, the mobile station should use standard alert as defined in
15 3.7.5.5.
- 16 • If the Call Control instance receives a message that is not included in the above list,
17 cannot be processed, or requires a capability which is not supported, the Call
18 Control instance shall discard the message and send a 'message rejected indication'
19 to the Layer 3, with the reject reason indicated except when the following condition
20 applies.
 - 21 - If the Call Control instance fails to meet the criteria solely due to receipt of the
22 Extended Record Type – International information record, the information record
23 shall be discarded and the message shall be processed in accordance with the
24 above procedures specified for the applicable message.

25 2.6.11 Common Procedures for Extended Encryption and Message Integrity

26 This section describes the common procedures for the messages used for extended
27 encryption and message integrity.

28 2.6.11.1 Registration Accepted Order

29 The mobile station shall perform the following procedures in the order listed below.

- 30 • If $ORDQ_R$ is equal to '00000101', the mobile station shall set $ROAM_INDI_S$ to
31 $ROAM_INDI_T$ and should display the roaming condition.
- 32 • If $ORDQ_R$ is equal to '00000111', the mobile station shall perform the following:
 - 33 - Set $ROAM_INDI_S$ to $ROAM_INDI_T$ and the mobile station should display the
34 roaming condition.
 - 35 - Set $C_SIG_ENCRYPT_MODE_S$ to $C_SIG_ENCRYPT_MODE_T$.
 - 36 - If $ENC_KEY_SIZE_T$ is included, the mobile station shall set $ENC_KEY_SIZE_S$ to
37 $ENC_KEY_SIZE_T$.
 - 38 - If $MSG_INTEGRITY_SUP_S$ is equal to '0' and $C_SIG_ENCRYPT_MODE_T$ is not
39 equal to '000', the mobile station shall perform the following:

- 1 + Set TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
2 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to $1 + 256 \times$
3 NEW_SSEQ_H included in the *Registration Message*.
- 4 + Form a 128-bit pattern by concatenating the CMEAKEY with a copy of itself
5 (the most recently generated CMEAKEY is associated with the AUTHR of the
6 *Registration Message*).
- 7 + Set ENC_KEY[KEY_ID] to the 128-bit pattern.
- 8 + Set INT_KEY[KEY_ID] to the 128-bit pattern.
- 9 - If MSG_INTEGRITY_SUP_s is equal to '1', the mobile station shall perform the
10 following:
- 11 + If CHANGE_KEYS_r is equal to '0', the mobile station shall set RESTORE_KEY
12 to '0'.
- 13 + If CHANGE_KEYS_r is equal to '1', the mobile station shall perform the
14 following:
- 15 ○ Set KEY_ID to SDU_KEY_ID provided by the LAC Layer (see [4]).
- 16 ○ Set TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
17 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to $1 + 256 \times$
18 NEW_SSEQ_H included in the *Registration Message*.
- 19 ○ If KEY_ID is equal to '00' or '01', the mobile station shall perform the
20 following:
- 21 Form a 128-bit pattern by concatenating the CMEAKEY with a copy of
22 itself (the most recently generated CMEAKEY associated with the
23 AUTHR of the *Registration Message*).
- 24 Set ENC_KEY[KEY_ID] to the 128-bit pattern.
- 25 Set INT_KEY[KEY_ID] to the 128-bit pattern.
- 26 Set LAST_2G_KEY_ID_s to KEY_ID.
- 27 ○ If KEY_ID is equal to '10' or '11', the mobile station shall perform the
28 following:
- 29 Set ENC_KEY[KEY_ID] to the CK generated by AKA.
- 30 Set INT_KEY[KEY_ID] to the IK generated by AKA.
- 31 Set LAST_3G_KEY_ID_s to KEY_ID.
- 32 If the mobile station supports R-UIM, then the mobile shall set
33 USE_UAK_s to USE_UAK_r; otherwise, the mobile station shall perform
34 the following:
35 - Set USE_UAK_s to '0'.

- 1 – If USE_UAK_r is equal to ‘1’, then the mobile station shall send
2 a *Mobile Station Reject Order* with ORDQ equal to ‘00010100’
3 (UAK not supported).

4 Set RESTORE_KEY to ‘0’.

5 Send a *Security Mode Completion Order*.

6 Disable the key setup timer if it is running.

- 7 + Set INTEGRITY_MODE_s to the SDU_INTEGRITY_ALGO provided by the LAC
8 Layer (see [4]).

- 9 – If ENC_KEY_SIZE_r is included and not set to reserved value and if current key
10 strength is greater than the desired key strength specified by ENC_KEY_SIZE_r
11 according to table 3.7.4.5-2, mobile station shall perform the key strength
12 reduction algorithm procedures to reduce the key strength of ENC_KEY[KEY_ID]
13 according to ENC_KEY_SIZE_r as described in 2.3.12.5.4. The current key
14 strength is 64 bit if KEY_ID is equal to ‘00’ or ‘01’ and is 128 bit if KEY_ID is
15 equal to ‘10’ or ‘11’.

16 2.6.11.2 Extended Channel Assignment Message

17 The mobile station shall perform the following procedures in the order listed below.

- 18 • If P_REV_IN_USE_s is less than 10, or MSG_INTEGRITY_SUP_s is equal to ‘0’, the
19 mobile station shall perform the following:
- 20 – If ENC_KEY_SIZE_r is included, the mobile station shall set ENC_KEY_SIZE_s to
21 ENC_KEY_SIZE_r.
- 22 – If D_SIG_ENCRYPT_MODE_r is included, the mobile station shall perform the
23 following:
- 24 + If D_SIG_ENCRYPT_MODE_r is equal to ‘000’, the mobile station shall set
25 D_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_s; otherwise, the
26 mobile station shall perform the following:
- 27 o Set D_SIG_ENCRYPT_MODE_s to D_SIG_ENCRYPT_MODE_r
- 28 o Form a 128-bit pattern by concatenating the CMEAKEY with a copy of
29 itself (the most recently generated CMEAKEY associated with the AUTHR
30 of the *Origination Message* or *Page Response Message*) and set
31 TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
32 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to 1 + 256 ×
33 NEW_SSEQ_H included in the *Origination Message* or *Page Response*
34 *Message*⁷³.

⁷³ If the mobile station is in the *Mobile Station Origination Attempt Substate*, the NEW_SSEQ_H field shall be the one included in the *Origination Message*. If the mobile station is in the *Page Response Substate*, the NEW_SSEQ_H field shall be the one included in the *Page Response Message*.

- 1 o Set ENC_KEY[KEY_ID] to the 128-bit pattern.
- 2 o Set INT_KEY[KEY_ID] to the 128-bit pattern.
- 3 – If C_SIG_ENCRYPT_MODE_r is included, the mobile station shall set
- 4 C_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_r.
- 5 • If P_REV_IN_USE_s is equal to or greater than 10 and MSG_INTEGRITY_SUP_s is
- 6 equal to ‘1’, the mobile station shall perform the following:
- 7 – If the LAC Layer indicates that the message does not contain a valid MACI, the
- 8 mobile station shall set D_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_s;
- 9 otherwise, the mobile station shall perform the following:
- 10 + Set D_SIG_ENCRYPT_MODE_s to D_SIG_ENCRYPT_MODE_r.
- 11 + If C_SIG_ENCRYPT_MODE is included, the mobile station shall set
- 12 C_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_r.
- 13 + If ENC_KEY_SIZE_r is included, the mobile station shall set
- 14 ENC_KEY_SIZE_s to ENC_KEY_SIZE_r.
- 15 + If MSG_INTEGRITY_INFO_r is set to ‘1’, the mobile station shall perform
- 16 the following:
- 17 o If CHANGE_KEYS_r is equal to ‘0’, the mobile station shall set
- 18 RESTORE_KEY to ‘0’.
- 19 o If CHANGE_KEYS_r is equal to ‘1’, the mobile station shall perform the
- 20 following:
- 21 Set KEY_ID to SDU_KEY_ID provided by the LAC Layer (see [4]).
- 22 Set TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
- 23 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to 1 + 256
- 24 × NEW_SSEQ_H included in the *Origination Message* or *Page*
- 25 *Response Message*.
- 26 If KEY_ID is equal to ‘00’ or ‘01’, the mobile station shall perform the
- 27 following:
- 28 – Form a 128-bit pattern by concatenating the CMEAKEY with
- 29 a copy of itself (the most recently generated CMEAKEY associated
- 30 with the AUTHR of the *Origination Message* or *Page Response*
- 31 *Message*).
- 32 – Set ENC_KEY[KEY_ID] to the 128-bit pattern.
- 33 – Set INT_KEY[KEY_ID] to the 128-bit pattern.
- 34 – Set LAST_2G_KEY_ID_s to KEY_ID.
- 35 If KEY_ID is equal to ‘10’ or ‘11’, the mobile station shall perform the
- 36 following:
- 37 – Set ENC_KEY[KEY_ID] to the CK generated by AKA.

- 1 – Set INT_KEY[KEY_ID] to the IK generated by AKA.
- 2 – Set LAST_3G_KEY_ID_s to KEY_ID
- 3 – If the mobile station supports R-UIM, then the mobile shall
- 4 set USE_UAK_s to USE_UAK_r; otherwise, the mobile station shall
- 5 perform the following:
 - 6 + Set USE_UAK_s to '0'.
 - 7 + If USE_UAK_r is equal to '1', then the mobile station shall
 - 8 send a *Mobile Station Reject Order* with ORDQ equal to
 - 9 '00010100' (UAK not supported).

10 Set RESTORE_KEY to '0'.

11 Send a *Security Mode Completion Order*.

12 Disable the key setup timer if it is running.

- 13 o Set INTEGRITY_MODE_s to the SDU_INTEGRITY_ALGO delivered by the
- 14 LAC Layer.

- 15 • If ENC_KEY_SIZE_r is included and not set to reserved value and if current key
- 16 strength is greater than the desired key strength specified by ENC_KEY_SIZE_r
- 17 according to table 3.7.4.5-2, mobile station shall perform the key strength reduction
- 18 algorithm procedures to reduce the key strength of ENC_KEY[KEY_ID] according to
- 19 ENC_KEY_SIZE_r as described in 2.3.12.5.4. The current key strength is 64 bit if
- 20 KEY_ID is equal to '00' or '01' and is 128 bit if KEY_ID is equal to '10' or '11'.

21 2.6.11.3 General Handoff Direction Message and Universal Handoff Direction Message

22 The mobile station shall perform the following procedures in the order listed below at the
23 action time of the message.

- 24 • If D_SIG_ENCRYPT_MODE_r is included, the mobile station shall set
- 25 D_SIG_ENCRYPT_MODE_s to D_SIG_ENCRYPT_MODE_r.
- 26 • If ENC_KEY_SIZE_r is included, the mobile station shall set ENC_KEY_SIZE_s to
- 27 ENC_KEY_SIZE_r.
- 28 • If REGISTER_IN_IDLE_r is included, the mobile station shall set
- 29 REGISTER_IN_IDLE_s to REGISTER_IN_IDLE_r.
- 30 • If MSG_INTEGRITY_SUP_r is included, the mobile station shall set
- 31 MSG_INTEGRITY_SUP_s to MSG_INTEGRITY_SUP_r.
- 32 • If GEN_2G_KEY_r is included and is set to '1', the mobile station shall perform the
- 33 following in the order listed below:
 - 34 – Perform the CDMA_3G_2G_Conversion procedure as defined in [44] for 3G to 2G
 - 35 one-way roaming to generate a new CMEAKEY from CK.

- 1 – Set TX_EXT_SSEQ[0][‘00’] to TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][‘00’]
2 to TX_EXT_SSEQ[1][KEY_ID], RX_EXT_SSEQ[0][‘00’] to
3 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][‘00’] to
4 RX_EXT_SSEQ[1][KEY_ID].
- 5 – Form a 128-bit pattern by concatenating the resultant CMEAKEY with a copy of
6 itself.
- 7 – Store the 128-bit pattern in ENC_KEY[‘00’] and INT_KEY[‘00’].
- 8 – Set KEY_ID and LAST_2G_KEY_IDS to ‘00’.
- 9 • If ENC_KEY_SIZE_r is included and not set to reserved value and if current key
10 strength is greater than the desired key strength specified by ENC_KEY_SIZE_r
11 according to table 3.7.4.5-2, mobile station shall perform the key strength reduction
12 algorithm procedures to reduce the key strength of ENC_KEY[KEY_ID] according to
13 ENC_KEY_SIZE_r as described in 2.3.12.5.4. The current key strength is 64 bit if
14 KEY_ID is equal to ‘00’ or ‘01’ and is 128 bit if KEY_ID is equal to ‘10’ or ‘11’.

15 2.6.11.4 Security Mode Command Message on f-csch

16 The mobile station shall perform the following procedures in the order listed below.

- 17 • Set C_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_r.
- 18 • If ENC_KEY_SIZE_r is included, the mobile station shall set ENC_KEY_SIZE_s to
19 ENC_KEY_SIZE_r.
- 20 • If MSG_INTEGRITY_SUP_s is equal to ‘0’, C_SIG_ENCRYPT_MODE_r is not equal to
21 ‘000’ and the mobile sent a *Security Mode Request Message* with the
22 NEW_SSEQ_H_INCL field equal to ‘1’ prior to receiving this message when
23 C_SIG_ENCRYPT_MODE_s was not equal to ‘000’, the mobile station shall perform
24 the following:
- 25 – Set TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
26 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to $1 + 256 \times$
27 NEW_SSEQ_H included in the *Security Mode Request Message*.
- 28 • If MSG_INTEGRITY_SUP_s is equal to ‘1’ and MSG_INTEGRITY_INFO_r is equal to ‘1’,
29 the mobile station shall perform the following:
- 30 – If CHANGE_KEYS_r is equal to ‘0’, the mobile station shall set RESTORE_KEY to
31 ‘0’.
- 32 – If CHANGE_KEYS_r is equal to ‘1’, the mobile station shall perform the following:
- 33 + Set KEY_ID to SDU_KEY_ID provided by the LAC Layer (see [4]).
- 34 + If KEY_ID is equal to ‘00’ or ‘01’, the mobile station shall perform the
35 following:
- 36 o Set TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
37 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to $1 + 256 \times$
38 NEW_SSEQ_H included in the *Security Mode Request Message*.

- 1 o Form a 128-bit pattern by concatenating the CMEAKEY with a copy of
2 itself (the most recently generated CMEAKEY associated with the AUTHR
3 of the *Registration Message, Origination Message, Page Response Message*
4 or the CMEAKEY associated with the AUTHU generated during Unique
5 Challenge-Response procedure as described in 2.3.12.1.4).
- 6 o Set ENC_KEY[KEY_ID] to the 128-bit pattern.
- 7 o Set INT_KEY[KEY_ID] to the 128-bit pattern.
- 8 o Set LAST_2G_KEY_ID_s to KEY_ID.
- 9 + If KEY_ID is equal to '10' or '11', the mobile station shall perform the
10 following:
- 11 o Set TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
12 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to 1 + 256 ×
13 NEW_SSEQ_H included in the *Authentication Response Message*, or
14 *Security Mode Request Message*.
- 15 o Set ENC_KEY[KEY_ID] to the CK generated by AKA.
- 16 o Set INT_KEY[KEY_ID] to the IK generated by AKA.
- 17 o Set LAST_3G_KEY_ID_s to KEY_ID.
- 18 o If the mobile station supports R-UIM, then the mobile station shall set
19 USE_UAK_s to USE_UAK_r; otherwise, the mobile station shall perform the
20 following:
- 21 ◇ Set USE_UAK_s to '0'.
- 22 ◇ If USE_UAK_r is equal to '1', then the mobile station shall send a
23 *Mobile Station Reject Order* with ORDQ equal to '00010100' (UAK not
24 supported).
- 25 + Set RESTORE_KEY to '0'.
- 26 + Perform the key strength reduction algorithm procedures to reduce the
27 key strength of ENC_KEY[KEY_ID] according to ENC_KEY_SIZE_r as
28 described in 2.3.12.5.3.
- 29 + Send a *Security Mode Completion Order*.
- 30 + Disable the key setup timer if it is running.
- 31 – Set INTEGRITY_MODE_s to the SDU_INTEGRITY_ALGO delivered by the LAC
32 Layer.
- 33 • If ENC_KEY_SIZE_r is included and not set to reserved value and if current key
34 strength is greater than the desired key strength specified by ENC_KEY_SIZE_r
35 according to table 3.7.4.5-2, mobile station shall perform the key strength reduction
36 algorithm procedures to reduce the key strength of ENC_KEY[KEY_ID] according to
37 ENC_KEY_SIZE_r as described in 2.3.12.5.4. The current key strength is 64 bit if
38 KEY_ID is equal to '00' or '01' and is 128 bit if KEY_ID is equal to '10' or '11'.

2.6.11.5 Base Station Reject Order on f-csch and f-dsch.

The mobile station shall perform the following procedures in the order listed below.

- If $ORDQ_R$ is equal to '00000000' or if $ORDQ_R$ is equal to '00000010', $REJECT_REASON_R = '0011'$, and $REJECTED_L3_MSG_TYPE_R$ indicates the rejected message is an *Origination Message*, the mobile station shall set $ENC_KEY[i]$ and $INT_KEY[i]$ to NULL, where i ranges from '00' to '11'. The mobile station shall set $C_SIG_ENCRYPT_MODE_S$ to '000'. The mobile station shall re-originate by sending a new *Origination Message*.
- If $ORDQ_R$ is equal to '00000001' or if $ORDQ_R$ is equal to '00000010' and $REJECTED_L3_MSG_TYPE_R$ indicates the rejected message is not an *Origination Message*, the mobile station shall send a *Security Mode Request Message*. If $MSG_INTEGRITY_SUP_S$ is equal to '0', the mobile station shall select a 24-bit number and include this number in the NEW_SSEQ_H field in the *Security Mode Request Message*; otherwise, the mobile station shall select a 24-bit number and deliver this number to the LAC Layer along with the *Security Mode Request Message*. If the mobile receives two *Base Station Reject Orders* without successfully decrypting any encrypted message or without successfully validating the MACI of any message between the two orders, the mobile station shall set $REG_SECURITY_RESYNC$ to YES and enter the *System Determination Substate* with an encryption/message integrity failure indication.

2.6.11.6 Mobile Station processing when decryption or MACI check failed

Whenever the mobile station cannot decrypt an encrypted message or validate the MACI of a message that requires MACI validation, the mobile station may send an un-encrypted *Mobile Station Reject Order* indicating the failure condition to the base station.

If the failure to decrypt or to validate MACI persists, the mobile station may attempt to resynchronize the crypto-sync with the base station by sending a *Security Mode Request Message* to the base station as follows:

- If $MSG_INTEGRITY_SUP_S$ is equal to '0', the mobile station shall select a 24-bit number and include this number in the NEW_SSEQ_H ⁷⁴ field in the *Security Mode Request Message*; otherwise, the mobile station shall select a 24-bit number and deliver this number to the LAC Layer along with the *Security Mode Request Message*.

The mobile station shall set $REG_SECURITY_RESYNC$ to YES and enter the *System Determination Substate* with an encryption/message integrity failure indication if either of the following conditions are true:

- The mobile station chooses not to perform resynchronization procedure as described above.

⁷⁴ The mobile station should select a different value of NEW_SSEQ_H every time NEW_SSEQ_H is included in a message. This is to prevent the re-use of the same 24 most significant bits of the 32-bit crypto-sync.

- 1 • The mobile station still cannot decrypt message or validate the MACI of message
2 from the base station after successfully receiving and processing *Security Mode*
3 *Command Message* in response to *Security Mode Request Message* sent by mobile
4 station in resynchronization procedure as specified in 2.6.11.4 or 2.6.4.1.14.

5 2.6.12 Common Procedures for Processing f-csch Messages

6 This section describes the common procedures for processing messages received on the f-
7 csch.

8 2.6.12.1 Fast Call Setup Order

9 The mobile station shall perform the following procedures in the order listed below:

- 10 • If $RER_MODE_ENABLED_r$ is included and equal to '1', and the mobile station
11 supports operation in the radio environment reporting mode, the mobile station
12 shall set $RER_MODE_ENABLED$ to YES, RER_COUNT to 0, and shall perform the
13 following:
 - 14 – The mobile station shall disable the radio environment report timer, if enabled.
 - 15 – The mobile station shall store the following:
 - 16 + Maximum number of *Radio Environment Messages* that the mobile station is
17 permitted to transmit while in radio environment reporting mode
18 ($RER_MAX_NUM_MSG_s = infinity$, if $RER_MAX_NUM_MSG_IDX_r$ is equal to
19 '111'; otherwise, $RER_MAX_NUM_MSG_s = 2^{RER_MAX_NUM_MSG_IDX_r}$).
 - 20 + Maximum number of pilots to maintain in RER_PILOT_LIST
21 ($MAX_RER_PILOT_LIST_SIZE_s = MAX_RER_PILOT_LIST_SIZE_r$).
 - 22 + System identification for radio environment reporting mode ($RER_SID_s =$
23 SID_s).
 - 24 + Network identification for radio environment reporting mode ($RER_NID_s =$
25 NID_s).
 - 26 – The initial radio environment report pilot list (RER_PILOT_LIST) is generated as
27 follows:
 - 28 + If $ORDQ_r$ is equal to '0000001' and the size of the current RER_PILOT_LIST
29 is greater than $MAX_RER_PILOT_LIST_SIZE_s$, the mobile station shall
30 remove all but the first $MAX_RER_PILOT_LIST_SIZE_s$ pilots from
31 RER_PILOT_LIST .
 - 32 + Otherwise, the initial RER_PILOT_LIST is generated according to the
33 procedures specified in [4].
 - 34 – The mobile station shall enable the radio environment report timer with an
35 initial value of *infinity* if RER_TIME_r is equal to '111'; otherwise, the mobile
36 station shall enable the radio environment report timer with an initial value of
37 $2^{RER_TIME_r}$ seconds if $RER_TIME_UNIT_r$ is equal to '00', or $2^{RER_TIME_r}$ minutes if
38 $RER_TIME_UNIT_r$ is equal to '01', or $2^{RER_TIME_r}$ hours if $RER_TIME_UNIT_r$ is
39 equal to '10'.

- 1 • If RER_MODE_ENABLED_r is included and equal to '0', and RER_MODE_ENABLED
2 is equal to YES, the mobile station shall perform the following:
- 3 – The mobile station shall disable the radio environment report timer and set
4 RER_MODE_ENABLED to NO.
- 5 – If TKZ_MODE_PENDING is equal to YES, then the mobile station shall set
6 TKZ_MODE_PENDING to NO.
- 7 • If TKZ_MODE_ENABLED_r is included and equal to '1', and the mobile station
8 supports tracking zone reporting, the mobile station shall set TKZ_COUNT to 0 and
9 perform the following:
- 10 – The mobile station shall disable the tracking zone update timer, if enabled.
- 11 – The mobile station shall store the following:
- 12 + Tracking zone list length (TKZ_LIST_LEN_s = TKZ_LIST_LEN_r).
- 13 + Tracking zone timer (TKZ_TIMER_s = TKZ_TIMER_r).
- 14 + Maximum number of *Radio Environment Messages* that the mobile station is
15 permitted to transmit while in tracking zone mode (TKZ_MAX_NUM_MSG_s =
16 *infinity*, if TKZ_MAX_NUM_MSG_IDX_r is equal to '111'; otherwise,
17 TKZ_MAX_NUM_MSG_s = 2^{TKZ_MAX_NUM_MSG_IDX_r}).
- 18 + System identification for tracking zone mode (TKZ_SID_s = SID_s).
- 19 + Network identification for tracking zone mode (TKZ_NID_s = NID_s).
- 20 + Tracking zone update period (TKZ_UPDATE_PRD_s = TKZ_UPDATE_PRD_r).
- 21 – If RER_MODE_ENABLED is equal to NO, the mobile station shall set
22 TKZ_MODE_ENABLED to YES; otherwise, the mobile station shall set
23 TKZ_MODE_PENDING to YES.
- 24 – If TKZ_MODE_ENABLED is equal to YES, the mobile station shall perform the
25 following:
- 26 + Initialize the tracking zone list (TKZ_LIST) to contain TKZ_ID_s.
- 27 + Enable the tracking zone update timer with an initial value of infinity if
28 TKZ_UPDATE_PRD_s is equal to '1111'; otherwise, the mobile station shall
29 enable the tracking zone update timer with an initial value of
30 2^{TKZ_UPDATE_PRD_s} + 6 seconds.
- 31 • If TKZ_MODE_ENABLED_r is included and equal to '0', and TKZ_MODE_ENABLED is
32 equal to YES, the mobile station shall perform the following:
- 33 – The mobile station shall disable the tracking zone update timer and set
34 TKZ_MODE_ENABLED to NO.

35 If ORDQ_r is equal to '00000000' (base station request for mobile station to operate in a fast
36 call setup mode), the mobile station shall respond with a *Fast Call Setup Order* (ORDQ =
37 '00000001') as follows:

- 1 • If RSC_MODE_SUPPORTED_r is equal to '1' and the mobile station accepts operation
2 in the reduced slot cycle mode, the mobile station shall set the RSC_MODE_IND
3 field to '1' and perform the following:
 - 4 – Set RSC_MODE_ENABLED to YES.
 - 5 – Set the RSC_END_TIME_UNIT and RSC_END_TIME_VALUE fields as specified in
6 2.7.3.6, and store the system time specified by these fields as RSC_END_TIME.
7 The value of RSC_END_TIME shall be no later than the system time specified by
8 MAX_RSC_END_TIME_UNIT_r and MAX_RSC_END_TIME_VALUE_r.
 - 9 – Set the RSCI field as specified in 2.7.3.6 and store it as RSCI_s; if RSCI_s is equal
10 to '0111', set SLOTTED_s to NO.
 - 11 – Set IGNORE_QPCH_s to IGNORE_QPCH_r.
- 12 • Otherwise, the mobile station shall set the RSC_MODE_IND field to '0'.

13 If ORDQ_r is equal to '0000001' (base station response to mobile station's request to
14 operate in a fast call setup mode), the mobile station shall perform the following:

- 15 • If RSC_MODE_SUPPORTED_r is equal to '1', the mobile station shall perform the
16 following:– Set RSC_END_TIME to the earlier of the current value of
17 RSC_END_TIME, and the system time specified by MAX_RSC_END_TIME_UNIT_r and
18 MAX_RSC_END_TIME_VALUE_r.
 - 19 – Set IGNORE_QPCH_s to IGNORE_QPCH_r.
- 20 • If RSC_MODE_SUPPORTED_r is equal to '0', the mobile station shall set
21 RSC_MODE_ENABLED to NO and set SLOTTED_s to YES.

23 2.6.13 Mobile Station BCMC Operation

24 This section specifies the mobile station requirements for monitoring BCMC flows. If the
25 mobile station supports BCMC, the requirements in this section apply in addition to all
26 other requirements in the Mobile Station Idle State, System Access State, and Mobile
27 Station Control on the Traffic Channel State.

28 The operations performed by a mobile station that supports BCMC are as follows:

- 29 • Procedures for commencing reception of a BCMC flow while in Mobile Station Idle
30 State or System Access State (see 2.6.13.1)
- 31 • Procedures while monitoring a Forward Supplemental Channel in *Mobile Station Idle*
32 *State* or *System Access State* (see 2.6.13.2)
- 33 • Procedures for BCMC registration while in Mobile Station Idle State or System
34 Access State (see 2.6.13.3)
- 35 • Procedures for Idle Handoff while Monitoring Forward Supplemental Channelwhile
36 in Mobile Station Idle State or System Access State (see 2.6.13.4)
- 37 • Procedures for stopping reception of a BCMC flow while in Mobile Station Idle State
38 or System Access State (see 2.6.13.5)

- 1 • Procedures for processing *BCMC Service Parameters Message* Updates while in
2 Mobile Station Idle State or System Access State (see 2.6.13.6)
- 3 • Procedures for Browsing BCMC flows while in Mobile Station Idle State or System
4 Access State (see 2.6.13.7)
- 5 • Procedures for BCMC Operation while in Mobile Station Control on the Traffic
6 Channel State (see 2.6.13.8)
- 7 • Procedures for computation of Authorization Signature (see 2.6.13.9)
- 8 • Procedures for generating public long code mask for F-SCH *Mobile Station Idle State*
9 or *System Access State* (see 2.6.13.10)

10 The following primitives can be received by Layer 3 from the BCMC Service Layer:

- 11 • *BCMC-Monitor.Request(BCMC_FLOW_ID⁷⁵, priority)* - to request Layer 3 to commence
12 monitoring the specified BCMC flow, where
 - 13 – *BCMC_FLOW_ID* identifies the BCMC flow to monitor.
 - 14 – *priority* is to be used when current BCMC flow(s) and the new BCMC flow cannot
15 both be accommodated.
- 16 • *BCMC-Browse.Request* - to request Layer 3 to report all BCMC flows currently
17 available.
- 18 • *BCMC-Stop-Monitor.Request(BCMC_FLOW_ID)* - to request Layer 3 to stop monitoring
19 the specified BCMC flow, where
 - 20 – *BCMC_FLOW_ID* identifies the BCMC flow to stop monitoring.

21 The following primitives can be sent by Layer 3 to the BCMC Service Layer:

- 22 • *BCMC-Monitor.Response(BCMC_FLOW_ID, result, cause, reason_ind)* – response to
23 the BCMC Service Layer for a request to monitor a BCMC flow or due to mobility,
24 where
 - 25 – *BCMC_FLOW_ID* identifies the requested BCMC flow.
 - 26 – *result* indicates the result of the request and can be one of following:
 - 27 + SUCCESS indicates the request was successful
 - 28 + FAILURE indicates the request was unsuccessful
 - 29 – *cause* indicates the reason for failure when the request was unsuccessful and
30 can be one of the following
 - 31 + FLOW_NOT_AVAILABLE which indicates the requested BCMC flow is not
32 available in this base station

⁷⁵ Although the primitive is modeled to allow the Upper Layer to request for a single BCMC_FLOW_ID at a time, this procedure can be implemented such that multiple BCMC_FLOW_IDs can be requested simultaneously.

- 1 + CANNOT_ACCOMMODATE which indicates the requested BCMC flow cannot
- 2 be monitored due to monitoring other higher priority BCMC flow(s)
- 3 + UNSUPPORTED_BEARER_CONFIG which indicates that the requested
- 4 BCMC flow cannot be monitored due to a physical channel capability
- 5 mismatch
- 6 + FLOW_NOT_TRANSMITTED which indicates that the requested BCMC flow
- 7 is not being transmitted by this base station although it is configured for
- 8 transmission.
- 9 + FLOW_TRANSMITTED_IN_IDLE which indicates that the requested BCMC
- 10 flow is being transmitted by this base station in idle state.
- 11 + CALL_RELEASED which indicates that the call was released.
- 12 – *reason_ind* is included when the request is unsuccessful and can be one of the
- 13 following
- 14 + CURRENT_SYS to indicate it occurred in current system
- 15 + MOBILITY to indicate it occurred due to idle handoff
- 16 • *BCMC-Browse.Response(result, {BCMC_FLOW_IDS})* - response to the BCMC Service
- 17 Layer for a request to browse for BCMC flows, where
- 18 – *result* indicates the result of the request and can be one of following:
- 19 + SUCCESS indicates current sector is configured to transmit one or more
- 20 BCMC flows and this list of BCMC flows is passed as {BCMC_FLOW_IDS}
- 21 + FAILURE indicates current sector is not configured to transmit any BCMC
- 22 flows.

23 The following primitives are sent by Layer 3 to Multiplex sublayer:

- 24 • *BMAC-Start-Deliver.Request(FSCH_ID, BSR_ID)* - to request the Multiplex sublayer to
- 25 start delivering the data blocks corresponding to the specified BCMC flow, where
- 26 – *FSCH_ID* identifies the physical channel on which this BCMC flow is being
- 27 carried
- 28 – *BSR_ID* identifies the BCMC Service Reference Identifier being used by this
- 29 BCMC flow on this physical channel
- 30 • *BMAC-Stop-Deliver.Request(FSCH_ID, BSR_ID)* - to request the Multiplex sublayer to
- 31 stop delivering the data blocks corresponding to the specified BCMC flow, where
- 32 – *FSCH_ID* identifies the physical channel on which this BCMC flow is being
- 33 carried
- 34 – *BSR_ID* identifies the BCMC Service Reference Identifier being used by this
- 35 BCMC flow on this physical channel

36 If the mobile station is currently not monitoring a BCMC flow, the mobile station shall

37 perform the following:

- 1 • If Layer 3 receives a *BCMC-Monitor.Request(BCMC_FLOW_ID, priority)* from the
2 BCMC Service Layer, Layer 3 shall perform the procedures specified in 2.6.13.1 to
3 commence reception of the BCMC flow.
- 4 • If Layer 3 receives a *BCMC-Browse.Request* from the BCMC Service Layer, Layer 3
5 shall perform the procedures specified in 2.6.13.7 to determine which BCMC flows
6 are currently available.

7 2.6.13.1 Procedures for commencing reception of a BCMC Flow

8 If Layer 3 is requested by the BCMC Service Layer to commence reception of a BCMC flow
9 (see 2.6.13), the mobile station shall perform the following procedures in the order
10 specified:

- 11 • If *SENDING_BSPM_s* equals '0', Layer 3 shall send a *BCMC-*
12 *Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause =*
13 *FLOW_NOT_AVAILABLE, reason_ind = CURRENT_SYS)* to the BCMC Service Layer
14 and shall not perform the remaining procedures in this section.
- 15 • If the stored *BCMC Service Parameters Message* parameters do not include this
16 BCMC_FLOW_ID (See section 2.6.13.11) and *FULL_BSPM_IND = '0'*, the mobile
17 station shall monitor the overhead channel to receive the *BCMC Service Parameters*
18 *Message* as specified in 2.6.2.2.18 until its stored *BCMC Service Parameters*
19 *Message* parameters include this BCMC_FLOW_ID, or until *FULL_BSPM_IND = '1'*
- 20 • The mobile station shall perform the following:
- 21 – If *FLOW_INFO_ON_OTHER_FREQ* equals '1', the mobile station shall perform
22 the following:
- 23 + If *FREQ_CHG_REG_REQUIRED_s* equals '1', the mobile station shall perform
24 BCMC registration procedures as specified in 2.6.13.3 to indicate change in
25 the frequency where the mobile station will reside to receive the *BCMC*
26 *Service Parameters Message*.
- 27 + The mobile station shall tune to the frequency specified by
28 *BSPM_CDMA_FREQ* and *BSPM_BAND_CLASS*; the mobile station should
29 tune to the new frequency only after performing BCMC registration specified
30 above (if any). If *FREQ_CHG_REG_TIMER_s* is not equal to NULL and the
31 BCMC frequency registration timer for the previous frequency is not enabled
32 or has expired, the mobile station shall start the BCMC frequency
33 registration timer for the previous frequency with a value of
34 *FREQ_CHG_REG_TIMER_s*.
- 35 + The mobile station shall monitor the overhead channel to receive the *BCMC*
36 *Service Parameters Message* as specified in 2.6.2.2.18, and shall perform the
37 following:

- 1 o If *SENDING_BSPM_s* equals '0', Layer 3 shall send a *BCMC-*
2 *Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause =*
3 *FLOW_NOT_AVAILABLE, reason_ind = CURRENT_SYS)* to the BCMC
4 Service Layer and shall not perform the remaining procedures in this
5 section.
- 6 o Otherwise, the mobile station shall perform the remaining procedures in
7 this section.
- 8 – If the stored *BCMC Service Parameters Message* parameters do not include this
9 BCMC_FLOW_ID (See section 2.6.13.11) and *AUTO_REQ_ALLOWED_IND_s*
10 equals '0', Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result*
11 *= FAILURE, cause = FLOW_NOT_AVAILABLE, reason_ind = CURRENT_SYS)* to the
12 BCMC Service Layer and shall not perform the remaining procedures in this
13 section.
- 14 – If the *BCMC Service Parameters Message* includes the BCMC flow indicated by
15 BCMC_FLOW_ID, BCMC_FLOW_ON_IND corresponding to this BCMC flow
16 equals '1', and BCMC_FLOW_ON_TRAFFIC_IND corresponding to this BCMC
17 flow equals '1', the mobile station shall either perform Mobile Station Origination
18 Operation as specified in 2.6.2.5 to request this flow in the *Mobile Station Control*
19 *on the Traffic Channel State* or monitor the flow in the *Mobile Station Idle State* as
20 specified in 2.6.13.2.
- 21 – If the stored *BCMC Service Parameters Message* does not include this
22 BCMC_FLOW_ID (See section 2.6.13.11), *AUTO_REQ_ALLOWED_IND_s* equals '1'
23 and *BCMC_ON_TRAFFIC_SUP_s* equals '1'; or the *BCMC Service Parameters*
24 *Message* includes the BCMC flow indicated by BCMC_FLOW_ID,
25 BCMC_FLOW_ON_IND corresponding to this BCMC flow equals '0', and
26 BCMC_FLOW_ON_TRAFFIC_IND corresponding to this BCMC flow equals '1',
27 the mobile station shall perform the following:
- 28 + The mobile station shall perform Mobile Station Origination Operation as
29 specified in 2.6.2.5 to request transmission of this BCMC flow. The mobile
30 station shall include the BCMC_FLOW_ID (See section 2.6.13.11) in the
31 *Origination Message*.
- 32 – If the stored *BCMC Service Parameters Message* parameters do not include this
33 BCMC_FLOW_ID (See section 2.6.13.11), *AUTO_REQ_ALLOWED_IND_s* equals
34 '1', and *BCMC_ON_TRAFFIC_SUP_s* equals '0'; or the stored *BCMC Service*
35 *Parameters Message* parameters include the BCMC flow indicated by
36 BCMC_FLOW_ID, BCMC_FLOW_ON_IND corresponding to this BCMC flow
37 equals '0', and BCMC_FLOW_ON_TRAFFIC_IND corresponding to this BCMC
38 flow equals '0', the mobile station shall perform the following:
- 39 + The mobile station shall send a *Registration Message* to request transmission
40 of this BCMC flow. Upon receiving conformation of delivery of the
41 *Registration Message*, the mobile station shall enable the BCMC wait timer
42 with a value of *BSPM_WAIT_TIME* seconds and shall wait for an updated
43 *BCMC Service Parameters Message*.

- 1 + If the BCMC wait timer expires, Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause =*
2 *FLOW_NOT_TRANSMITTED, reason_ind = CURRENT_SYS)* to the BCMC
3 Service Layer, and shall not perform the remaining procedures in this
4 section.
5
- 6 + If the mobile station receives a *BCMC Order* from the base station prior to
7 the expiration of the BCMC wait timer, the mobile station shall perform the
8 following:
- 9 o If *CLEAR_ALL_RETRY_DELAY_r* equals '1', the mobile station shall delete
10 the currently stored BCMC Retry Delay List.
- 11 o If *CLEAR_RETRY_DELAY_r* equals '1', the mobile station shall delete the
12 entry in the *BCMC_RETRY_DELAY_LIST_s[i]* corresponding to
13 *BCMC_FLOW_ID* (See section 2.6.13.11) in this message.
- 14 o If *ALL_BCMC_REASON_r* or *BCMC_REASON_r* equals '0000', Layer 3 shall
15 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause*
16 *= FLOW_NOT_AVAILABLE, reason_ind = CURRENT_SYS)* for each of the
17 corresponding *BCMC_FLOW_ID* to the BCMC Service Layer, and shall
18 not perform the remaining procedures in this section for the
19 corresponding *BCMC_FLOW_ID*.
- 20 o If *ALL_BCMC_REASON_r* or *BCMC_REASON_r* equals '0001', Layer 3 shall
21 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause*
22 *= FLOW_NOT_TRANSMITTED, reason_ind = CURRENT_SYS)* for each of
23 the corresponding *BCMC_FLOW_ID* to the BCMC Service Layer, and
24 shall not perform the remaining procedures in this section for the
25 corresponding *BCMC_FLOW_ID*.
- 26 o If *ALL_BCMC_REASON_r* or *BCMC_REASON_r* equals '0011', Layer 3 shall
27 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = SUCCESS,*
28 *reason_ind = REGISTRATION_ACCEPTED)* for each of the corresponding
29 *BCMC_FLOW_ID* to the BCMC Service Layer and shall not perform the
30 remaining procedures in this section for the corresponding
31 *BCMC_FLOW_ID*.
- 32 o If *ALL_BCMC_REASON_r* or *BCMC_REASON* equals '0100', Layer 3 shall
33 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause*
34 *= AUTHORIZATION_FAILURE, reason_ind = CURRENT_SYS)* for each of the
35 corresponding *BCMC_FLOW_ID* to the BCMC Service Layer, and shall
36 not perform the remaining procedures in this section for the
37 corresponding *BCMC_FLOW_ID*.
- 38 o If *ALL_BCMC_REASON_r* or *BCMC_REASON* equals '0101', the mobile
39 station shall perform the following:
- 40 ◇ Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result*
41 *= FAILURE, cause = RETRY_LATER, reason_ind = CURRENT_SYS)* for

- 1 each of the corresponding BCMC_FLOW_ID to the BCMC Service
2 Layer.
- 3 ◇ For each of the corresponding BCMC_FLOW_ID, if there is a
4 BCMC_RETRY_DELAY_LIST_s[i].BCMC_FLOW_ID which is same as
5 BCMC_FLOW_ID (See section 2.6.13.11), the mobile station shall set
6 BCMC_RETRY_DELAY_LIST_s[i].RETRY_DELAY to current system
7 time plus ALL_BCMC_RETRY_DELAY_r/BCMC_RETRY_DELAY_r;
8 otherwise, Layer 3 shall add new BCMC_RETRY_DELAY_LIST_s[i] to
9 the BCMC Retry Delay List and shall set
10 BCMC_RETRY_DELAY_LIST_s[i].BCMC_FLOW_ID to BCMC_FLOW_ID,
11 BCMC_RETRY_DELAY_LIST_s[i].RETRY_DELAY to current system
12 time plus ALL_BCMC_RETRY_DELAY_r/BCMC_RETRY_DELAY_r.
- 13 ◇ The mobile station shall not perform the remaining procedures in
14 this section for the corresponding BCMC_FLOW_ID.
- 15 o If the BCMC flow corresponding to this BCMC_FLOW_ID (See section
16 2.6.13.11) is included in the stored *BCMC Service Parameters Message*
17 parameters and BCMC_FLOW_ON_IND corresponding to this BCMC flow
18 changes to '1' prior to the expiration of the BCMC wait timer, the mobile
19 station shall disable the BCMC wait timer and perform the remaining
20 procedures in this section.
- 21 • The mobile station shall determine the Forward Supplemental Channel
22 corresponding to this BCMC_FLOW_ID from BCMC_FLOW_LIST_s. If the BCMC flow
23 corresponding to this BCMC_FLOW_ID is configured for transmission in the mobile
24 station's hash-to-frequency, the mobile station shall choose the mobile station's
25 hash-to-frequency; otherwise, the mobile station shall use the hash algorithm
26 specified in 2.6.7.1 and the number of CDMA channels on which this
27 BCMC_FLOW_ID is configured for transmission to choose the frequency to monitor.
28 The mobile station shall perform the following:
- 29 – The mobile station shall determine the Band Class (FSCH_BAND_CLASS) and
30 the CDMA channel (FSCH_FREQ) corresponding to the selected Forward
31 Supplemental Channel from FBSCH_LIST_s. If FSCH_BAND_CLASS is not equal
32 to CDMA_BAND_s or FSCH_FREQ is not equal to CDMACH_s and the mobile
33 station is currently monitoring one or more BCMC flows in the current
34 frequency that have a higher priority than the requested BCMC flow, Layer 3
35 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause =*
36 *CANNOT_ACCOMMODATE, reason_ind = CURRENT_SYS)* to the BCMC Service
37 Layer, and shall not perform the remaining procedures in this section.
- 38 – If the mobile station will not be able to monitor the Forward Supplemental
39 Channel on which the BCMC flow is being transmitted due to a capability
40 mismatch, Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result*
41 *= FAILURE, cause = UNSUPPORTED_BEARER_CONFIG, reason_ind =*
42 *CURRENT_SYS)* to the BCMC Service Layer, and shall not perform the
43 remaining procedures in this section.

- 1 • If FSCH_BAND_CLASS is not equal to CDMA_BAND_s or FSCH_FREQ is not equal to
2 CDMA_BAND_s, the mobile station shall perform the following:
- 3 – If FREQ_CHG_REG_REQUIRED_s equals ‘1’, the mobile station shall perform
4 BCMC registration procedures as specified in 2.6.13.3 to indicate change in the
5 frequency where the mobile station will reside while monitoring this BCMC flow.
- 6 – The mobile station shall tune to FSCH_FREQ in FSCH_BAND_CLASS; the
7 mobile station should tune to the new frequency only after performing BCMC
8 registration specified above (if any). If FREQ_CHG_REG_TIMER_s is not equal to
9 NULL and the BCMC frequency registration timer for the previous frequency is
10 not enabled or has expired, the mobile station shall start the BCMC frequency
11 registration timer for the previous frequency with a value of
12 FREQ_CHG_REG_TIMER_s.
- 13 – For each BCMC flow in current frequency that can no longer be monitored in
14 new frequency, the mobile station shall perform the following:
- 15 + Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result =*
16 *FAILURE, cause = CANNOT_ACCOMMODATE, reason_ind = CURRENT_SYS)* to
17 the BCMC Service Layer.
- 18 + Layer 3 shall send a *BMAC-Stop-Deliver.Request(FSCH_ID, BSR_ID)* to the
19 multiplex sublayer where *FSCH_ID* and *BSR_ID* are the values in
20 *BCMC_FLOW_LIST_s* corresponding to this *BCMC_FLOW_ID*.
- 21 • The mobile station shall set the Forward Supplemental Channel parameters as
22 given in *FBSCH_LIST_s* and shall start to monitor the Forward Supplemental
23 Channel.
- 24 • The mobile station shall send a *BMAC-Start-Deliver.Request(FSCH_ID, BSR_ID)* to the
25 multiplex sublayer where *FSCH_ID* and *BSR_ID* are the values in
26 *BCMC_FLOW_LIST_s* corresponding to the logical-to-physical mapping selected for
27 this *BCMC_FLOW_ID*.
- 28 • The mobile station shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID,*
29 *result=SUCCESS)* to the BCMC Service Layer.
- 30 • The mobile station shall perform the procedures as specified in 2.6.13.2 while
31 monitoring the Forward Supplemental Channel

32 2.6.13.2 Procedures while monitoring an Forward Supplemental Channel

33 While monitoring a Forward Supplemental Channel, the mobile station shall perform the
34 following:

- 35 • The mobile station shall determine the hash-to frequency based on received CDMA
36 Channel List Message or the Extended CDMA Channel List Message but shall not
37 tune to the hash-to frequency. If FREQ_CHG_REG_REQUIRED_s equals ‘1’ and the
38 mobile station determines that the hash-to frequency has changed and the mobile
39 station currently resides in the previous hash-to frequency, the mobile station shall
40 perform BCMC registration procedures as specified in 2.6.13.3 to indicate current
41 frequency.

- 1 • If the mobile station performs an idle handoff (see 2.6.2.1.4), the mobile station
2 shall perform the procedures as specified in 2.6.13.4. If the idle handoff results in
3 the mobile station residing in a frequency other than the frequency prior to the idle
4 handoff, the mobile station shall perform the following:
- 5 – If `FREQ_CHG_REG_REQUIREDs` equals '1', the mobile station shall perform
6 BCMC registration procedures as specified in 2.6.13.3 to indicate change in the
7 frequency where the mobile station will reside while monitoring this BCMC flow.
8 If `FREQ_CHG_REG_TIMERs` is not equal to NULL and the BCMC frequency
9 registration timer for the previous frequency is not enabled or is enabled and
10 has not expired, the mobile station shall start the BCMC frequency registration
11 timer for the previous frequency with a value of `FREQ_CHG_REG_TIMERs`.
- 12 • If the `BCMC_FLOW_LISTs[i].REGISTRATION_REQ_FLAG` is equal to '1' for any
13 BCMC flow being monitored by the mobile station, then the mobile station shall
14 perform BCMC registration procedures as specified in 2.6.13.3 if any of the
15 following conditions are true:
- 16 – The mobile station determines that
17 `BCMC_FLOW_LISTs[i].REGISTRATION_REQ_FLAG` was set to '0' since the last
18 time the mobile station initiated registration procedures due to
19 `BCMC_FLOW_LISTs[i].REGISTRATION_REQ_FLAG`.
- 20 – The mobile station cannot determine that
21 `BCMC_FLOW_LISTs[i].REGISTRATION_REQ_FLAG` was not set to '0' since the
22 last time the mobile station initiated registration procedures due to
23 `BCMC_FLOW_LISTs[i].REGISTRATION_REQ_FLAG`.
- 24 • If Layer 3 receives a *BCMC-Stop-Monitor.Request(BCMC_FLOW_ID)* from the BCMC
25 Service Layer, Layer 3 shall stop monitoring this BCMC flow as specified in
26 2.6.13.5.
- 27 • If Layer 3 receives a *BCMC-Monitor.Request(BCMC_FLOW_ID, priority)* from the
28 BCMC Service Layer, Layer 3 shall perform the procedures specified in 2.6.13.1 to
29 commence reception of the BCMC flow.
- 30 • If the mobile station determines that the content of the *BCMC Service Parameters*
31 *Message* has changed, Layer 3 shall perform the procedures as specified in
32 2.6.13.6.
- 33 • If the BCMC frequency registration timer for the frequency where the mobile station
34 is currently residing expires, the mobile station shall perform BCMC registration
35 procedures as specified in 2.6.13.3 to indicate current frequency.

36 2.6.13.3 Procedures for BCMC Registration

37 If the mobile station is to perform BCMC registration due to the
38 `REGISTRATION_REQ_FLAG` indicator being set, the mobile station shall perform the
39 following:

- 1 • If this is the first time $\text{BCMC_FLOW_LIST}_s[i].\text{REGISTRATION_REQ_FLAG}$ is set to '1'
- 2 for this BCMC flow received after an idle handoff, the mobile station shall perform a
- 3 BCMC registration immediately.
- 4 • Otherwise, if the BCMC registration required timer is not enabled, the mobile
- 5 station shall perform the following:
 - 6 – Enable the BCMC registration required timer with the initial value set to a
 - 7 pseudorandom value between 0 and $\text{REGISTRATION_REQ_TIMER_MAX}$.
 - 8 – Subsequently, if the $\text{BCMC_FLOW_LIST}_s[i].\text{REGISTRATION_REQ_FLAG}$ for all
 - 9 BCMC flows being monitored by the mobile station are equal to '0', the mobile
 - 10 station shall disable the BCMC registration required timer.
 - 11 – Otherwise, when the BCMC registration required timer expires, the mobile
 - 12 station shall perform a BCMC registration.

13 If the mobile station is to perform BCMC registration due to a frequency change, layer 3
14 shall perform the following:

- 15 • If the BCMC frequency registration timer for target frequency is enabled and has not
- 16 expired, the mobile station shall not perform the remaining procedures in this
- 17 section.
- 18 • Otherwise, the mobile station shall enter the System Access State with a
- 19 registration indication.

20 2.6.13.4 Procedures for Idle Handoff while Monitoring Forward Supplemental Channel

21 While monitoring a Forward Supplemental Channel, if the conditions for performing an idle
22 handoff are detected (see 2.6.2.1.4), the mobile station shall perform an idle handoff as
23 specified in this section.

24 When the mobile station performs an idle handoff the BCMC registration required timer
25 shall be disabled.

26 While performing an idle handoff, the mobile station should not begin operating in non-
27 slotted mode after the idle handoff if all of the following conditions hold:

- 28 • The mobile station supports the Quick Paging Channel;
- 29 • The mobile station has knowledge that the new base station supports configuration
- 30 change indicators;
- 31 • The mobile station determines that the Quick Paging Channel configuration change
- 32 indicator for the new Quick Paging Channel is set to "OFF" (see 2.6.2.1.2.1); and
- 33 • No more than T_{31m} seconds have elapsed since the mobile station last received a
- 34 valid message on the new Paging Channel or Forward Common Control
- 35 Channel/Primary Broadcast Control Channel.

36 Otherwise, the mobile station shall operate in non-slotted mode until the mobile station
37 has received at least one valid configuration message or mobile station-addressed page on
38 the new Paging Channel or Forward Common Control Channel/Primary Broadcast Control
39 Channel. Following the reception of this message the mobile station may resume slotted

1 mode operation in accordance with 2.6.2.1.1.3. After performing an idle handoff, the
2 mobile station shall discard all unprocessed messages received on the old Paging Channel
3 or Forward Common Control Channel/Primary Broadcast Control Channel.

4 If the new base station is listed in NGHBR_REC_LIST for the old base station (see 2.6.2.2.3,
5 2.6.2.2.7, and 2.6.2.1.4.1), the mobile station shall use the corresponding 3-bit
6 NGHBR_CONFIG field to determine the actions required to transition to the new base
7 station. If the new base station is not listed in NGHBR_REC_LIST for the old base station,
8 the mobile station shall perform the handoff operation using the same procedure as for a
9 pilot in NGHBR_REC_LIST with the NGHBR_CONFIG field set to '011'.

10 If the new base station is listed in BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k]
11 record of the current base station, the mobile station shall use the corresponding 3-bit
12 NGHBR_BCMC_CONFIG field to determine the actions required to monitor the Forward
13 Supplemental Channel of the new base station. If the new base station is not listed in
14 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k] record for the current base station, the
15 mobile station shall determine the actions required to monitor the Forward Supplemental
16 Channel of the new base station using the same procedure as for a pilot in
17 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k] record with the
18 NGHBR_BCMC_CONFIG field set to '000'.

19 If the mobile station is currently monitoring the Paging Channel and selected a neighbor
20 base station for idle handoff which supports Primary Broadcast Control Channel, the
21 mobile station shall perform the following:

- 22 • If the mobile station has not received parameters for the Primary Broadcast Control
23 Channel of the neighbor base station from the *BCMC System Parameters Message*,
24 the mobile station shall enter the System Determination Substate of the Mobile
25 Station Initialization State with a new system indication, upon performing idle
26 handoff to this neighbor base station.
- 27 – Upon entering the Mobile Station Idle State of the new system, the mobile
28 station shall resume monitoring the BCMC flow(s) as specified in 2.6.13.6.
- 29 – The mobile station shall not perform any of the remaining procedures in this
30 section.

31 If the NGHBR_CONFIG field is '011', the mobile station shall perform the following:

- 32 • Enter the System Determination Substate of the Mobile Station Initialization State
33 with a new system indication (see 2.6.1.1)
- 34 • Upon entering the Mobile Station Idle State of the new system, the mobile station
35 shall resume monitoring the BCMC flow(s) as specified in 2.6.13.6.
- 36 • The mobile station shall not perform any of the remaining procedures in this
37 section.

38 If the NGHBR_BCMC_CONFIG field is '000' or '011', the mobile station shall perform the
39 following:

- 1 • The mobile station shall perform idle handoff according to the procedures in
2 2.6.2.1.4.1 just as if the mobile station is currently not monitoring a Forward
3 Supplemental Channel.
- 4 • Upon completing the idle handoff, the mobile station shall resume monitoring the
5 BCMC flow as specified in 2.6.13.6.

6 If the NGHBR_BCMC_CONFIG field is '001' or '010', the mobile station shall perform the
7 following:

- 8 • If the mobile station has monitored the Paging Channel before the idle handoff, or
9 the mobile station has monitored the Forward Common Control Channel/Primary
10 Broadcast Control Channel before the idle handoff and NGHBR_CONFIG field is set
11 to '001', the mobile station shall perform the following:
 - 12 – The mobile station shall set ACC_MSG_SEQ_s, GAPM_SEQ_s and
13 CURR_ACC_MSG_SEQ to NULL and shall set PILOT_PN_s to the pilot offset index
14 of the base station transmitting the new Paging Channel.
 - 15 – If the stored information for any of the Paging Channels on the associated
16 NGHBR_FSCH_FREQ of the new base station is current, the mobile station shall
17 perform the following:
 - 18 + The mobile station shall use the hash algorithm specified in 2.6.7.1 to select
19 a new Paging Channel number in the range 1 to PAGE_CHAN_s, where
20 PAGE_CHAN_s is the value stored for the Paging Channel whose stored
21 information is current. The mobile station shall store the new Paging
22 Channel number as PAGECH_s. The mobile station shall perform the
23 following:
 - 24 o If the mobile station has not stored configuration parameters for the new
25 Paging Channel, or if the stored parameters are not current (see 2.6.2.2),
26 the mobile station shall set CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s,
27 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
28 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
29 EXT_SYS_PAR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
30 PRI_NGHBR_LST_MSG_SEQ_s, and
31 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
32 FD_CHAN_LST_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
33 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
34 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s and
35 GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
 - 36 o If the stored information for the new Paging Channel is current, the
37 mobile station shall set CONFIG_MSG_SEQ_s to the stored information
38 for the new Paging Channel and set NGHBR_REC_LIST, FBSCH_LIST_s,
39 and BCMC_FLOW_LIST_s to the stored information for the new Paging
40 Channel.

- 1 + If the mobile station has monitored the Forward Common Control
2 Channel/Primary Broadcast Control Channel before the idle handoff, the
3 mobile station shall set $PRAT_S = '00'$.
- 4 + If $CDMACH_S$ is not equal to $NGHBR_FSCH_FREQ$, the mobile station shall
5 set $CDMACH_S$ to $NGHBR_FSCH_FREQ$ and tune to the new CDMA Channel.
6 The mobile station shall begin monitoring the new Paging Channel and the
7 Forward Supplemental Channel of the new base station.
- 8 – If none of the Paging Channel stored information on the associated
9 $NGHBR_FSCH_FREQ$ of the new base station are current, the mobile station
10 shall perform the following:
- 11 + The mobile station shall set $CONFIG_MSG_SEQ_S$, $SYS_PAR_MSG_SEQ_S$,
12 $NGHBR_LST_MSG_SEQ_S$, $EXT_NGHBR_LST_MSG_SEQ_S$,
13 $GEN_NGHBR_LST_MSG_SEQ_S$, $CHAN_LST_MSG_SEQ_S$,
14 $EXT_SYS_PAR_MSG_SEQ_S$, $GLOB_SERV_REDIR_MSG_SEQ_S$,
15 $EXT_GLOB_SERV_REDIR_MSG_SEQ_S$, $EXT_CHAN_LST_MSG_SEQ_S$,
16 $FD_CHAN_LST_MSG_SEQ_S$, $USER_ZONE_ID_MSG_SEQ_S$,
17 $AP_PILOT_INFO_MSG_SEQ_S$, $AP_IDT_MSG_SEQ_S$, $AP_ID_TEXT_MSG_SEQ_S$,
18 $GOI_MSG_SEQ_S$, $FREQ_GOI_MSG_SEQ_S$, $ATIM_MSG_SEQ_S$,
19 $HDPPM_MSG_SEQ_S$ and $PRI_NGHBR_LST_MSG_SEQ_S$ to NULL.
- 20 + If the mobile station has monitored the Forward Common Control
21 Channel/Primary Broadcast Control Channel before the idle handoff, the
22 mobile station shall set $PRAT_S = '00'$.
- 23 + The mobile station shall set $PAGE_CHAN_S$ to '1' and $PAGECH_S$ to the
24 Primary Paging Channel. If $CDMACH_S$ is not equal to $NGHBR_FSCH_FREQ$,
25 the mobile station shall set $CDMACH_S$ to $NGHBR_FSCH_FREQ$ and tune to
26 the new CDMA Channel. The mobile station shall begin monitoring the
27 Primary Paging Channel and Forward Supplemental Channel of the new
28 base station.
- 29 If $PACA_S$ is equal to enabled, the mobile station shall enter the *Update Overhead*
30 *Information Substate* of the *System Access State* (see 2.6.3) with an origination
31 indication within T_{33m} seconds to re-originate the PACA call using the new base
32 station.
- 33 • If the mobile station has monitored the Forward Common Control Channel/Primary
34 Broadcast Control Channel before the idle handoff or if the mobile station has
35 monitored the Paging Channel before the idle handoff, and selected a neighbor base
36 station for idle handoff which supports Primary Broadcast Control Channel and the
37 mobile station has received parameters for the Primary Broadcast Control Channel
38 of the neighbor base station from the *BCMC System Parameters Message*, the mobile
39 station shall perform the following:
- 40 – The mobile station shall set $ACC_MSG_SEQ_S$, $GAPM_SEQ_S$ and
41 $CURR_ACC_MSG_SEQ$ to NULL and shall set $PILOT_PN_S$ to the pilot offset index
42 of the base station transmitting the new Forward Common Control
43 Channel/Primary Broadcast Control Channel.

- 1 – If the stored information for any of the Forward Common Control Channels and
2 Primary Broadcast Control Channel on the associated NGHBR_FSCH_FREQ of
3 the new base station is current, the mobile station shall perform the following:
- 4 + The mobile station shall use the hash algorithm specified in 2.6.7.1 to select
5 a new Forward Common Control Channel number in the range 1 to
6 NUM_FCCCH_s, where NUM_FCCCH_s is the stored value. The mobile station
7 shall store the new Forward Common Control Channel number as
8 FCCCH_ID_s. The mobile station shall perform the following:
- 9 o If the mobile station has not stored configuration parameters for the new
10 Forward Common Control Channel and Primary Broadcast Control
11 Channel, or if the stored parameters are not current (see 2.6.2.2), the
12 mobile station shall set CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s,
13 UNI_NGHBR_LST_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s,
14 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
15 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
16 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
17 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
18 ATIM_MSG_SEQ_s, HDPPM_MSG_SEQ_s and
19 PRI_NGHBR_LST_MSG_SEQ_s to NULL.
- 20 o If the stored information for the new Forward Common Control Channel
21 and Primary Broadcast Control Channel is current, the mobile station
22 shall set CONFIG_MSG_SEQ_s to the stored information for the new
23 Forward Common Control Channel and Primary Broadcast Control
24 Channel and set NGHBR_REC_LIST to the stored information for the new
25 Forward Common Control Channel and Primary Broadcast Control
26 Channel.
- 27 + If CDMACH_s is not equal to NGHBR_FSCH_FREQ, the mobile station shall
28 set CDMACH_s to NGHBR_FSCH_FREQ and tune to the new CDMA Channel.
29 The mobile station shall begin monitoring the new Forward Common Control
30 Channel/Primary Broadcast Control Channel and the Forward
31 Supplemental Channel of the new base station.
- 32 – If none of the Forward Common Control Channel and Primary Broadcast
33 Control Channel stored information on the associated NGHBR_FSCH_FREQ of
34 the new base station are current, the mobile station shall perform the following:
- 35 + The mobile station shall set the mobile station shall set
36 CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s,
37 UNI_NGHBR_LST_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s,
38 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
39 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
40 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
41 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s,
42 HDPPM_MSG_SEQ_s and PRI_NGHBR_LST_MSG_SEQ_s to NULL.

- 1 + If $CDMACH_S$ is not equal to $NGHBR_FSCH_FREQ$, the mobile station shall
 2 set $CDMACH_S$ to $NGHBR_FSCH_FREQ$ and tune to the new CDMA Channel.
 3 The mobile station shall begin monitoring the Primary Broadcast Control
 4 Channel of the new base station, using the same rate, code rate, and code
 5 channel. The mobile station shall begin monitoring the Forward
 6 Supplemental Channel of the new base station.
- 7 – If $PACA_S$ is equal to enabled, the mobile station shall enter the *Update Overhead*
 8 *Information Substate* of the *System Access State* (see 2.6.3) with an origination
 9 indication within T_{33m} seconds to re-originate the PACA call using the new base
 10 station.

11 2.6.13.5 Procedures for stopping reception of a BCMC Flow

12 If Layer 3 is requested by the BCMC Service Layer to stop monitoring a BCMC flow given by
 13 $BCMC_FLOW_ID$, the mobile station perform the following:

- 14 • Layer 3 shall send a *BMAC-Stop-Deliver.Request(FSCH_ID, BSR_ID)* to the multiplex
 15 sublayer where $FSCH_ID$ and BSR_ID are the values in $BCMC_FLOW_LIST_S$
 16 corresponding to this $BCMC_FLOW_ID$.
- 17 • If this is the only BCMC flow being monitored on this Forward Supplemental
 18 Channel, the mobile station shall stop monitoring this Forward Supplemental
 19 Channel.
- 20 • If this is the only BCMC flow being monitored on this frequency, the mobile station
 21 shall return to the hash-to frequency as follows:
- 22 – If the mobile station is currently monitoring the Paging Channel, the mobile
 23 station shall monitor the CDMA Channel List Message or Extended CDMA
 24 Channel List Message to determine the hash-to frequency as specified in
 25 2.6.2.2.4 and 2.6.2.2.12.1 respectively.
- 26 – If the mobile station is currently monitoring the Primary Broadcast Control
 27 Channel/Forward Common Control Channel, the mobile station shall monitor
 28 the *Extended CDMA Channel List Message* to determine the hash-to frequency as
 29 specified in 2.6.2.2.12.2.
- 30 – If this results in the mobile station residing in a frequency other than the
 31 frequency prior to stopping BCMC flow reception, the mobile station shall
 32 perform BCMC registration procedures as specified in 2.6.13.3 to indicate
 33 change in the frequency.

34 2.6.13.6 Procedures for Handling *BCMC Service Parameters Message* Updates

35 If the mobile station determines that the contents of the *BCMC Service Parameters Message*
 36 has changed or that the *BCMC Service Parameters Message* is not being transmitted
 37 anymore, the mobile station shall perform the following:

- 38 • If $SENDING_BSPM_S$ equals '0', the mobile station shall perform the following:
- 39 – For each BCMC flow currently being monitored, Layer 3 shall send a *BCMC-*
 40 *Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause =*

- 1 *FLOW_NOT_AVAILABLE, reason_ind*) to the BCMC Service Layer, where
 2 *reason_ind* is set to MOBILITY if this is due to idle handoff or to CURRENT_SYS
 3 otherwise.
- 4 – For each BCMC flow currently being monitored, Layer 3 shall send a *BMAC-*
 5 *Stop-Deliver.Request(FSCH_ID, BSR_ID)* to the multiplex sublayer where *FSCH_ID*
 6 and *BSR_ID* are the values in the previous BCMC_FLOW_LIST corresponding to
 7 this BCMC_FLOW_ID.
- 8 – The mobile station shall not perform the remaining procedures in this section.
- 9 • For each BCMC flow that the mobile station is currently monitoring, if the mobile
 10 station determines that the base station is not transmitting this BCMC flow
 11 anymore, the mobile station shall perform the following:
- 12 – Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE,*
 13 *cause= FLOW_NOT_AVAILABLE, reason_ind)* to the BCMC Service Layer, where
 14 *reason_ind* is set to MOBILITY if this is due to idle handoff or to CURRENT_SYS
 15 otherwise, and shall stop monitoring this BCMC flow as specified in 2.6.13.5.
- 16 • For each BCMC flow that the mobile station is currently monitoring, if the mobile
 17 station determines that this BCMC flow is being transmitted on a different Forward
 18 Supplemental Channel than currently transmitted, the mobile station shall perform
 19 the following:
- 20 – If more than one BCMC flows that the mobile station is currently monitoring are
 21 still available, then the mobile station shall choose the frequency based on the
 22 BCMC flow with the highest priority; if the BCMC flow is configured for
 23 transmission in the mobile station's hash-to-frequency, the mobile station shall
 24 choose the mobile station's hash-to-frequency; otherwise, the mobile station
 25 shall use the hash algorithm specified in 2.6.7.1 and the number of CDMA
 26 channels on which this BCMC_FLOW_ID is configured for transmission to
 27 choose the frequency to monitor.
- 28 – Layer 3 shall send a *BMAC-Stop-Deliver.Request(FSCH_ID, BSR_ID)* to the
 29 multiplex sublayer where *FSCH_ID* and *BSR_ID* are the values in the previous
 30 BCMC_FLOW_LIST corresponding to this BCMC_FLOW_ID.
- 31 – The mobile station shall determine the band class (*FSCH_BAND_CLASS*) and
 32 CDMA channel (*FSCH_FREQ*) corresponding to the selected Forward
 33 Supplemental Channel from *FBSCH_LIST_s*. If *FSCH_BAND_CLASS* is not equal
 34 to *CDMA_BAND_s* or *FSCH_FREQ* is not equal to *CDMACH_s* and the mobile
 35 station is currently monitoring one or more BCMC flows in the current
 36 frequency that have a higher priority than this BCMC flow, Layer 3 shall send a
 37 *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause =*
 38 *CANNOT_ACCOMMODATE, reason_ind)* to the BCMC Service Layer, where
 39 *reason_ind* is set to MOBILITY if this is due to idle handoff or to CURRENT_SYS
 40 otherwise, and shall not perform the remaining procedures in this section.
- 41 – If the mobile station will not be able to monitor the Forward Supplemental
 42 Channel on which the BCMC flow is being transmitted due to a capability

- 1 mismatch, Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result*
 2 *= FAILURE, cause = UNSUPPORTED_BEARER_CONFIG, reason_ind)* to the BCMC
 3 Service Layer, where *reason_ind* is set to MOBILITY if this is due to idle handoff
 4 or to CURRENT_SYS otherwise, and shall not perform the remaining procedures
 5 in this section for this BCMC flow.
- 6 – If FSCH_BAND_CLASS is not equal to CDMA_BAND_s or FSCH_FREQ is not
 7 equal to CDMACH_s, the mobile station shall perform the following:
 - 8 + If FREQ_CHG_REG_REQUIRED_s equals ‘1’, the mobile station shall perform
 9 BCMC registration procedures as specified in 2.6.13.3 to indicate change in
 10 the frequency where the mobile station will reside while monitoring this
 11 BCMC flow.
 - 12 + The mobile station shall tune to FSCH_FREQ in FSCH_BAND_CLASS; the
 13 mobile station should tune to the new frequency only after performing
 14 BCMC registration (if any) specified above. If FREQ_CHG_REG_TIMER_s is
 15 not equal to NULL and the BCMC frequency registration timer for the
 16 previous frequency is not enabled or is enabled and has not expired, the
 17 mobile station shall start the BCMC frequency registration timer for the
 18 previous frequency with a value of FREQ_CHG_REG_TIMER_s.
 - 19 + For each BCMC flow in current frequency that can no longer be monitored in
 20 new frequency, the mobile station shall perform the following:
 - 21 o Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID,*
 22 *result=FAILURE, cause= CANNOT_ACCOMMODATE, reason_ind)* to the
 23 BCMC Service Layer, where *reason_ind* is set to MOBILITY if this is due
 24 to idle handoff or to CURRENT_SYS otherwise.
 - 25 o Layer 3 shall send a *BMAC-Stop-Deliver.Request(FSCH_ID, BSR_ID)* to the
 26 multiplex sublayer where *FSCH_ID* and *BSR_ID* are the values in
 27 BCMC_FLOW_LIST_s corresponding to this BCMC_FLOW_ID.
 - 28 – The mobile station shall set the Forward Supplemental Channel parameters as
 29 given in FBSCH_LIST_s and shall start to monitor the Forward Supplemental
 30 Channel.
 - 31 – The mobile station shall send a *BMAC-Start-Deliver.Request(FSCH_ID, BSR_ID)* to
 32 the multiplex sublayer where *FSCH_ID* and *BSR_ID* are the values in
 33 BCMC_FLOW_LIST_s corresponding to the logical-to-physical mapping selected
 34 for this BCMC_FLOW_ID.
 - 35 • For any BCMC flow that the mobile station is currently monitoring, if the mobile
 36 station determines to monitor this BCMC flow on a traffic channel (e.g.,
 37 BCMC_FLOW_ON_IND corresponding to this BCMC flow equals ‘0’, and
 38 BCMC_FLOW_ON_TRAFFIC_IND corresponding to this BCMC flow equals ‘1’), the
 39 mobile station shall perform the following:
 - 40 – For each BCMC flow currently being monitored in the *Mobile Station Idle State*,
 41 Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE,*

1 *cause= CANNOT_ACCOMMODATE, reason_ind*) to the BCMC Service Layer,
 2 where *reason_ind* is set to MOBILITY if this is due to idle handoff or to
 3 CURRENT_SYS otherwise, and shall stop monitoring this BCMC flow as
 4 specified in 2.6.13.5.

- 5 – The mobile station shall perform Mobile Station Origination Operation as
 6 specified in 2.6.2.5 to request monitoring of this BCMC flow on the *Traffic*
 7 *Channel Substate*. The mobile station shall include the BCMC_FLOW_ID (See
 8 section 2.6.13.11) in the *Origination Message*.

9 2.6.13.7 Procedures for Browsing BCMC Flows

10 If Layer 3 is requested by the BCMC Service Layer to report list of all available BCMC flows
 11 (see 2.6.13), the mobile station shall perform the following procedures in the order
 12 specified:

- 13 • If SENDING_BSPM_s equals '0', Layer 3 shall send a *BCMC-*
 14 *Browse.Response(result=FAILURE)* to the BCMC Service Layer.
- 15 • Otherwise, if FULL_BSPM_IND = '0', the mobile station shall monitor the overhead
 16 channel to receive the *BCMC Service Parameters Message* as specified in 2.6.2.2.18
 17 or until FULL_BSPM_IND = '1', and shall perform the following:
 - 18 – Layer 3 shall send a *BCMC-Browse.Response(result = SUCCESS,*
 19 *{BCMC_FLOW_IDS}*) to the BCMC Service Layer where *{BCMC_FLOW_IDS}* is a
 20 list of all unique BCMC flows configured for transmission in this sector as
 21 determined from the stored *BCMC Service Parameters Message* parameters.

22 2.6.13.8 Procedures for BCMC Operation while on Traffic Channel

23 This section specifies the mobile station requirements for BCMC feature while in the Mobile
 24 Station Control on the Traffic Channel State.

25 If Layer 3 is requested by the BCMC Service Layer to commence reception of a BCMC flow
 26 (see 2.6.13), the mobile station shall send *Enhanced Origination Message* as specified in
 27 2.6.4.3.

28 If Layer 3 is requested by the BCMC Service Layer to stop monitoring a BCMC flow (see
 29 2.6.13), the mobile station shall release a BCMC call as specified in 2.6.4.3.

30 If the mobile station is monitoring BCMC flow on traffic channel, when traffic channel is
 31 released and the BCMC Service Layer has not requested to stop monitoring the BCMC flow,
 32 the mobile station shall either continue monitoring the BCMC flow in idle state (see 2.6.13)
 33 or the Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE,*
 34 *cause = CALL_RELEASED)* to the BCMC Service Layer.

35 2.6.13.9 Procedures for Computation of Authorization Signature

36 For each BCMC flow included in the *Registration Message, Origination Message, Page*
 37 *Response Message* and *Enhanced Origination Message*, if
 38 BCMC_FLOW_LIST_s[i].AUTH_SIGNATURE_REQ_IND equals '1', then the mobile station
 39 shall compute the Authorization Signature value for the BCMC flow as follows:

- The mobile station shall create an input working buffer to EHMACSHA as shown in Table 2.6.13.9 1.

Table 2.6.13.9-1. Subfields of the input working buffer

Subfield	Length (bits)
TIME_STAMP_LONG	TIME_STAMP_LONG_LENGTHs

TIME_STAMP_LONG The mobile station shall set this field to the LSBs of the CDMA System Time, in units of $2^{\text{TIME_STAMP_UNIT}_s}$ slots, corresponding to a time that is not later than when the Physical Layer will begin transmission of the *Registration Message*, *Origination Message*, *Page Response Message*, or *Enhanced Origination Message* that will carry this Authorization Signature. The mobile station shall use the same TIME_STAMP_LONG field for computing all Authorization Signature parameters included in a *Registration Message*, *Origination Message*, *Page Response Message* or a *Enhanced Origination Message*.

- The mobile terminal shall compute the Authorization Signature value as follows using the EHMACSHA procedure as specified in [43], section 3.3.
 - The KEY parameter of EHMACSHA shall be set to BAK.
 - The L_KEY parameter of EHMACSHA shall be set to 16, identifying the length of BAK in octets.
 - The MESSAGE parameter of EHMACSHA shall be set to the pointer to the most significant bit of the input working buffer.
 - The MESSAGE_OFFSET parameter of EHMACSHA shall be set to 0.
 - The MESSAGE_LENGTH parameter of EHMACSHA shall be set to the number of bits of data in the input working buffer
 - The HMAC parameter of EHMACSHA shall be set to the pointer to the most significant bit of the output buffer that will contain the computed MAC value.
 - The L_HMAC parameter of EHMACSHA shall be set to 4, identifying the length of the output in octets.

The mobile station shall set the AUTH_SIGNATURE field to the 32 least significant bits of the Message Digest computed MAC value obtained in the previous step.

2.6.13.10 Procedures for Public Long Code Mask schemes

2.6.13.10.1 Procedures for BCMC Flow ID based autonomous PLCM generation

The Public Long Code Mask of the Forward Supplemental Channel to be received in idle state is determined as follows:

- If the first occurrence of the BCMC_FLOW_ID (see section 2.6.13.11) in the *BCMC Service Parameters Message* multiplexed on this Forward Supplemental Channel is 16bits, FIRST_FLOW_ID shall be set as follows.

- 1 - The 16 MSBs shall be set to sixteen '0's.
- 2 - The 16 LSBs shall be set to the BCMC_FLOW_ID.
- 3 • If the first occurrence of the BCMC_FLOW_ID (see section 2.6.13.11) in the *BCMC*
4 *Service Parameters Message* multiplexed on this Forward Supplemental Channel is
5 24bits, FIRST_FLOW_ID shall be set as follows.
- 6 - The 8 MSBs shall be set to eight '0's.
- 7 - The 24 LSBs shall be set to the BCMC_FLOW_ID.
- 8 • If the first occurrence of the BCMC_FLOW_ID (see section 2.6.13.11) in the *BCMC*
9 *Service Parameters Message* multiplexed on this Forward Supplemental Channel is
10 32bits, FIRST_FLOW_ID shall be set to the BCMC_FLOW_ID.
- 11 • Set the FIRST_BSR_ID to the BSR_ID corresponding to the FIRST_FLOW_ID in the
12 *BCMC Service Parameters Message* multiplexed on this Forward Supplemental
13 Channel.
- 14 • PLCM_42 is set as follows.
- 15 - Bits P41 through P35 shall be set to '1100111'.
- 16 - Bits P34 through P3 shall be set to FIRST_FLOW_ID.
- 17 - Bits P2 through P0 shall be set to FIRST_BSR_ID.

18 2.6.13.10.2 Procedures for index based PLCM generation

19 The Public Long Code Mask of the Forward Supplemental Channel to be received in idle
20 state is determined as follows:

- 21 • PLCM_42 is set as follows.
- 22 - Bits P41 through P24 shall be set to '110011100110111000'.
- 23 - Bits P23 through P16 shall be set to FSCH_PLCM_INDEX_s.
- 24 - Bits P15 through P0 shall be set to '0000000000000000'.

25 2.6.13.11 BCMC_FLOW_ID generation

26 The BCMC_FLOW_ID structure is shown in Figure 2.6.13.11-1.

27

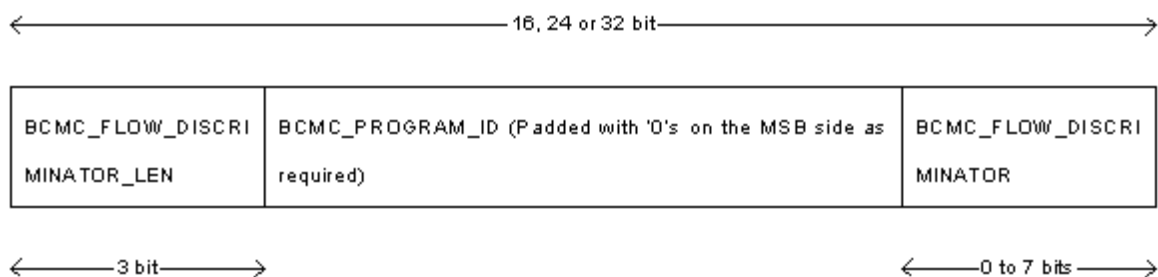

Figure 2.6.13.11-1. Structure of BCMC_FLOW_ID

BCMC_FLOW_ID is obtained by concatenating the BCMC_FLOW_DISCRIMINATOR_LEN field, the BCMC_PROGRAM_ID field, and BCMC_FLOW_DISCRIMINATOR fields as follows:

- The exact contents of the 3 bit BCMC_FLOW_DISCRIMINATOR_LEN field,
- The unsigned binary value of the BCMC_PROGRAM_ID field padded with '0's on the most significant bits as necessary to satisfy the following:
 - If the sum of the lengths of the BCMC_FLOW_DISCRIMINATOR_LEN, BCMC_PROGRAM_ID, and BCMC_FLOW_DISCRIMINATOR fields is less than or equal to 16 bits, then the BCMC_FLOW_ID shall be of 16 bits length.
 - If the sum of the lengths of the BCMC_FLOW_DISCRIMINATOR_LEN, BCMC_PROGRAM_ID, and BCMC_FLOW_DISCRIMINATOR fields is less than or equal to 24 bits but greater than 16 bits, then the BCMC_FLOW_ID shall be of 24 bits length.
 - If the sum of the lengths of the BCMC_FLOW_DISCRIMINATOR_LEN, BCMC_PROGRAM_ID, and BCMC_FLOW_DISCRIMINATOR fields is less than or equal to 32 bits but greater than 24 bits, then the BCMC_FLOW_ID shall be of 32 bits length.
- and the exact content of the BCMC_FLOW_DISCRIMINATOR field, where the length of this field is specified by the value of BCMC_FLOW_DISCRIMINATOR_LEN.

The length of a BCMC_FLOW_ID shall be 16, 24, or 32 bits.

2.6.13.12 BCMC TDM

Base station may multiplex multiple BCMC flows on a single F-SCH. Time Division Multiplexing (TDM) is an optional feature that supports BCMC. When multiple flows are multiplexed on a single F-SCH, the base station may include TDM related parameters. Mobile station can use TDM related parameters to save battery, by waking up only when BCMC_FLOW that MS is interested in is transmitted.

TDM related parameters are included in *BCMC Service Parameters Message*. TDM related parameters are TDM_STRUCTURE_IND, TDM_SLOT_LENGTH, TDM_SUPER_PERIOD_MASK_LEN, TDM_MEGA_PERIOD_MASK_LEN, TDM_USED_IND,

1 TDM_MASK, TDM_SUPER_PERIOD_MASK_INCL, TDM_SUPER_PERIOD_MASK,
2 TDM_MEGA_PERIOD_MASK_INCL, TDM_MEGA_PERIOD_MASK.

3 TDM parameters include 3 levels TDM masks TDM_MASK, TDM_SUPER_PERIOD_MASK
4 and TDM_MEGA_PERIOD_MASK. These masks indicate BCMC flow to F-SCH time slot
5 mapping.

6 Each bit of TDM_MASK indicates presence of a flow on a slot. Length of a slot is defined by
7 TDM_SLOT_LENGTH. Each bit of TDM_SUPER_PERIOD_MASK indicates presence of a flow
8 on a super slot. Super slot length is equal to slot length multiplied by number of bits in
9 TDM_MASK. Each bit of TDM_MEGA_PERIOD_MASK indicates presence of a flow on a
10 mega slot. Super slot length is equal to super slot length multiplied by number of bits in
11 TDM_SUPER_PERIOD_MASK.

12 When outer coding is used TDM_SUPER_PERIOD_MASK length is always 16 bits, but only
13 partial mask (first part) is included in the *BCMC Service Parameters Message*. Remaining
14 bits in the mask that are not included in the *BCMC Service Parameters Message* are “don’t
15 care” bits, and the mobile station can decide if remaining slots need to be received based on
16 outer coding algorithm.

17 Subsection 2.6.13.12.1 defines how TDM period is aligned with system time.

18 2.6.13.12.1 BCMC TDM period alignment requirement

19 Each TDM period for a BCMC flow on a particular Forward Supplemental Channel starts
20 when the system time (t) in 20 ms units satisfies the following equation:

- 21 • If outer coding is used for the FSCH where this BCMC flow is transmitted (i.e.
22 FSCH_OUTER_CODE_INCL for the FSCH is equal to ‘1’)

$$23 \quad t \bmod (\text{TDM period}) = \text{FSCH_OUTERCODE_OFFSET}$$

24 where FSCH_OUTERCODE_OFFSET is the outer coding buffer offset for the
25 FSCH where this BCMC flow is transmitted

- 26 • Otherwise

$$27 \quad t \bmod (\text{TDM period}) = 0$$

28 Here, TDM period is calculated as following:

- 29 • If TDM_MEGA_PERIOD_MASK_INCL for the BCMC flow on this particular Forward
30 Supplemental Channel is equal to ‘1’

31 TDM period = (duration of mega slot in 20 ms units) × (length of
32 TDM_MEGA_PERIOD_MASK in bits)

- 33 • Otherwise

$$34 \quad \text{TDM period} = \text{duration of mega slot in 20 ms units}$$

35 2.6.14 Common Procedures for Processing r-csch Messages

36 This section describes the common procedures for processing messages sent on the r-csch.

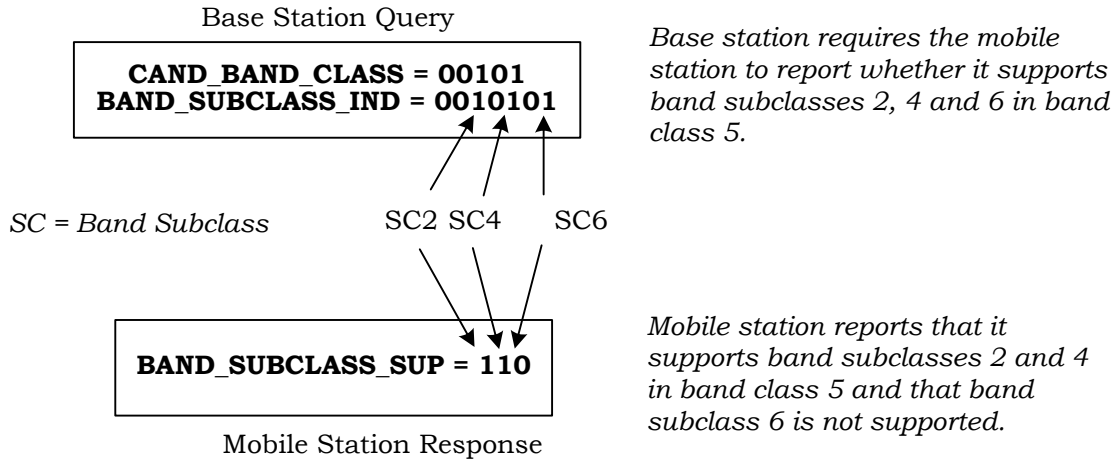

2.6.14.1 Reporting Band Class – Band Subclass Capabilities

If the FD_CHAN_LST_IND_s is set to '0' and CAND_BAND_INFO_REQ_r is set to '1' in the *Extended System Parameters Message* or in the *MC-RR Parameters Message*, the mobile station shall report band subclass capabilities via the *Registration Message*, *Origination Message* or *Page Response Message*. If the FD_CHAN_LST_IND_s is set to '1' and CAND_BAND_INFO_REQ_r is set to '1' the mobile station shall use *General Extension Message* to carry the *Registration Message*, *Origination Message* or *Page Response Message* and include the Supported Band Class - Subclass Record. The mobile station shall perform the following procedures when reporting band class:

- In the procedures below, the following assumptions apply:
 - For band classes defined with multiple band subclasses, the mobile station shall indicate support of this band class if at least one band subclass is supported.
 - If the mobile station supports a candidate band class but it is not aware of any band subclass definition for that band class, the mobile station shall report its capabilities as if it supports band subclass 0 of that band class.
- If the mobile station supports at least one band class and band subclass (if applicable) combination queried by the base station, the mobile station shall set BAND_SUB_REP_INCL to '1'; otherwise, the mobile station shall set this field to '0' and shall not perform the remaining procedures.
- If the mobile station is sending this information in a Bandclass - Subclass Information Record included in General Extension Message then the mobile station shall initialize NUM_BAND_SUBCLASS to '00000'.
- Otherwise, the mobile station shall initialize NUM_BAND_SUBCLASS to '0000'.
- If the mobile station supports all candidate band class and band subclass (if applicable) combinations queried by the base station, the mobile station shall not perform the remaining procedures; otherwise, for $i = 1$ to NUM_CAND_BAND_CLASSES, the mobile station shall perform the following:
 - If CAND_BAND_CLASS_REC[i].SUBCLASS_INFO_INCL is equal to '0', the mobile station shall perform the following:
 - + The mobile station shall include one instance of the BAND_SUBCLASS_SUP field and set it as follows. If the mobile station supports the candidate band class CAND_BAND_CLASS_REC[i].CAND_BAND_CLASS, the mobile station shall set this field to '1'; otherwise, it shall set it to '0'.
 - + The mobile station shall increment NUM_BAND_SUBCLASS by 1.
 - Otherwise, for $j = 0$ to CAND_BAND_CLASS_REC[i].SUBCLASS_REC_LEN, if CAND_BAND_CLASS_REC[i].BAND_SUBCLASS_IND_REC[j] is equal to '1', the mobile station shall perform the following:

- 1 + The mobile station shall include one instance of the BAND_SUBCLASS_SUP
- 2 field and set it as follows. If the mobile station supports the band subclass
- 3 CAND_BAND_CLASS_REC[i].BAND_SUBCLASS_IND_REC[j], the mobile
- 4 station shall set this field to '1'; otherwise, it shall set it to '0'.
- 5 + The mobile station shall increment NUM_BAND_SUBCLASS by 1.

6 Figure 2.6.14.1-1 illustrates the relationship between the base station
 7 CAND_BAND_CLASS, BAND_SUBCLASS_IND fields and the mobile station
 8 BAND_SUBCLASS_SUP fields for one possible scenario.

9
 10

11 **Figure 2.6.14.1-1. Illustration of Band Class - Band Subclass Reporting**

12 2.6.14.2 Reporting Additional Geo Location Type Capabilities

13 If the ADD_LOC_GEM_ALLOWED_s is set to '1' the mobile station may use⁷⁶ a *General*
 14 *Extension Message* to include a Additional Geo Location Type Record with Origination and
 15 Registration Messages⁷⁷.

16 2.6.15 MEID procedures when communicating with P_REV 6, 7, 8, 10 Base Stations

17 The mobile station shall conform to the requirements in [47] when communicating with a
 18 P_REV 6, 7, 8, or 10 base station.

19 2.6.16 Initialization of RC parameters

20 The mobile station shall initialize the RC parameters as follows:

⁷⁶ The mobile station may include this record for an emergency call.

⁷⁷ The mobile station will not use GEM to include a Additional Geo Location Type Record if the base station allows access entry handoff and the neighboring base station to which the mobile station could perform an access handoff and this neighboring base station does not support the use of GEM.

- 1 • The mobile station shall set FOR_FCH_ACK_MASK_RL_BLANKING_S to '0001 1001
- 2 1001 1000' and set FOR_FCH_ACK_MASK_NO_RL_BLANKING_S to '0000 1010 1010
- 3 1010'.
- 4 • The mobile station shall set REV_FCH_ACK_MASK_S to '0000 1010 1010 1010'.
- 5 • The mobile station shall set FOR_SCH_ACK_MASK_RL_BLANKING_S to '0000 0000
- 6 0001 1000' and set FOR_SCH_ACK_MASK_NO_RL_BLANKING_S to '0000 0000 0010
- 7 1000'.
- 8 • The mobile station shall set REV_SCH_ACK_MASK_S to '0000 0000 0010 1010'.
- 9 • The mobile station shall set FOR_SCH_DELAYED_ACK_MASK_S to '000'
- 10 • The mobile station shall set REV_SCH_DELAYED_ACK_MASK_S to '000'
- 11 • The mobile station shall set FOR_N2M_IND_S to '001' (4 bad frames).
- 12 • The mobile station shall set RPC_MODE_S to '00' (200 to 400 bps).
- 13 • The mobile station shall set PWR_CNTL_STEP_S to '000' (1 dB).
- 14 • The mobile station shall set FOR_FCH_BLANKING_DUTYCYCLE_S to '001' (N=4).
- 15 • The mobile station shall set REV_FCH_BLANKING_DUTYCYCLE_S to '000' (N=1).
- 16 • The mobile station shall set REV_FCH_BLANKING_DUTYCYCLE_IN_USE to '000'
- 17 (N=1).
- 18 • The mobile station shall set REV_ACKCH_GAIN_ADJ_ACS1_S to '0000 000'.
- 19 • The mobile station shall set REV_ACKCH_GAIN_ADJ_ACS2PLUS_S to '0000 000'.
- 20 • The mobile station shall initialize RC_PARAMS_RECORD_S to have entry
- 21 RC_PARAMS_RECORD_S[i] for each of the PILOT_PNs assigned to mobile and
- 22 initialize corresponding fields of each of the RC_PARAMS_RECORD_S[i] record as
- 23 follows:
- 24 – Set RC_PARAMS_RECORD_S[i].QOF_SET_IN_USE set to '000'.
- 25 – Set RC_PARAMS_RECORD_S[i].REV_SCH_ACK_CH_WALSH[00] to NULL.
- 26 – Set RC_PARAMS_RECORD_S[i].REV_SCH_ACK_BIT[00] to NULL.
- 27 – Set RC_PARAMS_RECORD_S[i].REV_SCH_ACK_CH_WALSH[01] to NULL.
- 28 – Set RC_PARAMS_RECORD_S[i].REV_SCH_ACK_BIT[01] to NULL.
- 29 – Set RC_PARAMS_RECORD_S[i].FOR_FCH_CCSH_INTERLEAVER_TYPE to '0'.

30 2.6.17 RC_PARAMS_RECORD update procedures

31 The mobile station shall update RC_PARAMS_RECORD in Traffic Channel Substate as
32 follows:

- 33 • When a pilot is added to the active set for which there is no entry present in
- 34 RC_PARAMS_RECORD_S, the mobile station shall update RC_PARAMS_RECORD_S to
- 35 add an entry RC_PARAMS_RECORD_S[i] and perform the following:

- 1 – Set RC_PARAMS_RECORD_s[i].PILOT_PN to the PILOT_PN of the added pilot.
- 2 – Set RC_PARAMS_RECORD_s[i].QOF_SET_IN_USE to '000'.
- 3 – Set RC_PARAMS_RECORD_s[i].REV_SCH_ACK_CH_WALSH[00] to NULL.
- 4 – Set RC_PARAMS_RECORD_s[i]. REV_SCH_ACK_BIT[00] to NULL.
- 5 – Set RC_PARAMS_RECORD_s[i]. REV_SCH_ACK_CH_WALSH[01] to NULL.
- 6 – Set RC_PARAMS_RECORD_s[i]. REV_SCH_ACK_BIT[01] to NULL.
- 7 – Set RC_PARAMS_RECORD_s[i]. FOR_FCH_CCSH_INTERLEAVER_TYPE to '0'.
- 8 • When a pilot is removed from the active set for which there was an entry present in
- 9 RC_PARAMS_RECORD_s, the mobile station shall update RC_PARAMS_RECORD_s to
- 10 remove the entry.
- 11 • When a *Radio Configuration Parameters Message* or *General Extension Message*
- 12 carrying the Radio Configuration Parameters record is received, the mobile station
- 13 shall update RC_PARAMS_RECORD_s as described in section 2.6.4.3.

14 2.6.18 Processing of General Extension Message

15 The base station may extend layer 3 messages with additional fields using the *General*
16 *Extension Message*. The mobile station shall process this message at the action time:

- 17 • explicitly specified in the message carried in the MESSAGE_REC field, or
- 18 • implicitly specified by the message carried in the MESSAGE_REC field when action
- 19 time is not carried explicitly in the message carried in the MESSAGE_REC field.

20 The mobile station shall process this message as follows:

- 21 • The mobile station shall store the *i*th occurrence of the GE_REC_TYPE_r in
- 22 GE_REC_TYPE_s[*i*].
- 23 • The mobile station shall store the *i*th occurrence of the GE_REC_LEN_r in
- 24 GE_REC_LEN_s[*i*].
- 25 • If any General Extension Record type is not supported, the mobile station shall
- 26 send a *Mobile Station Reject Order* with ORDQ equal to 00011101.
- 27 • If any field value in any of the General Extension Records is outside its permissible
- 28 range, the mobile station shall send a *Mobile Station Reject Order* with ORDQ equal
- 29 to 00011110.
- 30 • If any field value in any of the General Extension Records is not supported, the
- 31 mobile station shall send a *Mobile Station Reject Order* with ORDQ equal to
- 32 00011111.
- 33 • The mobile station shall store the *i*th occurrence of the GE_REC_r as follows.
- 34 • If GE_REC_TYPE_s[*i*] is equal to '00000000' the mobile station shall store the
- 35 BAND_CLASS_r field in the GE_REC_r as BAND_CLASS_s and REV_CHAN_r field in the
- 36 GE_REC_r as REV_CHAN_s. The mobile station shall use the REV_CHAN_s channel
- 37 number of BAND_CLASS_s as the associated reverse link for the channel carried in
- 38 the message carried by the MESSAGE_REC field.

- 1 • If `GE_REC_TYPEs[i]` is equal to '00000001' the mobile station shall store and use
 2 the fields included in the Radio Configuration Parameters Record at the action time.
 3 If the `USE_TIME` field in the Radio Configuration Parameters Record is set to '0'⁷⁸,
 4 the mobile station shall process the message contained in the `MESSAGE_REC` and
 5 then update the stored parameters by the values of the fields included in the Radio
 6 Configuration Parameters Record as follows:
- 7 - If Radio Configuration Parameters Record is received with an *Extended Channel*
 8 *Assignment Message* or a *MEID Extended Channel Assignment Message*, the
 9 mobile station should initialize the radio configuration parameters and
 10 `RC_PARAMS_RECORD` according to section 2.6.16 and then update the
 11 parameters and `RC_PARAMS_RECORD` using the values included in the Radio
 12 Configuration Parameters Record as described in 2.6.4.3.
 - 13 - If Radio Configuration Parameters Record is received with *Universal Handoff*
 14 *Direction Message* or an *Extended Handoff Direction Message* or a *General*
 15 *Handoff Direction Message* or a *MEID Universal Handoff Direction Message* that
 16 requires a hard handoff, the mobile station should initialize the Radio
 17 Configuration Parameters and `RC_PARAMS_RECORD` according to section
 18 2.6.16 and then update the parameters and `RC_PARAMS_RECORD` using the
 19 values included in the Radio Configuration Parameters Record as described in
 20 2.6.4.3.
- 21 • The mobile station shall use the `MESSAGE_TYPE` field as specified in [4] and
 22 process the reception of layer 3 message carried in the `MESSAGE_REC` field.

23 2.6.19 Delayed ACK Record update procedures

24 The mobile station shall update Delayed ACK Record as follows:

- 25 • If the mobile station receives a Delayed ACK record in a General Extension Message
 26 that contains `FOR_SCH_DELAYED_ACK_MASK` or
 27 `REV_SCH_DELAYED_ACK_MASK` values that the mobile station does not support,
 28 the mobile station shall send a Mobile Station Reject Order with `ORDQ` equal to
 29 00011111.
- 30 • If the mobile station receives a Delayed ACK record in a General Extension Message
 31 that contains `FOR_SCH_DELAYED_ACK_MASK` or
 32 `REV_SCH_DELAYED_ACK_MASK` values that the mobile station can support, the
 33 mobile station shall:
- 34 • If the `FOR_SCH_DELAYED_ACK_MASK_INCLr` is set to '1', the mobile station shall
 35 set `FOR_SCH_DELAYED_ACK_MASKs` to `FOR_SCH_DELAYED_ACK_MASK` value
 36 received in the Delayed ACK record.

⁷⁸ The base station will set the `USE_TIME` field for Radio Configuration Parameters Record to '0' when this record is sent in a General Extension Message.

- 1 • If the REV_SCH_DELAYED_ACK_MASK_INCL_r is set to '1', the mobile station shall
2 set REV_SCH_DELAYED_ACK_MASKs to REV_SCH_DELAYED_ACK_MASK value
3 received in the Delayed ACK record.

4 The base station and mobile station may use the FOR_SCH_DELAYED_ACK_MASK or
5 REV_SCH_DELAYED_ACK_MASK to transmit an ACK or NAK for frame n during the
6 reception of frame n+1.⁷⁹⁸⁰

7 The mobile station should use the FOR_SCH_DELAYED_ACK_MASK to transmit an
8 acknowledgement only when the F-SCH is assigned to the mobile station.

9 2.6.20 SO 73 support for RL RC 8, FL RC 11 and 12 Operation

10 If the mobile station supports RL RC 8 or FL RC 11 or FL RC 12 then the mobile station
11 shall support Service Option 73 NB Mode (i.e. Operating Point 1 through 7 of Service
12 Option 73) and shall indicate support for SO 73 to the base station.

13 **2.7 PDU Formats for Mobile Stations**

14 This section describes the formats of the PDUs corresponding to the messages sent by the
15 mobile station.

16 In any multi-bit field in the following messages, the most significant bit (MSB) shall be
17 transmitted first.

18 Some bits in the PDUs are marked as RESERVED. These bits allow extension of the PDUs
19 for future features and capabilities. The mobile station sets all reserved bits to '0'. Some
20 fields include values marked as reserved. The mobile station shall not set a field to a value
21 that is marked as reserved.

22

⁷⁹ The physical layer characteristics of acknowledgement transmission using FOR_SCH_DELAYED_ACK_MASK and REV_SCH_DELAYED_ACK_MASK are similar to transmission using REV_SCH_ACK_MASK and FOR_SCH_ACK_MASK_RL_BLANKING and FOR_SCH_ACK_MASK_NO_RL_BLANKING.

⁸⁰ The base station will set one of the bit of the FOR_SCH_DELAYED_ACK_MASK_INCL and REV_SCH_DELAYED_ACK_MASK_INCL to '1' and other to '0' to prevent unnecessary ACK channel transmissions.

1 2.7.1 r-csch

2 This section describes the messages and their PDU formats sent by the mobile station on
3 the r-csch.

4 2.7.1.1 Reserved

5 2.7.1.2 Reserved

6 2.7.1.3 PDU Formats on r-csch

7 The messages sent on the r-csch are summarized in Table 2.7.1.3-1.

8

REG_TYPE – Registration type.

This field indicates which type of event generated the registration attempt.

The mobile station shall set this field to the REG_TYPE value shown in Table 2.7.1.3.2.1-1 corresponding to the event that caused this registration to occur (see 2.6.5.1).

Table 2.7.1.3.2.1-1. Registration Type (REG_TYPE) Codes

REG_TYPE (binary)	Type of Registration
0000	Timer-based (see 2.6.5.1.3)
0001	Power-up (see 2.6.5.1.1)
0010	Zone-based (see 2.6.5.1.5)
0011	Power-down (see 2.6.5.1.2)
0100	Parameter-change (see 2.6.5.1.6)
0101	Ordered (see 2.6.5.1.7)
0110	Distance-based (see 2.6.5.1.4)
0111	User Zone-based (see 2.6.5.1.10)
1000	Encryption Re-sync required (see 2.6.5.1.11)
1001	BCMC Registration (see 2.6.13.3)
All other REG_TYPE values are reserved.

- SLOT_CYCLE_INDEX – Slot cycle index.
 If P_REV_IN_USE_s is less than 11, or if MIN_SLOT_CYCLE_INDEX is equal to ‘0’, the mobile station shall perform the following:
- If the mobile station is configured for slotted mode operation, the mobile station shall set this field to max (0, SLOT_CYCLE_INDEX_p) (see 2.6.2.1.1). Otherwise, the mobile station shall set this field to ‘000’.
- Otherwise, the mobile station shall perform the following:
- If the mobile station is configured for slotted mode operation, the mobile station shall set this field to the absolute value of the preferred slot cycle index, SLOT_CYCLE_INDEX_p (see 2.6.2.1.1); otherwise, the mobile station shall set this field to ‘000’. The sign of the preferred slot cycle index, SLOT_CYCLE_INDEX_p, is specified in the SIGN_SLOT_CYCLE_INDEX field of this message (see Table 2.7.1.3.2.1-8).
- MOB_P_REV – Protocol revision of the mobile station.
 The mobile station shall set this field to ‘00001101’.
- SCM – Station class mark.
 The mobile station shall set this field to its station class mark. See 2.3.3.
- MOB_TERM – Mobile terminated calls accepted indicator.

If the mobile station is configured to accept mobile terminated calls while operating with the current roaming status (see 2.6.5.3), the mobile station shall set this bit to '1'. Otherwise, the mobile station shall set this bit to '0'.

RETURN_CAUSE – Reason of the mobile station registration or access.

The mobile station shall set this field to the RETURN_CAUSE value shown in Table 2.7.1.3.2.1-2 corresponding to the service redirection failure condition (see 2.6.1.1).

Table 2.7.1.3.2.1-2. RETURN_CAUSE Codes

RETURN_CAUSE (binary)	Redirect Failure Condition
0000	Normal access.
0001	Service redirection failed as a result of system not found.
0010	Service redirection failed as a result of protocol mismatch.
0011	Service redirection failed as a result of registration rejection.
0100	Service redirection failed as a result of wrong SID.
0101	Service redirection failed as a result of wrong NID.
All other RETURN_CAUSE values are reserved.	

QPCH_SUPPORTED – Quick Paging Channel supported indicator.

If P_REV_IN_USE_s is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

If the mobile station supports the Quick Paging Channel, the mobile station shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.

ENHANCED_RC – Enhanced radio configuration supported indicator.

If P_REV_IN_USE_s is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

If the mobile station supports any radio configuration in the Radio Configuration Class 2 (see 1.1.1), the mobile station shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.

UZID_INCL – User Zone Identifier included indicator.

- 1 If P_REV_IN_USE_S is less than six, the mobile station shall
 2 omit this field; otherwise, the mobile station shall include this
 3 field and set it as follows.
- 4 If the message is to contain the User Zone Identifier, the
 5 mobile station shall set this field to '1'; otherwise, the mobile
 6 station shall set this field to '0'.
- 7 UZID – User Zone Identifier.
- 8 If the UZID_INCL is included in the message and is set to '1',
 9 the mobile station shall include this field and set it to UZID_S;
 10 otherwise, the mobile station shall omit this field.
- 11 GEO_LOC_INCL – Geo-location included indicator.
- 12 If P_REV_IN_USE_S is less than seven, the mobile station shall
 13 omit this field; otherwise, the mobile station shall include this
 14 field and set it as follows.
- 15 If the message is to contain the GEO_LOC_TYPE field, the
 16 mobile station shall set this field to '1'; otherwise, the mobile
 17 station shall set this field to '0'.
- 18 GEO_LOC_TYPE – Geo-Location Type.
- 19 If GEO_LOC_INCL is included in the message and is set to '1',
 20 the mobile station shall include this field and shall set it to
 21 the value shown in Table 2.7.1.3.2.4-7; otherwise, the mobile
 22 station shall omit this field.
- 23 OTD_SUPPORTED – Orthogonal Transmit Diversity supported.
- 24 If P_REV_IN_USE_S is less than seven, the mobile station shall
 25 omit this field; otherwise, the mobile station shall include this
 26 field and set it as follows.
- 27 The mobile station shall set this field to '1' if Orthogonal
 28 Transmit Diversity is supported; otherwise, the mobile station
 29 shall set this field to '0'.
- 30 STS_SUPPORTED – Space Time Spreading Transmit Diversity supported.
- 31 If P_REV_IN_USE_S is less than seven, the mobile station shall
 32 omit this field; otherwise, the mobile station shall include this
 33 field and set it as follows.
- 34 The mobile station shall set this field to '1', if Space Time
 35 Spreading Transmit Diversity is supported; otherwise, the
 36 mobile station shall set this field to '0'.
- 37 3X_CCH_SUPPORTED – 3X Common Channels supported.
- 38 If P_REV_IN_USE_S is less than seven, the mobile station shall
 39 omit this field; otherwise, the mobile station shall include this
 40 field and set it as follows.
- 41 The mobile station shall set this field to '1' if the mobile
 42 station supports the Spreading Rate 3 common channels (3X
 43 BCCH, 3X F-CCCH, and 3X R-EACH); otherwise, the mobile
 44 station shall set this field to '0'.

1 WLL_INCL – WLL information included indicator.
 2 If P_REV_IN_USE_s is less than seven, the mobile station shall
 3 omit this field; otherwise, the mobile station shall include this
 4 field and set it as follows.
 5 If the mobile station is a Wireless Local Loop device, the
 6 mobile station shall set this field to ‘1’; otherwise, the mobile
 7 station shall set this field to ‘0’.

8 WLL_DEVICE_TYPE – WLL device type indicator.
 9 If WLL_INCL is not included, or if WLL_INCL is included and
 10 is set to ‘0’, the mobile station shall omit this field; otherwise,
 11 the mobile station shall set this field as follows.
 12 The mobile station shall set this field to the
 13 WLL_DEVICE_TYPE value shown in Table 2.7.1.3.2.1-3
 14 corresponding to the mobile station device type.

15 **Table 2.7.1.3.2.1-3. WLL Device Types**

WLL_DEVICE_TYPE (binary)	Description
000	Wireless Local Loop terminal with no mobility
001	Wireless Local Loop terminal with limited mobility
010	Wireless Local Loop terminal with full mobility
011 - 111	Reserved

16
 17 HOOK_STATUS – WLL terminal hook status.
 18 If WLL_INCL is not included, or if WLL_INCL is included and
 19 is set to ‘0’, the mobile station shall omit this field; otherwise,
 20 the mobile station shall set this field to the value shown in
 21 Table 2.7.1.3.2.1-4 corresponding to the hook state.

Table 2.7.1.3.2.1-4. Hook Status Values

HOOK_STATUS (binary)	Description
0000	Subscriber terminal is on-hook
0001	Subscriber terminal is off-hook
0010	Subscriber terminal is stuck off-hook
0011 – 1111	Reserved

ENC_INFO_INCL – Encryption fields included.

If P_REV_IN_USE_S is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

The mobile station shall set this field to '1' if the encryption related fields are included; otherwise the mobile station shall set this field to '0'. The mobile station shall set this field to '0' if the base station does not support encryption or the mobile station does not support any of the encryption modes supported by the base station.

SIG_ENCRYPT_SUP – Signaling encryption supported indicator.

If ENC_INFO_INCL is included and is set to '1', the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to indicate which signaling encryption algorithms are supported by the mobile station.

This field consists of the subfields shown in Table 2.7.1.3.2.1-5.

Table 2.7.1.3.2.1-5. Encoding of the SIG_ENCRYPT_SUP Field

Subfield	Length (bits)	Subfield Description
CMEA	1	Support of Cellular Message Encryption Algorithm
ECMEA	1	Support of Enhanced Cellular Message Encryption Algorithm
REA	1	Support of the Rijndael Encryption Algorithm
RESERVED	5	Reserved bits

If this field is included, the mobile station shall set the subfields as follows:

The mobile station shall set the CMEA subfield to '1'.

The mobile station shall set each other subfield to '1' if the corresponding signaling encryption algorithm is supported by

- 1 the mobile station; otherwise, the mobile station shall set the
2 subfield to '0'.
